To the stops in general use, as the diapasons and principal, must be added, for the accompaniment of the psalms, tierces, twelfths, octaves, and fifteenths, according to their nearest proportions, and in proportion to the number of people assembled for the celebration of the divine service.

To the full organ may be added the reed stops and the whole play of the pedals; to the choir organ half the play of the pedals.

Reed stops, being of peculiar structure, require a different mode of treatment. They are used principally in solos, and in such a manner as appears best suited to the powers or expression of the human voice intended by the composer to be imitated. From the nasal qualities of some of the reed stops they should never be employed in the accompaniment of the psalms. The disagreeable qualities of some of the reed stops are lost in the combination with flute stops of eight or four feet.

Particular attention should be paid to the style of music to be executed, in order that the stops employed should be applicable to the expression required. In the performance of a specimen of harmony in four, five, or six sustained parts, flutes and diapasons are necessary,

and the reed stops are on no account to be tolerated. The attention of the organist is also particularly directed to the study of the lugubrious effects so peculiar to the stopt diapasons than which, when combined with the flute, nothing interests the heart so much or prepares the soul to devotional feeling. On the continent organs for this purpose are muffled or covered with cloth, and the tremblants are used. The expert organist profits greatly by the multiplicity of claviers, employing one for the harmonic support of the melody and the pedals for the bass, and another for the melody suitable for the diapasons of instruments or voices intended to be imitated, producing by this display of his tact, genius, and experience, the most grateful sensations upon the minds of the congregation.

The facility with which organists of Germany and France execute difficult passages with their feet upon the pedals, displaying at the same time their intimate knowledge of the powers of harmony upon different claviers with their feet, is truly astonishing, and, to musicians conversant only with the music generally adopted in the church of England, the recital of these extraordinary feats appears incredible. High heeled shoes facilitate much the execution of quick passages for the pedals.

From the great variety of forms and modes of worship observed in the Roman and Protestant churches in Germany, France, Italy, and Switzerland, the qualifications requisite for an organist are of greater magnitude than those necessary for one of the church of England. But, unfortunately, such is the degraded state to which sacred music is brought in our churches, that the ability of playing one of Handel's overtures and a couple of psalm tunes, are considered by the umpires deputed to decide upon the merits and demerits of the musical candidates, to be the only requisites for the regular installment of an organist. Hence, instead of a well conducted musical education, which, next to respectability of character, ought at all times to be the passport to the exercise of the honorable functions of an organist, persons of mean pretensions are put into the possession of the majority of the organs in the metropolis; a misfortune, tending not only to the exclusion from the celebration of divine service of that talent and experience which upon all occasions, would ensure the correct and judicious performance of the finest specimens of harmony and melody, of the German, Italian, and English schools, thereby forming and improving the taste for good music in England, but to facilitate the introduction of those contemptible and interminable effusions designated extemporaneous performances, which, resulting nearly in all cases from gross ignorance, throw ridicule upon the principles of music as a science, and are with difficulty to be endured with common decency although performed in the sanctuary.

The best and indeed the only criterion of the abilities of an organist is his intimacy with the finest specimens of classical music, and his power of performing them with facility and judgment. But, to ensure at all times the mode most suitable for the church, every parish should be provided

with a musical library consisting of about eight volumes of well and classically chosen compositions; and this music, as much as possible, should be strictly and regularly performed, a system ensuring at once respect for the organist, and that decency which is commended by the ritual.

The swell, on the score of expression, is the most valuable part of the organ, but a dangerous instrument in the hands of an organist not gifted with an ear to sound, as in discourse, musical periods with discrimination.

ORGASM, *n. s.* Fr. *orgasme*; Gr. *οργασμος*. Sudden vehemence.

This rupture of the lungs, and consequent spitting of blood, usually arises from an *orgasm*, or immoderate motion of the blood. *Blackmore.*

By means of the curious lodgment and inosculation of the auditory nerves, the *orgasms* of the spirits should be allayed, and perturbations of the mind quieted. *Derham.*

OR'GEIS, *n. s.* A sea-fish, called also organling, corruptions of the orkenyling, perhaps as being taken on the Orkney coast.

ORGIA, feasts and sacrifices in honor of Bacchus, held every third year, and chiefly celebrated by women, called Bacchæ. The chief solemnities were performed in the night, to conceal, perhaps, their shocking impurities; and a mountain was generally chosen as the place of celebration. They were instituted by Orpheus; and from him are sometimes called Orphica. Authors are not agreed as to the derivation of the word; but from the frantic proceedings of the Bacchanalians, *οργη*, furor, seems to be the true etymology. See BACCHANALIA. Orgia, according to Servius, was a common name for all kinds of sacrifices among the Greeks, as ceremoniz was amongst the Romans.

ORG'ILLOUS, *adj.* Fr. *orgueilleux*. Proud; haughty Not in use.

From isles of Greece

The princes *orgillous*, their high blood chafed,
Have to the port of Athens sent their ships.

Shakespeare.

OR'GIES, *n. s.* Fr. *orgies*; Lat. *orgia*. The old mad rites of Bacchus; frantick revels.

These are nights,
Solemn to the shining rites
Of the fairy prince and knights,
While the moon their *orgies* lights.

Ben Jonson.

She feigned nocturnal *orgies*; left my bed,
And, mixed with Trojan dames, the dances led.

Dryden.

In Bacchus' *orgies* I can bear no part,
And scarcely know a diamond from a heart.

Whyte's Poems.

ORGUES, in the military art, are thick long pieces of wood, pointed at one end, and shod with iron, loose one from the other; hanging, each by a particular rope or cord, over the gateway of a strong place, perpendicularly, to be all let fall at once in case of the approach of an enemy. Orgues are preferable to hersees or portcullices, because these may be either broke by a petard, or they may be stopped in their falling down; but a petard is useless against an orgue, for, if it break one or two of the pieces, they im-

mediately fall down again and fill up the vacancy; or, if they stop one or two of the pieces from falling, it is no hindrance to the rest; for, being all separate, they have no dependence upon one another. It is also the name of a machine composed of several harquebuss or musket barrels bound together, by means whereof several discharges are made at the same time. It is used to defend breaches and other places attacked.

ORIBASIA, in botany, a genus of the monogynia order and pentandria class of plants, natural order forty-seventh, stellatæ: cor. small, tubulated, and monopetalous; pericarp a globular berry, grooved longitudinally; quinquelocular and containing one seed. Of this there are six species, all natives of the warmer parts of America.

ORIBASIVS, or ORIBASUS, a celebrated physician, greatly esteemed by the emperor Julian, in whose reign he flourished. He abridged the works of Galen, and of all the most respectable writers on physic, at the request of the emperor. He accompanied Julian into the east, but his skill proved ineffectual in attempting to cure the fatal wound which his benefactor had received. After Julian's death he fell into the hands of the barbarians. The best edition of his works is that of Dundas, 4to. Lug. Bat. 1745.

OR'ICHALCH, *n. s.* Lat. *orichalcum*. Brass. See AURICHALCUM.

Nor Bilbo steel, nor brass from Corinth fet,
Nor costly *orichaleh* from strange Phoenix,
But such as could both Phæbus' arrows ward,
And the hailing darts of heaven beating hard.

Spenser.

ORICHALCH, ORICHALCUM, or AURICHALCUM, a metallic substance resembling gold in color, but very inferior in value. It was well known to the old Romans, who often took advantage of its resemblance to gold; for some sacrilegious characters, who could not resist the temptation of taking gold from temples and other public places, chose to conceal their guilt by substituting orichalcum for it. It was thus that Julius Cæsar acted, when he robbed the capitol of 3000 pound weight of gold; in which he was followed by Vitellius, who despoiled the temples of their gifts and ornaments, and put this inferior metal in their place. It has been a matter of dispute, with philosophers and others, what this metal could be, or how it was procured or made; it is probable, at least, that it was greatly analogous to our brass, if not wholly the same with it. See BRASS. The resemblance of brass to gold, in color, is obvious at first sight. Both brass and gold are susceptible of a variety of shades of yellow, in proportion to their alloy with copper; but the nearness of the resemblance is sufficiently proved by the difficulty of distinguishing substances gilded with brass or Dutch leaf from such as are gilded with gold leaf. The Romans knew the manner of making orichalcum, and the materials from which they made it were the very same from which we make brass. There are, indeed, authors of repute who think otherwise. M. Cronstedt does not think it just to conclude from old coins and other antiquities, that it is evidently proved that the making of brass was known in the most

ancient times ; and the authors of the French Encyclopédie assure us that our brass is a very recent invention. It appears, however, from Pliny's Natural History, lib. xxxiv, sect. 2, and from the concurring testimony of other writers, that orichalcum was not a pure or original metal ; but that its basis was copper, which the Romans changed into orichalcum by means of cadmia, a species of earth which they threw upon the copper, and which it absorbed. The testimony of Ambrose, bishop of Milan, in the fourth century ; of Primasius, bishop of Atrumentum, in Africa, in the sixth ; and Isidorus, bishop of Seville, in the seventh, all confirm Pliny's account. We may therefore safely conclude that the Romans knew the method of making brass by mixing cadmia or calamine with copper ; yet it is probable they were not the inventors of this art. It appears from a variety of testimonies that brass was made in Asia, in a manner very similar to that at Rome ; and it is supposed that in India it was made in the remotest ages. It is generally supposed that there were two sorts of orichalcum, one factitious, the other natural. The factitious, whether we consider its qualities or composition, appears to have been the same with our brass. As to the natural orichalcum, it is not impossible that copper ore may be so intimately blended with ore of zinc, or of some other metallic substance, that the compound, when smelted, may yield a mixed metal of a paler hue than copper, and resembling the color of either gold or silver. In Du Halde's History of China we meet with the following account of the Chinese white copper :—' The most extraordinary copper is called de-tong, or white copper ; it is white when dug out of the mine, and still more white within than without. It appears, by a vast number of experiments made at Pekin, that its color is owing to no mixture ; on the contrary, all mixtures diminish its beauty ; for, when it is rightly managed, it looks exactly like silver ; and were there not a necessity of mixing a little tutanag, or some such metal, with it, to soften it and prevent its brittleness, it would be so much the more extraordinary, as this sort of copper is perhaps to be met with nowhere but in China, and that only in the province of Yun-nan.'—Vol. I., p. 16. Notwithstanding this, it is certain that the Chinese white copper, as brought to us, is a mixed metal ; so that the ore from which it is extracted must consist of various metallic substances, and from some such ore it is possible that the natural orichalcum, if ever it existed, may have been made. But, though the existence of natural orichalcum cannot be proved impossible, yet there is reason to doubt whether it ever had a real existence. We know of no country in which it is now found ; nor was it any where found in the age of Pliny ; nor does he seem to have known the country where it ever had been found. Plato acknowledges that orichalcum was a thing only talked of in his time ; it was nowhere then to be met with, though in the island of Atlantis it had been formerly extracted from its mine. The Greeks were in possession of a metallic substance, called orichalcum, before the foundation of Rome ; for it is mentioned by Homer and by

Hesiod in such a manner as shows that it was then held in great esteem. Other ancient writers have expressed themselves in similar terms of commendation ; and it is principally from the circumstance of the high reputed value of orichalcum that authors are induced to suppose the ancient orichalcum to have been a natural substance. But this conclusion cannot be justly drawn from their encomiums upon it ; for, at whatever time the method of making it was first discovered, both its novelty and scarceness, joined to its utility, would enhance its value. Respecting the etymology of the word there is great diversity of opinions. Those who write it aurichalcum think it is composed of the Latin word aurum, gold, and the Greek χαλκος, brass or copper. The most general opinion is, however, that it is composed of ορος, a mountain, and χαλκος, alluding to its being found in mountains. See Memorials of the Literary and Philosophical Society of Manchester, vol. ii. The following etymology is also given, which seems equally well founded, and is as ingenious as either. The Hebrew word or, aur, signifies light, fire, flame ; the Latin terms uro, to burn, and aurum, gold, are derived from it, inasmuch as gold resembles the color of flame ; and hence it is not improbable that orichalcum may be composed of a Hebrew and a Greek term, and that it is rightly rendered flame-colored copper. In confirmation of this, the Latin epithet lucidum, and the Greek one φαεινον, are both applied to orichalcum by the ancients.

ORICUM, or ORICUS; an ancient town of Epirus, with a good harbour, on the Ionian Sea, founded by a colony from Colchis ; called, also, Dardania, because Helenus, the son of Priam, king of Troy or Dardania, reigned in it along with Andromache, after the destruction of Troy.

O'RIENT, *adj. & n. s.* } Fr. *orient* ; Latin
ORIEN'TAL, *adj. & n. s.* } *oriens*. Rising, as
ORIEN'TALISM, } the sun : hence
ORIEN'TALLY, *adv.* } eastern ; bright ;
shining ; the east : oriental is, eastern ; proceeding from, or pertaining to, the east ; and, as a noun-substantive, an inhabitant of that part of the globe : orientalism, an idiom of the east ; an eastern mode of expression.

The liquid drops of tears that you have shed,
Shall come again transformed to *orient* pearl ;
Advantaging their loan with interest,
Oftentimes double gain of happiness. *Shakspeare.*

We have spoken of the cause of *orient* colors in birds ; which is by the fineness of the strainer.

Bacon's Natural History.

Your ships went as well to the pillars of Hercules, as to Paequin upon the *oriental* seas, as far as to the borders of the east Tartary. *Bacon.*

There do breed yearly an innumerable company of gnats, whose property is to fly unto the eye of the lion, as being a bright and *orient* thing. *Abbot.*

Wherefore hath he clothed the trees in cotton, or the fields with flax—wherefore hath he treasured up such *orient* and pleasing colors in grains and fishes, if not for the use and behoof of man ? *Hall.*

Moon, that now meet'st the *orient* sun, now fly'st,
With the fixed stars. *Milton's Paradise Lost.*

In thick shelter of black shades embowered,
He offers to each weary traveller
His *orient* liquor in a crystal glass,
To quench the drouth of Phœbus.

Milton.

Some, ascribing hereto the generation of gold, conceive the bodies to receive some appropriate influence from the sun's ascendant and *oriental* radiations.

Brown.

His revolution being regular, it hath no efficacy peculiar from its *orientality*, but equally disperseth his beams.

Id.

The chiefs about their necks the scutcheons wore, With *orient* pearls and jewels powdered o'er.

Dryden.

They have been of that great use to following ages, as to be imitated by the Arabians and other *orientals*.

Grew.

His victory was that of *orient* light.

When the sun's shafts disperse the gloom of night.

Couper.

ORIFICE, *n. s.* *Fr.* *orifice*; *Lat.* *orificium*; *ab. ore* and *fucio*. The mouth or opening of a wound or perforation.

The prince of Orange, in his first hurt by the Spanish boy, could find no means to staunch the blood, but was fain to have the orifice of the wound stopped by men's thumbs, succeeding one another for the space of two days.

Bacon.

Their mouths

With hideous *orifice* gaped on us wide,

Portending hollow truce.

Milton.

Ætna was bored through the top with a monstrous *orifice*.

Addison.

Blood-letting, Hippocrates saith, should be done with broad lancets or swords, in order to make a large *orifice* by stabbing or pertusion.

Arbutnot.

ORIFLAMB, or **ORIFLAME**. See **AURIFLAMME**.

ORIGANUM, **ORIGANY**, or **marjoram**, a genus of the gymnospermia order, belonging to the didynamia class of plants, and in the natural method ranking under the forty-second order, verticillatæ. There is a strobilus or cone collecting the calyces together. There are sixteen species, mostly natives of Palestine and the east.

O. dictamnus, dittany of Crete. This holds the first rank among the medicinal plants produced in Crete. The praises betowed on its virtues by the ancients are altogether extravagant; yet we, perhaps, treat its medicinal virtues with too much contempt. Its leaf is very balsamic, and its flower diffuses a delicious odor. The inhabitants of Crete apply it with success on various occasions. The leaf, when dried and taken in an infusion with sugar, makes a very pleasant drink. This plant assumes an under-shrubby growth, often with abiding stalks, if it has shelter in winter.

O. heracleoticum, or winter sweet *marjoram*; a finely scented aromatic, excellent for culinary purposes. It is also useful for giving fragrance to ointments, and other medical purposes.

O. marjoranum, or annual sweet *marjoram*, is an aromatic of the highest fragrance, is proper both for the kitchen and pleasure garden, but more particularly for the former. It is often called knotted *marjoram*, from the flowers growing in close knotted-like heads.

O. vulgare, the common wild pot *marjoram*, possesses the same properties with the *heracleoticum*. All these species flower in July and August; the flowers are small, monopetalous, ringent, universally hermaphrodite; and collected into verticilli round the stalks; succeeded by ripe seed in autumn; though in this country the

annual *marjoram* and the three green-house sorts seldom perfect seed well, unless the autumn proves remarkably fine and warm: in default, however, of seed, the propagation of all the perennial sorts, both hardy and green-house kinds, is easily effected by slips of the roots, &c. And the seed of the annual sort is imported plentifully from France and Italy.

ORIGEN, one of the most celebrated ecclesiastical writers of the primitive church, during the third century, was born at Alexandria, A. D. 185, and was surnamed Adamantius, either from his indefatigable application to study, or from the firmness he discovered amidst the torments he suffered for the faith. Leonidas his father trained him with great care, and made him study the Holy Scriptures from his infancy, in which he made surprising progress; and very early manifested a taste for expounding the Scriptures allegorically, which he afterwards carried to great excess. He had afterwards for his instructors in philosophy Ammonius, the celebrated Christian philosopher, and St. Clement of Alexandria. At eighteen years of age he succeeded St. Clement in the office of catechist, an important employment, which consisted in teaching divinity, and expounding the Scriptures. Leonidas his father had suffered martyrdom the year before, during the persecution of Severus in 202; and Origen had shown such eagerness to follow his father to martyrdom, that his mother was obliged to hide his clothes to prevent his going abroad. Origen had a great concourse of auditors who attended his school, some of whom were of the faithful, and others pagan. He confirmed and strengthened the first in their faith, and converted many of the others; and there was such a number of martyrs amongst his disciples, that it might be said that he kept rather a school of martyrdom than of divinity. Taking in a too literal sense what Christ says of becoming voluntary eunuchs, he castrated himself, to prevent his deserving or suffering scandal, as he instructed females in the doctrines of the New Testament. He took a voyage to Rome in 211, in the beginning of Caracalla's reign, and under the pontificate of Zepherinus. After his return he published many works, by which he acquired an extraordinary reputation, that drew to him a great number of auditors. But Demetrius, bishop of Alexandria, conceiving a jealousy of him, endeavoured by various pretences to injure him. At length Origen went to Antioch, whither the empress Mammaea had sent for him to hear him discourse on the Christian religion. He returned to Alexandria, where he continued to teach till the year 228, when he travelled into Achaia and Palestine, and was ordained by the bishops of that province, at forty-two years of age. His being ordained by foreign bishops, without the permission of Demetrius, renewed that prelate's resentment; on which Origen returned to Alexandria, to endeavour to mollify him: but Demetrius drove him thence in 231, and caused him to be excommunicated, and even deposed, in a council held at Egypt. Origen then returned to Cæsarea in Palestine, where he raised a celebrated school, and had St. Gregory Thaumaturgus, and a great number of illustrious persons

among his disciples. He afterwards travelled to Athens; and, at the desire of Firmilianus, staid some time at Cæsarea in Cappadocia; whence he was invited into Arabia. Under the seventh persecution of the Christians, in the reign of Decius, none were used with greater severity than Origen; but he supported with incredible constancy the dreadful torments which his persecutors invented against him. He died at Tyre in 254, aged sixty-nine. He was the author of a great number of excellent works. The principal of those extant are, 1. A Treatise against Celsus; 2. A number of Homilies, with Commentaries on the Holy Scriptures; 3. Philocalia, and several other treatises; 4. Fragments of his Hexapla, collected by father Montfaucon, 2 vols. folio. Of all Origen's books, the loss of his Hexapla is most to be regretted. This work was thus named from its containing six columns; in the first of which was the Hebrew text of the Bible; in the second the same text in Greek characters; in the third the Greek version of the Septuagint; in the fourth that of Aquila; in the fifth that of Symmachus; and in the sixth that of Theodotion. This admirable book gave the first hint for our Polyglot Bibles. 5. The book of Principia, of which we have only an incorrect Latin version. In all his writings he discovers modesty, candor, and humility; a noble and sublime genius, profound learning, and great erudition. He wrote with so much ease that he is said to have dictated to seven or eight amanuenses at a time.

ORIGENIANI, or ORIGENIANS, ancient heretics, who even surpassed the abominations of the Gnostics. Epiphanius speaks of them as subsisting in his time; but their numbers, he says, were inconsiderable. He fixes their rise about the time of the great Origen; but distinguishes them from the Origenisti, whom he derives from Origen Adamantius. And St. Augustine expressly asserts that it was another Origen. Their doctrines were shameful: they rejected marriage; they used several apocryphal books, as the Acts of St. Andrew, &c., and endeavoured to excuse their open vices by saying that the Catholics did the same in private.

ORIGENISTI, in church history, a Christian sect in the fourth century, so called from their asserting that they derived their opinions from the writings of Origen. The Origenisti maintained, that the souls of men had a pre-existent state; that they were holy intelligences, and had sinned in heaven before the body was created; that Christ is only the son of God by adoption; that he has been successively united with all the angelical natures, and has been a cherub, a seraph, and all the celestial virtues one after another; that in future ages he will be crucified for the salvation of the devils, as he has already been for that of men; and that their punishment, and that of the damned, will continue only for a certain limited time.

ORIGIN, n. s.

ORIG'INAL, n. s. & adj.

ORIG'INALLY, adv.

ORIG'INALNESS, n. s.

ORIG'INARY, adj.

ORIG'INATE, v. a. & v. n.

ORIGINA'TION, n. s.

French *origine*;

Lat. *origo, origin-*

alis; ab *orior*,

to rise, or spring.

Beginning; spring

head; source;

commencement of

existence; first state of existence; derivation; descent. Both origin and original are used in all the above senses; original further means first copy or language in which any thing is written; archetype; and, as an adjective, primitive; first; primary: originally is primarily; having regard to the first cause or author; at first: originary is productive; causing existence; primitive: to originate, to bring into existence; and (unusually) to take existence: origination is the act or mode of production; descent.

Remember I am built of clay, and must

Resolve to my *originary* dust. *Sandys on Job.*

Nature, which contemns its *origin*,

Cannot be bordered certain in itself.

Shakespeare.

A very great difference between a king that holdeth his crown by a willing act of estates, and one that holdeth it *originally* by the law of nature and descent of blood. *Bacon.*

The tradition of the *origination* of mankind seems to be universal; but the particular methods of that *origination* excoagitated by the heathen were particular. *Hale.*

For what *originally* others writ

May be so well disguised, and so improved,

That with some justice it may pass for yours.

Roscommon.

As God is *originally* holy in himself, so he might communicate his sanctity to the sons of men, whom he intended to bring into the fruition of himself.

Pearson.

The Greek word used by the apostles to express the church signifieth a calling forth, if we look upon the *origination*. *Id.*

The *original* question was, whether God hath forbidden the giving any worship to himself by an image? *Stillingfleet.*

They, like the seed from which they sprung, accursed,

Against the gods immortal hatred nurst;

An impious, arrogant, and cruel brood,

Expressing their *original* from blood. *Dryden.*

External material things, as the objects of sensation; and the operation of our minds within, as the objects of reflection; are the only *originals* from whence all our ideas take their beginnings.

Locke.

This eruca is propagated by animal parents, to wit, butterflies, after the common *origination* of all caterpillars. *Ray.*

Some philosophers have placed the *original* of power in admiration, either of surpassing form, great valour, or superior understanding. *Davenant.*

Had Adam obeyed God, his *original* perfection, the knowledge and ability God at first gave him, would still have continued. *Wake.*

A present blessing upon our fasts, is neither *originally* due from God's justice, nor becomes due to us from his veracity. *Smallridge.*

The sacred historian only treats of the *origin* of terrestrial animals. *Bentley's Sermons.*

Compare this translation with the *original*, the three first stanzas are rendered almost word for word, not only with the same elegance, but with the same turn of expression. *Addison.*

You still, fair mother, in your offspring trace
The stock of beauty destined for the race;
Kind nature forming them, the pattern took
From heaven's first work, and Eve's *original* look.

Prior.

Original of beings! power divine!
Ince that I live and that I think, is thine. *Id.*

These great orbs,

Primitive founts, and *origins* of light. *Id.*

The metallic and mineral matter, found in the perpendicular intervals of the strata, was *originally* and at the time of the deluge, lodged in the bodies of those strata. *Woodward.*

If any station upon earth be honourable, theirs was; and their posterity therefore have no reason to blush at the memory of such an *original*. *Atterbury.*

The production of animals in the *originary* way, requires a certain degree of warmth, which proceeds from the sun's influence. *Cheyne.*

The merit of these is the inveterate likeness, all stiff and awkward as the *originals*, and like nothing in human nature besides. *Sheridan.*

ORIGINAL SIN. See THEOLOGY.

ORIGNY (Anthony John Baptist Abraham d'), born in 1734 at Rheims, was counsellor of the mint, and member of many provincial academies. He died in October, 1798, having published *Dictionnaire des Origines, ou Epoches des Inventions, Decouvertes, &c.* Paris, 1776, 1778, 6 vols. 8vo.; *Abrégé de l'Histoire du Théâtre Français*, tome quatrième, 1783, in continuation of a work by Moubly; and *Annales du Théâtre Italien*, 1788, 3 vols. 8vo.

ORIGNY (Peter Adam d'), was also a native of Rheims, and died there September 9th, 1774. In the early part of his life he became a captain of grenadiers; but having been disabled by a wound at the attack of the lines of Weissembourg, he retired from the service with a pension. He was the author of *L'Egypte Ancienne, ou Mémoires Historiques et Critiques sur les Objets les plus Importans du Grand Empire des Egyptiens*, 1762, 2 vols. 12mo.; and another on *Egyptian Chronology*: at the time of his death he was occupied in more extended researches relating to this subject.

ORIHUELA, a large well-built town of Spain, near the north-east of the province, and in the Huerta, or plain of Murcia, on both sides of the Segula. It is situated at the foot of a mountain, at the entrance of a beautiful country, but the town is narrow, though of considerable length. Its streets are in general airy and straight but, instead of pavement, they are covered with sand, which is removed from time to time. Some of the widest only have a raised pavement on each side. The town contains five small squares, but the houses here are indifferent. There are two bridges over the river, the water of which is used for culinary purposes. The public edifices have nothing to attract attention; except that the grating of the high altar of the cathedral is considered a master piece. An episcopal see was founded here in the fifteenth century; and the town contains, besides the cathedral, four churches, nine monasteries, three convents, a poor house, and hospitals for the sick, and for orphans. There is also a small university, and two foundation schools. The manufactures carried on here—namely, silk spinning, distilling of brandy, and some saltpetre works—are all on a small scale. The employment of the majority of the inhabitants, about 20,000, is derived from the cultivation of the neighbouring country, which resembles a succession of fruit gardens of various kinds, such as orange, lemon, almond,

pomegranate, and mulberry trees. The corn fields are also so productive that it has become a proverb in Spain, 'rain or no rain, there is always corn at Orihuele.' This city was in the possession of the Moors 550 years; in 1264 they lost it to the Arragonese; it was laid waste by the plague in 1648; and in 1651 a great part of it was destroyed by an extraordinary rise of the river. In 1706 it was taken by Belluga, the bishop of Murcia, who gave it up to pillage. It was the Orclis of the Romans, the Orzuella of the Goths; the Orguella of the Moors; whence the Orihuele of modern Spaniards. Twelve miles north-east of Murcia.

ORILLON, in fortification, is a small rounding of earth, faced with a wall; raised on the shoulder of those bastions that have casemates, to cover the cannon in the retired flank, and prevent their being dismounted by the enemy. See FORTIFICATION.

ORINOCO, an immense river of South America, the source of which has never been perfectly ascertained. Humboldt wishing to penetrate in 1800 was prevented by a nation of warlike savages. He was obliged, therefore, to trust to the natives for all his information on this point. According to La Cruz, it rises in a small lake called Ipava, in 55° N. lat., and turning round thence enters the lake of Parima to the south-east, whence it issues by two outlets, and afterwards turning holds a circular northerly course, when, being joined by the numerous large streams from the eastern Andes, it is swelled to an immense size. Here a junction is formed between this river and its great rival the Amazon, by means of the Rio Negro and Cassiquari. This was first ascertained by M. Humboldt, who entered the Orinoco by the Cassiquari, in 3° 30' N. lat., and mounted the current of the great river as far as Esmeraldas, the last Spanish settlement in that quarter. The whole country for 300 miles was a complete desert, in which the ants and mosquitoes were so troublesome as almost to deter him from proceeding. On its southern or left bank this river receives the Maquiritari, the Cunucunuma, Ventuari, Caura, Aruy, and Caroni; and from its northern, or rather its western or right bank, it receives still more important accessions from the Cassiquari, Guariari, the Meta, and the Apure, with their tributary streams which often equal the main river. After being enlarged with these vast additions to its stream, it turns eastward, and pursues its course to the ocean.

Including the windings its length is estimated at 1380 miles; at 200 leagues from the sea it has a breadth of from 2500 to 3000 fathoms, without the interruption of a single isle: its breadth before St. Thomas's is 3850 fathoms, and its depth at the same place in March, when its waters are at the lowest, has been found to be sixty-five fathoms.

The Delta of the Orinoco commences about 100 miles from the coast; and, like all the other rivers which roll a vast body of water over a flat country, it makes its way into the ocean by an innumerable variety of channels. The inundation during the highest flood is calculated to extend on each side from eighty to ninety miles.

It is computed that the river has fifty outlets into the ocean, only seven of which are navigable, and these not for vessels of any great burden. The Guayanos Indians, although born on the islands, and accustomed to the intricacies of the different channels, yet frequently lose themselves here, and are obliged to allow the current to carry them out to sea, and then to re-enter, after the most minute observations to ascertain the proper passage. It even requires great skill to find the current. The grand mouth is formed by Cape Barima to S. S. E. which is in $8^{\circ} 54' N.$ lat., and the island of Cangrejos, twenty-five miles off, lying W. N. W. of the cape: the breadth of the navigable part of this passage is not quite three. The depth of water on the bar, which lies a little farther out to sea than the cape, is at ebb seventeen feet. On passing the bar, the depth on the side of the island is four or six fathoms, whilst on the side of the cape it is not more than one fathom and a half. The flats extend from Cangrejos seven leagues into the sea, but from Cape Barima not more than two leagues.

The banks of the Orinoco are described as magnificent. Forests filled with aromatic trees extend on every side; birds of all varieties of song and plumage are every where observed, and hordes of monkeys. In other places enormous plains extend their verdure further than the eye can reach, and the cataracts of the Orinoco give their name to the whole Cordillera; but no good description of these falls has yet been given. They are situated at Maypura and Atures, two villages in about $6^{\circ} N.$ lat. The river throughout abounds with fish and amphibious animals; among which the alligator is conspicuous. The annual swell of the Orinoco commences in April and ends in August. All the month of September it remains with the vast body of water which it has acquired the five preceding months: about 1300 miles from the ocean the rise is thirteen fathoms. In February it is at its lowest ebb. The mouth of the great estuary is in long. $59^{\circ} 50' W.$, and lat. $8^{\circ} 30' N.$

ORIOLE or **ORIOLEUS**, in ornithology, a genus belonging to the order of *picæ*. The bill in this genus is straight, conic, very sharp pointed; edges cultrated, inclining inwards; mandibles of equal length. Nostrils small, placed at the base of the bill, and partly covered: tongue divided at the end: toes, three forward, one backward; the middle joined near the base to the utmost one. These birds, mostly inhabitants of America, are a noisy, gregarious, frugivorous, granivorous, and voracious race, very numerous, and often building pensile nests. The several species, which are very numerous (for Latham enumerates and describes forty-five), are chiefly distinguished by their color.

O. acuta cauda, the sharp-tailed oriole, is about the size of a lark: the bill is dusky; the crown is brown and cinereous: the cheeks are brown, bounded above and below with deep dull yellow. The throat is white; the breast, sides, thighs, and vent, are a dull pale yellow, spotted with brown; the belly is white; the back is varied with ash-color, black, and white; the wing-coverts are dusky, with ferruginous edges. The quills are also

dusky; the tail consists of narrow sharp-pointed feathers, of a dusky color, tinged with olive, and obscurely barred; and the legs are pale brown.

O. Baltimore, of Linnæus, the Baltimore bird of Catesby and Latham, le Baltimore of Buffon, and the Baltimore oriole of Pennant, is an inhabitant of North America; which it quits before winter, and probably retires to Mexico, the xochitoll of Fernandez seeming to be of the same species. The head, throat, neck, and upper part of the back of the male, are black; the less coverts of the wings orange; the greater black, tipped with white; the breast, belly, lower part of the back, and coverts of the tail, of a bright orange; the primaries dusky, edged with white; the two middle feathers of the tail black; the lower part of the same color, the remaining part orange; and the legs black. The head and back of the female are orange, edged with pale brown; the coverts of the wings of the same color, marked with a single bar of white; the under side of the body and coverts of the tail yellow; the tail dusky, edged with yellow. The length both of the male and female is seven inches. This species suspend their nests to the horizontal forks of the tulip and poplar trees, formed of the filaments of some tough plants curiously woven, mixed with wool, and lined with hairs. The nest is of a pear shape, open at top, with a hole on the side through which the young discharge their excrements, and are fed. In some parts of North America, this species, from its brilliant color, is called the fiery hang-nest. It is named the Baltimore bird from its colors resembling those in the arms of lord Baltimore, whose family were proprietors of Maryland. There are several other species of orioles, all inhabitants of North America. These, according to Mr. Pennant, are the white-backed, the bastard, the black, the brown-headed, the rusty, the white-headed, the Hudsonian white-headed, the olive, the yellow-throated, the Unalaschka, and the red-wing. This last species, in America, is named the red-winged starling, and the swamp black-bird. Although they appear at New York only from April to October, they probably continue through the whole year in the southern parts. They are seen at times in such prodigious flocks as even to obscure the sky. They were esteemed the pest of the colonies, making most dreadful havoc among the maize and other grain, both when new sown and when ripe. They are very bold, and not to be terrified by a gun; for, after the sportsman makes slaughter in a flock, the remainder will take a short flight, and settle again in the same field. The farmers sometimes attempt their destruction, by steeping the maize, before they sow it, in a decoction of white hellebore. This potion is particularly aimed at the purple jackdaws, which consort in myriads with this species. But these seemingly destructive birds are not formed in vain. Notwithstanding they cause such havoc among the grain, they make ample recompense, by clearing the ground of the noxious worms with which it abounds; particularly the bruchus pisi, or peas beetle. There is another variety of this species, called the bastard Baltimore: its size is nearly that of the true Baltimore, but it measures somewhat less in length: the bill is

lead-colored; the forehead and cheeks black mixed with yellow: the hind head and nape are olive gray, marked with a few spots of black; the upper part of the back is the same, but somewhat duller; the lower part of the back, the rump, fore part of the neck, breast, belly, sides, thighs, upper and lower tail-coverts, and under the wings, are orange-yellow, but brightest on the breast and tail-coverts; the less wing-coverts are deep brown; the greater are the same, tipped with dirty yellowish white: the quills are brown, bordered on both edges with white; the two middle tail feathers are olive, then blackish, marked at the end with a longitudinal yellowish spot; the next on each side are olive and black, confusedly mixed; and the four outer ones are of a yellowish olive: the legs and claws are bluish. They inhabit North America. There seems to be great confusion and uncertainty as to the true and bastard *Baltimores* and their females; perhaps they are only varieties of one species referable to one or other sex of the true *Baltimore*, in the different stages of growth.

ORION, in astronomy, one of the constellations of the southern hemisphere. The ancients placed it near the feet of the bull. It was composed of seventeen stars in the form of a man holding a sword; for which reason the poets often speak of Orion's sword. As the constellation of Orion, which rises about the ninth day of March, and sets about the 21st of June, is generally supposed to be accompanied at its rising with great rains and storms, it has the epithet of *aquosus* given it by Virgil. The name is formed from the Greek *ὤρεω*, to produce water: the ancients supposing that it occasioned floods at its rising and setting. See *ASTRONOMY*.

ORION, in mythology, was the son of Jupiter, Neptune, and Mercury. For, as these gods were visiting the earth, they entered the house of Hyrieus, a native of Tanagra, in Boeotia, as benighted travellers, he being famed for hospitality to strangers. Hyrieus treated them generously, and even killed an ox, the only one he had, for their entertainment. This liberality so pleased the gods that they bid him request any favor he would at their hands, and he should receive it. Hyrieus answered that having no children these were what he chiefly desired, and soon after says Hyginus, 'Mercurius de tauro quem Hyrieus immolaret, corium pertulit. Illi (i. e. Jupiter, Neptune, and Mercury) in eum urinam fecerunt et in terram obruerant unde natus est. Ourion afterwards, to obliterate the memory of his birth, changed the first letter of his name and called himself Orion. Soon afterwards he became conspicuous; and Diana took him among her attendants, and became deeply enamored of him. His gigantic stature, however, displeased Enopion king of Chios, whose daughter Hero or Merope he requested in marriage. The king, not willing to deny him openly, promised to make him his son-in-law as soon as he delivered his island from wild beasts. This task, which Enopion supposed to be impracticable, was soon performed by Orion, who demanded his reward. Enopion, on pretence of complying, intoxicated his illustrious guest, and put out his eyes on the sea-shore, where he had laid himself

down to sleep. Orion found himself blind when he awoke. He went, directed by the sound, to a neighbouring forge, where he placed one of the workmen on his back, and by his directions went to a place where the rising sun was seen with the greatest advantage. Here he turned his face towards the luminary, recovered his eye-sight, and hastened to punish the perfidious cruelty of Enopion. Orion was an excellent workman in iron, and fabricated a subterraneous palace for Vulcan. Aurora, whom Venus had inspired with love, carried him away into the island of Delos, that she might enjoy his company; but Diana, who was jealous of this, killed him with her arrows. Some say, that Orion had provoked Diana's resentment, by offering violence to Opis, one of her female attendants; or, as others say, because he had attempted the virtue of the goddess herself. Perhaps the fable denotes that Orion was an astronomer, who lost his sight, and at last his life by studying the moon and stars in cold nights. According to Ovid, Orion died of the bite of a scorpion, which Terra produced to punish his vanity, in boasting that no animal on earth could conquer him. Some say that Orion was son of Neptune and Euryle, and that he received from his father the privilege and power of walking over the sea without wetting his feet. Others assert that he was a son of Terra, like the rest of the giants. He had married a nymph called Sina, before his connexion with the family of Enopion; but Sida was the cause of her own death, by boasting herself fairer than Juno. Diodorus says that Orion was a celebrated hunter, superior to the rest of mankind, by his strength and uncommon stature. He built the port of Zancle, and fortified the coast of Sicily against the inundations of the sea, by heaping a mountain of earth called Pelorum, on which he built a temple to the gods of the sea. After death Orion was placed in heaven, and changed into a constellation. Orion was buried in the island of Delos; and the monument which the people of Tanagra in Boeotia showed, as containing his remains, was a Cœnotaph. The daughters of Orion distinguished themselves as much as their father; and, when the oracle had declared that Boeotia should not be delivered from a dreadful pestilence before two of Jupiter's children were immolated on the altars, they voluntarily sacrificed themselves for the good of the country. Their names were Menippe and Merioche. They had been carefully educated by Diana; and Venus and Minerva had made them rich and valuable presents. The infernal deities were struck at the patriotism of these two females; and instantly two stars arose from the earth, which still smoked with their blood, and were placed in the heavens in the form of a crown. According to Ovid, their bodies were burned by the Thebans, and from their ashes arose two persons, whom the gods soon after changed into constellations.

ORISSA, or UDDessa, an important province of the Deccan, Hindostan, extending from 16° to 23° of N. lat. To the north it is bounded by Bengal; to the south by the Godavery; on the east it has the Bay of Bengal; and on the west the province of Gundwana. In length, from north-east to south-west, it may be

estimated at 530 miles, by ninety the average breadth.

In 1592 Orissa was divided into five districts, viz. Jellasir, comprising Midnapoor, and the British possessions lying north and east of the river Subunreeka; 2. Buddruck (now Cuttack); 3. Cuttack; 4. Kulling, or Cicacole; 5. Rajamundry. Besides this territory on the sea-coast, Orissa also comprehended an unproductive region on the western frontier, making part of the Jeharcund, or Jungly country, with the districts of Ruttenpoor and Sumhullpoor: but the two latter properly belong to Gundwana. The modern subdivisions of this province are, Cicacole, Rajamundry, Cuttack, Mohurbunge, Midnapoor, and Konjeur. The interior of the province still remains in a savage state, being composed of rugged hills and uninhabited jungles, surrounded by deserts and forests, pervaded by a pestilential atmosphere. It forms a strong natural barrier to the maritime districts, being only traversed during the driest season from February to May by the Lumballies, or inland carriers; and there are only two passes properly explored, in the whole length of the great ridge, extending from the Godavery to the Mahanuddy: the one direct from Chandah to Cicacole; the other oblique from Choteesghur by the way of Kalahindi; both uniting at the pass of Saloor, or Saureacca. By this pass, during the French possession of the northern Circars in 1754, a body of Mahrattas were introduced; more than half of whom perished from the noxious air of the hills. The chief rivers are the Godavery, the Mahanuddy, the Byturnee, and the Subunreeka, besides innumerable mountain streams. Although, as compared with Bengal, Orissa may be generally described as a barren province, yet the maritime part equals in fertility any territory in the Carnatic; and the district of Midnapoor is excelled by few in Bengal. The country between the Gaintee and Bamoni is one of the finest parts of the province, and is inhabited by a considerable number of weavers of coarse muslins for turbans, &c. The best bamboos used for palanquins come from the purgunnahs of Tolchan and Hindole.

In the back parts of this province, beyond the British dominion, the native Ooreas are a fierce people, commonly armed with bows and arrows, or swords; the latter being generally carried naked. They are broad at the end, but narrow in the middle. These people have a rooted antipathy to the Mahrattas. The language of this province, and the character in which it is written, are both called Ooreeah. This was formerly an independent Hindoo kingdom, governed by a dynasty of princes of the race of Gujaputty, who, in 1592, were conquered by Mansingh, the emperor Acber's vicaroy in Bengal, to which dominion it was then annexed. It then measured along the sea coast nearly 600 miles, by forty the medium breadth, stretching to the hills westward, and contained the nation of the Ooreas, a distinct race of Hindoos, differing in language, manners, and some peculiarities of religion, from the other Brahminical sects of Hindostan. From the accounts of ancient European travellers, fragments of national history, and a few remnants of former splendor, it was probably a flourishing

country before the Mahommedan invasion; but soon after fell into a state of comparative depression. It does not appear, however, that the Mahommedans ever completely occupied or colonised this province, which still remains one of those in which the Hindoo manners are preserved in their greatest purity. The temple of Juggernaut is famous for its antiquity, sanctity, and the great annual resort of pilgrims. After the expulsion of the Afghauns from Bengal, during the reign of the emperor Acber, they retreated into Orissa, and retained possession of the maritime and more fertile portions of it, and also of the Juggernaut temple for many years.

No province of India exhibits a greater difference, with respect to the proportion of inhabitants. Midnapoor, which comprehends less than 7000 square miles, has been found, by enumeration, to contain a million and a half of souls; yet it is probable the population of the whole province does not exceed four millions and a half. Three-fourths of this extensive territory are possessed by the British, the remainder by various petty native chiefs in a state of perpetual hostility with each other.

ORISON, *n. s.* *Fr. oraison.* See ORAISON. A prayer; oral supplication.

The ORKNEY ISLANDS, the Orcaides of the Romans, are separated from the north-east extremity of Scotland by the Pentland Frith, which is between ten and eleven miles broad. They are about thirty in number; but many are uninhabited, being small, and producing only sheep pasture. The principal inhabited islands are Pomona or Mainland, Hoy, North Ronaldshay, South Ronaldshay, Sanday, Stronsay, Eday, Westray, Shapinshay, Eglishay, Græmsay, Rousay, Weir, Enhallow, Papa Westray, Papa Stronsay, Burray, &c. The small uninhabited islands are often denominated holms; and the sharp and rugged rocks, overflowed at high water, and with scarcely any soil on them for the production of vegetables, are called skerries. The forms of the islands are very irregular, and their dimensions very different, some not exceeding a mile in length; whereas the Mainland extends to nearly twenty-five. They are disjoined from one another by sounds or friths, from one to five miles broad, having exceedingly rapid and dangerous currents; the whole extending from the south-west to north-east, the distance not less than seventy miles, and upwards of forty in breadth. The east and north coasts are in general low; the western more elevated, terminating in bold and steep cliffs. From similar appearances on the opposite coasts, many have concluded that they were formerly joined to the mainland of Great Britain. Near the small island Swinna are two great whirlpools, called the wells of Swinna, which are particularly dangerous in a calm.

Mainland or Pomona, the grand island of the archipelago, and occupying its centre, is eight leagues long and one to three broad, but so deeply indented by bays that these dimensions give no accurate idea of its surface. Though very hilly, it has a considerable portion of fertile land, and on it are the two towns of the islands, Kirkwall and Stromness: the former is the chief place,

and is on a bay of the north coast, forming a good haven; it consists of about 300 neat houses, inhabited by the chief persons of the island, besides shop-keepers and tradesmen. Here is a vast cathedral dedicated to St. Magnus, and the ruins of the bishop's palace. Stromness, on the west side of the island, has recently risen from a poor hamlet to a thriving town, and almost vies with Kirkwall; its haven is entered by 200 to 300 vessels a year, caught in foul winds in the Pentland Frith.

The following are the inhabited islands south of Mainland. 1. South Ronaldsay, two leagues long and one broad, 1600 inhabitants, is one of the most fertile, and has a good harbour on the north. 2. Burray, separated from the preceding island by a strait two miles broad, is only five or six miles in circuit, but produces potatoes, carrots, and other garden vegetables, in greater perfection than the other islands. 3. Hoy, the highest land of the islands, is three leagues long and two broad, but at high water is nearly divided into two islands. On the north is a hill 1600 yards high called the Warth or Ward of Hoy, and at its foot in a dark glen is the greatest curiosity of the island, a hermitage cut out of a solid block of freestone, thirty-eight feet long, eighteen broad, and nine thick, and which seems to have tumbled from the hill. This island chiefly pastures sheep; its population is 1400; it has three good harbours, of which that named Longhope is much frequented by vessels for shelter. West of Hoy is a stupendous rock called the Old Man of Hoy, 1500 feet high, and resembling the ruins of an immense building. 4. Flotay, noted for its good road for ships, named Panhope, and also for its abundance of moor game. It has 200 inhabitants.

The smaller islands south of Mainland are Græmsay, one mile and a half from Stromness, three miles in circuit. It is in great part composed of schistus, and has 180 inhabitants. Teraay pastures some sheep. Sinthay and Lamau; Cavay has only three families, and Lamholm, only one.

The islands north of Mainland are Shapinsay, tolerably fertile, has 750 inhabitants; Stronsay, two leagues long and one broad, has two good harbours, 900 inhabitants. Papa Stronsay is a little pleasant island off the north end of Stronsay. Eday, five miles long and two broad, abounds in peat which it supplies to the other islands; great numbers of lobsters are taken round it: population 600. It has two good harbours. Sanday, four leagues long and one broad, is one of the most populous and the richest of the archipelago, making 500 tons of kelp a year; it has two good harbours. Westray, two leagues long and one broad, has abundance of pastures and peat; 1400 inhabitants. Papa Westray, north-east of the preceding, is a pleasant island with a little lake of fresh water; on it are the ruins of two buildings, supposed to have been druidical temples. It has 200 inhabitants.

Faray is one of the most level of the islands, and is clothed with grass. Eaglesay, two miles long, was accounted so much superior to the other islands, that it was the residence of the bishops and earls of Orkney; it is also noted for the murder of St. Magnus; it has 200 inhabitants.

Roussay, two leagues long and one broad, is one of the most rugged of the islands; it has 700 inhabitants. North Ronaldsay, three miles long and one broad, is one of the most level islands; it has 420 inhabitants. Weir, 150 inhabitants; Enhallon; Gairsay, a conical hill, fifty inhabitants; Domsay, a fine little island a mile in circuit, before the bay of Kirkwall, has but one family.

Copihslay, east of Mainland, is a noted mark for seamen; it has but two or three families.

Fair Island lies between the Orkneys and Zetland, and has a little haven.

The commerce of the Orkney Islands consists in the export of beef, pork, tallow, hides, linen, yarn, coarse linen, feathers, and especially kelp, to the amount of 2500 tons. The imports besides luxuries are coals. The following is a statement of the trade in several years:—

| | £. | Vessels. | Tons. | Men. |
|--------------|--------|----------|-------|------|
| 1770 Exports | 12,018 | 17 | 825 | 76 |
| Imports | 10,406 | | | |
| Balance | 1,612 | | | |
| 1780 Exports | 23,247 | 20 | 940 | 90 |
| Imports | 14,011 | | | |
| Balance | 9,276 | | | |
| 1790 Exports | 26,596 | 33 | 2000 | 170 |
| Imports | 20,803 | | | |
| Balance | 5,793 | | | |
| 1800 Exports | 39,677 | 21 | 1375 | 119 |
| Imports | 35,789 | | | |
| Balance | 4,888 | | | |

The fisheries of the Orkneys are neglected, except that of lobsters.

All the islands have been said to contain about 384,000 acres, divided in the following proportions; viz. heath and moss, occupied as common 294,000 acres; green pastures occupied as common 30,000; in field pasture and meadow, 30,000; arable, including gardens, 24,000; total productive land, 84,000; houses, roads, walls, ditches, 2000; fresh water, 4000. The old system of agriculture prevails; nevertheless the county does more than support its inhabitants. Husbandry is in a very backward state. The plough used is the single stilted one, though the double stilted one is gradually coming into use. The plan of husbandry is to till very shallow, and to harrow sparingly, as the farmer relies more on the quantity of manure for raising a good crop. The manure is almost solely the sea-weed drifted ashore. Fallowing is rarely used, and a proper rotation of crops never followed. Black oats are sown in the end of March, or the beginning of April; and bigg or bear from the 1st to the 20th of May. The summer is chiefly employed in preparing turf and peat for fuel. The crop is reaped from the 20th of August to the end of September; if it should remain after that time it is lost, in the violent gales and storms which generally succeed. There is scarcely a tree or shrub to be seen; and, although several experiments have been tried to raise trees, they have failed; but the hills are

well clothed with beath, and the valleys are variegated with a profusion of beautiful herbs. The whole district is well supplied with lakes and rivulets, which yield delicious trout and salmon; turn mills, &c.

Rain falls in considerable quantity through the islands. Snow generally comes from the north-west and south-east. About the middle of June, a cold wind, accompanied with snow and hail showers, often blows from the north about two or three weeks, and checks the progress of vegetation. When this is past the wind changes, and warm showers succeed. Thunder and lightning are most common in winter. The *auroa borealis* is more frequent and more splendid in this than in most other regions. In summer the inhabitants can distinctly see to read at midnight; but in December and January the days are, on the other hand, proportionably short. During this season very little work is done; and it is then that the neighbouring farmers enjoy their convivial pleasures. On the coast, the small farmers employ themselves in fishing during the winter months, and in the summer in the making of kelp.

The land animals are small horses, cattle, sheep, swine, and rabbits. Of these the sheep are the most numerous, there being upwards of 50,000 in the islands, and, within the last twenty years, a far greater degree of attention has been paid than formerly to the breeding them. The domesticated fowls are as common here as in other parts of Scotland, and the heaths abound with snipes, red grouse, and plovers. The other wild fowl are large eagles of various kinds; wild geese and ducks in great variety, herons, hawks, gulls, solan geese or gannets, swans, &c. The eagles make much havoc among the lambs, so that, by law, he that kills an eagle is entitled to a hen from every house in the parish where it was killed. The half-tide rocks swarm with seals; sea otters are very common; the friths are occasionally visited by whales, and by great herds of grampuses. Cod, ling, haddock, and flat-fish are abundant in the surrounding seas. Coal-fish, under the names of sillocks, cooths, and sethes, form much of the food of the people. Shoals of herrings used formerly to frequent the bays; but they have disappeared for some years. On the shores are found a variety of sponges, corals, and corallines; large oysters, mussels, cockles, &c. Ambergris and spermaceti are sometimes thrown ashore; but the greatest curiosity which the sea brings to these islands are the large *Molucca* or Orkney beans, all of American or West Indian origin, being conveyed across the Atlantic by the gulf-stream. The seeds of the *mimosa scandens* are the most common.

The coarse woollen manufacture of cloth, stockings, and blankets, has of late been less attended to than formerly; and, instead of it, that of linen yarn and linen cloth was introduced about the year 1747, and is in a flourishing state; but kelp is still the staple commodity.

It has been asserted that the Orkneys, as well as the hills of Shetland, were originally peopled from Norway, in the ninth, tenth, or eleventh century. Others imagine that the Picts were the original inhabitants, and call Orkney the an-

cient kingdom of the Picts. Certain singular houses, now overgrown with earth, are called Picts Houses; and the Pentland frith (formerly Pightland, or Pictland) evidently retains their name. Claudian's line, cited by Camden, proves that the Picts, with some other German colony, particularly the Saxons, were then in possession of these isles; and so Ninnius expressly says. Many of the inhabitants used, until of late years, the Norse language, which differs but little from the Teutonic. The English language, with a Norwegian accent, is now that of these islands; but the appearance of the people, in their manners and genius, evidently show their northern origin.

The best and in all probability the most authentic account we have of this early part of the history of the Orkneys is from Torsæus. According to this writer, during the reign of Gregory the Great, when by his policy the Picts were driven from other parts of Scotland, they came to the Orkades, but did not meet with a favorable reception, for many of them migrated to Shetland, and thence to Norway. These islands were at various times harassed and plundered by adventurers from Scandinavia; and the Norwegian princes often laid the inhabitants under tribute. The Christian religion was transported to the Orkneys from Norway, in the beginning of the eleventh century, when Sigurdus possessed the entire dominion of these isles. About this time he married a daughter of Malcolm III., by whom he had a son named Torphinus, who succeeded him. He defeated Ronald, a grandson of Sigurdus, who had lived in Norway, and who was esteemed the rightful heir to the earldom of Orkney, after he had made a successful descent. He established salutary laws, and encouraged the arts of industry. Torphinus built a sumptuous church in Byrsa, where the first bishops of Orkney resided, and to which he retired in the decline of his life, and was interred in it, on his death at an advanced age. He left two sons, Paul and Erland, who amicably shared in the government of their father's extensive domain. During this period the northern counties are said to have arrived at a very superior degree of cultivation and improvement, which became equally conspicuous in the richness of their lands and in the mildness of their disposition. Their sons, however, did not both inherit their father's virtues. Magnus, the son of Erland, was pious and peaceable: a great promoter of religion, and anxious in patronising the establishment of Christianity: but Hacon, the heir of Paul, was vehement, wild, and impatient of restraint. He saw how Magnus was revered, envy drove him to revenge, and having, by the most deliberate villany, got Magnus into his power, he murdered him. The latter part of his life was spent in penitence, and in improving his dominions. Magnus's singular piety, and his unfortunate death, were so well represented at Rome that he was canonised. Harquin had two sons, Paul the Silent, and Harold the Orator. Harold succeeded in Caithness, and the Orkneys were governed by Paul. Ronald, a descendant of St. Magnus, an elegant and accomplished youth, appeared at the court of Norway, and was supported

in his claim upon the Orkneys, as the heir of the canonised martyr. He sent messengers to Paul and offered to share the government with him; but this proposal was refused. By a very artful manœuvre, however, Ronald obtained his purpose, and shared his sovereignty with Harold, the heir of Paul. They lived amicably together till Ronald was at last assassinated by a proud chieftain; and Harold possessed the unrivalled sovereignty of the north for a long period.

In 1196 he was able to bring 7000 men to the field, and a body of cavalry, against the army of William, king of Scotland, but was defeated. In 1197 the Caithnessians rebelled, headed by one Roderic, and Torphinus, son of Harold. The king met and defeated them near Inverness. Roderick was slain: and William, seizing on Harold in the extremity of Caithness, detained him till Torphinus surrendered himself as an hostage; but, on some new treasons of the father, the king caused the eyes of the unhappy youth to be put out; and had him emasculated, of which he soon died in prison. Harold died in the seventy-third year of his age; and with him ended the independent sovereignty of the north of Scotland. The Norwegians seem to have been in possession of these isles as late as 1266; for then Magnus IV., king of Norway, being worsted in war with the Scots, yielded them to Alexander III., king of Scotland, by treaty, and Haquin, king of Norway, confirmed the possession of them to king Robert Bruce in 1312. Lastly, in 1464, Christian I., king of Norway and Denmark, when he gave his daughter in marriage to James III., king of Scotland, transferred all his right to them, to his son-in-law, and his successors; to make which more binding, the pope's confirmation was obtained. Magnus sold them to Alexander for 4000 merks sterling, and a yearly acknowledgment of 100 merks. The Danes, however, had pretensions to the Orkneys, which were not totally abandoned, until James VI. marrying Anne, daughter of the king of Denmark, the possession was finally recognised in favor of the Scottish king. Queen Mary advanced James Hepburn, earl of Bothwell, to the dignity of duke of Orkney, which became extinct on his death, when king James VI. created a natural son of James V. earl of Orkney; which failing in his son, it returned to the crown. The title of earl was revived in the family of Hamilton in 1696, and in that family it remains.

The Orkney and Shetland isles compose one stewartry, and send one member to the imperial parliament. The Shetland freeholders, however, neglect their franchise, which is exercised solely by those of Orkney. The right of superiority to the Orkneys was dismembered from the crown by the union parliament, and granted, for a certain yearly consideration, to the earl of Morton, who was by queen Anne appointed hereditary steward and judiciary. Upon the abolition of hereditary jurisdictions the appointment of the steward became vested in the crown; but as the earl of Morton possessed the patronage of the stewartry, that nobleman long possessed the office of steward and sheriff. Sir Thomas Dundas, now created lord Dundas, acquired many years ago the superiority of the islands, from the earl of

Morton, by purchase, and still possesses it, with the right of patronage to all the parishes of the stewartry except two. Some of the islands contain ores of lead and iron, near Stromness and in Hoy. Limestone is common in them. They are divided into eighteen parochial districts.

ORLEANS, GENABUM, a large, handsome, and very ancient post town and city, the principal place of the department of the Loiret, France, having a royal court for that department, and those of the Loir-et-Cher, and the Indre-et-Loire; an inferior court of judicature; a chamber of commerce; an exchange; an academy; a society of sciences, Belles Lettres, and the arts; a royal college; and a free-school, for drawing and architecture. Its population is 43,000. It is situated in a fine fertile plain, on the right bank of the Loire, over which there is a magnificent bridge built of freestone. It is generally well built; the streets are wide, clean, and airy; its public squares are large, and its walks very pleasant. It is surrounded by numerous country houses, and extensive suburbs, which bespeak the opulence of a great city. Placed almost in the centre of France, at the branching out of the great roads that lead to every part of the kingdom, on the banks of a river which affords a facility for the conveyance of the productions and manufactures of all the departments, this place is the mart of a considerable quantity of merchandise, and the centre of a flourishing trade.

The origin of Orleans is to be traced to a very distant period. It is said to have been built on the ruins of the ancient Genabum, which was taken and burned by Cæsar; it was one of the principal cities of Gaul under the Roman power. In the year 450 it sustained a memorable siege by Attila, king of the Huns, and owed its safety to its general Actius, who obliged these barbarians to retire, and defeated them on the plains of Champagne. On the fall of the Roman empire it came into the possession of the Franks, and under the successor of Clovis was the capital of that kingdom. It was re-united to the crown in the reign of Hugh Capet. In 1428 the English laid siege to it, and were compelled to renounce their enterprise by the heroic valor of Joan of Arc and Dunois. Sixteen councils have been held here.

There are manufactures here of caps for the Levant, hats, woollen counterpanes, shot, files, rasps, curry-combs, candle-sticks, chemicals, paste, pipes, square tiles, earthen and brass pots, &c.; also cotton and woollen spinning factories, numerous and fine sugar-refining houses, vinegar breweries, wax bleaching-houses, dye-houses, brass-foundries, tan-yards, and manufactories of white and chamois leather. A considerable trade is carried on in wine, vinegar, brandy, flour, corn, sugar, saffron, timber, coals, grocery, drugs, and the above-mentioned articles. This is the native place of Amelot de la Houssaye, the celebrated commentator, and Pothier, a famous lawyer. Here are a public library, containing 23,000 volumes; the bridge over the Loire, commenced in 1751, and remarkable for its extent and its lightness, the middle arch being 100 feet broad; the monument erected to the memory of Joan of Arc, in the Place Mar-

troy; the cathedral, one of the finest in France, begun in the reign of Henry IV., and still unfinished: the entrance, surmounted by two round towers, is very beautiful. Orleans is eighty-four miles south-west of Melun; eighty-one N. N. W. of Bourges; forty-two north-east of Blois; eighty-seven north-east of Tours, and eighty-eight south of Paris; in W. long. from that capital 1° 26' N., lat. 47° 54'.

ORLEANS, New, city, port of entry, and capital of Louisiana, in a parish and on an island of the same name; 105 miles by the course of the river, above the bar at the mouth of the Mississippi, and about ninety in a direct line. It is distant from Washington about 1260 miles. Long. 90° 8' W., lat. 29° 57' N. Population of the city, in 1810, 17,242, of whom 5,961 were slaves, and of the parish 24,552. The population of the city in 1802 was estimated at 10,000 or 11,000; and in 1818 at 36,000. The city is on the left bank of the Mississippi, but so situated on a bend that it faces to the east. It is regularly laid out; the streets are generally forty feet wide, and intersect each other at right angles. On the streets near the river the houses are principally of brick, but in the back parts of the town they are mostly of wood. The buildings have no cellars, except the space between the ground and the lower floors, which are raised five or six feet from the earth. Most of the houses in the suburbs have beautiful gardens, ornamented with orange groves. The country here is lower than the surface of the river, which is confined within its channel by an artificial embankment, called the Levee, raised at great expense, and extending about 100 miles. It is directly in front of the town, and affords a very pleasant walk.

The city contains a court-house, a jail, a market-house, an arsenal, a governor's palace, a custom-house, a hospital, a French theatre, a catholic college, a female orphan asylum, a nunnery containing thirty or forty nuns, three insurance offices, four banks, one of which is a branch of the United States' bank, and three houses of public worship, one for Roman Catholics, one for Episcopalians, and one for Presbyterians. There also two chapels and a hall where public worship is celebrated. Most of the public buildings are large and handsome. The Catholic cathedral church is a large and elegant edifice. The Presbyterian church, just erected, is a spacious and handsome edifice of brick and stone.

The buildings of the city were formerly almost entirely of wood, but those recently erected are, for the most part, handsomely built of brick; and the place is of late, in various respects, very rapidly improving. The population is fast increasing by accessions from all the states in the union, and from almost every kingdom in Europe. The French language, fifteen years ago, was here almost universal, but at present the English predominates. There are five newspapers published in the city, three of which are printed in English, the other two both in French and English.

New Orleans is very advantageously situated for trade, near the mouth of one of the noblest rivers in the world, whose numerous branches,

extending many hundred miles in different directions, waft to this port the products of various climates; and it is already become one of the greatest emporiums of commerce in America. The shipping belonging to this port, in 1816, amounted to 13,299 tons. The number of arrivals and clearances in a year, ending October 1st, 1815, was 623; 1816, 699; and 1817, 1,030. In the year ending October 1st, 1817, 1,500 flat-bottomed boats, and 500 barges, arrived at the city, from the upper country, bringing its productions. There are twenty steam boats now navigating the rivers Mississippi and Ohio; and several more are building.

Statement of the principal articles of domestic production which arrived at New Orleans in one year, ending October 1st, 1817:—

Table of productions, 1816-17.

| | | |
|--------------------|----------------|-----------|
| Apples | barrels | 5,000 |
| Bacon and hams | cwts. | 18,000 |
| Bagging for cotton | pieces | 2,500 |
| Bark: quercitron | hhds. | 800 |
| Beef | bbls. | 4,000 |
| Beer | do. | 300 |
| Butter | do. and kegs | 1,800 |
| Candles | boxes | 150 |
| Cider | bbls. | 500 |
| Cotton | bales | 65,000 |
| Cordage | coils | 4,300 |
| Corn | bushels | 140,000 |
| Cornmeal | bbls. | 4,000 |
| Flour | do. | 190,000 |
| Ginseng | do. | 1,200 |
| Hemp | tons | — |
| Do. yarns | reels | 200 |
| Hides | sides | 6,000 |
| Lard | bbls. and kegs | 4,000 |
| Lead | cwts. | 7,000 |
| Ditto shot | do. | 600 |
| Molasses | gallons | 1,000,000 |
| Sugar | hhds. | 20,000 |
| Taffia | gallons | 400,000 |
| Tallow | cwts. | 200 |
| Tar | bbls. | 8,000 |
| Tobacco | hhds. | 28,000 |
| Ditto carrots | carrots | 10,000 |
| Ditto manufactured | cwts. | 1,500 |
| Wax, bees' | do. | 300 |
| Wheat | bushels | 95,000 |
| Whiskey | gallons | 250,000 |

The total amount of exports from the port of New Orleans, from October 1st 1816, to October 1st 1817, 13,501,036 dollars 72 cents.

The British made an attack on New Orleans in December, 1814, but were repulsed by the Americans under general Jackson, with the loss of about 3000 men, killed, wounded, and prisoners. The American army lost only seven men killed and six wounded.

The island of New Orleans is formed by the river Mississippi on one side, and the lakes Pontchartrain and Maurepas, together with an outlet of the Mississippi, called the river Iberville, on the other. It is about 160 miles long, and from three to fifty broad. It produces sugar, lemons, oranges, and figs. Lake Pontchartrain communicates with the city by the Bayou

St. John, which is navigable for small vessels, which pass between New Orleans, Mobile, and Pensacola. Fort St. John is situated at its entrance into the lake, seven miles north of New Orleans. Fort St. Charles is situated north-east of the city.

ORLÉANS (Louis, duke of), son of Philip, the regent of France, was born at Versailles, August 4, 1703. He had for a tutor the abbé Mongault, who inspired him with an early taste for study; which was combined, however, in the first part of his life with much dissipation. He married in 1724 the princess of Baden, and, having the misfortune to lose her two years after, he fell into a profound melancholy, which at length induced him to preclude himself from the world. He had an apartment in the abbey of St. Genevieve in 1730, and resided there entirely from 1742 till his death, February 4, 1752. He wrote translations, paraphrases, and annotations on the Scriptures, and other theological works.

ORLÉANS (Louis Joseph Philip, duke of), the celebrated Egalité, was a grandson of the foregoing, and born at St. Cloud, April 13, 1747. He was first called the duke of Chartres, and in 1769 was married to the daughter of the duke of Penthièvre, the grand admiral of France. To this office the prince wished to have succeeded, but, not being able to do so, he went as a volunteer on board the squadron of d'Orvilliers, and was present at the engagement with the English off Ushant, where he is said to have behaved with extreme cowardice. On his return home, the post of colonel-general of the hussars was bestowed on him. Some time after he succeeded the count de Clermont as chief of the French freemasons. On the death of his father, 1787, he became possessed of the hereditary estates, and from that period adopted various methods to obtain popularity, and gradually drew around him the friends of the rising revolution. His behaviour towards the king at the royal session, November 19, 1787, occasioned his exile to Villiers Coteret. Before the convocation of the States-general, attempts were made to gain him over to the court, but, becoming a member of that body, he protested against all the decrees of the chamber of nobles, and at length joined the tiers état to form the National Assembly. He evidently at this period wished to reduce the king to a state of tutelage, and procure for himself the office of lieutenant-general of the kingdom. But he soon became the passive instrument of the Jacobins, and ultimately the victim of his own and their schemes. Chosen a member of the Convention in September, 1792, the commune of Paris authorised him to adopt for himself and his descendants the appellation of Egalité, and he abandoned the name and title of his family. He voted in the Convention for the death of the king, and on the 7th of April following he was himself arrested and committed to prison at Mar-seilles; but, being brought before the tribunal of the department, he was declared innocent of all charges of conspiracy against the government. The committee of public safety, however, forbade his liberation, and after six month's detention he was transferred to Paris. At his examination on a new trial, he defended himself with considerable

address, but was condemned to suffer by the guillotine, and executed November 6, 1793.

ORLÉANS (Charlotte Elizabeth, duchess of) the daughter of Charles Louis of Bavaria, was born in 1652, and became in 1671 the second wife of the brother of Louis XIV., by whom she was the mother of the celebrated regent duke of Orleans. Her person was plain, but her disposition was lively, and her talents and wit made an impression on the king. She died in 1722. Her letters addressed to duke Ulrich of Bavaria, and the princess of Wales, tend to elucidate the history of Louis XIV., and the regency of her son. They were published at Paris in 1788, and reprinted in 1807; the best edition is that of M. Schubart, Paris, 1823, 8vo.

ORLÉANS (Peter Joseph), a French Jesuit, born at Bourges in 1641. He taught the belles lettres for some time in his society, but afterwards devoted himself to history. He wrote a History of the Revolutions of Spain: a History of Two Conquering Tartars, Chunchi and Camhi; the Life of Father Coton; and a History of the Revolutions in England, under the Stuarts, from 1603 to 1690. He died in 1698.

ORLOFF (Gregory), a favorite of Catherine II. of Russia, first served in the artillery under the empress Elizabeth, and was aide-de-camp to general Schuvaloff, whose mistress preferring him to the general, the intrigue was discovered, and Orloff was dismissed from his post. Catherine, then grand duchess, saved him from being sent into Siberia. He and his brother Alexis, who is said to have strangled the emperor, had a principal share in the subsequent revolution. He was now made grand master of the artillery, and raised to the first offices in the state. He even aimed at sharing the throne; but the empress, it is said, would only submit to a private marriage, which he imprudently refused. His influence, in consequence, declined, and he was supplanted by a new favorite. He was then ordered to travel, gratified with magnificent presents, and received the title of prince of the German empire. After an absence of five months he returned, and resided several years at Petersburg, hoping to recover his former influence. Disappointed in this, he made a tour in Germany, Italy, and France. He retired to Petersburg in 1782, when he became deranged, and died at Moscow the following year. He had by the empress one son, named Bobrinski, educated under the direction of his mother, but he showed himself unworthy of her care.

ORLOP, *n. s.* Belg. *overloop*; Teut. *overloft*. The middle deck of a ship.

A small ship of the king's, called the *Pensie*, was assailed by the *Lyon*, a principal ship of Scotland; wherein the *Pensie* so applied her shot, that the *Lyon's overloop* was broken, her sails and tackling torn; and, lastly, she was boarded and taken.

Hayward.

ORME (Robert), a modern historical writer, was born in 1728, at Anjengo, in the East Indies, where his father was a physician. He was sent to be educated at Harrow, after which he obtained a civil appointment in India, and became a member of the council at Fort St. George; and commissary and accomptant-gene-

ral. In 1758 he returned to England and wrote *The History of the Military Transactions of the British Nation in Indostan*, 2 vols, 4to. Also a work entitled *Historical Fragments of the Mogul Empire of the Mahrattas, &c.*, in one volume, 8vo. He died at Ealing in 1801. After his death appeared a new edition of the last work, with additions, and his life.

ORMSKIRK, in Lancashire, is a handsome town, with a good inland trade, lying about forty miles south by west of Lancaster, twelve from Liverpool, and 219 N.N.W. from London. By the inland navigation it has communication with the Mersey and its extensive windings. There is a bituminous earth about this place, from which oil is extracted that preserves raw flesh, and serves the poor people instead of candles. The only remarkable monuments are those of the ancient family of the Stanleys. Near this town is Latham House, the mansion of the earl of Derby, to which belongs a large estate, and a fine park. It was gallantly defended in the civil wars by lady Charlotte, countess of Derby, who gloriously held it to the last extremity against the parliament's forces, till she was relieved by prince Rupert. It was, however, ruined in a second siege. The church is an ancient Gothic structure, having a square tower, and at a small distance, in the church-yard, a spire-steeple was built by two sisters of the name of Orme. Besides the church there are two chapels of ease, and other places of worship.

ORMUZ, an island in the Persian Gulf, on which was built a city, once the most splendid and celebrated in all Asia in consequence of its being then the emporium of the trade not only between India and Persia, but also between Europe and the former country, its commodities being carried up the Euphrates and across the Syrian desert. Ormuz, indeed, did not owe its greatness in any degree to natural advantages, it being a mere rock of salt, producing not a single article of provision, nor a drop of water; so that it became a difficult task to render it habitable. When the Portuguese fleets had found their way round the Cape into the Indian seas, their cupidity was soon excited by the riches of Ormuz. They made several abortive attempts to seize it; but in 1514 Albuquerque sailed thither with a force so overwhelming, that resistance was scarcely attempted. It continued thus one of the most important seats of Portuguese power, till Shah Abbas conceived the design of wresting it from their hands. His efforts, however, would probably have been fruitless, had he not engaged the aid of an English squadron, then cruising in the Indian seas, which combined with him and took possession of the island of Kishme, on which Ormuz mainly depended for supplies. They then landed and obliged the Portuguese to evacuate the town, and retire into the castle, which was at last reduced by famine. The Persian monarch soon after ordered the inhabitants to evacuate the place, leaving only a Persian garrison. About the end of the last century, Ormuz was taken possession of by the Imam of Maskat; but, as a city and mart, it had no longer any existence, containing not more than twenty families. The

fort has now been put into a tolerable state of repair. The island, when viewed from the sea, resembles a mass of rocks and shells, thrown up by some violent convulsion of nature. The whole of the ancient city is one mass of ruins, the reservoirs for water being the only buildings that are at all in a perfect state. Long. 56° 40' E., lat. 27° 8' N.

ORNAMENT, *n. s.*

ORNAMENTAL, *adj.*

ORNAMENTALLY, *adv.*

ORNATE, *adj.*

ORNATENESS, *n. s.*

ORNATURE.

Fr. *ornement*; Ital. *Span. and Port. ornamento*; Lat. *ornamentum, ornatus*. Decoration; embellishment; adornment; dress; honorable attire or insignia: ornamental and ornamentally follow these senses: ornate is, decked; decorated; set off; fine: ornateness and ornature (rarely used), embellishment; finery.

So may the outward shows be least themselves;
The world is still deceived with ornament.

Shakespeare.

Ivorie, wrought in ornaments to decke the cheekes
of horse.

Chapman.

What thing of sea or land,

Female of sex it seems,

That so bedecked, ornate and gay,

Comes this way sailing? *Milton's Agonistes.*

Some think it most ornamental to wear their bracelets on their wrists, others about their ancles.

Brown.

The Tuscan chief to me has sent

Their crown, and every regal ornament.

Dryden.

If the kind be capable of more perfection, though rather in the ornamental parts of it than the essential, what rules of morality or respect have I broken, in naming the defects, that they may hereafter be amended?

Id.

The persons of different qualities, in both sexes, are indeed allowed their different ornaments; but these are by no means costly, being rather designed as marks of distinction than to make a figure.

Addison.

They are abused and injured, and betrayed from their only perfection, whenever they are taught that any thing is an ornament in them that is not an ornament in the wisest among mankind.

Low.

No circumstance of life can place a man so far below the notice of the world, but that his virtues or vices will render him, in some degree, an ornament or disgrace to his profession.

Rogers.

Even the Heathens have esteemed this variety not only ornamental to the earth, but a proof of the wisdom of the Creator.

Woodward.

Your ornaments hung all

On some patched doghole eked with ends of wall.

Pope.

If no advancement or knowledge can be had from universities, the time there spent is lost; every ornamental part of education is better taught elsewhere.

Swift on Religion.

A man whose great qualities want the ornament of exterior attractions is like a naked mountain with mines of gold, which will be frequented only till the treasure is exhausted.

Johnson.

ORNE, a river in France, which rises at Aunon, near Seez, in the department to which it gives its name, and passing by Argentau, Ecouches, Pont-d'Ouilly, Harcourt, and Caen, falls into the Manche, below Sallanelles, in the department of Calvados, after a course of ninety miles. It is navigable at high tides from Caen to its mouth, and conveys along its stream wines,

brandies, salt and salt fish, iron, wood soap, flax seed, building stones, plaster, &c. In its course it receives the waters of the Noiveau, the Aize, the Odon, and several other rivers, and at one spot forms a grand cascade falling between two rocks from a height of more than 100 feet.

ORNE, DEPARTMENT OF THE, in France, is formed of the Perche and the southern part of the ancient province of Normandy, and takes its name from the river Orne, which flows through it from the east to the north-west. The chief place of this prefecture is Alençon; it is divided into four arrondissements; Alençon, containing 72,115 inhabitants; Argentau, 113,218; Domfront, 117,266; and Mortagne, 120,285; being a total population of 422,884 souls, on an area of 2790 square miles, and yielding a territorial revenue of 22,096,000 francs. It is in the fourteenth military division, having a royal court at Caen and a bishopric at Seez, and containing thirty-five cantons and 627 communes, consisting of four electoral arrondissements, which send seven members to the chamber of deputies. This department is bounded on the north by that of Calvados, on the north-east by that of the Eure, on the east by the Eure-et-Loir; on the south by those of the Sarthe and the Mayenne, and on the west by that of the Channel.

The surface of the country is intersected through its whole length by a chain of lofty hills, partly covered with woods; some parts consist of uncultivated lands, and some of fertile plains producing all sorts of grain, and valleys abounding in pasturage, for the feed of great numbers of cattle and horses, which are held in high estimation for cavalry. This district is generally fertile in corn, hemp, flax, and great quantities of apples for cider. The quality of the soil and the variations of the climate are unfavorable to the cultivation of the vine. It is mostly cultivated with horses, and produces more than a sufficient supply for its inhabitants; consisting of 58,960 hectares of forest (oak, beech, and birch), besides arable land, which produces on an average twenty-nine francs twenty-two centimes per hectare. Besides the articles already mentioned there is abundance of small game, such as hares, red and gray partridges, &c., good fresh-water fish, sheep, pigs, poultry, geese, and bees. There are mines of iron, black lead, and manganese, and quarries of marble, granite, and freestone, and great quantities of turf. There are hot-baths at Bagnoles, and a mineral spring at Herse; also a royal stud at Pin, which is one of the finest in Europe, and races at Alençon, for twenty-one departments.

The manufactures consist of pointlace at Alençon, iron wire, pins, sewing and knitting-needles, ironmongery, oil of vitriol, thread, tapes, laces, linen cloths for the colonies, cotton, canvas, dimities, &c. There are also woollen and cotton spinning factories, twelve blast furnaces, thirty-six wire-forges, glass-houses, delf-potteries, paper-mills, bleaching grounds, tan-yards, and curriers' shops. A considerable trade is carried on in grain, trefoil-seed, timber of different kinds, cattle, pigs, poultry, goose feathers, &c. The chief rivers that water this department are the Orne, the Sarthe, the Eure, the Mayenne, the Noireau, the Iton, the Huisnes, the Egrenne, the Varennes, the Don, the Dive and the Rille. It is crossed by the great roads of Caen, Laval, Mans, and Chartres.

ORNICUS LAPIS, a name given by some authors to the sapphire of the ancients, which is a peculiar species of our lapis lazuli, in which the gold-colored matter is not disposed in veins, but in separate spots of the form of a star. It was first called oriniscus and orinus, by corruption from aurinus, golden; and thence came at length the word ornicus.

ORNITHÆ, a name given by the ancients to certain winds, which usually blew in the spring, at the time when the birds of passage came over to them. Pliny says that these winds blew from the west, and that by some the Etesian winds were called by this name. Others suppose that they blew from the north or north-west.

ORNITHOGALUM, star of Bethlehem; a genus of the monogynia order, and hexandria class of plants; natural order tenth, coronariæ: cor. hexapetalous, erect, persisting, and patent above the middle; the filaments alterdilated at the base. There are forty-three species, herbaceous perennials, rising from six inches to three feet high, having stalks terminated with long spikes of hexapetalous, star-shaped, white, and yellow flowers. Some of these are very hardy, and will prosper in any situation, but

O. Capense, a native of the Cape of Good Hope, requires the assistance of artificial warmth to preserve it in this country. They are all easily propagated by off-sets from the roots. The bulbous roots of all the species are nutritious and wholesome.

ORNIS/CIPIST, n. s. } Gr. ορνις, a bird, ORNITHOL'OGY. { and ορνιθολογια. One who prognosticates by the flight of birds: ornithology is the science which treats of their distinctions and peculiarities. See below.

ORNITHOLOGY.

ORNITHOLOGY is a branch of zoology, or the science which treats of birds, describes their form, external and internal, and teaches their economy and their uses.

A bird is an animal covered with feathers, furnished with a bill, having two wings, and only two legs, with the faculty, except in a very few instances, of removing itself from place to place through the air.

SECT. I.—EXTERNAL PARTS OF BIRDS.

A bird may be divided into the head, the body, and the limbs.

I. HEAD.

1. *Bill* (rostrum) is a hard horny substance, consisting of an upper and under part, extending from the head, and answering to the mandibles in quadrupeds. Its edges generally plain

and sharp, like the edge of a knife, cultrated, as are the bills of crows; but sometimes serrated, as in the toucan; or jagged, as in the gannet and some herons; or pectinated, as in the duck; or denticulated, as in the mergansers; but always destitute of real teeth imbedded in sockets. The base in falcons is covered with a naked skin or cere (cera); in some birds with a carnosous appendage, as the turkey; or a callous, as the curassow. In birds of prey, the bill is hooked at the end, and fit for tearing; in crows, straight and strong for picking; in water-fowls, either long and pointed for striking, or slender and blunt for searching in the mire, or flat and broad for gobbling. Its other uses are for building nests; feeding the young; climbing, as in parrots; or, lastly, as an instrument of defence or offence.

2. *Nostrils* (nares), the nice instruments of discerning their food, are placed either in the middle of the upper mandible, or near the base, or at the base, as in parrots; or behind the base, as in toucans and hornbills: but some birds, as the gannet, are destitute of nostrils. The nostrils are generally naked; but sometimes covered with bristles reflected over them, as in crows, or hid in the feathers, as in parrots, &c.

The fore part of the head is called the front (capistrum); the summit (vertex), or the crown; the hind part, with the next joint of the neck (nucha), the nape; the space between the bill and the eyes, which in herons, grebes, &c., is naked (lora) the straps; the space beneath the eyes (genae) the cheeks.

3. *Orbits* (orbitæ), the eye-lids; in some birds naked, in others covered with short soft feathers. Birds have no eye-brows; but the grouse kind have in lieu a scarlet naked skin above, which are called supercilia; the same word is also applied to any line of a different color that passes from the bill over the eyes.

4. *Ears*. Birds are destitute of auricles or external ears, having an orifice for admission of sound; open in all but owls, whose ears are furnished with valves.

5. The *chin*, the space between the parts of the lower mandible and the neck, is generally covered with feathers; but, in the cock and some others, has carnosous appendages called wattles (palearia); in others is naked, and furnished with a pouch, capable of great dilatation (sacculus), as in the pelican and corvorants.

6. *Neck* (collum), the part that connects the head to the body, is longer in birds than in any other animals; and longer in such as have long legs than in those that have short, either for gathering up their meat from the ground, or striking their prey in the water; except in web-footed fowls, which are, by reversing their bodies, destined to search for food at the bottom of waters, as swans, and the like. Birds, especially those that have a long neck, have the power of retracting, bending, or stretching it out, in order to change their centre of gravity from their legs to their wings.

II. BODY.

1. Consists of the *back* (dorsum), which is flat, straight, and inclines; terminated by the

2. *Rump* (uropygium), furnished with two

glands, secreting a fattish liquor from an orifice each has, which the birds express with their bills, to oil or anoint the discomposed parts of their feathers. These glands are particularly large in most web-footed water-fowls; but in the grebes, which want tails, they are smaller.

3. *Breast* (pectus) is ridged and very muscular, defended by a forked bone (clavicula), the merry-thought. The short winged birds, such as grouse, &c., have their breasts most fleshy or muscular; as they require greater powers in flying than the long-winged birds, such as gulls and herons, which are specifically lighter, and have greater extent of sail.

4. *Belly* (abdomen) is covered with a strong skin, and contains the entrails.

5. The *Vent*, or vent-feathers (crissum), which lies between the thighs and the tail. The anus lies hid in those feathers.

III. LIMBS.

1. *Wings* (alæ), adapted for flight in all birds except the dodo, ostriches, cassowary, great auk, and the penguins, whose wings are too short for the use of flying; but in the dodo and ostrich, when extended, serve to accelerate their motion in running; and in the penguins perform the office of fins in swimming or diving. The wings have near their end an appendage, covered with four or five feathers, called the bastard wing (ala notha), and alula spuria.

The lesser coverts (tectrices) are the feathers which lie on the bones of the wings. The greater coverts are those which lie beneath the former, and cover the quill-feathers and the secondaries.

The quill-feathers (primores) spring from the first bones (digiti and metacarpi), of the wings, and are ten in number. Quill feathers are broader on their inner than their exterior sides. The secondaries (secondariæ), are those that rise from the second part (cubitus), and are about eighteen in number, and equally broad on both sides. The primary and secondary wing-feathers are called remiges. A tuft of feathers placed beyond the secondaries near the junction of the wings with the body. This in water-fowls is generally longer than the secondaries, cuneiform, and may not unaptly be called the tertials.

The scapulars are a tuft of long feathers arising near the junction of the wings (brachia) with the body, and lie along the sides of the back, but may be easily distinguished, and raised with one's finger. The inner coverts are those that clothe the under side of the wing. The subaxillary are peculiar to the greater Paradise. The wings of some birds are instruments of offence. The anhima of Marcgrave has two strong spines in the front of each wing. One, species of plover has a single one in each; the whole tribe of jacana, and the gambo, or spur-winged goose of Willoughby, the same.

2. The *tail* is the director, or rudder, of birds in their flight; they rise, sink, or turn by its means; for, when the head points one way, the tail inclines to the other side; it is, besides, an equilibrium or counterpoise to the other parts; the use is very evident in the kite and swallows. The tail consists of strong feathers (rectrices), ten

in number, as in the woodpeckers, &c.; twelve in the hawk tribe, and many others; in the gallinaceous, the mergansers, and the duck kind, of more. It is either even at the end, as in most birds; or forked, as in swallows; or cuneated, as in magpies, &c.; or rounded, as in the purple jackedaw of Catesby. The grebe is destitute of a tail, the rump being covered with down; and that of the cassowary with the feathers of the back. Immediately over the tail are certain feathers, that spring from the lower part of the back, and are called the coverts of the tail (uropygium).

3. *Thighs* (femora) are covered entirely with feathers in all land birds, except the bustards and the ostriches; the lower part of those of all waders, or cloven-footed water fowls, are naked; that of all webbed-footed fowls the same, but in a less degree: in rapacious birds, they are very muscular.

4. *Legs* (crura); those of rapacious fowls very strong, furnished with large tendons, and fitted for tearing and a firm gripe. The legs of some of this genus are covered with feathers down to the toes, such as the golden eagle: others to the very nails; but those of most other birds are covered with scales, or with a skin divided into segments, or continuous. In some of the pies, and in all the passerine tribe, the skin is thin and membranous; in those of web-footed water-fowls, strong. The legs of most birds are placed near the centre of gravity: in land birds, or in waders that want the back toe, exactly so; for they want that appendage to keep them erect. Auks, grebes, divers, and penguins, having their legs placed quite behind, are necessitated to sit erect: their pace is awkward and difficult, walking like men in fetters: hence Linné styles their feet pedes compedes. The legs of all cloven-footed water fowls are long, as they must wade in search of food: of the palmated, short, except those of the flamingo, the avoset, and the courier.

5. *Feet* (pedes), in all land birds that perch, have a large back toe; most of them have three toes forward, and one backward. Woodpeckers, parrots, and other birds that climb much, have two forward, two backward; but parrots have the power of bringing one of their hind toes forward while they are feeding themselves. Owls have also the power of turning one of their fore toes backward. All the toes of the swift turn forward, which is peculiar among land-birds; the tridactylous woodpecker is also anomalous, having only two toes forward, one backward; the ostrich is another, having but two toes.

6. *Toes* (digiti). The toes of all waders are divided; but between the exterior and middle toe is generally a small web, reaching as far as the first joint. The toes of birds that swim are either plain, as in the single instance of the common water-hen or gallinule; or pinnated, as in the coots and grebes; or entirely webbed or palmated, as in all other swimmers. All the plover tribe, or charadrii, want the back toe. In the swimmers the same want prevails among the albatrosses and auks. No water fowls perch, except certain herons, the corvorant, and the shag.

7. *Claws* (ungues). Rapacious birds have

very strong, hooked, and sharp claws, vultures excepted. Those of all land birds that roost on trees have also hooked claws, to enable them to perch in safety while asleep. The gallinaceous tribe have broad concave claws for scraping up the ground. Grebes have flat nails like the human.

Among water fowls, only the skua and the black-toed gull have strong hooked or aquiline claws. All land birds perch on trees, except the struthious and some of the gallinaceous tribes. Parrots climb; woodpeckers creep up the boughs and boughs of trees; swallows cling. All water fowls rest on the ground, except certain herons, and one species of ibis, the spoonbill, and one or two species of ducks and of corvorants.

IV.—THE FEATHERS.

Feathers are designed for two uses; as coverings from the inclemency of the weather, and instruments of motion through the air. They are placed in such a manner as to fall over one another (tegulatum), so as to permit the wet to run off, and to exclude the cold; and those on the body are placed in a quincuncial form; most apparent in the thick-skinned water fowls, particularly in the divers.

The parts of a feather are, the shaft; corneous, strong, light, rounded, and hollow at the lower part; at the upper, convex above, concave beneath, and chiefly composed of a pith.

On each side the shafts are the vanes, broad on one side and narrow on the other; each vane consists of a multitude of thin laminæ, stiff, and of the nature of a split quill. These laminæ are closely braced together by the elegant contrivance of a multitude of small bristles; those on one side hooked, the other straight, which lock into each other, and keep the vanes smooth, compact, and strong. The vanes near the bottom of the shafts are soft, unconnected, and downy.

Feathers are of three kinds:—such as compose instruments of flight; as the pen-feathers, or those which form the wings and tail, and have a large shaft; the vanes of the exterior side bending downward, of the interior upward, lying close on each other, so that when spread not a feather misses its impulse on the air.

The feathers that cover the body, which may be properly called the plumage, have little shaft and much vane; and never are exerted or relaxed, unless in anger, fright, or illness.

The down (plumæ), which is dispersed over the whole body amidst the plumage, is short, soft, unconnected, consists of lanuginous vanes, and is intended for excluding that air or water which may penetrate or escape through the former. This is particularly apparent in aquatic birds, and remarkably so in the anserine tribe. There are exceptions to the forms of feathers. The vanes of the subaxillary feathers of the Paradise are unconnected, and the laminæ distant, looking like herring-bone. Those of the tail of the ostrich, and head of a species of curasso, curled. Those of the cassowary consist of two shafts, arising from a common stem at the bottom; as do, at the approach of winter, those of the ptarmigans of arctic countries. The

feathers of the penguins, particularly those of the wings, consist chiefly of thin flat shafts, and more resemble scales than feathers; those of the tail like split whale-bone.

SECT. II.—OF THE FLIGHT OF BIRDS.

The flight of birds is various; for, had all the same, none could elude that of rapacious birds. Those which are much on wing, or flit from place to place, often owe their preservation to that cause; those in the water to diving.

Kites, and many of the falcon tribe, glide smoothly through the air, with scarcely any apparent motion of the wings. Most of the order of pies fly quick, with a frequent repetition of the motion of the wings. The bird of Paradise floats on the air. Wood-peckers fly awkwardly, and by jerks, and have a propensity to sink in their progress.

The gallinaceous tribe, in general, fly very strong and swiftly; but their course is seldom long, by reason of the weight of their bodies.

The columbine race is of singular swiftness; witness the flight of the carrier pigeon. The passerine fly with a quick repetition of strokes; their flight, except in migration, is seldom distant. Among them, the swallow tribe is remarkably agile, their evolutions sudden, and their continuance on wing long.

The struthious race cannot fly; but still, in running, their short wings are of use when erect, to collect the wind, and accelerate their motion.

Many of the greater cloven-footed water-fowls, or waders, have a slow and flagging flight; but most of the less fly swiftly, and most of them with extended legs, to compensate the shortness of their tails. Rails and gallinules fly with their legs hanging down. Coots and grebes with difficulty are forced from the water; but, when they rise, fly swiftly.

Grebes and also divers fly with their hind parts downwards, by reason of the forwardness of their wings. Web-footed fowls are various in their flight. Several have a sailing or flagging wing, such as gulls. Penguins, and a species of auk, are denied the power of flight. Wild geese, in their migrations, fly off in a regular figure, in order to cut the air with greater ease; for example, in long lines, in the figure of a Δ , which the ancients report that the cranes assumed in their annual migrations, till their order was broken by storms.

The flight of birds is much assisted by their being endowed with the peculiar faculty of enlarging their bulk at will; and from this circumstance the animal is enabled to buoy itself up the easier in the air, its specific gravity being lessened in proportion as the bulk is increased.

This arises from certain air-vessels communicating with the lungs, and dispersed over various parts of the body, whereby the bird, by filling or emptying these vessels, has the power of contracting or dilating itself according to the occasion it may have for the change. See ZOOLOGY.

SECT. III.—OF THE NUPTIALS, NIDIFICATION, AND EGGS OF BIRDS.

Most birds are monogamous, or pair; in spring fixing on a mate, and keeping constant

till the cares of incubation and educating the young brood is past. Birds that lose their mates early, associate with others; and birds that lose their first eggs will pair and lay again. The male as well as the female, of several, join alternately in the act of incubation, and always in that of nutrition; when the young are hatched, both are busied in looking out for and bringing food to the nestlings; and at that period the mates of the melodious tribes, who before were perched on some sprig, and by their warbling alleviated the care of the females confined to the nest, now join in the common duty.

Of the gallinaceous tribe, the greatest part are polygamous, at least in a tame state; the pheasants, many of the grouse, the partridges, and bustards are monogamous.

The males of polygamous birds neglect their young; and, in some cases, would destroy them if they met with them. The economy of the struthious order, in this respect, is obscure. It is probable that the birds which compose it are polygamous, like the common poultry, for they lay many eggs; the dodo, however, is said to lay but one.

All waders or cloven-footed fowls are monogamous; and all with pinnated feet are also monogamous, except the ruffs. The swimmers, or web-footed fowls, observe the same order.

The affection of birds to their young is very strong during the whole time of nutrition, or as long as they continue in a helpless state; but, as soon as the brood can fly and shift for itself, the parents neglect, and even drive it from their haunts; the affection ceasing with the necessity for it.

The nest of a bird is one of those daily wonders that, from its familiarity, is passed over without regard. Each bird, after nuptials, prepares a place suited to its species, for depositing its eggs and sheltering its little brood; different genera, and different species, set about the task in a manner suitable to their several natures; yet every individual of the same species collects the same kind of materials, puts them together in the same form, and chooses the same sort of situation for placing this temporary habitation. The young bird of the last year, which never saw the building of a nest, pursues the same plan in the structure of it, and selects the same materials, as its parents did before. Birds of the same species, of different and remote countries, do the same. The swallows of Britain, and of the remoter parts of Germany, observe the same order of architecture; and in many instances have been known to return to the same places in which they had reared their young the year before.

The nests of the larger rapacious birds are rude, made of sticks, and bents, but often lined with something soft; they generally build in high rocks, ruined towers, and in desolate places; enemies to the whole feathered creation, they seek solitude. A few build upon the ground. Shrikes, allied to the rapacious birds, build their nests in bushes, with moss, wool, &c. The order of pies is very irregular in the structure of their nests. Parrots, and in fact all birds with two toes forward and two backward,

lay their eggs in the hollows of trees. And most of this order creep along the bodies of trees, and lodge their eggs also within them. Crows build in trees: among them, the nest of the magpie, composed of rude materials, is made with much art, quite covered with thorns, and only a hole left for admittance.

The nests of the orioles are contrived with wonderful sagacity, and are hung at the end of some bough, or between the forks of extreme branches. In Europe only three birds have pensile nests; the common oriole, the parus pendulinus or hang-nest titmouse, and one more. But in the torrid zone, where the birds fear the search of the gliding serpent and inquisitive monkey, the instances are very frequent; a marvellous instinct implanted in them for the preservation of their young. See ORIOLES.

All of the gallinaceous and struthious orders lay their eggs on the ground. The ostrich is the only exception, among birds, of the want of natural affection; 'which leaveth her eggs in the earth, and warmeth them in the dust, and forgetteth that the foot may crush them, or the wild beast may break them.'

The columbine race make a most artless nest, a few sticks laid across may suffice. Most of the passerine order build their nests in shrubs or bushes, and some in holes of walls or banks. Several in the torrid zone are pensile from the boughs of high trees; that of the tailor bird is a wondrous instance. Some of this order, such as larks, and the goatsucker, on the ground. Some swallows make a curious plaster nest beneath the roofs of houses; and an Indian species, nests of a certain glutinous matter, which are collected as delicate ingredients for soups of Chinese epicures.

Most of the cloven-footed water fowls, or waders, lay upon the ground. Spoonbills and the common herons build in trees, and make large nests with sticks, &c. Storks build on churches, or the tops of houses. Coots make a great nest near the water side. Grebes, in the water, a floating nest, adhering generally to some neighbouring reeds.

Web-footed fowls breed on the ground, as the avosets, terns, some of the gulls, mergansers, and ducks; the last pull the down from their breasts to make a softer and warmer bed for their young. Auks and guillemots lay their eggs on the naked shelves of high rocks; penguins, in holes under ground: among the pelicans, that which gives name to the genus makes its nest in the desert, on the ground. Shags sometimes on trees; cormorants and gannets on high rocks, with sticks, dried algae, and other coarse materials.

Rapacious birds, in general, lay few eggs; eagles and the larger kinds fewer than the lesser. The eggs of falcons and owls are rounder than those of most other birds; they lay more than six.

The order of pies vary greatly in the number of their eggs. Parrots lay only two or three white eggs. Crows lay six eggs, greenish, mottled with dusky. Cuckoos, as far as we can learn, two. Woodpeckers, wryneck, and kingfisher, lay eggs of a clear white and semi-transparent color. The woodpeckers lay six, the others more.

The nuthatch lays often in the year, eight at a time, white, spotted with brown. The hoopoe lays but two cinereous eggs. The creeper lays a great number of eggs. The honeysucker, the least and most defenceless of birds, lays but two; but the extinction of the genus is prevented by a swiftness of flight that eludes every pursuit.

The gallinaceous order, the most useful of any to mankind, lay the most eggs, from eight to twenty. 'Benigna circa hoc natura, innocua, et esculenta animalia fecunda generavit,' is a fine observation of Pliny; with exception of the bustard, a bird that hangs between the gallinaceous and the waders, which lays only two. The columbine order lay but two white eggs; but the domestic kind, breeding almost every month, supports the remark of the Roman naturalist.

All of the passerine order lay from four to six eggs, except the titmouse and the wren, which lay fifteen or eighteen, and the goatsucker, which lays only two. The struthious order disagree much in the number of eggs; the ostrich laying many, as far as fifty, the dodo but one.

The cloven-footed water fowls, or waders, lay, in general, four eggs; the crane and the Norfolk plover seldom more than two. All of the snipe and plover genus are of a dirty white, or olive spotted with black, and scarcely to be distinguished in the holes they lay in. The land rails (an ambiguous species) lay from fifteen to twenty. Of birds with pinnated feet, the coot lays seven or eight eggs and sometimes more. Grebes from four to eight, and those white.

The web-footed, or swimmers, differ in the number of their eggs. Those which border on the order of waders lay few eggs; the avoset two; the flamingo three; the albatross, the auks, and guillemots, lay only one egg a piece: the eggs of the two last are of a size strangely large in proportion to the bulk of the birds. They are commonly of a pale green color, spotted and striped so variously, that not two are alike; which gives every individual the means of distinguishing its own on the naked rock where such multitudes assemble. Divers lay only two. Terns and gulls lay about three eggs, of a dirty olive, spotted with black. Ducks lay from eight to twenty eggs; the eggs of all the genus are of a pale green, or white, and unspotted. Penguins probably lay but one egg.

Of the pelican genus, the gannet lays but one egg; the shags or cormorants six or seven, all white; the last the most oblong of eggs.

A minute account of the eggs of birds might occupy a treatise of itself. This is only meant to show the great conformity in the shape and colors of congenerous birds; and that the same uniformity of color is in the eggs as in the plumage of the birds they belong to.

Zinanni published at Venice, in 1737, *A Treatise on Eggs*, illustrated with accurate figures of 106 eggs. Mr. Reyger of Dantzic published, in 1766, a posthumous work by Klein, with twenty-one plates, elegantly colored.

SECT IV.—OF SYSTEMS OF ORNITHOLOGY.

Of the many systems that have been offered to the public of late years, Pennant gives the preference to that composed by Ray, in 1667, and afterwards published in 1678; but observes, at

Pavo bicalcaratus.

the same time, that it would be unfair to conceal the writer from whom our great countryman took the original hint of forming that system, which has proved the foundation of all that have been composed since that period.

Belon of Mans, a Frenchman, who first attempted to range birds according to their natures, published a work on ornithology in 1555. His arrangement of rapacious birds is as judicious as that of the latest writers. His second chapter treats of vultures, falcons, shrikes, and owls; in the two next he passes over to the web-footed water fowls, and to the cloven-footed; in the fifth he includes the gallinaceous and struthious, but mixes with them the plovers, buntings, and larks; in the sixth are the pies, pigeons, and thrushes; and the seventh takes in the rest of the passerine order.

Ray, and his illustrious pupil Francis Willoughby, assumed the same plan; but formed the great division of the terrestrial and aquatic birds; they made every species occupy their proper place, consulting at once exterior form and natural habit.

The subjoined scheme of arrangement, by Mr. Pennant, is introduced with the following observations:—‘Mr. Ray’s general plan is so judicious that to me it seems scarcely possible to make any change in it for the better; yet, notwithstanding he was in a manner the founder of systematic zoology, later discoveries have made a few improvements on his labors. My candid friend Linné did not take it amiss, that I, in part, neglected his example; for I permit the land fowl to follow one another, undivided by the water-fowl, the Grallæ, and anseres of his system; but, in my generical arrangement, I most punctually attend to the order he has given in his several divisions, except in those of his anseres and a few of his grallæ. For, after the manner of Mr. Brisson, I make a distinct order of water-fowl with pinnated feet, placing them between the waders or cloven-footed water fowl and the web-footed. The ostrich, and land birds with wings useless for flight, I place as a distinct order. The trumpeter (*psophia* Linnæi), and the bustards, I place at the end of the gallinaceous tribe; the last granivorous, swift runners, avoiders of wet places; and both have bills somewhat arched. It must be confessed that both have legs naked above the knees, and the last, like the waders, lay but few eggs. They seem ambiguous birds, that have affinity with each order; and it is hoped that each naturalist may be indulged the toleration of placing them as suits his own opinion.’

TABLE of Pennant’s Arrangement, with the corresponding Orders and Genera in the *Systema Naturæ* of Linné.

DIVISION I.—LAND BIRDS. DIVISION II.—WATER FOWL.

ORNITHOPUS, in botany, bird's-foot, a genus of the decandria order, and diadelphia class of plants: natural order thirty-second, papilionaceæ. Legumen articulated, cylindrical, and bent in the form of a bow. Species five, of which one is common to our own pastures, and was formerly thought a specific for the stone.

ORNUS, a species of the fraxinus, or ash tree, which produces the manna. Its smaller leaves are sawed, with flowers having petals. To obtain the manna, those employed in July and August make an oblong incision, and take off from the bark of the tree about three inches in length, and two in breadth: they leave the wound open, and by degrees the manna runs out, is almost suddenly thickened to its proper consistence, and is found adhering to the bark. This is collected in baskets, and called manna grassa. When they want fine manna, they apply to the incision of the bark thin straw, or small bits of shrubs; so that the manna in coming out runs upon these bodies, and is collected in a sort of regular tubes, which give it the name of manna in cannoli.

OROBANCHE, in botany, broom rape, a genus of the angiospermia order, and didynamia class of plants: natural order fortieth, personate: CAL. bifid: COR. ringent: CAPS. unilocular, bivalved, and polyspermous: there is a glandule under the base of the germen. Species eighteen, five of which are common to the fields and woods of our own country; the rest are scattered over Europe, Asia, and America.

OROBIO (Balthasar), a celebrated Jew of Spain. He was so skilled in the scholastic philosophy of Spain, that he was made professor of metaphysics in the university of Salamanca.

Afterwards, however, applying himself to the study of physic, he practised that art at Seville with success, till, accused of Judaism, he was thrown into the inquisition, and suffered the most dreadful tortures. After three years confinement, during which he constantly denied that he was a Jew, and professed to be a true Christian, he was discharged; and, repairing to France, was made professor of physic at Thoulouse. At last, weary of dissembling, he repaired to Amsterdam, where he was circumcised, took the name of Isaac, and professed Judaism; still continuing, however, to practise physic, in which he was much esteemed. He distinguished himself in a controversy with Limborch, and by writing against Spinoza. Orobio died in 1687.

OROBUS, bitter vetch, a genus of the decandria order, and diadelphia class of plants: natural order thirty-second, papilionaceæ: style linear: CAL. obtuse at the base, with the upper segments deeper and shorter than the rest. There are nine species. All of them have fibrated roots, which are perennial, but are annual in stalk, rising early in spring, and decaying in autumn. They are very hardy plants, and prosper in any common soil of a garden. Most of these plants are very floriferous, and the flowers conspicuous and ornamental for adorning the flower compartments. The flowers are universally of the papilionaceous or butterfly kind, consisting each of four irregular petals, i. e. a standard, two wings, and a keel; and are all succeeded by long taper seed-pods, furnishing plenty of ripe seed in autumn; by which the plants may be propagated abundantly, as also by parting the roots.

O. tuberosus, wood pea, or peas heath. The

Highlanders have a great esteem for the tubercles of the roots of this species. They dry and chew them to give a better relish to their liquor; they also affirm that they are good against most disorders of the breast, and that by the use of them they are enabled to resist hunger and thirst for a long time. In Breadalbane and Ross-shire they sometimes bruise and steep them in water, and make an agreeable fermented liquor with them. They have a sweet taste, something like the roots of liquorice; when boiled, are nutritious and well flavored; and in times of scarcity they have served as a substitute for bread.

ORODES, a prince of Parthia, who murdered his brother Mithridates, and ascended his throne. He defeated Crassus, the Roman triumvir, and poured melted gold down the throat of his fallen enemy, to reproach him for his avarice and ambition. He joined the party of Cassius and Brutus at Philippi. It is said that, when Orodes became old and infirm, his thirty children applied to him, and disputed in his presence their right to the succession. Phraates, the eldest of them, obtained the crown from his father; and, to hasten him out of the world, he attempted to poison him. The poison had no effect; and Phraates, still determined on his father's death, strangled him with his own hands, about thirty-five years before the Christian era. Orodes had reigned about fifty years.

ORONTES, a famous river of Syria, about which Strabo and other ancient authors mention many fabulous stories of its disappearing and running under ground for several miles, &c. It rises in Cœlosyria, and after a rapid course falls into the Mediterranean below Antioch. It is now called Asi.

ORONTIUM, in botany, a genus of the monogynia order, and hexandria class of plants: natural order second, piperitæ. Spadix cylindrical, covered with florets: cor. hexapetalous and naked: the follicles monospermous. Style none.

OROPESA, a town of Peru, the capital of the province of Cochabamba, situated on one of the tributary streams of the Rio Grande. Its inhabitants, about 17,000, are chiefly employed in trading with the neighbouring provinces in fruits and grain. They include many rich and noble families. Eight miles north of Cochabamba, and eighty-nine N. N. W. of Chuquisaca. There are other settlements of this name in the neighbourhood.

OROSIUS (Paul), a Spanish historian and divine, and a disciple of St. Augustin; who sent him to Jerusalem to consult St. Jerome on the origin of the soul. He wrote a Universal History from the creation to his own time, entitled *Miseria Humana*, in which he displays more learning and diligence than chronological accuracy. The best edition is that of Havercanys, 4to. Lug. Bat. 1767. He wrote also a treatise on Free Will, and other pieces. He flourished about A. D. 416.

ORPHAN, *n. s. & adj.* } *Fr. orphanin; Gr. ὀρφανός.* A child bereft of parents; applied to a child who has lost either one parent or

both: orphanage and orphanism, mean the state of an orphan.

Poor orphan in the wide world scattered,
As budding branch rent from the native tree,
And thrown forth until it be withered:
Such is the state of man. *Spenser.*

Sad widows, by thee rifled, weep in vain,
And ruined orphans of thy rapen complain. *Sandys.*

This king, left orphan both of father and mother, found his estate, when he came to age, so disjointed, even in the noblest and strongest limbs of government, that the name of a king was grown odious. *Sidney.*

Who can be bound by any solemn vow
To leave the orphan of his patrimony,
To wring the widow from her 'customed right,
And have no other reason for his wrong,
But that he was bound by a solemn oath? *Shakespeare.*

The sea with spoils his angry bullets strow,
Widows and orphans making as they go. *Waller.*

Pity, with a parent's mind,
This helpless orphan whom thou leavest behind. *Dryden.*
Collections were made for the relief of the poor, whether widows or orphans. *Nelson.*

Coriolanus's father died when he was an infant. Alcibiades and Coriolanus would, with Demosthenes, make as noble a trio of orphans as all antiquity could furnish. *Bp. Watson.*

Rich, noble, but an orphan; left an only
Child to the care of guardians good and kind;
But still her aspect had an air so lonely. *Byron.*

First stern philanthropy; not she who dries
The orphan's tears and wipes the widow's eyes,
But French philanthropy, whose boundless mind
Glows with the general love of human kind. *Canning.*

ORPHEUS, a celebrated poet and musician of antiquity, who, according to Sir Isaac Newton, was the son of Cægrus, who received Thrace from Sesac when he conquered that country. With the kingdom, the latter gave Cægrus one of his singing women, for his wife, who brought him Orpheus. Hence his mother was fabled to be Calliope. On account of the great antiquity of Orpheus, numberless fables have been intermingled with his history, but there can be no doubt of his existence. To his father he was indebted for his first instruction in religion, and he afterwards became a disciple of the Idæi Dactyli in Crete. Thence he travelled into Egypt, and became a proficient in all kinds of literature. From the latter country he transplanted the whole fable of Osiris into Greece, adapting it to the family of Cadmus. The people held him in the highest veneration, supposing him to be possessed of the secrets of expiating crimes, curing diseases, and appeasing the gods. He promulgated an idea of hell, instituted the mysteries of Hecate among the Æginetes, and those of Ceres in Sparta. He is chiefly famed for his music, which is poetically represented to have had the effect of taming the most ferocious animals, and making the trees of the forest dance in concert to his lyre. Eurydice made a deep impression on the melodious musician, and their nuptials were celebrated. Their happiness, however, was but short: for Aristæus became enamoured of her; and as she

fled from her pursuer, a serpent bit her foot, and she died of the poisoned wound. Her loss was severely felt by Orpheus, and he resolved to recover her or perish in the attempt. With his lyre in his hand, he entered the infernal regions, and gained an easy admission to the palace of Pluto. Having charmed all hell with his strains, Pluto and Proserpine consented to restore Eurydice, provided he forbore looking behind him till he had come to the extreme borders of hell. The conditions were gladly accepted, and Orpheus was already in sight of the upper regions of the air, when he forgot his promise, and, turning back to look at his wife, lost her for ever. The only comfort he could find was to soothe his grief by the sound of his musical instrument in grottoes or on mountains. He totally separated himself from the society of mankind; and the Thracian women, whom he had offended by his coldness to their amorous passion, attacked him while they celebrated the orgies of Bacchus; and, after they had torn his body to pieces, they threw his head into the Hebrus, which still articulated Eurydice! Eurydice! as it was carried down the stream into the Ægean Sea. Others say, that as he attempted to conjure his wife from the dead, which they understand by the story of his going down to hell, he thought he saw her; and when afterwards, on looking back, he missed her, he died of grief. Pausanias speaks of a temple in Thesprotia, where Orpheus went to call up the ghost of Eurydice. Some say that he was killed by a thunder-bolt. He was buried at Pieria, in Macedonia, according to Apollodorus. The inhabitants of Dion boasted that his tomb was in their city, and the people of Mount Libethrus in Thrace claimed the same honor; and reported that the nightingales, which built their nests near his tomb, sang with greater melody than all other birds. Orpheus, after death, received divine honors; the muses gave an honorable burial to his remains, and his lyre became one of the constellations. Tzetzes explains the fable of his drawing his wife Eurydice from hell, by his great skill in medicine, with which he prolonged her life, and thus snatched her from the grave. With respect to the writings of Orpheus, he is mentioned by Pindar as author of the Argonautics, and Herodotus speaks of his Orphics. His hymns, says Pausanias, were very short, and but few in number. Those poems that bear his name, many of which are known to be the work of others, were published at Nuremberg in 1702, and reprinted at Leipsic, in 1764, under the title of *OPHIOE ADIANTA*.

ORPHEUS, in ichthyology, the name of a fish caught in the Archipelago. It is of a broad and flat figure, and of a fine purple color; its eyes are large and prominent; and its teeth serrated; it has only one fin on the back, and the anterior rays of that are prickly, the others soft to the touch; its anus is small, and is said to have no passage for the semen. This was the fish called orpheus by the ancients, but the modern Greek call another fish by that name. It is a species of the sparus, of a flat figure, but very thick, has

a small mouth, and is covered with small but very rough scales, which adhere very firmly to the flesh; the tail is not forked; it has fleshy lips, and very small teeth; its back and sides are black; its belly white; it has a large black spot at the root of the tail; its head is reddish, and its fins are very elegantly diversified with various colors: it has only one back fin, and that has the anterior ray prickly, the hinder ones not at all so. It grows sometimes to twenty pounds weight, and is much esteemed among the modern Greeks.

ORPIMENT, *n. s.* Fr. *orpiment*; Lat. *auripigmentum*. A gold-colored fossil, defined in the extracts.

For the golden color, it may be made by some small mixture of *orpiment*, such as they use to brass in the yellow alchemy; it will easily recover that which the iron loseth.

Bacon.

True and genuine *orpiment* is a foliaceous fossil, of a fine and pure texture, remarkably heavy, and its colour is a bright and beautiful yellow, like that of gold. It is not hard, but very tough, easily bending without breaking. *Orpiment* has been supposed to contain gold, and is found in mines of gold, silver, and copper, and sometimes in the strata of marl.

Hill.

ORPIMENT, in natural history, a mineral composed of sulphur and arsenic, sometimes artificially produced, but found also native, and constituting one of the ores of arsenic. It is of two kinds, red and yellow, the former called realgar. It is commonly found in shapeless masses, very seldom crystallised; though baron Borne once found it in a polyhedral form on a blue clay in Hungary. The red orpiment is a very beautiful substance of a fine bright red, very glossy, and a little transparent, and is found in the Turkish dominions, in the islands of the Archipelago, and even in our own country, Dr. Hill having received some of it from Cornwall, under the name of red mundic. The yellow kind contains about one-tenth of its weight of sulphur. It is the common orpiment of the shops. Some think that the noxious qualities of the arsenic are so much counteracted by the sulphur with which this substance is mixed, that it may be swallowed with safety; but Macquer positively asserts the contrary, and cautions against its use, even though we be certain that the orpiment is native. There is, besides, a broad-flaked, gold-colored kind, well-known among the ancients, as is plain from the description of it left by Dioscorides, and still much esteemed by our painters. It is found in the islands of the Archipelago, in the mines of Gosselaer, in Saxony, in some parts of Turkey, and the East Indies, and in its utmost purity about Smyrna. It makes the finest of all yellows in painting. The small flaked, yellow kind, which is the common orpiment of the shops, is also a fine color, though greatly inferior to the former.

ORPINE, *n. s.* Fr. *orpin*. A plant. The sedum telephium of Linnæus.

Cool violets and *orpine* growing still,
Embathed balm and cheerful galingale.

Spenser.

ORPINE, in botany. See SEDUM.

ORRERY. The employment of planetary machines to illustrate and explain the motions of the heavenly bodies appears to have been coeval with the construction of clepsydræ and other horological automata, as nearly all the early water-clocks, of a complex character, represented the motions of the starry sphere, and in this respect the ancients were more successful than the mechanics of the present day. But the splendid graphic delineations furnished by the modern astronomer were wanting, and for these we are mainly indebted to the labors of Walker and Bartlet. The eidouranion is indeed a mimic representation of the vast system of which our earth forms so insignificant a part. It may, however, be advisable to commence our notice of this useful apparatus for popular instruction, by examining some of the best early planetary machines.

Ptolemy, who died about 140 years after the commencement of the Christian era, devised the circles and epicycles that distinguish his system, in order to account for the apparent irregularities of the planetary motions; and, though he probably could not construct a machine to represent these motions exactly, yet, in his *Almagest*, he described a sphere, furnished with the constellations, to which he could refer the apparent paths of the heavenly bodies, and by which he could explain his system.

From the time of Ptolemy to the sixteenth century, in which Copernicus revived the system of Philolaus, or, as is generally said, of Pythagoras, the machines which were constructed represented the Ptolemaic system, which, like the Egyptian, placed the earth in the centre, but supposed the moon and planets all separately revolving round it every day, whilst they slowly performed periodic cycles and epicycles, to account for the stationary and retrograde appearances, that could not otherwise be explained. The most ancient machine of which we have met with any account during this period is that of Chromatius, the governor of Rome, in the third century, which is mentioned in the first volume of Beckmann's *History of Inventions and Discoveries*. According to the accounts of St. Sebastian and Polycarp, this costly piece of mechanism consisted of a pavilion of glass, in the construction of which were consumed 200 lbs. weight of gold, as materials for the workmanship, and all the heavenly bodies were represented by mechanism, together with the phases of the moon; there also appears to have been an ecliptic circle divided into signs. But, whatever might be the particular construction of this machine, it was entirely destroyed, on account of some imaginary impiety attached to such a representation of the heavens.

The planetary clock invented by the celebrated mathematician Finee was begun in 1553, and made during the space of seven years by the best workmen that could be found. The interior shape of this machine is represented as a pentagonal column seventeen inches in diameter, and six feet high, surmounted by a brass celestial globe of seven inches diameter, which contains forty-eight constellations, and which revolves once in every twenty-four hours from east to

west. The interior part of this pillar contains upwards of 100 wheels to give the respective motions to the sun, moon, and planets, actuated by clock-work, and the whole kept in their respective motions by a weight suspended within the pillar, the fall of which is one foot per day, and the motions continue forty-eight hours and upwards. The movement of each planet consists of twelve, ten, or eight wheels, as the necessary accuracy requires, and they are all made of steel, and actuated by one common arbour. The description of this elaborate instrument is contained in a printed description preserved in the Royal Library, Paris, in which it is said that the increase and decrease of velocity is affected by the interior mechanism; and the motions of the heavenly bodies are represented, together with the eccentricities and motions of the apogees, nodes, and latitudes of each. The five plain sides of the pentagonal column have each a brass face of two feet in length, and ten inches in breadth, in each of which are two circles, the upper and the lower, except in that containing the places of the sun and moon, which has three circles; and hands or pointers are made to indicate the different motions on the respective dials or circles which are appropriated according to the subjoined arrangement, viz.

Face 1st. The motion of Saturn above, and of Jupiter below.

2nd. The motion of Mars above, and of Mercury below.

3rd. The motion of Venus above, and of the sun below.

4th. The motion of the moon above, and of the moon's nodes below.

5th. The hours above, and astrolabe below; and in the middle the conjunctions, opposition, eclipses, &c., of the sun and moon.

The wheel work and other mechanical parts of the instrument are not contained in Berthoud's extract, whence this detail is abridged; but the times of the various revolutions attributed to the movements, and also to the celestial bodies themselves, which are said to be represented to a minute in a revolution, are given in the subjoined table.

| Planets. | Whole periods. | Motion in twenty-four hours. |
|-------------|----------------|------------------------------|
| | d. h. m. s. | |
| Mercury . | 87 23 15 36 | 0 59 8 |
| Venus . . | 224 17 53 2 | 0 59 8 |
| Sun . . . | 365 5 48 15 | 0 59 8 |
| Mars . . . | 688 23 31 56 | 0 31 26 |
| Jupiter . . | 4332 14 49 31 | 0 4 59 |
| Saturn . . | 10759 4 58 25 | 0 2 1 |
| Moon . . . | 27 13 18 35 | 13 3 54 |
| Do. synodic | 29 12 44 3 | 13 8 35 |
| Do. nodes . | 19 years. | |

This machine does not exhibit to the eye the representatives of the planets in their orders and distances, but only indicates on their different faces the periods of their sidereal revolutions; the earth is considered by the inventor as the centre of the orbits of the Moon, Sun, Mars,

Jupiter, and Saturn, the three last of which are made to move in the Ptolemaic epicycles, but the sun is made the centre of the orbits of Mercury and Venus, according to the Egyptian system, which is the reason why the daily progress in the ecliptic is put down for these three alike. It is somewhat remarkable that this arrangement is not according to the Copernican system, though Copernicus had published his book called the *Revolutions of the Celestial Orbs*, which laid the foundation of his system, twelve years before; hence we must suppose, either that the book had not found its way from Prussia into France at that time, or else that the system at first met with opposition. Thus a union of the Ptolemaic with the old Egyptian system became the favorite of the astronomer before us, and three years afterwards he published a book in defence of this theory.

The next machine we meet with is the planetarium of P. Schirleus de Rheita described in the *Technica Curiosa* of Schott, and made about the year 1650. This machine is said to have represented all the true and mean motions of the planets, their stations, and direct and retrograde appearances, without epicycles or equations, and with very few wheels by the help of endless screws and pulleys. The movements were actuated by water, and on the exterior part of the instrument were three separate faces, or dials, described into a number of circles for the orbits of the planets and signs of the zodiac; the lowest face contained the circles of the Sun, Venus, and Mercury, which were denominated the inferior planets, and their respective hands or arms; the uppermost face had the circle of Saturn, Jupiter, and Mars, with their respective hands; and the face in the middle had twelve hours, and also a circle for the moon. The first wheel, which gave motion to all the rest, was carried round by a fall of water once in a minute, on the arbor of which was a single endless screw which drove a wheel of fifteen teeth round in as many minutes; on the arbor of this was another screw driving another wheel of twenty-four round in six hours; again, on the arbor of the wheel of twenty-four was another screw, making a wheel of twenty teeth revolve in five days: and, lastly, a screw on the arbor of the last mentioned wheel of twenty impelled a wheel of seventy-three once round in exactly 365 days, which represented the annual motion of the sun in his supposed orbit round the earth. The last screw also drove a wheel of forty-five teeth round in 255 days, which, by the help of two equal pulleys, carried Venus round the sun in this period; and in like manner, it is said, motions were produced in the rest of the planets; but the numbers of the other wheels are not given by Berthoud. Alexander, in his *Traité des Horloges*, thus describes the mechanism: 'This machine,' says he, 'cannot be of great utility, nor will it represent the motions of the planets with sufficient accuracy.'

1. 'The first wheel which moves all the rest is carried round by a fall of water which cannot have the requisite regularity.'

2. 'The movement is not regulated by a balance, pendulum, or fly.'

3. 'The motion of the sun completes the year

in exactly 365 days, which makes an error of twenty-five days in a century.'

4. 'The discs of the planets are made much too large in proportion to the sun.'

The last of these observations must necessarily constitute an objection in every instrument, where the ball for the sun is not made inconveniently bulky.

Passemant's planetary apparatus possessed considerable merit. It is thus described by Berthoud:—The clock is surmounted by a sphere, which it puts in motion according to the Copernican system. It was presented to the Academy of Sciences on the 23d of August 1749, by M. Passemant, the author of the calculations of the sphere. The gentlemen of the Academy, from the report of Messrs. Camus and Deparcieux, the committee named for the examination of this clock, certified that the revolutions of the planets were exact in it; as they did not find a degree of difference from the astronomical tables in more than 3000 years. Dauthiau, the clock maker who constructed this machine, employed twelve years upon it. It was presented to the king at Choisy, on the 7th of September 1750. His majesty testified his approval of it, and ordered a new case to be made for it after a design of his own choice. It is now at Versailles.

The sphere represents from day to day the different motions of the planets round the sun, viz. of Saturn, Jupiter, and Mars, the Earth, Moon, Venus, and Mercury, also their places in the zodiac, their configurations, stations, and apparent retrogradations with respect to the earth. Upon every circle which carries the orb of a planet is engraven the time of its revolution round the sun. The earth, during its annual revolution, makes its movement of parallelism, and the spectator views the sun passing through the signs and degrees of the zodiac; also through the months and their lesser divisions of time, indicating the seasons, the equinoxes, and solstices; besides it makes a rotation in twenty-four hours, being divided by twenty-four meridian lines: it has likewise a map of the principal places of the globe; so that the rising, setting, and meridian passage of the sun, together with its different elevations, and the continuance of day and night, may be seen for every principal place. The moon finishes her revolution round the earth in 29d. 12h. 44mi. 3sec., during which time are indicated her age and different phases; her progress through the signs of the zodiac; her nodes, her eclipses, and those of the sun with precision, viz. their place, size, and duration; besides the various altitudes, the time of rising, setting, and southing.

The clock beats seconds, which are indicated in the centre of the dial-face by a dead-beat escapement of a particular construction. This clock effects the equation by itself, by showing both apparent and mean time; it strikes the hours and the quarters of solar time, which it will repeat at pleasure. The movement of the striking part is by a spring, fusee, and chain; that of the clock by a weight of twenty pounds doubly suspended, which has a descent of eight inches in six weeks, and the going is not interrupted by winding up the weight. The pendulum rod consists

of bars of steel and brass, adjusted so as to keep the metallic ball always at the same distance from the point of suspension by the difference of their expansions; and by this difference a hand is made to point out the variation of temperature on a divided circle on the top of the rod, which forms a natural thermometer by the sole actions of metals.

On the front of the clock, over the face, is a planisphere marking the age and phases of the moon; in which are besides the day of the week, the names and days of the month and year; and though some months have twenty-eight, thirty, and thirty-one days each, yet the clock makes February to have twenty-nine days every fourth year for bissextile. The mechanism for showing the days of the year will point them out for 10,000 years by means of four indexes, revolving respectively in ten, 100, 1000, and 10,000 years. In this clock and sphere are three contrivances for disengagement: the first for the escapement, the second for the sphere to be detached from the clock work to move by a handle; and the third for detaching the diurnal motion of the earth; and the planets may have a quick motion by means of a corresponding handle. Thus the different portions may be disengaged from each other to make the necessary rectifications. The number of wheels and pinions employed in this mechanism amounts to sixty, some of which are in the interior part of it; the diameter of the sphere is one foot, and is surrounded by a cover of glass; the case of the clock is gilt with four faces, having glass covers neatly designed, well finished, and so exposed to view that all the mechanism may be seen. The whole height from the top of the sphere is seven feet. According to the report of Antide Janvier, who was employed to repair this instrument previously to its being placed in the gallery of the thuileries at Paris, the following are the numbers of the wheels and pinions, which are put down according to his method of noting them, and also their respective values in time.

The periodic revolution of the moon from a motion of forty-eight hours.

Pinions, $72 \cdot 25 \cdot 20 \cdot 41 \cdot 20$
Wheels, $75 \cdot 54 \cdot 44 \cdot 31 \cdot 73$ } = 27d. 7h. 43' 4". 58"

Revolution of Mercury from a motion of twenty-seven days seven hours, &c.

Pinions $31 \cdot 85$ } = 87d. 23h. 14' 15" 56"
Wheels $84 \cdot 101$ }

Annual revolution of the Earth from a motion of eighty-seven days twenty-three hours, &c.

Pinions $8 \cdot 35 \cdot 83$ } = 365d. 5h. 48' 58". 3"
Wheels $43 \cdot 44 \cdot 51$ }

Revolution of Venus from a motion of 365 days five hours forty-eight minutes, &c.

Pinions $53 \cdot 76$ } = 224d. 16h. 40' 30"
Wheels $42 \cdot 59$ }

Revolution of Mars from a motion of 365 days five hours forty-eight minutes, &c.

Pinions $53 \cdot 75$ } = 1y. 321d. 16h. 32' 11"
Wheels $84 \cdot 89$ }

Revolution of Jupiter from a motion of 365 days five hours forty-eight minutes, &c.

Pinions $9 \cdot 45$ } = 11y. 312d. 22h. 28' 0"
Wheels $49 \cdot 98$ }

Revolution of Saturn from a motion of 365 days five hours forty-eight minutes, &c.

Pinions $7 \cdot 40$ } = 29y. 156d. 12h. 46' 40"
Wheels $80 \cdot 103$ }

Revolution of the Moon, with respect to the nodes, from a motion of twenty-nine days twelve hours forty-four minutes three seconds.

Pinions $50 \cdot 67$ } = 27d. 5h. 5' 36"
Wheels $49 \cdot 63$ }

'It may be asked,' says Janvier, in a note to his report, 'where is the revolution of twenty-nine days twelve hours forty-four minutes three seconds which gives motion to this last movement, it being not contained in the preceding statement; but we have seen the periodic revolution, which consists of the time which the moon goes round the heavens; that interval, we know, is shorter than a synodic revolution; but this (synodic) revolution has no real existence, but by means of the earth's change of situation, whose orbit carries a wheel immoveably fixed at the centre of the moon's orbit, round which the moon revolves really in twenty-nine days twelve hours forty-four minutes three seconds; it is this wheel, then, which gives motion to the wheel-work which represent the eclipses with great accuracy. The last wheel of this movement carries a small dial plate, on which the moon shows her position with respect to her node; this dial carries besides an eccentric piece, which marks the moon's place below and above the plane of the ecliptic within the limits of her greatest latitude.'

The artificial globe serves as a useful instrument for determining, in a rough manner, without calculation, the arrangement of the heavenly bodies at particular times; their places being first ascertained from tables, or, in the case of the sun, merely from a scale of the globe's horizon, or on its surface. We have only to adjust the elevation of the pole of the globe in such a manner that its axis may form the same angle with its horizon, as the axis of the earth does with the real horizon of the place; then, finding a point on its surface corresponding to the place of the sun or planet, we may represent its apparent motion by the motion of this point, and the time occupied by that motion will be shown by the index of the globe: thus we may find the length of the day and night, and the time and place of rising and setting, and, by means of a graduated circle perpendicular to the horizon, we may measure the altitude of the sun or planet at any other time, and also its azimuth or the distance of this circle from the north or south point of the horizon. If we have a ring of any kind parallel to the horizon, and 33' below it, we may consider this ring as the apparent horizon, allowing for the effects of refraction; if it be still 15' or 16' lower, it will represent the rising or setting of the extreme margin of the sun or moon. We might also have a circle about 1° above either of these which might represent the sensible apparent horizon with regard to the moon, including the correction for her parallax; and a similar ring, placed still lower, would show the duration of twilight, or any supposition that might be formed respecting the depression of the sun required for producing total darkness. By means of the celestial globe the apparent motions of the fixed stars may be represented in a manner nearly similar, proper

Fig. 2.

Fig. 1.

attention being paid to the situation of the sun in the ecliptic, as determining the corresponding time.

Many of these operations may also be performed with equal convenience with a planisphere, which is a stereographical projection of the globe on a plane surface. Professor Bode's planisphere comprehends in one view all the stars that are ever visible at Berlin: he has added to it a moveable circle, representing the horizon of that place, carrying with it the circles of altitude and azimuth, delineated on a transparent paper, which is adjusted, by graduations at the margin of the chart, to the day and hour for which he wished to ascertain the apparent place of the heavenly bodies. Any other chart of the stars, having the pole in its centre, may be applied to a similar use by cutting out a circle, or part of a circle, to represent the horizon of a place of which the latitude is given; and, if the stars are projected as is usual on two equal charts, they must have two equal arcs to represent the respective parts of the horizon belonging to them.

The common orrery or planetarium is represented at fig. 1, plate ORRERY. A brass frame *a b c d* is so contrived as to contain twelve wheels and pinions, actuating one another respectively on such a way as to produce the mean motions of the six primary planets, that have been long discovered, of which our earth is one. *A B* is a revolving arbor, pivotted into holes made in the upper and lower parts of the frame, and is made to revolve by means of an endless screw, acting with the lowest wheel of 83 teeth, which is made fast to it, as are also the five other wheels

and pinions with the number of teeth specified in the figure. *C D* is an upright stem of steel wire, screwed fast into the lower plate at *C*, and ascending through a large hole made in the upper plate, which it does not fill. The six wheels revolving round this stem have each a separate tube, to the inferior end of which they are respectively attached; and the tubes are so contrived that the exterior surface of the innermost forms a stem for the bore of the next largest, till all the six are fitted one within another round the stem of steel, which keeps them in a vertical position while they revolve separately with different velocities. The arbor *A B*, which receives its motion from the handle by the medium of the endless screw, is assumed as revolving in a year which may be either civil, sidereal, or tropical; but, whichever be the period assumed, the pairs of wheels that act together respectively will be so many fractions of that period. Thus, the lowest wheel of 83 teeth, on the annual arbor, will drive its fellow 20 with its tube, round in $\frac{20}{83}$ of a year, and the little arm that is fixed by friction on its superior end will perform a revolution round the sun in the same time. In like manner, the period of Venus will be performed in $\frac{8}{13}$ of the year; the earth in $\frac{11}{12}$ or one year; Mars in $\frac{2}{3}$; Jupiter in $\frac{1}{4}$; and Saturn in $\frac{1}{7}$; the driving wheels being the denominators of the fraction, and the driven ones the numerators, agreeably to our directions given under the article PLANETARY NUMBERS, for computing the value of wheel-work acting in this simple manner.

If we assume an exact solar year as the period of the first moving or driving wheels, then the fraction will produce the period subjoined, viz.

| | d. | h. | m. | s. |
|---|-------|----|----|----|
| Mercury will revolve $\frac{88}{265,342}$ of &c. or | 88 | 0 | 14 | 24 |
| Venus | 224 | 18 | 20 | 9 |
| Earth | 365 | 5 | 48 | 48 |
| Mars | 684 | 19 | 52 | 19 |
| Jupiter | 4330 | 17 | 30 | 3 |
| Saturn | 10738 | 2 | 54 | 43 |

If these periods be compared with the true periods, given under PLANETARY NUMBERS, it will be seen that the mean motions produced by this simple mechanism are far from being accurate; and the errors, by continual accumulation, will become sensible in a comparatively short space of time but where general representation only is aimed at, and the respective times of the phenomena exhibited by the planetarium are disregarded, this is the cheapest and simplest construction of a planetary machine that has yet been devised; and, where its imperfection can be dispensed with, its simplicity is no small recommendation. Still, however, the true places of the planets, depending on the equator as well as mean motions of these bodies, are not the places indicated by this planetarium, supposing its mean motions ever so accurate; nor are the motions of the five recently discovered planets attempted to be exhibited, which they might be by additional wheel-work, without altering the construction of the machine. For the use of those who are satisfied with the representation of mean motions only, we beg leave to suggest the numbers suitable for wheels that will produce the

revolutions of these five diminutive bodies also.

Let $\frac{88}{265,342}$ be taken for Vesta, $\frac{11}{12}$ for Juno, and $\frac{2}{3}$ for both Ceres and Pallas, with one tube only for these two pairs; and these wheels, acting in the same way that has been describing, will give the mean revolutions with as much accuracy as the present state of our knowledge of the motions of these little bodies will allow. The planet Herschel would require $\frac{1}{4}$ for its long period, which numbers are impracticable in a small machine; but for this planet a train might be substituted, such as will be described as forming a part of the following machine. When a planetarium of this common construction is fitted up, its appendages are usually alunarium and tellurium, separately adapted to the same stand, but in those the annual and lunar trains are never free from considerable errors.

The late Mr. Ferguson's ingenious orrery may be thus described:—

This machine shows the motions of the Sun, Mercury, Venus, Earth, and Moon; and occasionally the superior planets, Mars, Jupiter, and Saturn, may be put on; Jupiter's four satellites are moved round him in their proper times by a

small winch; and Saturn has his five satellites, and the ring which keeps its parallelism round the Sun.

In the centre, fig. 2, No. 1 represents the Sun, supported by its axis inclining almost 8° from the axis of the ecliptic; and turning round in twenty-five days and a quarter on its axis, of which the north-pole inclines towards the 8° of Pisces in the great ecliptic (No. 11), whereon the months and days are engraven over the signs and degrees in which the sun appears, as seen from the earth, on the different days of the year.

The nearest planet (No. 2) to the sun is Mercury, which goes round him in eighty-seven days twenty-three hours, or $87\frac{3}{4}$ diurnal rotations of the earth; but has no motion round its axis in the machine, because the time of its diurnal motion in the heavens is not known to us.

The next planet in order is Venus (No. 3), which performs her annual course in 224 days seventeen hours; and turns round her axis in twenty-four days eight hours, or in twenty-four and one-third diurnal rotations of the earth. Her axis inclines 75° from the axis of the ecliptic, and her north-pole inclines towards 20° of Aquarius, according to the observations of Bianchini.

Next without the orbit of Venus is the earth (No. 4), which turns round its axis, to any fixed point at a great distance, in twenty-three hours fifty-six minutes four seconds of mean solar time, but from the sun to the sun again in twenty-four hours of the same time. No. 6 is a sidereal dial-plate under the earth; and No. 7 a solar dial-plate on the cover of the machine. The index of the former shows sidereal, and of the latter solar time; and hence the former index gains one entire revolution on the latter every year, as 365 solar or natural days contain 366 sidereal days, or apparent revolutions of the stars. In the time that the earth makes $365\frac{1}{4}$ diurnal rotations on its axis, it goes once round the sun in the plane of the ecliptic, and always keeps opposite to a moving index (No. 10), which shows the sun's apparent daily change of place, and also the days of the months.

The earth is half covered with a black cap, for dividing the apparently enlightened half next the sun from the other half, which, when turned away from him, is in the dark. The edge of the cap represents the circle bounding light and darkness, and shows at what time the sun rises and sets to all places throughout the year. The earth's axis inclines $23\frac{1}{2}^\circ$ from the axis of the ecliptic; the north-pole inclines towards the beginning of Cancer, and keeps its parallelism throughout its annual course; so that in summer the northern parts of the earth incline towards the sun, and in winter from him: by which means the different lengths of days and nights, and the cause of the various seasons, are demonstrated to the sight.

There is a broad horizon, to the upper side of which is fixed a meridian semicircle in the north and south points, graduated on both sides from the horizon to 90° in the zenith, or vertical point. The edge of the horizon is graduated from the east and west to the south and north points, and

within these divisions are the points of the compass. From the lower side of this thin horizon-plate stand out four small wires, to which is fixed a twilight circle 16° from the graduated side of the horizon all round. This horizon may be put upon the earth (when the cap is taken away), and rectified to the latitude of any place: and then, by a small wire, called the solar ray, which may be put on so as to proceed directly from the sun's centre towards the earth's, but to come no farther than almost to touch the horizon, the beginning of twilight, time of sun-rising, with its amplitude, meridian altitude, time of setting, amplitude then, and end of twilight, are shown for every day of the year at that place to which the horizon is rectified.

The moon (No. 5) goes round the earth, from between it and any fixed point at a great distance, in twenty-seven days seven hours forty-three minutes, or through all the signs and degrees of her orbit, which is called her periodical revolution; but she goes round from the sun to the sun again, or from change to change, in twenty-nine days twelve hours forty-five minutes, which is her synodical revolution; and in that time she exhibits all the phases already described.

When the above-mentioned horizon is rectified to the latitude of any given place, the times of the moon's rising and setting, together with her amplitude, are shown to that place, as well as the sun's; and all the various phenomena of the harvest moon are made obvious to sight.

The moon's orbit (No. 9) is inclined to the ecliptic (No. 11), one-half being above and the other below it. The nodes or points at 0 and O lie in the plane of the ecliptic, and shift backward through all its signs and degrees in eighteen years and two-thirds. The degrees of the moon's latitude, to the highest at N L, north latitude, and the lowest at S L, south latitude, are engraven both ways from her nodes at O and O; and, as the moon rises and falls in her orbit according to its inclination, her latitude and distance from her nodes are shown for every day; having first rectified her orbit, so as to set the nodes to their proper places in the ecliptic, and then, as they come about at different, and almost opposite times of the year, and point twice towards the sun, all the eclipses may be shown for hundreds of years (without any new rectification), by turning the machinery backward for time past, or forward for time to come. At 17° distance from each node, on both sides, is engraved a small sun, and at 12° distance a small moon, which show the limits of solar and lunar eclipses; and when, at any change, the moon falls between either of these suns and the node, the sun will be eclipsed on the day pointed to by the annual index, and, as the moon has then north or south latitude, one may easily judge whether that eclipse will be visible in the northern or southern hemisphere, especially as the earth's axis inclines towards the sun, or from him at that time. And when, at any full, the moon falls between either of the little moons and node, she will be eclipsed, and the annual index shows the day of that eclipse. There is a circle of twenty-nine and a half equal parts, on the cover of the machine, on which an index shows the days of the moon's age.

A semi-ellipsis and semi-circle are fixed to an elliptical ring, which, being put like a cap upon the earth, and the forked part F upon the moon, shows the tides as the earth turns round within them, and they are led round it by the moon. When the different places come to the semi-ellipsis, A a E b B, they have tides of flood; and when they come to the semicircle, C E D, they have the tides of ebb; the index on the hour-circle (No. 7) showing the times of these phenomena.

There is a jointed wire, of which one end being put into a hole in the upright stem that holds the earth's cap, and the wire laid into a small forked piece which may be occasionally put upon Venus or Mercury, shows the direct and retrograde motions of these two planets, with their stationary times and places, as seen from the earth.

The whole machinery is turned by a winch or handle (No. 12), and is so easily moved that a clock might turn it without any danger of stopping.

To furnish a plate of the wheel-work of this machine would answer no purpose, because many of the wheels lie so behind others as to hide them from sight in any view whatsoever.

Simple as this apparatus may at first view appear, it is sufficiently accurate for furnishing a general notion of the arrangement of the planetary bodies and the phenomena of the seasons. It may be proper to add, that the vertical orreries of Bartlet and Walker are constructed on nearly similar principles.

OR'RIS, *n. s.* Lat. *orris*. A plant.

OR'ris, *n. s.* Fr. *orris*; Lat. *aureus*. A kind of gold lace.

ORSI (Francis Joseph), a learned cardinal, born in Tuscany, and raised to the purple by Clement XIII. He wrote an Ecclesiastical History, in 20 vols. 4to.

Orar (John Joseph), an ingenious philologer and poet, born at Bologna in 1652. He studied polite literature, philosophy, the civil law, and mathematics. His house was a kind of academy, where many persons of literature regularly assembled. He wrote many ingenious sonnets, pastorals, and other works, in Italian, and died in 1733.

ORSKAIA, a town of Asiatic Russia, in the government of Orenbourg, on the side on which the town of Orenbourg was originally built. It is distinguished by two forts of earth, near the Or, one of which is built upon a rock of jasper, of fine quality. A number of indifferent houses are built round the forts. The Asiatic caravans usually pass the Oural in their way to Orenbourg, near this place. 132 miles east of Orenbourg.

ORT, *n. s.* Scot. *ort*. Plural ORTS, in which form it chiefly occurs. According to Skinner, from Germ. *ort*, the fourth part; to Mr. Lye, from Irish *orda*, a fragment. Dr. Johnson adds, 'In Anglo-Saxon *ord* signifies the beginning; whence in some provinces odds and ends, for ords and ends, signify remnants, scattered pieces, refuse; from *ord* thus used probably came *ort*. Mr. Thomson refers us with yet greater probability to the Sax. *oþer æts*, over feedings. Waste food; refuse; something left or thrown away.

He must be taught and trained, and bid go forth;
A barren-spirited fellow, one that feeds
On abject *orts* and imitations. *Shakspeare.*

The fractions of her faith, *orts* of her love,
The fragments, scraps, the bits, and greasy reliques
Of her o'er-eaten faith, are bound to Diomedes. *Id.*

Much good do't you then;
Brave plush and velvet men
Can feed on *orts*, and safe in your stage-cloths,
Dare quit, upon your oaths,
The staggers, and the stage-wrights too.

Ben Jonson.

Like lavish ancestors, his earlier years
Have disinherited his future hours,
Which starve on *orts*, and glean their former field.

Young.

ORTEGIA, a genus of plants of the class triandria, and order monogynia; natural order twenty-second, caryophylleæ.

ORTELUS (Abraham), a celebrated geographer, born at Antwerp, in 1527. He was well skilled in languages and mathematics, and acquired such reputation by his skill in geography that he was called the Ptolemy of his time. He resided at Oxford in the reign of Edward VI., and came a second time into England in 1577. He was the author of several excellent astronomical and geographical works. He died at Antwerp in 1598.

ORTHITE, from Gr. *opθos*, right, is the name of a mineral so called because it always occurs in straight layers, generally in felspar. It resembles gadolinite, and, according to the analysis of Berzelius, consists of peroxide of cerium 19.5, protoxide of iron 12.44, protoxide of manganese 3.44, yttria 3.44, silica 32.0, alumina 14.8, lime 7.84, water 5.36. It is found in the mine of Finbo, in the vicinity of Fahlum in Sweden. The mine is situated in a vein of granite which traverses gneiss.

ORTHODOX, *adj.*

ORTHODOXAL,

ORTHODOXY, *n. s.*

Gr. *opθos*, and } *doxeo*, to think.
} Sound or right in
opinion: applied sometimes collectively to parties. Supposed to be so as in the phrase 'the orthodox': orthodoxy is soundness of doctrine or opinion.

Be you persuaded and settled in the new protestant religion professed by the church of England, which is as sound and orthodox in the doctrine thereof as any Christian church in the world.

Bacon.

The doctrine of the church of England, expressed in the thirty-nine articles, is so soundly, and so orthodoxly settled, as cannot be questioned without extreme danger to the honour of our religion. *Id.*

Eternal bliss is not immediately superstructed on the most orthodox belief; but, as our Saviour saith, If ye know these things, happy are ye if ye do them; the doing must be first superstructed on the knowing or believing, before any happiness can be built on it.

Hammond.

Origen and the two Clemens's, their works were originally *orthodox*, but had been afterwards corrupted, and interpolated by heretics in some parts of them.

Waterland.

Basil himself bears full and clear testimony to Gregory's *orthodoxy*. *Id.*

An uniform profession of one and the same *orthodox* verity, which was once given to the saints in the holy Apostles' days.

White.

I do not attempt explaining the mysteries of the Christian religion; since Providence intended there should be mysteries, it cannot be agreeable to piety, *orthodoxy*, or good sense, to go about it. *Swift*.

ORTHODROMICKS, *n. s.* } From *ορθος*
ORTHODROMY, *n. s.* } and *δρομος*.

The art of sailing in the arc of some great circle, which is the shortest or straightest distance between any two points on the surface of the globe.

ORTHOGON, *n. s.* } Gr. *ορθος* and *γωνια*,
ORTHOGONAL. } an angle. A right-angled figure; rectangular.

The square will make you ready for all manner of compartments; your cylinder for vaulted turrets and round buildings; your *orthogon* and pyramid, for sharp steeples. *Peacham*.

ORTHOGRAPHER, *n. s.* }

ORTHOGRAPHICAL, *adj.* }

ORTHOGRAPHICALLY, *adv.* }

ORTHOGRAPHY, *n. s.* }

French *orthographe*; Greek *ορθος* and *γραφο*, to write, or delineate. One who writes or spells a word correctly: orthographical is, rightly spelled: orthography, that part of grammar which teaches to spell words correctly; the practice of so doing; also the delineation of a building, particularly its elevation.

He was wont to speak plain, like an honest man and a soldier; and now he is turned *orthographer*, his words are just so many strange dishes. *Shakespeare*.

This would render languages much more easy to be learned, as to reading and pronouncing, and especially as to the writing them, which now as they stand we find to be troublesome, and it is no small part of grammar which treats of *orthography* and right pronunciation. *Holder*.

I received from him the following letter, which, after having rectified some little *orthographical* mistakes, I shall make a present of to the public. *Addison's Spectator*.

In the *orthographical* schemes there should be a true delineation and the just dimensions of each face, and of what belongs to it. *Mortimer*.

You have the *orthography* or upright of this ground plot, and the explanation with a scale of feet and inches. *Maron*.

In London they clip their words after one manner about the court, another in the city, and a third in the suburbs; all which, reduced to writing, would entirely confound *orthography*. *Swift*.

ORTHOGRAPHICAL PROJECTION OF THE SPHERE, that wherein the eye is supposed to be at an infinite distance; so called, because the perpendiculars from any point of the sphere will all fall in the common intersection of the sphere with the plane of the projection. See *GEOGRAPHY* and *MAPS*.

ORTHOGRAPHY is that part of grammar which teaches the nature of letters, and is one of the four great divisions of grammar. See *GRAMMAR*.

ORTHOGRAPHY, in geometry, the art of drawing or delineating the fore right plan of any object, and of expressing the heights or elevations of each part. It is called orthography on account of its determining objects by perpendicular lines falling on the geometrical plane.

ORTHO'PNOEA, *n. s.* Gr. *ορθοπνοια*; Fr. *orthopnie*. A disorder of the lungs, in which

respiration can be performed only in an upright posture.

His disease was an asthma oft turning to an *orthopnea*; the cause a translation of tartarous humours from his joints to his lungs. *Harvey*.

ORTHOPNOEA is a species of asthma, where there is such a difficulty of respiration that the patient is obliged to sit or stand upright in order to be able to breathe. See *MEDICINE*.

ORTHUS, in mythology, a dog which had two heads. He was the son of Typhon and Echidna, and the brother of Cerberus and the Hydra. He was kept by Geryon, and killed by Hercules.

ORTIVE, in astronomy, is the same with eastern. The ortive or eastern amplitude is an arch of the horizon intercepted between the place where a star rises, and the east point of the horizon, or point where the horizon and equator intersect.

ORTOLAN, *n. s.* Fr. *ortolan*; Ital. *hortolano*; from Lat. *hortus*. A very delicate and scarce little bird.

Nor ortolans nor godwits.

Cowley.

ORTOLAN. See *EMBERIZA*.

ORTON (Job), a celebrated nonconformist, was born at Shrewsbury in 1717. He was educated at the free-school of his native place, and under Dr. Doddridge, whose assistant he afterwards became. In 1741 he became minister of the Independent congregation at Shrewsbury; but in 1765, his health being in a delicate state, he was obliged to desist from preaching. He now fixed his residence at Kidderminster, and passed his time in various literary occupations until his death in 1783. Though Mr. Orton received the degree of doctor in divinity several years previous to his death, he never would be addressed by that title. His principal works are *Memoirs of Dr. Doddridge*; *Christian Zeal*, three Discourses; *Discourses on Eternity*; *Religious Exercises*; *Christian Worship*, three Discourses; *Sacramental Meditations*; *Summary of Doctrinal and Practical Religion*; *Exposition of the Old Testament*; *Discourses to the Aged*; *Letters to a young Clergyman*, &c.

ORTON, a market town of Westmoreland, eight miles S.S.W. of Appleby, and 276 from London. Its church is an extensive ancient building, with an old tower steeple, and there are two free schools in this town. Market day Wednesday.

ORTONA-A-MARE, a town and bishop's see of Naples, in the Abruzzo Citra, situated on a hill on the coast, between the Pescara and Sangro. It has a cathedral, with several other churches and convents, and its environs produce wine. It has a small harbour. Inhabitants 5700. Fifty miles east of Aquila, and 100 north of Naples.

ORTYGLIA, the birth place of Diana, was a beautiful grove of trees of various kinds, chiefly cypresses, near Ephesus. This place was filled with shrines and images. The priests of the goddess were eunuchs, and greatly respected by the people. A general assembly was held there yearly, and splendid entertainments were provided, and mystic sacrifices solemnised. The

Cenchrius ran through it; and above it was the mountain Solmissus. But the birth-place of Diana and its sanctity are now forgotten, and the groves and buildings which adorned it appear no more.

ORTOGIA, an island of Sicily, in the bay of Syracuse, which formed one of the four quarters of that great city. In this island the celebrated fountain Arethusa arose.

ORVIETO, a town in the States of the Church, Italy, situated on a steep hill. It is sixty miles N. N. W. of Rome, at the confluence of the Paglia and Chiana, and is the see of a bishop. The cathedral is a fine Gothic edifice, and contains some good sculptures and paintings. The only public institution worth notice is a college of Jesuits. Inhabitants 7000.

ORVILLE (James Philip), a learned critic, born at Amsterdam, of French parents, in 1696. He travelled into England, France, and Germany; and on his return, in 1730, he was made professor of history, eloquence, and Greek; but resigned in 1742. He wrote several learned dissertations in the *Observationes Miscellanæ*, a work of deep erudition. He died in 1743.

ORURO, a bleak but fertile province of Peru, bounded on the north by the province of Sicasica, east by Cochabamba, south and south-east by Paria, and west and north-west by Pacajes. It is very subject to tempests, and has numerous herds of cattle and Peruvian camels. It formerly had silver mines of considerable value, which are now in a great measure filled with water. In 1796 one individual obtained, we are told, even by the imperfect mode of amalgamation in use, a considerable gain from the residuum thrown away. Population 8000.

ORWELL, a river of England, which rises in the middle of Suffolk, where it is called Gipping; passes by Stow, Needham, and Ipswich, where it is named Ipswich Water, and, uniting with the Stour from Manningtree, forms the fine harbour of Harwich. See HARWICH.

ORYX, in zoology. See CAPRA.

ORYZA, rice, in botany, a genus of the digynia order, and hexandria class of plants, natural order fourth, graminæ: CAL. a bivalved uniflorous glume: COR. bivalved, nearly equal, and adhering to the seed. There is but one species, viz.

O. sativæ, common rice. This plant is greatly cultivated in most of the eastern countries, where it is the chief support of the inhabitants; and great quantities of it are brought into England and other European countries every year, as it is too tender to be produced in these northern countries without the assistance of artificial heat. It grows upon moist soils, where the ground can be flowed over with water after it is come up. So that whoever would cultivate it in this country should sow the seeds upon a hot-bed; and, when the plants are come up, they should be removed into pots filled with light rich earth, and placed in pans of water, which should be plunged into a hot-bed; and, as the water wastes, it must from time to time be renewed. In July these plants may be set abroad in a warm situation, still preserving the water in the pans, otherwise they will not thrive; and, toward the end

of August, they will produce their grain, which will ripen tolerably well, provided the autumn proves favorable. The leaves of rice are long, like the reed, and fleshy; the flowers blow on the top like barley: but the seed which follows is disposed in clusters, each of which is enclosed in a yellow husk, ending in a spiral thread. The seed is oblong, or rather oval, and white. Hasselquist gives the following description of the manner in which the Egyptians dress and separate it from the husks:—'It is pounded by hollow iron pestles of a cylindrical form, lifted up by a wheel worked by oxen. A person sitting between the two pestles pushes forward the rice when the pestles are rising; another sifts, winnows, and lays it under the pestles. In this manner they continue working it until it is entirely free from chaff and husks. When clean they add a thirtieth part of salt, and pound them together; by which the rice, formerly gray, becomes white. After this purification, it is passed through a fine sieve to part the salt from the rice; and then it is ready for sale.' See RICE.

OSACCA, a large city of Japan, and the port town of Meaco. It is situated at the head of a bay of this name, at the mouth of a considerable river, and is one of the most flourishing places in the empire. In the neighbourhood is an earth of a beautiful orange color, which is exported to all parts of Japan, for covering the houses. Twenty-five miles south-west of Meaco.

OSAGE, a river of Louisiana, which joins the Missouri, 133 miles from the Mississippi. It is very crooked, and navigable for boats about 600 miles.

OSBORN (Francis), an eminent English writer in the seventeenth century. He frequented the court, and was master of the horse to William earl of Pembroke. Upon the breaking out of the civil wars, he adhered to the parliament, and had several public employments conferred upon him. In the latter part of his life he lived at Oxford, in order to print several books, and to look after his son, for whom, by the favor of the parliament, he procured a fellowship in All Souls College. His Advice to a Son being complained of to Dr. John Tenant, vice-chancellor of Oxford, as of irreligious tendency, it was ordered that no bookseller or others should sell it, which, as usual in such cases, only made it sell the faster. He wrote also Historical Memoirs of the Reigns of Queen Elizabeth and King James I.; a Discourse on the greatness and corruption of the Church of Rome; a Discourse upon Machiavel, &c. He died in 1659.

OSCHEOCELE, *n. s.* Gr. *οσχεον* and *επλην*. A kind of hernia when the intestines break into the scrotum.

OSCHOPHORIA, a festival observed by the Athenians. It receives its name, *απο του φορειν τας οσχας*, from carrying boughs hung up with grapes, called *οσχα*. Its original institution is thus mentioned by Plutarch in Theseus:—Theseus, on returning from Crete, forgot to hang out the white sail, by which his father was to be apprised of his success. This neglect proved fatal to Ægeus, for he threw himself into the sea, and perished. Theseus no sooner reached the land than he sent a herald to inform his father

of his safe return, and in the mean time he began to make the sacrifices which he had vowed to make when he first set sail from Crete. The herald, on his entrance into the city, found the people in great agitation. Some lamented the king's death, while others, elated at the sudden news of the victory of Theseus, crowned the herald with garlands in token of their joy. The herald carried back the garlands on his staff to the sea shore; and, after waiting till Theseus had finished his sacrifice, he related the melancholy account of the king's death. Upon this the people ran in crowds to the city, showing their grief by cries and lamentations. From this circumstance, therefore, at the feast of Oschophoria, not the herald, but his staff was crowned with garlands, and all the people that were present exclaimed *ελεειν, ιε, ιε*, the first of which expresses haste, and the others a consternation or depression of spirits. The historian further mentions, that Theseus, when he went to Crete, did not take with him the usual number of virgins, but that, in the place of two of them, he took two youths of his acquaintance, whom he caused to pass for women, by disguising their dress, and by accustoming them to the ointments and perfumes of women, as well as by a long and successful imitation of their voice. The imposition succeeded; their sex was not discovered in Crete; and, when Theseus had triumphed over the Minotaur, he, with these two young men led a procession, with branches in their hands, in the same habit, which was still used at the celebration of the festival. The branches which were carried were in honor of Bacchus and Ariadne, or because they returned in autumn, when the grapes were ripe. Besides this procession, there was also a race in which young men only, whose parents were both alive, were permitted to engage. It was customary for them to run from the temple of Bacchus to that of Minerva, which was on the sea-shore. The place where they stopped was called *οσχοφοριον*, because the boughs which they carried in their hands were deposited there. The reward of the conqueror was a cup called *πενταλοα*, five-fold, because it contained a mixture of five different things; wine, honey, cheese, meal, and oil.

OSCI, an ancient people of Italy, who dwelt between Campania and the country of the Volsci, and assisted Turnus against Æneas.—*Tacit. Ann.* iv. c. 14.

OSCILLA, small images of wax or clay made in the shape of men or women, and consecrated to Saturn, to render him propitious. The word is sometimes used to signify a kind of masks scooped from the bark of trees, and worn by the performers of comedy in the ruder ages of Rome. In this sense we find it in *Virg. Geo.* ii. 386. It also signifies little heads or images of Bacchus, which the countrymen of old hung upon trees, that the face might turn every way, out of a notion that the countenance of this god gave felicity to themselves, and fertility to their vineyards. An allusion to this opinion and custom is also found in *Virgil, Geo.* ii. 388.

OSCILLATION, *n. s.* } Lat. *oscillum*. The
OSCILLATORY, *adj.* } act of moving back-
wards and forwards, or in the manner of a pendulum.

The actions upon the solids are stimulating or increasing their vibrations, or oscillatory motions.

Arbuthnot.

OS'CITANCY, *n. s.* } Lat. *oscitatio*.
OS'CITANT, *adj.* } Yawning; sleepiness;
OSCITA'TION, *n. s.* } hence, carelessness:
oscitation is the act of yawning.

Our *osceitant* lazy piety gave vacancy for them, and they will now lend none back again.

Decay of Piety.

If persons of circumspect piety have been overtaken, what security can there be for our reckless *oscitancy*?

Government of the Tongue.

It might proceed from the *oscitancy* of transcribers, who, to dispatch their work the sooner, used to write all numbers in cyphers. *Addison's Spectator.*

I shall defer considering the subject till I come to my treatise of *oscillation*, laughter, and ridicule.

Tatler.

OSIANDER (Adam), chancellor of the university of Tubingen, published a work entitled *Theologia Causalis; a System of Casual Theology*; containing the solution of dubious questions and cases of conscience, six vols. 4to. Tubingen, 1682.

OSIANDER (Andrew), a Lutheran divine, born in Bavaria, in 1498. He studied at Wirtemberg, and became professor of theology at Konigsberg. He denied the doctrine of imputed righteousness, which gave rise to a controversy between him and other Lutheran divines, and he died in 1552.

O'SIER, *n. s.* Fr. *osier, viter*. A tree of the willow kind, growing by the water, of which the twigs are used for basket work.

The rank of *osiers*, by the murmuring stream,
Left on your right hand brings you to the place.

Shakespeare.

Ere the sun advance his burning eye,
I must fill up this *osier* cage of ours
With baleful weeds and precious juiced flowers.

Id.

Car comes crowned with *osier*, segs, and weeds.

Drayton.

Bring them for food sweet boughs and *osiers* cut,
Nor all the winter long thy hay-rick shut.

May.

Like her no nymph can willing *osiers* bend,
In basket works, which painted streaks commend.

Dryden.

Along the marshes spread,
We made the *osier* fringed bank our bed.

Pope.

OSIER, in botany. See SALIX.

OSIRIS, in mythology, one of the gods of ancient Egypt, and generally supposed to mean the sun, or the mind actuating that luminary. Macrobius says that, in the hieroglyphic writings of ancient Egypt, 'Osiris was represented by a sceptre and an eye,' to denote that this god was the sun looking down from heaven on all things upon earth. Some of the ancients, however, and a few of the most learned moderns, have contended that, by Osiris, the Egyptians understood the Nile, or spirit of the Nile, whilst others have confounded him with the Grecian Bacchus. But though the original Osiris was undoubtedly the sun, or the intelligence actuating the sun, yet there was a secondary Osiris, who was said to be the founder of the Egyptian monarchy; and, as was customary in those days, having either received the name of the sun, or communicated his own to that luminary, was after his death

deified for the benefits which he had rendered to his country; and, being at first worshipped only as a demigod, was in process of time advanced to full divinity, and confounded with the sun. The Greeks, who, though original in nothing, were always prompted by their vanity to hold themselves out as the first of the nations, claimed this Osiris as their own, and pretended that he was the son of Jupiter and Niobe. See MYSTERIES.

OSMAN I., or OTHMAN I., emperor of the Turks, succeeded his uncle Mustapha I., who was deposed in 1618. He marched against the Poles in 1621, with a great army; but, being repeatedly defeated, concluded a disadvantageous peace, and returned home, where he was deposed by the janizaries, and Mustapha restored, who caused him to be strangled.

OSMIUM. A new metal lately discovered by Mr. Tennant among platina, and thus called by him from the pungent and peculiar smell of its oxide. For the mode in which he extracted it, see IRIIDIUM.

Its oxide may likewise be obtained in small quantity by distilling with nitre the black powder left after dissolving platina; when at a low red heat an apparently oily fluid sublimes into the neck of the retort, which on cooling concretes into a solid, colorless, semi-transparent mass. This, being dissolved in water, forms a concentrated solution of oxide of osmium. This solution gives a dark stain to the skin that cannot be effaced. Infusion of galls presently produces a purple color in it, which soon after becomes of a deep vivid blue. This is the best test of the oxide. With pure ammonia it becomes yellow, and slightly so with carbonate of soda. With lime it forms a bright yellow solution; but it is not affected either by chalk, or by pure magnesia. The solution with lime gives a deep red precipitate with galls, which is turned blue by acids. It produces no effect on solution of gold or platina; but precipitates lead of a yellowish-brown, mercury of a white, and muriate of tin of a brown color.

Oxide of osmium becomes of a dark color with alcohol, and after some time separates in the form of black films, leaving the alcohol without color. The same effect is produced by ether, and much more quickly.

It parts with its oxygen to all the metals except gold and platina. Silver, kept in a solution of it some time, acquires a black color, but does not deprive it entirely of smell. Copper, tin, zinc, and phosphorus, quickly produce a black or gray powder, and deprive the solution of smell, and of the property of turning galls blue. This black powder, which consists of the metallic osmium, and the oxide of the metal employed to precipitate it, may be dissolved in nitro-muriatic acid, and then becomes blue with infusion of galls.

If the pure oxide dissolved in water be shaken with mercury, it soon loses its smell, and the metal forms a perfect amalgam. By squeezing the superfluous mercury through leather, and distilling off the rest, a dark gray or blue powder is left, which is the osmium.

Exposed to a strong heat in a cavity in a piece

of charcoal, it does not melt; nor is it volatile if oxidation be carefully prevented. With copper and with gold it forms malleable alloys, which are easily dissolved in nitro-muriatic acid, and afford by distillation the oxide of osmium. The pure metal, previously heated, did not appear to be acted upon by acids. Heated in a silver cup, with caustic alkali, it combined with it, and gave a yellow solution, similar to that from which it was procured. From this solution acids separate the oxide of osmium.—*Philosophical Transactions.*

OSMUNDA, in botany, moonwort; a genus of the order of filices, and class cryptogamia. There are several species; the most remarkable is the

O. regalis, osmund royal, or flowering fern. This is a native of Britain, growing in putrid marshes. Its leaf is doubly winged, bearing bunches of flowers at the ends. The root boiled in water is very slimy; and is used in the north to stiffen linen, instead of starch. Some of the leaves only bear flowers.

OSNABRUCK, a province in the S. S. W. of Hanover, between the grand duchy of Oldenburg and Westphalia. Its form is an irregular oblong, having its length from south to north, and an area of about 920 square miles. The majority of the people are Lutherans, and the rest Catholics. Jews, by the old constitution, were not tolerated here. The peasants were long in a singular state of vassalage here, the proprietor of the soil sharing the property, at the father's death, with the children. A large proportion of this province consists of heath, and sandy eminences; but the want of wood is supplied by turf from the bogs, and the produce of the coal mines. The chief corn raised is rye, oats, barley, and buck-wheat. Inferior hemp and flax are also raised; and great quantities of the coarse linen, known by the name of Osnaburgs, are manufactured here. The see is of very remote antiquity, having been founded by Charlemagne. After the reformation, most of the inhabitants embracing the Lutheran faith, it was agreed at the treaty of Westphalia that the bishop should be alternately a Catholic and a Lutheran, the chapter being left at liberty in their choice of the former, but limited in the election of a Protestant to the family of Brunswick-Luneburg. The Catholic bishop was generally an aged member of the chapter, and the Protestant a young prince; so that since 1648 the principality has been much longer subject to the house of Brunswick than to the Catholics. Neither party, however, were able to introduce any change, until, in 1802, it was agreed that the bishopric should devolve in perpetuity on the house of Hanover. It was annexed in 1807 to the kingdom of Westphalia, but restored to Hanover in 1814. The public revenue is between £50,000 and £60,000. It is divided into six baliwics. Population 126,000.

OSNABRUCK, or OSNABURG, the capital of the principality of this name, is situated on the river Hase. It is divided into the Old and New town (both irregularly built), and surrounded with old walls and ditches, and entered by five gates. The best buildings are the cathedral and

town house, in which was concluded the peace of Westphalia in 1648, at the same time as at Munster, Osnaburg being the place for the conferences of the Protestant ambassadors. The quarter called the Freyung is a favorite resort, and has a very pleasant promenade. Other public buildings are two Lutheran, and two Catholic churches, a Lutheran orphan house, four hospitals, a workhouse, and the Catholic and Lutheran gymnasiums. Here are manufactories of coarse woollen, leather, and tobacco; several linen bleach-fields, and the Osnaburgs of the surrounding country are brought here to be measured and stamped. Two miles off is Ebersburg, with a botanical garden containing some curious exotics. Inhabitants 9300. Seventy miles west of Hanover, and twenty-eight north-east of Munster. Long. 2° 1' 11" E., lat. 52° 16' 32" N.

OSORIO, or **OSORIUS** (Jerom), was born of a noble family in Lisbon, in 1500. He was educated at the university of Salamanca, and afterwards studied at Paris and Bologna. On his return to Portugal he gradually rose to the bishopric of Sylves, to which he was appointed by Catherine of Austria, regent in the minority of Sebastian. At the request of cardinal Henry, of Portugal, he wrote his History of King Emanuel, and the Expedition of Gama; which his great contemporary Camoens made at the same time the subject of his immortal *Lusiad*. Osorius used many arguments to dissuade Sebastian from his unfortunate expedition into Africa, and felt so deeply the miseries which befell the Portuguese, after that fatal event, that his grief accelerated his death. He died in 1580. His various works were published at Rome in 1592, by his nephew, in 4 vols. folio.

OSORIUS (Jerome), nephew of the preceding, was also a man of letters. He was canon of Evora, and wrote the life of his uncle, and several theological works.

OSPRAY, *n. s.* Lat. *ossifragia*, of which the word is a corruption. See **OSSIFRAGE**. The sea-eagle. Dr. Johnson, to explain the extract from Shakspeare, adds, 'of which it is reported, that when he hovers in the air, all the fish in the water turn up their bellies, and lie still for him to seize which he pleases.'

Among the fowls shall not be eaten, the eagle, the ossifrage, and the *aspray*. Numbers, xi. 13.

I think he'll be to Rome,
As is the *aspray* to the fish, who takes it
By sovereignty of nature.

Shakspeare. *Coriolanus*.

OSPRAY, or **OSPREY**. See **FALCO**.

OSSA, a lofty mountain of Thessaly, near the Peneus, which runs between this mountain and Olympus; famous in fabulous history as one of those which the giants piled up to facilitate their attack on heaven. (Homer, Virgil, Horace, Seneca, Ovid). It was once the residence of the Centaurs, and was formerly joined to mount Olympus; but Hercules is fabled to have separated them, and made between them the celebrated valley of Tempe. This separation was probably effected by an earthquake which happened about A. A. C. 1885.

OSSAT (Arnauld de), born in the diocese of

Auch in 1536, of mean parentage, was taken notice of by a gentleman in the diocese, who made him study with his ward, the lord of Castlenau de Magnoc. He studied the law at Dijon under Cujace, and applied himself to the bar at Paris. He was secretary at Rome to M. de Foix, archbishop of Thoulouse; to cardinal Este; and afterwards to cardinal de Joyeuse, by the French king's express command. After rising to the highest dignities, both in church and state, in 1599 he was created a cardinal by pope Clement VIII. He died in 1604. An eminent French writer gives him the following character: — 'He was a man of great penetration; applied himself so closely to business, and was so judicious in forming his resolutions, that it is almost impossible to find out one false step in the many negotiations in which he was concerned.' His works, and especially his letters, have been much esteemed.

OSSELET, *n. s.*

Fr. *osselet*; dim. of Lat.

OSICLE, *n. s.*

ossis, ossiculum. Osselet

OSIFIC, *adj.*

is a term in farriery, for a

OSSIFICATION, *n. s.*

small hard substance that

OSSIFRAGE, *n. s.*

grows in a horse's knee

OSSIFY, *v. a.*

among the small bones:

OSSIVOROUS, *adj.*

ossicle is, a small bone:

OSSUARY, *n. s.*

ossific, having the power

or tendency to make bone or bony substance: ossification, act of growing into or becoming bone: the ossifrage is a kind of eagle, so called because reported to break the bones of its prey for the marrow: to ossify is, to change to bone: ossivorous is devouring bones: ossuary, a charnel or bone house.

There are three very little bones in the ear, upon whose right constitution depends the due tension of the tympanum; and if the action of one little muscle, which serves to draw one of these *ossicles*, fixed to the tympanum, be lost or abated, the tension of that membrane ceasing, sound is hindered from coming into the ear.

Holder.

The bore of the gullet is not in all creatures alike answerable to the body or stomach: as in the fox, which feeds on bones, and swallows whole or with little chewing; and next in a dog and other *ossivorous* quadrupeds, it is very large.

Derham.

If the caries be superficial, and the bone firm, you may by medicaments consume the moisture in the caries, dry the bone, and dispose it, by virtue of its *ossific* faculty, to thrust out callus, and make separation of its caries.

Wise man.

Ossifications or indurations of the artery, appear so constantly in the beginnings of aneurisms, that it is not easy to judge whether they are the cause or the effect of them.

Sharp.

The dilated aorta every where in the neighbourhood of the cyst is generally *ossified*.

Sharp's Surgery.

OSSIAN, a celebrated Celtic poet, who is supposed to have flourished about the end of the second or beginning of the third century, and to have been the son of Fingal a Caledonian chief. Little, however, is known of him beside what is contained in those of his poems which were collected, translated, and published by Mr. M'Pherson. Fingal is said to have commanded the Caledonians during the invasion of Severus; and it appears, from his poems, that, in one of his early expeditions to Ireland, Ossian had fallen in love with and married Eivirallin, daughter to

Branno, petty king of Lego. This Eirallin brought him his son Oscar, whose exploits he celebrates in many of his poems, and whose death he laments in the first book of *Temora*. Eirallin died some time before Oscar (Fingal. b. iv.), who seems to have been her only child; and Ossian did not marry afterwards: so that his posterity ended in the death of Oscar; who seems to have died as he was about to be married to Malvina, the daughter of Toscar. This celebrated maid remained with her intended father-in-law while she lived, and paid him every attention which his age demanded. It is not certain at what age Ossian died; but from his having been long blind with years, and from the many contrasts between his present and past situation, in poems composed, as it would appear, at a considerable distance of time from each other, it is most likely he lived to an extreme old age. The current tradition is, that he died in the house of a Culdee, called the Son of Alpin, with whom he is said to have held several conferences about the doctrines of Christianity. The principal residence of Ossian was in the vale of Cona, now Glenco, in Argyleshire. His poems relate many of his expeditions to Ireland, Scandinavia, Clyde, and Tweed or Tuetha. His exploits on these occasions, after making a large allowance for poetical exaggeration, show him to have been no less a warrior than a poet. Such is the brief amount of our knowledge respecting Ossian, and the authenticity even of these particulars has been disputed by men of the highest literary eminence. As the controversy that has arisen on the subject cannot be narrated with perspicuity, without entering more minutely into detail than our plan will allow, we shall avoid it entirely. Dr. Hugh Blair in a private letter to Mr. William Morison, bookseller, Perth, dated Summerfield, 7th October, 1800, gives the following opinion upon it, entitled to considerable respect:—‘That Mr. M’Pherson may not have given an exact and scrupulous translation of all these poems: that he may have joined and collected scattered pieces into one, and have omitted some pieces that were in the original, is what I never called in question. But that they are not poems of his composing, but are really and truly in the substance of them genuine, original and ancient Gaelic songs, well known to many natives of the Highlands, is what, from innumerable circumstances which I had access to trace, I am as fully convinced, and as certain of, as I can be of any thing under the sun.’ An Enquiry into the Authenticity of the Poems ascribed to Ossian, was first published by Mr. W. Shaw, author of a Gaelic grammar and dictionary, in 1781. He was answered by Mr. John Clarke, a member of the society of Scottish antiquaries, and a translator of Caledonian poetry. Mr. Laing more recently attacked the credit of the Ossianic poetry, and was opposed by Mr. Archibald Macdonald and Dr. Patrick Graham. See Report of the Highland Society, published by Henry M’Kenzie, Esq., and the pieces attached to the Gaelic poems, published as the originals of Ossian, with a literal Latin version, by Robert M’Farlan, A.M. 3 vols. 8vo.

OSSIFICATION, in the animal economy, is

the formation of the bones, but more particularly the conversion of parts naturally soft to the hardness and consistency of bones; as the blood of old men, which by a long course of circulation becomes in a manner unfit for the common office of nutrition, is apt to ossify, and convert into bones, many of the tendons and ligaments, and even the coats of the vessels themselves, whose substance being next to the bones the most compact, admits only of the smallest particles of the blood, which therefore soonest become osseous, as they are frequently found. Dr. Nesbit’s opinion of ossification is, that in the blood, or a fluid secreted from it, there is an ossifying juice, having particles which are not apparent: that, whenever nature designs an ossification between membranes, or within a cartilage, she occasions a more than usual afflux of this fluid; which so much distends the vessels which were before invisible as to make them capable of receiving the red globules of blood, which are always to be seen near to the place where ossification is begun. In this blood, gritty bony particles may be felt by the point of a knife, which have been formed by the attraction and cohesion of the particles of the ossifying juice obstructed, along with other grosser fluids, in the beginning of the vessels prepared to receive reflux juices.

OSSUNA, a large inland town of Andalusia, Spain, in the province of Seville. It has a collegiate church, fifteen monasteries and convents, and three hospitals. It had formerly a university, now suppressed, and is a place of great antiquity. In a military sense it possesses strength, principally from its neighbourhood being destitute of water, while in the town is a good spring, a circumstance which obliged Cæsar, when he besieged it, to bring from a great distance the provisions and water for his army. Inhabitants 15,000. Forty-eight miles east of Seville, and twenty-eight W. N.W. of Antequera.

OSTADE (Adrian Van), an eminent Dutch painter, born at Lubec, in 1610. He was a disciple of Francis Hals. The subjects of this painter were always of the low kind, having the same ideas as Teniers; but, though Ostade copied nature as it appeared in the lower class of mankind, yet there is so much spirit in his compositions, such truth, nature, life, and delicacy of pencil, that, even while many of his objects are in some respects disgusting, a spectator cannot forbear to admire his genius and execution. His pictures are so transparent and highly finished, that they have the lustre and polish of enamel, being at the same time warm and clear. They have frequently a force superior to Teniers, and are always more highly finished; though it must be acknowledged that Teniers grouped his objects better, and showed more skill in the disposition of his design than Ostade. He perfectly understood the principles of chiaro-obscuro, and introduced his lights and shadows with so much judgment that every figure seems animated; it might, however, be wished that he had not designed his figures so short. His tone of coloring is exquisitely pleasing and natural; his touch light and wonderfully neat; and throughout all his works there is a peculiar and uncommon transparency. The figures of Ostade

were so universally admired for their lively expression, that several of the most eminent among his contemporary artists solicited him to paint the figures in their landscapes; which at the present day contribute greatly to their value. His works are very scarce, especially those of his best time and manner; and, when the genuine productions of Ostade are to be purchased, no price is accounted too exorbitant for them. This clever artist produced many etchings from his own designs that are very deservedly admired. He died in 1685, aged seventy-five.

OSTEN'SIBLE, *adj.* } Lat. *ostendo*. Pro-
OSTEN'SIVE. } per, or intended, to be shown.

His *ostensible* motive was the embarkation of the troops; but it is more than probable that some underplot engaged his attention. *Swift.*

OSTENT', *n. s.* } Fr. *ostentateur*;
OSTENTA'TION, } Lat. *ostentum*, *os-*
OSTENTA'TIOUS, *adj.* } *tentatio*. Show;
OSTENTATIOUSLY, *adv.* } manner; portent;
OSTENTA'TIOUSNESS, *n. s.* } omen; appearance;
OSTENTA'TOUR. } Shakespeare uses it

for token or sign: ostentation is, outward show; mere show or display; ambitious or boastful display; all the other derivatives following this sense: ostentatour, a needless Gallicism for a boaster.

To stirre our zeales up, that admired, whereof a fact so cleane

Of all ill as our sacrifice, so fearfull an *ostent*,
Should be the issue. *Chapman.*

Be merry, and employ your chiefest thoughts
To courtship and such fair *ostents* of love
As shall conveniently become you there. *Shakespeare.*

Use all the observance of civility,
Like one well studied in a sad *ostent*,
To please his grandam.

Id. Merchant of Venice.

The king would have me present the princess with some delightful *ostentation*, show, pageant, antick, or firework. *Shakespeare.*

If these shows be not outward, which of you
But is four Volscians?

—March on my fellows;
Make good this *ostentation*, and you shall
Divide in all with us. *Id. Coriolanus.*

Latinus, frighted with this dire *ostent*,
For council to his father Faunus went;
And sought the shades renowned for prophecy,
Which near Alburnia's sulphurous fountain lie. *Dryden.*

Your modesty is so far from being *ostentatious* of the good you do, that it blushes even to have it known; and therefore I must leave you to the satisfaction of your own conscience, which, though a silent panegyric, is yet the best. *Id.*

They let Ulysses into his disposition, and he seems to be ignorant, credulous, and *ostentatious*. *Broome.*

If all these secret springs of detraction fail, yet a vain *ostentation* of wit sets a man on attacking an established name, and sacrificing it to the mirth and laughter of those about him. *Addison's Spectator.*

He knew that good and bountiful minds were sometimes inclined to *ostentation*, and ready to cover it with pretence of inciting others by their example, and therefore checks this vanity: Take heed, says he, that you do not your alma before men, to be seen. *Atterbury.*

With all her lustrre, now, her lover warms;
Then out of *ostentation*, hides her charms. *Young.*

The great end of the art is to strike the imagination. The painter is therefore to make no *ostentation* of the means by which this is done; the spectator is only to feel the result in his bosom. *Reynolds.*

But the mind that is fit to be spoken (if I may express myself so strangely), ought to be free from pride, *ostentation*, and ill-nature; for, from these hateful passions, the bluntness here alluded to may generally be derived. *Beattie.*

OSTEOCOPE, *n. s.* } Fr. *osteocope*; Gr.
OSTEOLOGY. } *οστειον* and *κοπη*.

Pains in the bones or surrounding membranes: osteology is a description of the bones, or the science that describes them.

Richard Farlow, well known for his acuteness in dissection of dead bodies, and his great skill in *osteology*, has now laid by that practice. *Tatler.*

OSTEOCOLLA, *οστεocolλα*, in natural history, a white or ash-colored sparry substance, in shape like a bone. It is found in long, thick, and irregularly cylindric pieces, which are in general hollow, but are sometimes filled up with a marly earth, and sometimes contain within them the remains of a stick, round which the osteocolla had been formed; but, though it is plain from thence that many pieces of osteocolla have been formed by incrustations round sticks, yet the greater number are not so, but are irregularly tubular, and appear to be formed of a flat cake, rolled up in a cylindric shape. The osteocolla is found of different sizes, from that of a crow-quill to the thickness of a man's arm. It is composed of sand and earth, which may be separated by washing the powdered osteocolla with water, and is found, both in digging and in several brooks, in many parts of Germany and elsewhere. It is called *hammosteus* in many parts of Germany. It has this name in these places from its always growing in sand, never in clay, or any solid soil, nor even in gravel. Where a piece of it any where appears on the surface they dig down for it, and find the branches run ten or twelve feet deep. They usually run straight down, but sometimes they are found spreading into parts near the surface, as if it were a subterraneous tree, whose main stem began at twelve feet deep, and thence grew up in a branched manner till met by the open air. The main trunk is usually as thick as a man's leg, and the branches that grow out from it are thickest near the trunk, and thinner as they separate from it. The thinnest are about the size of a man's finger. The people employed to collect it, when they cannot find any mark of it on the surface, search after the specks of white, or little lumps of whitish soft matter, which they find lying in various parts on the top of the sand. These always lead them, either to a bed of perfect osteocolla, or to some in the formation. If they miss it, they still find a substance like rotten wood; which, when traced in its course, is found to proceed from a main trunk, at the depth of that of the osteocolla, and to spread itself into branches in the same manner. The diggers call this substance the flower of osteocolla or *hammosteus*. What the rotten substance resembling the decayed branches of trees is, we cannot determine, unless it really be such; but the opinion of the common people, that it is the root of something, is absurd; be-

cause its thickest part always lies at the greatest depth, and the branches all run upwards. The osteocolla is a marly spar, which concretes round this matter; but what it is that determines it to concretes nowhere on the same ground but about these branches, it is difficult to say. The rottenness of this substance, which forms the basis of the osteocolla, renders it very liable to moulder and fall away; and hence it is that we usually see the osteocolla hollow. Sometimes it is found solid; but in this case there will be found to have been a vegetable matter serving as its basis; and, instead of one branch, it will be found in this case to have concreted about a number of fibres, the remains of which will be found in it on a close examination.

OSTERVALD (John Frederick), a celebrated Protestant divine, born at Neufchatel in 1663, and descended from an ancient family. He made such rapid progress in his studies, that he became M. A. at Saumur before he was sixteen years of age. He afterwards studied at Orleans and at Paris. On his return to Neufchatel, in 1699, he became professor of divinity and pastor of the church there; and contracted a strict friendship with the celebrated John Alphonsus Turretin of Geneva, and the illustrious Samuel Werenfels of Basil. The union of these three divines, which was called the triumvirate of the divines of Switzerland, lasted till his death. Mr. Osterwald acquired the highest reputation by his zeal in instructing his disciples, and restoring ecclesiastical discipline. He wrote many books in French, the principal of which are, 1. A Treatise concerning the Causes of the present Corruptions of Christians, and the remedies, which was translated into English, and has been often published; 2. A Catechism, or Instruction in the Christian Religion, which has been translated into German, Dutch, and English; and the Abridgment of the Sacred History, which he prefixed to it, was translated and printed in Arabic, to be sent to the East Indies, by the Society for the Propagation of the Gospel, established in London, who admitted him an honorary member; 3. A Treatise against Impurity; 4. An edition of the French Bible of Geneva, with Arguments and Reflections, in folio; 5. *Ethica Christiana*; 6. *Theologiæ Compendium*, &c. He died in 1747. He had a son, who was pastor of the English church at Basil, and maintained the reputation of his father. He published a work, which was much esteemed, entitled *Les Devoirs des Communions*.

OSTIA, an ancient and celebrated town of Italy, in Campagna, at the mouth of the Tiber, sixteen miles south-west of Rome. It was built by Ancus Martius, the fourth king of Rome, and was called Ostia Tiberina, i. e. the two mouths of the Tiber, which were separated by the Holy Island, an equilateral triangle, whose sides were each of them computed at two miles. The colony of Ostia was founded immediately beyond the south or left, and the port immediately beyond the north or right, branch of the river; and the distance between their remains measures something more than two miles. In the time of Strabo the sand and mud deposited by the Tiber had choked the harbour of Ostia; the

progress of the same cause has added much to the size of the Holy Island, and gradually left both Ostia and the port at a considerable distance from the shore. The dry channels and the large estuaries mark the changes of the river and the efforts of the sea. Its port was one of the most stupendous works of the Roman magnificence, and it was a long time one of the best towns on the coast; but having been destroyed by the Saracens, and the harbour choked up, it has never since been able to recover its importance. There were salt-works in Ostia, called *Salinæ Ostienses*, as early as the reign of Ancus Martius (Livy); from which the Via Salaria took its name. It gave name to the gate of Rome called *Ostiensis*.

OSTIA, an unhealthy modern town in the States of the Church, Italy, situated near the influx of the Tiber into the Mediterranean. It is the see of a bishop, and in the neighbourhood are extensive salt-works, which supply a great part of the Ecclesiastical States. Population 4000. The ancient town of Ostium stood between this place and the sea. It appears to have been three or four miles in circuit. Fourteen miles south-west of Rome.

OSTIARY, *n. s.* Lat. *ostium*. The opening at which a river disembogues itself.

It is received, that the Nilus hath seven *ostiaris*, that is, by seven channels disburtheneth itself unto the sea. *Brownie.*

OSTLER, *n. s.* } Fr. *hostelier*. A person
OSTLERY. } who has charge of the horses
at public stables: the ostlery is his place of abode.

The smith, the *ostler*, and the boot-catcher, ought to partake. *Swift.*

OSTRACISM, *n. s.* Gr. *οστρακισμος*; Fr. *ostracisme*. A manner of passing sentence, in which the note of acquittal or condemnation was marked upon a shell which the voter threw into a vessel. Banishment; public censure.

Virtue in courtiers' hearts

Suffers an *ostracism* and departs;

Profit, ease, fitness, plenty, bid it go,

But whither, only knowing you, I know. *Donne.*

Public envy is an *ostracism*, that eclipseth men when they grow too great; and therefore it is a bribe to keep them within bounds. *Bacon's Essays.*

Hyperbolus by suffering did traduce

The *ostracism* and shamed it out of use. *Cleaveland.*

This man, upon a slight and false accusation of favouring arbitrary power, was banished by *ostracism*; which in English would signify, that they voted he should be removed from their presence and council for ever. *Swift.*

OSTRACISM, in Grecian antiquity, denotes the banishment of persons whose influence excited the jealousy of the people of Athens, lest they should attempt any thing against the public liberty. This punishment was called *ostracism*, from the Greek word *οστρακον*, which properly signifies a shell; but, when applied to this object, it is used for the billet on which the Athenians wrote the names of the citizens whom they intended to banish, which was a piece of baked earth in the form of a shell: the person who proposed the law was its first victim; but

as to his name, and the time of its establishment, the ancients differ extremely. Many think that ostracism owes its origin to very remote times. The punishment of ostracism was inflicted by the Athenians when their liberty was in danger. When jealousy or ambition had sowed discord among the chiefs of the republic, and different parties were formed, which threatened a revolution, the people assembled to propose measures proper to be taken, to prevent the consequences of a division, which in the end might be fatal to freedom. A decree was made, by which a day was fixed to proceed to the sentence of ostracism. Then they who were threatened with banishment omitted no art to gain them the favor of the people. Some time before the meeting of the assembly, a wooden enclosure was raised in the forum, with ten doors, as many as there were tribes in the republic; and, when the appointed day was come, the citizens of each tribe entered at their respective doors, and threw into the middle of the enclosure the small brick on which the citizen's name was written whose banishment they voted. The archons and the senate presided at this assembly, and counted the billets. He who was condemned by 6000 of his fellow-citizens was obliged to quit the city within ten days; for 6000 voices, at least, were requisite to banish an Athenian by ostracism. The Athenians, without doubt, foresaw the inconveniences to which this law was subject; but they chose rather, as Cornelius Nepos has remarked, sometimes to expose the innocent to an unjust censure, than to live in continual alarms. Yet, as they were sensible that the injustice of confounding virtue and vice would have been too flagrant, they softened, as much as they could, the rigor of ostracism. It was not aggravated with the circumstances which were most dishonorable and shocking in the ordinary mode of exile. They did not confiscate the goods of those who were banished by ostracism. They enjoyed the produce of their effects in the places into which they were banished; and they were banished only for a certain time. But, in the common banishment, the goods of the exiles were always confiscated, and no hopes were given them of ever returning to Athens.

OSTRACITES, or fossile oysters, are common in many parts of England. They are of various shapes and kinds; and the name is by some authors used for the shell itself, when preserved in its native state and condition; as is the case with those about Woolwich and Blackheath; and by others for the stone cast or formed in those shells, or in cavities whence they have been washed away and dissolved: in both these cases the stone carries the exact resemblance of the shell, even in its nicest lineaments; in the first case, bearing every mark of the inside; in the other, of the outer surface. We have this stone in great plenty in many parts of England; and it is famous, in some places, for its reputed virtue in cases of gravel.

OSTREA, the oyster, in zoology, a genus belonging to the order of *vermes testacea*. The shell has two unequal valves; the *cardo* has no teeth, but a small hollowed one with transverse lateral streaks. There are numerous species,

principally distinguished by peculiarities in their shells. The common oyster is reckoned an excellent food; and is eaten both raw and variously prepared. The character of the genus, in the words of Barbut, is: 'The animal is a tethys; the shell bivalve, unequivalve, with something like ears; the hinge void of teeth, with a deep oval hole, and transverse streaks on the sides. There is no womb nor anus.' This sea fish occupies in the scale of nature one of the degrees the most remote from perfection; destitute of defensive weapons and progressive motion, without art or industry, it is reduced to mere vegetation in perpetual imprisonment, though it every day opens regularly to enjoy the element necessary to its preservation. The animal figure, and the springs of its organisation, are scarcely discernible through the coarse and shapeless mass; a ligament placed at the summit of the shell serves as an arm to its operations. Oysters are reputed to be hermaphrodites; the spawn, which they cast in May, adheres to the rocks and other matters at the bottom of the sea; and, in the space of twenty-four hours, is provided with shells, in which are contained other oysters, that never leave the spot on which they were fixed till the greedy fisherman tears them from the element. The green oysters, eaten at Paris, are commonly brought from Dieppe. Their color is owing to the care taken to bed them in creeks encompassed with verdure, whence they acquire their delicacy. Common oysters should be fresh, tender, and moist. The most esteemed are those caught at the mouths of rivers, and in clear water. Great account is made of oysters from Brittany; but still greater of those that come from Marennes in Saintonge. Preference is given to those that are edged with a small brown fringe, or beard, which epicures call fecundated oysters; but that these are females is a mistake. The want of fresh water renders oysters hard, bitter, and unpalatable. Mud and sea-weeds destroy them in their very birth; galangal root, muscles, scollops, sea-stars, and crabs, are formidable enemies to the oyster. There are found in Spain red and russet-colored oysters; in Illyria brown colored, with the flesh black; and, in the Red Sea, of the colors of the Iris. Oysters of the mangle tree are of two sorts; those of St. Domingo are delicate, adhering to the stumps of the trees that dip in the water. The negro divers cut them off with a bill, and they are served upon table with the roots. Britain has been noted for oysters from the time of Juvenal. The luxurious Romans were very fond of this fish, and had their layers or stewers for oysters as we have at present. Sergius Orata was the first inventor of these, as early as the time of L. Crassus the orator. He did not make them for the sake of indulging his appetite, but through avarice, and made great profits from them. Orata got great credit for his Lucrine oysters; for, says Pliny, the British were not then known. The ancients eat them raw, having them carried up unopened, and generally eating them at the beginning of the entertainment, but sometimes roasted. They had also a custom of stewing them with mallows and ducks, or with fish. Britain still preserves its superiority in oysters

eyes other countries. Most of our coasts produce them naturally; and in such places they are taken by dredging, and are become an article of commerce, both raw and pickled. The very shells, calcined, become a useful medicine as an absorbent. In common with other shells, they prove an excellent manure. Stews or layers of oysters are formed in places which nature never allotted as habitations for them. Those near Colchester have been long famous; at present there are others that at least rival the former, near the mouth of the Thames. The oysters, or their spats, are brought to convenient places, where they improve in taste and size. It is an error to suppose that the fine green, observed in oysters taken from artificial beds, is owing to copperas; it being notorious how destructive the substance or the solution of it is to all fish.

In May the oysters cast their spawn, which the dredgers call their spats; and in the same month the dredgers (by the law of the admiralty court) have liberty to catch all oysters of what size soever. When they have taken them, with a knife they gently raise the small brood from the clutch, and then they throw the clutch in again, to preserve the ground for the future, unless they be so newly spat that they cannot be safely severed from the clutch; in that case they are permitted to take the stone or shell, &c., that the spat is upon, one shell having many times twenty spats. After May, it is felony to carry away the clutch, and punishable to take any other oysters, unless it be those of size; that is to say, about the bigness of a half-crown piece, or when, the two shells being shut, a fair shilling will rattle between them. The places where these oysters are chiefly caught are called the Pent-Burnham, Malden, and Colne waters; the latter taking its name from the Colne, which passes by Colchester and gives name to that town. See COLNE. This brood and other oysters they carry to the creeks of the sea, at Brickelsea, Mersy, Langno, Fingrego, Wivenho, Tolesbury, and Saltcoast, and there throw them into the channel, which they call their beds, or layers, where they grow and fatten; and in two or three years the smallest brood will be oysters of the size aforesaid. Those oysters which they would have green, they put into pits about three feet deep in the salt-marshes, which are overflowed only at spring tides, to which they have sluices, and let out the salt water until it is about a foot and a-half deep. These pits, from some quality in the soil co-operating with the heat of the sun, will become green, and communicate their color to the oysters that are put into them four or five days, though they commonly let them continue there six weeks or two months, in which time they will be of a dark green. The oysters, when the tide comes in, lie with their hollow shell downwards; and, when it goes out, they turn on the other side: they remove not from their place, unless in cold weather, to cover themselves in the ouse. The oysters are sick after they have spat; but in June and July they begin to mend, and in August they are perfectly well.

OSTRICH, *n. s.* Fr. *autruche*, probably from

the Arab *shostrar*; Ital. *strazzo*. A species of *struthio* or cassowary. See STRUTHIO.

Gavest thou the goodly wings unto the peacock? or wings and feathers unto the *ostrich*? *Job xxxix.*

I'll make thee eat iron like an *ostrich*, and swallow my sword like a great pin, ere thou and I part.

Shakespeare.

The Scots knights errant fight, and fight to eat, Their *ostrich* stomachs make their swords their meat.

Cleveland.

Modern *ostriches* are dwindled to mere larks, in comparison with those of the ancients. *Arbuthnot.*

The *ostrich* swallows bits of iron or brass, in the same manner as other birds will swallow small stones or gravel, to assist in digesting or comminuting their food. It lays its eggs upon the ground, hides them under the sand, and the sun hatches them.

Calmet.

OSTRICH. See STRUTHIO.

OSTROGOSH, a large town of European Russia, in the government of Voronez. Of its 11,000 inhabitants, a part are Cossacs, and it contains ten churches, and a number of shops built of brick. At the annual fairs horses and oxen are brought from different parts.

OSWALD (St.), the first Christian king of Northumberland, during the heptarchy. He totally defeated Cadwell, the British monarch, at the village named from him St. Oswald; but was afterwards defeated and killed by Penda, king of Mercia, at Oswestry, on the 5th of August 642. The Pagan barbarian, Penda, cut his body in pieces, and exposed them on stakes, in the field, as trophies of his victory. The priests, therefore, ranked him as a saint and martyr, and pretended to confirm his saintship by miracles.

OSWEGO, a river of New York, which runs from Oneida Lake into Lake Ontario. After a very crooked course of eighteen miles, it meets Seneca River at Three River Point, whence to its mouth it is twenty-four miles. The principal fall is at Volney, twelve miles from Oswego. This is a rapid river, and its navigation is improved by locks and canals.

OSWEGO, a county of New York, bounded north-west by Lake Ontario, north by Jefferson county, east by Lewis and Oneida counties, south by Oneida Lake, Onondaga and Cayuga counties, and west by Cayuga.

OSWESTRY, an ancient market-town of England, in Shropshire; 174 miles from London; with a castle. It was anciently a borough, and is celebrated in Saxon history for the defeat and death of king Oswald. From its situation it was much harassed during the conquest of Wales by Edward I.; and, during the barons wars, king John set fire to the town; it was soon afterwards rebuilt, and again destroyed by Llewellyn, in the year 1233. The town-gates were fixed at the four cardinal points, which are all down, and but few vestiges of the walls are now to be seen. The ancient name of Oswaldstre, Oswald's cross, is supposed to have been derived from Oswald, king of Northumberland, who was killed here in a battle with Penda, king of Mercia, before which time it was called Masefield. The town, in consequence of an act obtained in 1810, has been very considerably improved, and it is now well-paved and lighted. Its church was

formerly a monastery called *Blancminster*. It is spacious, and has a handsome plain tower. In 1542 and 1567 this town suffered much by fire. It is governed by two bailiffs, burgesses, &c., and once carried on considerable trade in Welsh cottons and flannels, which is now much decayed. But, besides a good grammar school, it has an excellent charity school for forty boys, besides girls. There are only two fragments of the castle remaining. It stood on an artificial mount, surrounded by a fosse, extending to the Willow-gate. It is 180 miles north-west of London, and eighteen north of Shrewsbury.

OSYMANDES, or **OSYMANDYAS**, a famous king of Egypt, who, according to some authors, was the first monarch who collected a great number of books for the purpose of forming a library. To this curious collection he gave the curious title of *Pharmacy of the Soul*. 'He appears to have been a prince of great elegance and taste.' *Diodorus Siculus* describes many sumptuous edifices erected by him; among these his palace or mausoleum has been eminently distinguished for the paintings and sculptures with which it was adorned.

OTACOUS TIC, *n. s.* *Gr. ωτα and ακουω*; *Fr. otacoustique*. An instrument to facilitate hearing.

In a hare, which is very quick of hearing, it is supplied with a bony tube; which, as a natural *otacoustick*, is so directed backward as to receive the smallest and most distant sound that comes behind her.

Grew's Cosmologia.

OTAHETEE, or **KING GEORGE THE THIRD'S ISLAND**, an island of the South Sea, discovered by captain Wallis in 1767; visited in 1768 by M. Bougainville; and by captain Cook in 1773 and 1774, who had in 1769 sailed round the island in a boat to observe the transit of Venus. Long. from 149° 13' to 150° 0' W., lat. from 17° 30' to 17° 48' N. The island consists of two distinct parts united by a narrow neck of land; the larger being called by the natives *Tiarrabou*, or *O-Taheitee-Neu*; the smaller one *Opouronou*, or *O-Taheitee-Ete*. The circumference of the whole island is about forty leagues.

The country has a delightfully romantic appearance, rising from the sea like an amphitheatre, and being covered with fruit trees of various kinds, particularly the cocoa-nut. About three miles from the shore the country ascends into lofty hills, terminated in peaks, covered with wood to the summits, from which large rivers are precipitated into the sea. The climate is extremely healthy and pleasant; there is generally a little breeze of wind from east to S. S. E., and the tide rises very little, being governed by the winds. In the published account of the first missionary voyage, it is mentioned that from March till August the thermometer never fell below 65°, and seldom rose above 73°. During the other half of the year the weather is, however, hotter. From December to March the weather is often rainy and tempestuous. The wind blows hard from the west, with rain, and a heavy swell breaks on the shore. During the remainder of the year the easterly wind prevails, with an alternate land and sea breeze.

The islanders, who inhabit huts exposed to all

the winds, and hardly cover the earth, which serves them for a bed, with a layer of leaves, are remarkably healthy and vigorous, and live to old age without enduring any of its infirmities; their senses are acute, and they retain their beautiful teeth to the last. They are subject, however, to several sorts of leprous complaints; some were seen by captain Cook that had ulcers upon various parts of their bodies: yet they seemed little regarded by those who were afflicted with them, and no application whatever was used to them. They are sometimes also afflicted with choleric, and coughs are frequent; the chiefs are sometimes attacked with a disorder similar to the gout, in which the legs are swelled and excessively painful. M. de Bougainville's surgeon had seen many with marks of the small pox. The usual method employed here to restore the sick to health is by incantations, after which the exorcist applies the leaves of the cocoa tree plaited to the fingers and toes.

The soil is a rich fat earth, of a blackish color. It produces spontaneously, or with very slight culture, a great variety of the most excellent fruits; such as the bread-fruit, cocoa-nuts, bananas, plantains, potatoes, yams, sugar-canes, ginger, turmeric; a fruit that grows in a pod like a large kidney-bean; a tree called *wharra*, which produces fruit something like the pine-apple; a species of fern; and the Chinese paper mulberry, of the bark of which they make their cloth; the *ava-ava*, the *barringtonia*, with many other rare plants.

When the trade wind gets far south, and blows fresh, it generally rains on the south side of the island, bringing the clouds from the mountains of *Tiarrabou*. This occasions a great difference in the bread-fruit season between the north and south sides of the island. The great bread-fruit harvest commences on the northern side about November, and continues till the end of January; whilst, on the south side, in some parts, it begins in January, and continues in different districts till November. But though this is the case with the general harvest, on both sides of the island, there are some kinds of bread-fruit, though scarce, in season all the year in the district of *Attahooroo*. The different species of the same tree amount to thirty.

On the hills the soil changes from the rich loam into various veins of red, white, dark, yellow, or bluish earth, clay, or marl: in the red are found stones resembling cornelian or flint; but being full of veins, though they will strike fire with steel, they break on a second stroke. The white appears a pipe-clay, or fuller's earth; the dark a fine fat mould, probably the decayed parts of vegetable substances; the yellow is mixed with gravel; the blue a marly substance. These are all found in digging ten or twelve feet, and the under stratum appears a soft sandstone of a brownish color, intermixed with hard rock. The hills also afford a blackish stone, a kind of lava, in pieces of eight or ten feet long, and from four to ten inches thick, of which they formerly made their stone tools: it is of a fine grain, though not very hard, nor apt to splinter; which answered best the purposes of the natives, as they could thus bring them more easily to an

edge; but at every stroke almost their adzes required whetting, and two-thirds of their time nearly was employed in this labor. The beds of the rivers consist of stones and gravel; many of which contain a glassy substance, and will melt in a strong fire; others are more infusible, and many are found like pumice stone. In powder the magnet attracts many particles. In the district of Matavia is a cliff called Peeha, which one of the missionaries describes as formed of an immense number of oblong pieces of stone, strongly cemented together, and hanging in a very romantic manner. It is about eighty or ninety feet high, and twice as broad; at the bottom runs the largest river in the island. This is probably basaltic. The mountains are in some parts bare and full of precipices, broken as by earthquakes. In the bosom of those which bound the district of Vyeorede there is a large freshwater lake called Vyeheerea, which the natives say cannot be sounded with any line, and contains very large eels. On the banks many inhabitants are seated, who have plenty of all sorts of provisions, except the bread-fruit, for which they substitute the mountain plantain. This lake empties itself into the valley of Vyeorede.

The bay of Matavai has safe anchorage during eight months of the year, but is dangerous from December to March. The weather is in general temperate; captain Cook, and all the other navigators by whom this island have been since visited, concur in stating that they were not incommoded by the heat.

The food of the common people entirely consists of the bread-fruit, bananas, plantains, yams, apples, and a sour fruit, which, though not pleasant by itself, gives an agreeable relish to roasted bread-fruit, with which it is frequently beaten up. The flesh, which is reserved for the tables of the great, is that of poultry, hogs, or dogs: the flesh of their fowls is not well tasted, but that of dogs is esteemed by the natives beyond pork. The dogs are fed on vegetables, and never allowed to taste animal food. The smaller fish are generally eaten raw, as we eat oysters: every thing that can be procured from the sea is made an article of their food. To dress their food they kindle a fire, by rubbing the end of one piece of dry wood upon the side of another. They then dig a pit about half a foot deep, and two or three yards in circumference; they pave the bottom with large stones, which they lay down very smooth and even, and then kindle a fire in it with dry wood, leaves, and the husks of cocoa-nuts. When the stones are sufficiently heated, they take out the embers, and rake up the ashes on every side; they then cover the stones with a layer of green cocoa-nut leaves, and wrap up the animal that is to be dressed in the leaves of the plantain. When it is placed in the pit, they cover it with the hot embers, and lay upon them bread-fruit and yams, which are also wrapt up in the leaves of plantain. They were quite unacquainted, when first visited, with the method of boiling water, and had no vessels among them that would bear the fire. Their general drink was water, or the milk of the cocoa-nut. They showed in general an aversion to strong liquors; and, when one of them happen-

ed to drink so freely with any of the ship's company as to be intoxicated, he resolutely refused to taste any thing that was likely to produce the same effect again; but they have a plant called ava-ava, from the root of which they procure a liquor which has an inebriating quality. The quantity of food which they eat at a meal is prodigious. Captain Cook says, he has seen one man devour two or three fishes as big as a perch; three bread-fruits, each bigger than two fists; fourteen or fifteen plantains, or bananas, each six or seven inches long and four or five round; and nearly a quart of the pounded bread-fruit. Men of rank are constantly fed by their women. They have also a kind of fermented paste called mahie. The men and women never eat together.

The government is monarchical and hereditary. There is also an aristocracy, consisting of the chiefs of the several districts, some of whom are supreme in one district, and exercise in their own territories all regal power, yet still subject to the monarch as their sovereign paramount. There is a third rank next to these, namely, rattira, or gentlemen; and another class of them who cultivate the land, and a fifth class of servants. In the scale of rank birth enjoys singular distinction. A chief is always a chief; and though expelled from his command, losing his district, or having his honors transferred to his child, he continues noble; on the other hand no acquisition can raise a common man to a higher station than that of towha, or rattira: yet the meanest are in no slavish dependence. The honor and respect which they pay their chief is rather through force of custom than the fear of punishment. They are admitted as their companions on all occasions, and treated with perfect freedom; indeed in outward appearance they can hardly be distinguished. The king is not averse to converse with the lowest of his subjects, or to be their visitor; and never treats them with hauteur. His retinue is often changing: no man serves him longer than he pleases. They have no wages, nor engage for any stated time, though some remain in the same family all their lives; and these ancient domestics are as much respected as their own relations.

They have no writing or records respecting property, but memory and landmarks. Every man knows his own; and he would be thought of all characters the basest who should attempt to infringe on his neighbour, or claim a foot of land that did not belong to him or his adopted friend; for the tayo may use it during his friend's lifetime, and, if he has no child, possess it at his death. If a man bequeaths his property to another on his death-bed, no person disputes the bequest, as there are always witnesses abundant to the gift, if the heir is not present. The landmarks set by their ancestors the father points out to the son or heir; should any dispute arise, multitudes know where the mark stood, and the matter is in general easily settled. Indeed it is much the same in all litigations; the case is referred to a by-stander, and the party which he declares in the wrong submits, and makes the other a peace-offering of the plantain-stalk. If any matter of serious offence is given, the whole family or district take it up, and go to

war with their adversaries ; but, if they choose not to fight, a peace-offering must be made, which is never refused : if they will fight the weakest must suffer ; and, as all the relations adopt the quarrel, there is sometimes much bloodshed.

The chief use which they make of their houses is to sleep in ; for, unless it rains, they generally eat in the open air. These houses are sheds, not quite four feet from the ground, raised on three rows of pillars, and erected on an oblong square ; their width is nearly half their length. They are all built in the woods between the sea and the mountains. The roof resembles our thatched houses in England, and consists of two flat sides inclining to each other, covered with palm-leaves. The floor is covered with hay, over which they spread mats. Some of these huts are furnished with a stool, and a few blocks of wood, which being square, one side is hollowed into a curve ; and these they use as pillows. In these open dwellings the whole family repose at night. Their day-clothes are their only night covering.

The stature of the men, in general, is from five feet seven to five feet ten inches : the tallest men seen by captain Wallis measured six feet three inches and a half ; and captain Cook, in his second voyage, describes O-Too, the king of Otaheitee, to be of that height. They are of a pale brown complexion ; their hair in general is black, and finely frizzled ; they have black eyes, flat noses, large mouths, and white teeth ; the men wearing their beards in many fashions, but all of them pluck out a great part. The women, in general, are much smaller, especially those of the lower ranks, which is attributed to their early and promiscuous intercourse with the men ; the better sort are above the middle stature of Europeans. Their skin is most delicately smooth and soft ; they have no color in their cheeks ; their nose is generally somewhat flat, but their eyes are full of expression, and their teeth beautifully even and white. 'The women,' says M. de Bougainville, 'have features not less agreeable than the generality of Europeans, and a symmetry of body and beautiful proportion of limbs, which might vie with any of them. Some have their hair brown, red, or flaxen, in which they are exceptions to all the natives of Asia, Africa, and America, who have their hair black universally ; here, in the children of both sexes, it is generally flaxen. The strongest expression is painted in the countenances of these people ; their walk is graceful, and all their motions are performed with great vigor and ease.' When Vancouver visited the island, he did not find that the personal attractions of the women corresponded to the accounts of former navigators. According to the account of the natives, they had fallen off in their looks, which they attributed to their indiscriminate commerce with the Europeans, and to the loathsome diseases they had received from their visitors.

The language of these islanders is soft and melodious, abounding with vowels ; it was found very difficult to teach the natives to pronounce a single English word ; but Spanish and Italian words ending in a vowel they pronounce with the greatest ease. They called captain Cooke

Toote, Mr. Hicks, the first lieutenant, Hote, &c., and gave their own names to almost every man in the ship.

The Otaheiteans are industrious, and friendly in their dispositions ; but, like all other nations not fully civilised, their passions are violent, and they are very fickle. Bougainville says, 'even in Europe itself one cannot see more expert filchers than the people of that country.' They are lascivious almost beyond credibility. A number of the principal people are said to have formed themselves into a society, in which every woman is common to every man. This society is named Arreoy. If any of the female members prove with child, unless she can procure some man to adopt the child as his own, not all the strong affections of a mother can save the life of the pre-condemned innocent ; but the child as soon as born is smothered, and the mother is left at liberty to renew her former course of execrable prostitution. Should any man co-operate with a woman in saving the life of a child, they are both excluded for ever from the arreoy, and are considered as man and wife. Both men and women wash their whole bodies three times a day in running water, and are remarkably cleanly. They are most expert swimmers, being accustomed to the water from their infancy. 'Their countenances,' says captain Cook, 'very remarkably express the abundant good nature which they possess, and are entirely free from that savage keenness which marks nations in a barbarous state. Their peaceable disposition is evinced from the friendly reception all strangers have met with who have visited them. Instead of offering to attack them openly or clandestinely, as has been the case with most of the inhabitants of these seas, they have never appeared in the smallest degree hostile, but, on the contrary, like the most civilised people, have courted an intercourse with their visitors by bartering, which is the only medium that unites all nations in a sort of friendship.'

The principal manufacture among the Otaheitan is cloth, made of the bark of trees, which are of three kinds, viz. the Chinese mulberry-tree, or aouta ; the bread-fruit tree, or ooro ; and one that is described by Dr. Hawesworth as resembling the wild fig-tree of the West Indies. (Of all these the paper mulberry affords the best cloth ; being both finer, softer, whiter, and better suited to take a color ; the ooro produces cloth much inferior in contexture ; and the last is very coarse, in color resembling the darkest brown paper ; but this last is the only kind that withstands water. They likewise prepare a red dye ; made by mixing the yellow juice of a small species of fig, which the natives call matee, with the greenish juice of a sort of fern or bindweed, or of several other plants, which produce a bright crimson : and this the women rub with their hands, if the piece is to be uniformly of a color ; or they make use of a bamboo reed, if the piece is to be marked or sprinkled into different patterns : they also make finer mats than any in Europe. Rushes, grass, the bark of trees, and the leaves of a plant called wharrow, are their materials, and the matting is applied to various uses. The coarser kind is employed for sleep-

ing or sitting on; the finer sort its used for garments. They are dexterous too in making basket and wicker-work. Ropes and lines are made of the bark of a tree; and the fibres of the cocoa-nut furnish them with thread, with which they fasten the different parts of their canoes, &c. The bark of a nettle which grows in the mountains, called *orawa*, supplies them with excellent fishing-lines; their hooks are made of mother-of-pearl, to which they fix a tuft of hair, made to resemble the tail of a fish. The point is turned inwards. They make also a kind of seine of a coarse broad grass, the blades of which are like flags. These they twist and tie together in a loose manner, till the net, which is about as wide as a large sack, is from sixty to eighty fathoms long. This they haul in smooth shoal-water; and its own weight keeps it so close to the ground that scarcely a single fish can escape. Their cane harpoons, pointed with hard wood, are very effectual weapons. Tools used by the Otaheiteans are, an adze made of a kind of basaltes, of a gray or blackish color, not very hard, but of considerable toughness; a chisel or gouge of bone, generally the bone of a man's arm between the wrist and elbow; a rasp of coral, and the skin of a sting-ray; also coral and sand, as a file or polisher. With such tools they generally take up several days in felling a tree; but after it is down, and split into planks, they smooth them very expeditiously with their adzes, and can take off a thin coat from a whole plank without missing a stroke.

The men of consequence wear the nails of their fingers long, as a badge of distinction. The women always cut their hair short round their heads. Both sexes tattoo the hinder part of their thighs and loins with black lines in various forms; these marks are made by striking the teeth of an instrument somewhat like a comb just through the skin, and rubbing into the punctures a kind of paste made of soot and oil, which leaves an indelible stain. Both sexes are gracefully clothed. Their dress consists of two pieces of this cloth; one of them, having a hole in the middle to put the head through, hangs from the shoulders to the mid-leg before and behind; another piece between four and five yards long, and about one broad, they wrap round the body; this cloth is made like paper, of the macerated fibres of the inner bark spread out and beaten together. Their ornaments are feathers, flowers, pieces of shell, and pearls; the pearls are worn chiefly by the women. In wet weather they wear matting. They have a custom also of anointing their heads with what they call *monoe*, an oil expressed from the cocoa-nut, in which some sweet herbs or flowers have been infused: as the oil is generally rancid, the smell is at first very disagreeable to a European; and as they live in a hot country, and never use a comb, they are not able to keep their heads free from lice, which the children and common people pick out and eat; a custom wholly different from their manners in every other particular, for they are delicate and cleanly, almost without example; and those to whom captain Cook distributed combs, soon delivered themselves from vermin. Later voyagers, however,

give the same account of their filthiness in this respect as Cook. Since captain Cook was here the number of the inhabitants on the island is much decreased; it is not now supposed to contain above 5000 souls.

The priesthood seems to be hereditary in one family or tribe; and is said to be numerous. These priests are professedly the men of science and medicine. They teach that the Supreme Deity, besides many female descendants, has one son named Tane, and to him they direct their worship, though they do not believe that the good or bad conduct of mankind on earth makes them more or less acceptable to him. They believe the existence of the soul after death, and of a greater or less degree of happiness to be then enjoyed; but they seem to have no conception of a state of punishment hereafter. The share of happiness they imagine every individual will enjoy in this future state will be assigned to him according to the rank he holds on earth. Much parade is used in their attempts to recover the sick, though their remedies consist only of ridiculous ceremonies and enchantments. The marriages are secular contracts; but no one has a right to perform tattooing except the priests; and, this being a custom universally adopted, it may be supposed that the performing it is a lucrative employment. The males in general undergo a kind of circumcision which is likewise the exclusive privilege of the priests to perform. But what most establishes the credit of this order of men is their skill in astronomy and navigation.

Captain Cook saw a wicker representation of *Mauwe*, one of their *Eatuas*, or gods of the second class, which was said to be the only one of the kind in Otaheite. It was seven feet high. These people pray at sun-rise and sun-set. Our navigator, who had some reason to believe that, among the religious customs of this people, human sacrifices were sometimes offered up to their deities, went to a *morai*, or place of worship, accompanied by captain Furneaux, having with them a sailor who spoke the language tolerably well, and several of the natives. In the *morai* was a *tupapow*, a kind of bier, with a shed erected over it, on which lay a corpse and some provisions. Captain Cook asked if the plantain were for the *Eatua*? If they sacrificed to the *Eatua* hogs, dogs, fowls, &c.? To which an intelligent native answered in the affirmative. He then asked if they sacrificed men to the *Eatua*? He was answered, 'bad men they did; first beating them till they were dead.' He then asked if good men were put to death in this manner? His answer was No. He gathered that men for certain crimes were condemned to be sacrificed to the gods, provided they did not possess any property, which they might give for their redemption. It seems to rest with the high-priest to single out the victims for sacrifice.

The dead bodies are placed in the open air till the bones become quite dry: a shed was erected on one occasion close by the house where the deceased had resided; it was about fifteen feet long, and eleven broad; one end was left quite open; the other end and the two sides were partly enclosed with a sort of wicker-work. The

bier was a frame of wood, like that on which the sea beds, called cots, are placed, with a matted bottom, and supported by four posts, at the height of about four feet from the ground. The body was covered first with a mat, and then with white cloth; by the side of it lay a wooden mace, one of their weapons of war; and near the head of it, which lay next to the close end of the shed, lay two cocoa-nut shells; at the other end a bunch of green leaves, and some dried twigs, all tied together, were stuck in the ground, by which lay a stone about as big as a cocoa-nut. Near these lay one of the young plantain-leaves that are used for emblems of peace, and close by it a stone axe. At the open end of the shed also hung, in several strings, a great number of palm-nuts; and without the shed was stuck up in the ground a stem of a plantain-tree, about six feet high, upon the top of which was placed a cocoa-nut shell full of fresh water; against the side of one of the posts hung a small bag, containing a few pieces of bread-fruit ready roasted. The food so placed by the corpse seemed designed as an offering to their gods. They cast in, near the body, small pieces of cloth, on which the tears and blood of the mourners have been shed; for in their paroxysms of grief it is a universal custom to wound themselves. The mourner is always a man; and he is dressed in a very singular habit. When the bones are stripped of their flesh, and become dry, they are buried.

The mourning which is worn here is a head-dress of feathers, the color of which is consecrated to death, and a veil over the face. The whole nation is said to appear thus on the death of their king. The mourning for fathers is very long. The women mourn for their husbands, but not the husbands for their wives.

Their boats or canoes are of different sorts. Some are made out of a single tree, and hold from two to six men. These are principally employed in fishing; others are constructed of planks very dexterously sewed together; they will sometimes hold from ten to forty men; they generally lash two of these together, and set up two masts between them; or, if they are single, they have only one in the middle; and in these vessels they will sail far beyond the sight of land. A third sort seems to be principally designed for pleasure. These are very large, but have no sail; and in shape resemble the gondolas of Venice. The plank of which these vessels are constructed is made by splitting a tree, with the grain, into as many thin pieces as possible. The boards are brought to the thickness of about an inch, and are afterwards fitted to the boat with great exactness. To fasten these planks together, holes are bored with a piece of bone, fixed into a stick for that purpose. Through these a kind of plaited cordage is passed, so as to hold the planks strongly together. The seams are caulked with dry rushes; and the whole outside of the vessel is painted over with a kind of gummy juice, which supplies the place of pitch. Their weapons are slings, which they use with great dexterity; pikes headed with the skins of sting-rays, and clubs of about six or seven feet

long, made of a very hard wood. Thus armed, they fight with great obstinacy, and give no quarter to man, woman, or child, who happens to fall into their hands during the battle, nor for some time afterwards, till their passion subsides. They have likewise bows and arrows; but the latter are headed only with stone, and none of them pointed. They have targets of a semicircular form, made of wicker-work, and plaited strings of the cocoa-nut; fibres, covered with glossy bluish green feathers belonging to a kind of pigeon, and ornamented with sharks' teeth, arranged in three concentric circles.

European visits led to the attempt to establish missionaries on this island; but, after various efforts to introduce Christianity and the arts of civilised life, those worthy laborers were compelled to retreat.

OTAKOOTAI, or Wenooaette, an island in the South Pacific Ocean, about three miles in circumference, discovered by Cook in the year 1777. The beach within the reef is composed of a white coral sand, and the land within does not rise above six or seven feet: it is entirely destitute of water. The only common trees found there were cocoa-palms, of which there were several clusters; and vast numbers of the wharra. The only bird seen was a beautiful cuckoo, of a chestnut brown, variegated with black. But upon the shore were some egg-birds, a smaller sort of curlew, blue and white herons, and great numbers of noddies. Though there were at this time no fixed inhabitants, indubitable marks remained of its being, at least occasionally, frequented. Long. 201° 37' E., lat. 19° 51' S.

OTFORD, a town of England, in Kent, celebrated for a battle between the two Saxon kings, Offa of Mercia, and Alrick of Kent, who was killed by Offa; and another in 1016, wherein the Danish king Canute was routed by king Edmund Ironside. Offa, to atone for the blood he had shed in that battle, gave this place to Christchurch, Canterbury (as the deed says), in pascua porcorum, 'for feeding the archbishop's hogs;' and so it remained in the archbishop's liberty, till exchanged with king Henry VIII. for other lands. There was a chantry founded at the Ryehouse in this parish.

ent; not this; not the same; not I or he; something beside; correlative to each; the remaining one of two; the next; the third part; other gates (from other and gates, meaning way) is in another manner: otherwise, in other places: otherwise, in a different manner; or in different respects; by or from other causes.

In lowliness of mind let each esteem *other* better than themselves. *Philip. ii. 3.*

Of good actions some are better than *other* some. *Hooker.*

They only plead that whatsoever God revealeth, as necessary for all Christian men to do and believe, the same we ought to embrace, whether we have received it by writing or *otherwise*, which no man denieth. *Id*

As Jews they had access to the temple and synagogues, but as Christians they were of necessity forced *otherwise* to assemble themselves. *Id.*

The dismayed matrons and maidens, some in their houses, *other* some in the churches, with floods of tears and lamentable cries, poured forth their prayers to the Almighty, craving his help in that their hard distress. *Knolles.*

Were I king,
I should cut off the nobles for their lands;
Desire his jewels and this *other's* house.

Shakespeare.

Will it not be received

That they have don't?

—Who dares receive it *other*!

Id.

If Sir Toby had not been in drink, he would have tickled you *othergates* than he did. *Id.*

Sir John Norris failed in the attempts of Lisbora, and returned with the loss, by sickness and *otherwise*, of eight thousand men. *Raleigh.*

Physicians are some of them so conformable to the humour of the patient, as they press not the cure of the disease; and some *other* are so regular in proceeding according to art, as they respect not the condition of the patient. *Bacon.*

Bind my hair up: as 'twas yesterday?

No, nor the *other* day.

Ben Jonson.

The king had all he craved, or could compel,
And all was done—let *others* judge how well.

Daniel.

His godlike acts, and his temptations fierce,
And former sufferings *otherwise* are found.

Milton.

The evidences for such things are not so infallible, but that there is a possibility that the things may be *otherwise*. *Wilkins.*

I can expect no *other* from those that judge by single sights and rash measures, than to be thought fond or insolent. *Glanville.*

Scotland and thou did each in *other* live,
Nor would'st thou her, nor could thee she survive.

Dryden.

He that will not give just occasion to think that all government in the world is the product only of force and violence, and that men live together by no *other* rules but that of beasts, where the strongest carries; and so lay a foundation for perpetual disorder and mischief, tumult, sedition, and rebellion; things that the followers of that hypothesis so loudly cry out against, must of necessity find out another state of government. *Locke.*

There is that controlling worth in goodness, that the will cannot but like and desire it; and, on the *other* side, that odious deformity in vice, that it never offers itself to the affections of mankind but under the disguise of the *other*. *South.*

In these good things, what all *others* should practise, we should scarce know to practise *otherwise*. *Sprat.*

Thy father was a worthy prince,
And merited, alas! a better fate;
But heaven thought *otherwise*.

Addison's Cato.

Never allow yourselves to be idle, whilst *others* are in want of any thing that your hands can make for them. *Low.*

Men seldom consider God any *otherwise* than in relation to themselves, and therefore want some extraordinary benefits to excite their attention, and engage their love. *Rogers.*

No leases shall ever be made *other* than leases for years not exceeding thirty-one, in possession, and not in reversion or remainder. *Swift.*

I have long discontinued this practice, and many *others* which I found necessary to adopt, that I might

escape the worst of all evils, both in itself and in its consequences—an idle life. *Couper.*

Sure never were seen two such sweet little ponies; *Other* horses are clowns, and these macaronies; And to give them this title I'm sure is 'not wrong, Their legs are so slim and their tails are so long.

Sheridan.

And the pale smile of beauties in the grave,
The charms of *other* days, in starlight gleams
Glimmer on high; their buried locks still wave
Along the canvas. *Byron.*

OTHNIEL, the celebrated judge of Israel, was the son of Kenaz, of the tribe of Judah. We are told (Joshua xv. 17 and Judges i. 13) that he was Caleb's younger brother. But, if Caleb and Othniel had been brothers, the latter could not have married his niece Achsah the daughter of Caleb. The Scripture mentions Kenaz as father to Othniel, and Jephunneh as the father of Caleb. It is therefore supposed that Kenaz and Jephunneh were brothers, and that Othniel and Caleb were cousin-germans, and in this sense to be brothers according to the language of Scripture. Thus, Achsah being but second-cousin in respect of Othniel, he might marry her consistently with the letter of the law. The heroism by which he obtained Achsah is recorded in Joshua xv. 16, 17: and the still greater heroism by which he delivered his country from the oppressions of Chushanrishathaim, A. M. 2599, is recorded in Judges iii. 9—11. Whether he judged Israel during the forty years of peace that followed is uncertain.

OTHO, a tribune of the people, who, in Cicero's consulship, introduced a regulation to permit the Roman knights at public spectacles to have the fourteen first rows after the seats of the senators. This was opposed with virulence by some, but Cicero ably defended it.

OTHO (M. Salvius), the eighth emperor of Rome, born A. D. 32, of a family descended from the ancient kings of Etruria. He was among the number of Nero's favorites, was raised to the highest offices of the state, and made governor of Pannonia by the interest of Seneca, who wished to remove him from Rome, lest Nero's love for Poppæa should prove his ruin. After Nero's death, Otho conciliated the favor of Galba the new emperor; but, when Galba refused to adopt him as his successor, he procured his assassination, and proclaimed himself emperor. He was acknowledged by the senate, but the sudden revolt of Vitellius in Germany rendered his situation very precarious. Otho obtained three victories; but in a general engagement near Brixellum his forces were defeated, and he stabbed himself when all hopes of success had vanished, in the thirty-seventh year of his age, after a reign of about three months. The last moments of Otho's life were those of a philosopher. He comforted his soldiers who lamented his fortune, and, expressing his concern for their safety, observed, that it was better that one man should die than that all should be involved in ruin on account of his obstinacy. His nephew was much affected, and feared the anger of the conqueror; but Otho observed, that Vitellius would be kind to the relations of Otho, since, in the time of their greatest enmity, the mother of Vitellius had received every friendly

treatment from his hands. He also burnt the letters which, by falling into the hands of Vitellius, might provoke his resentment against those who had favored the cause of an unfortunate general. His father was a favorite of Claudius.

OTHONNA, in botany, African ragwort, a genus of the polygamia necessaria order, syngenesia class of plants; natural order forty-ninth, composite: receptacle naked; there is almost no pappus: *cal.* monophyllous, multifid, and nearly cylindrical. Species one, a native of the south of Europe.

OTHRYADES, one of the 300 Spartans who fought against 300 Argives, when those two nations disputed their respective right to Thyreata. Two Argives, Alcinoor and Cronius, and Othryades, survived the battle. The Argives went home to carry the news of their victory; but Othryades, who had been reckoned among the number of the slain on account of his wounds, recovered himself, and carried some of the spoils of which he had stripped the Argives into the camp of his countrymen; and after he had raised a trophy, and had written with his own blood the word *vici* on his shield, he killed himself, unwilling to survive the death of his countrymen.

OTHUS and EPHEALTES, in mythology, two giants, sons of Neptune by Iphimedia, the wife of the giant Aloeus; who educated them as his own, whence they were called Aloeides. They grew nine inches every month, and were only nine years old when they made war against the gods; but were slain by Apollo and Diana. They built the town of Asera, at the foot of Mount Helicon.

OTIS, in ornithology, a genus of birds belonging to the order of grallæ. There are several species, principally distinguished by their color. One of these,

O. tarda, the bustard, is the largest of the British land fowls; the male at a medium weighing twenty-five pounds; there are instances of some very old ones weighing twenty-seven: the breadth nine feet; the length nearly four. Besides the size and difference of color, the male is distinguished from the female by a tuft of feathers about five inches long on each side of the lower mandible. Its head and neck are ash-colored: the back is barred transversely with black and bright rust color: the greater quill-feathers are black: the belly white: the tail is marked with broad red and black bars, and consists of twenty feathers: the legs are dusky. The female is about half the size of the male: the crown of the head is of a deep orange, traversed with black lines; the rest of the head is brown. The lower part of the fore side of the neck is ash-colored: in other respects it resembles the male, only the colors of the back and wings are far more dull. These birds inhabit most of the open countries of the south and east parts of England, from Dorsetshire, as far as the Wolds in Yorkshire. They are exceedingly shy, and difficult to be shot; run very fast, and when on the wing can fly, though slowly, many miles without resting. They take flight with difficulty, and are sometimes run down with greyhounds. They keep near their old haunts, seldom wandering above

twenty or thirty miles. Their food is corn and other vegetables, and those large earth worms that appear in great quantities on the Downs before sun-rising in the summer. These are replete with moisture, answer the purpose of liquids, and enable them to live long without drinking on those extensive and dry tracts. Besides this, the males have an admirable magazine for their security against drought, being a pouch, whose entrance lies immediately under the tongue, and which is capable of holding nearly seven quarts; this they fill with water, to supply the hen when sitting, or the young before they can fly. Bustards lay only two eggs, of the size of those of a goose, of a pale olive brown, marked with spots of a dark color; they make no nest, only scrape a hole in the ground. In autumn they are (in Wiltshire generally found in large turnip fields near the Downs, and in flocks of fifty or more.

OTODINI, OTTADINI, or OTTODINI, a nation of ancient Britons, seated on the north-east of the Brigantes, in the countries now called Northumberland, Merse, and the Lothians. As the Otodini are not mentioned by any of the Roman historians, but only by Ptolemy, it is uncertain whether they formed a distinct independent state, or were united with the Brigantes. They were, however, a considerable people, and possessed a long tract of the sea coast, from the Tyne to the Frith of Forth. Their name is derived by Baxter from the old British words *Ot o dineu*, which signify a high and rocky shore; descriptive enough of their country. They were probably reduced by Agricola at the same time with their more powerful neighbours the Brigantes; but, as they lived without the wall of Severus, they were, like the rest of the *Mæatæ*, engaged in frequent revolts. In the most perfect state of the Roman government in this island, the country of the Otodini made a part of the Roman province called Valentia; which comprehended all that large tract between the two walls. As this province was never long together in the peaceable possession of the Romans, they had but few stations in the country of the Otodini, except those on the line of the wall of Severus. Various opinions are entertained among the learned respecting the real situation of the Otodini; and it is even doubtful whether their country was in England or in Scotland. The celebrated Drummond of Hathornden contends for the latter. From Dr. Henry's description, above quoted, it appears to have been in part of both.

OTRANTO, or TERRA D'OTRANTO, a province of Naples, forming the south-east extremity of Italy, having the gulf of Taranto on the west, and the Adriatic on the east. It has a superficial extent of 2600 square miles; and, though mountainous, is very fertile. It suffers, however severely from a want of water. The chief product is olives, whole forests of which grow wild cotton, tobacco, vines, and fruits. On the hills is found noble pasturage; and, on the sea-coast, abundant encouragement to fishing. Otranto is divided into the three districts of Lecce (the capital), Taranto, and Messagna. Population 292,000.

OTRANTO, a fortified town in the Neapolitan province to which it gives name, on the Adriatic.

It is miserably built and decayed; and its inhabitants do not amount to more than 2400. They carry on some trade in olive-oil. In 1810 Fouché, Buonaparte's minister of police, received the title of duke of Otranto. Thirty-three miles east by north of Gallipoli, and eighty east by south of Taranto.

OTRANTO, CAPO DI, a cape of Italy, on the coast of the Adriatic, a few miles south of the town of Otranto.

OTRAR, or Farab, a town of independent Tartary, on the Arsch, formerly a place of considerable extent. It is stated that Timur died at this place; but other accounts represent his death to have taken place at Samarcand. 110 miles north-west of Tocat.

OTTER, *n. s.* Sax. *otter*; Goth. *otr*; Teut. *otter*; Dan. *odder*; Sans. *ood*. An amphibious animal. See below.

The toes of the *otter's* hinder feet, for the better swimming, are joined together with a membrane, as in the bevir; from which he differs principally in his teeth, which are canin; and in his tail which is felin, or a long taper: so that he may not be unfitly called *putoreus aquaticus*, or the water polecat. He makes himself burrows on the water side as a bevir; is sometimes tamed, and taught, by nimbly surrounding the fishes, to drive them into the net.

Grew.

At the lower end of the hall is a large *otter's* skin stuffed with hay.

Addison's Spectator.

Would you preserve a numerous finny race?

Let your fierce dogs the ravenous *otter* chase;

The amphibious monster ranges all the shores,
Darts through the waves, and every haunt explores.

Gay.

OTTER, in zoology. See MUSTELA.

OTTER CREEK, a river of Vermont, United States, which rises near Dorset, and runs west of north, passes by Rutland, Pittsford, Brandon, Middlebury, New Haven, Vergennes, besides other towns, and flows into Lake Champlain, at Basin Harbour, in Ferrisburg. It is navigable for sloops to Vergennes, six miles. Length eighty-five miles.

OTTER CREEK, a river of Kentucky, which runs into the Ohio, long. 86° 24' W., lat. 37° 45' N. Also a river of Vermont.

OTTERBURN, a town of Northumberland, near Ellesdon. It was the field of battle between the English and Scots in 1388, wherein Henry Percy, called Hotspur, was taken prisoner, and Douglas the Scotch general was killed. On this battle was founded the old ballad of Chevy-chase; the village being situated by the river Rhead, on the south side of the Cheviot Hills. The entrenchments are still visible; and a number of tumuli scattered over the adjacent ground mark the slaughter made there. It lies twenty-one miles from Morpeth.

OTTERY, ST. MARY'S, a market town in Devonshire, 159 miles west of London, and ten miles east of Exeter. Its market is on Tuesday, and it has two fairs. The church is very ancient, and resembles a cathedral. A very extensive woollen manufactory was established here by Sir George Yonge and Sir John Duntze, barts. It derived its name from the Otter, and that from the otters formerly found in it. This town was given by king Edward the Confessor to the

church of St. Mary at Rouen in Normandy; but was afterwards bought by Grandison bishop of Exeter, who made of it a quarter college in the reign of Edward III., and therein placed secular priests, with other ministers, to whom he gave the whole manor, parish, tythes, fines, spiritual profits, &c., which amounted to £304 2s. 10d. yearly.

OTTOGANO, or OTTAGANO, a fine old town of Italy, Naples, situated at the eastern base of Mount Vesuvius, about twelve miles east of Naples. The town is understood to owe its name and origin to the ancient Roman villa of Octavianum. It contains three churches, and a castle on the top of an adjacent hill. A large proportion of the inhabitants, about 14,000, support themselves by cultivating gardens.

OTTOMAN PORTE, a title given by Europeans to the grand signior, or the Turkish emperor; from Othoman, the first emperor of the Turks. It is also used metaphorically for the Turkish power, and often simply for the Porte by way of emphasis.

OTWAY (Thomas), an eminent tragic poet, the son of Mr. Humphry Otway, rector of Wolbeding in Sussex; was born at Trotin in that county on the 3d of March 1651. He was educated at Oxford; but went to London, where he became a player, with but indifferent success. However, the sprightliness of his conversation gained him the favor of Charles Fitz-Charles, earl of Plymouth, who procured him a cornet's commission in one of the regiments sent into Flanders; but he returned in very necessitous circumstances, and applied himself to writing for the stage. In comedy he has been deemed too licentious; which, however, was no great objection to his pieces in the profligate days of Charles II. But, in tragedy, few English poets have ever equalled him; and perhaps none ever excelled him in touching the tender passions. There is generally something familiar and domestic in the fable of his tragedies, and there is amazing energy in his expression. But though Otway possessed in so eminent a degree the rare talent of writing to the heart, yet he was not always successful in his dramatic compositions. Dr. Johnson gives this account of his death:—'He died in a manner which I am unwilling to mention. Having been compelled by his necessities to contract debts, and haunted, as is supposed, by terriers of the law, he retired to a public-house on Tower Hill, where he died of want; or, as it is related by one of his biographers, by swallowing, after a long fast, a piece of bread which charity had supplied. He went out, as is reported, almost naked, in the rage of hunger, and finding a gentleman in a neighbouring coffee-house, asked him for a shilling. The gentleman gave him a guinea; and Otway going away bought a roll, and was choked with the first mouthful. All this, I hope, is not true; but that indigence, and its concomitants sorrow and despondency, brought him to the grave, has never been denied.' The doctor adds, that Otway had not much cultivated versification, nor much replenished his mind with general knowledge. His principal power was in moving the passions, to which Dryden in his latter years

left an illustrious testimony. He appears by some of his verses to have been a zealous royalist ; and, as was in those times the common reward of loyalty, he lived and died neglected.'—His dramatic writings are nine in number; the most admired are, *The Orphan*, and *Venice Preserved*. He also made some translations, and wrote several miscellaneous poems. His whole works are printed in two pocket volumes. He wrote four acts of a play, which are lost.

OUACHITTA, or **WACHITTA**, or **WASHTA**, a river of North America, which rises in the Missouri Territory, enters Louisiana, and, pursuing a S. S. E. course, joins Red River, about twenty-three miles from its mouth. About thirty miles by the course of the river above its junction with Red River, it is joined by the Tensaw and Ocatahoola, and after its junction it usually takes the name of Black River.

OUACHITTA (False), is a branch of Red River, which it joins between long. 98° and 99° west.

OVAL, *adj.* & *n. s.* *Fr. oval*; of *Lat. ovum*, an egg. Of an egg shape.

The mouth is low and narrow, but, after having entered pretty far in the grotto, opens itself on both sides in an oval figure of an hundred yards.

Addison.

Mercurius, nearest to the central sun,

Does in an oval orbit circling run ;

But rarely is the object of our sight

In solar glory sunk.

Blackmore.

A triangle is that which hath three angles, or an oval is that which has the shape of an egg.

Watts's Logick.

OVAL is an oblong curvilinear figure, otherwise called ellipsis. See **ELLIPSIS**. However, the proper oval, or egg shape, differs considerably from that of the ellipsis, being an irregular figure, narrower at one end than at another ; whereas the ellipsis, or mathematical oval, is equally broad at each end ; though, it must be owned, these two are commonly confounded together ; even geometers calling the oval a false ellipsis.

OVAQUAPHENOGAW, or **OKEFONOCO**, or **EKANFANOKA**, or **OKERFONOKE**, a marshy lake in the state of Georgia, between the Oakmulgee and Flint Rivers. It is about 280 miles in circumference. In wet seasons it appears like an inland sea with several fertile islands.

OVAR, a brisk trading town of the central part of Portugal, near the coast, stands on a small river which flows through an inland lake, and afterwards into the Vouga. Inhabitants 5000. Twenty-two miles S.S.W. of Oporto.

OVARIUM, in botany, the germen or seed-bud, containing the rudiments of the future seed. See **BOTANY**.

OVARIOUS, *adj.* } *Latin ovum, ovarium.*

O'VARY, *n. s.* } Consisting of eggs : a part of the human matrix.

The **OVATION** generally began at the Albanian mountain, whence the general with his retinue made his entry into the city on foot, with many flutes or pipes sounding in concert as he passed along, and wearing a garland of myrtle as a token of peace. The term ovation, according to Servius, is derived from ovis, a sheep ; because on this occasion the conqueror sacrificed a sheep, as in triumph he sacrificed a bull. The senate,

knights, and principal plebeians, assisted at the procession ; which concluded at the capital, where rams were sacrificed to Jupiter. The first ovation was granted to Publius Posthumus the consul, for his victory over the Sabines, A. U. C. 253.

OUCH, *n. s.* An ornament of gold or jewels. *Ouches* or *spangs*, as they are of no great cost, so they are of most glory.

Beacon.

OUDE, a fertile province of Hindostan, situated between 26° and 28° of N. lat., is bounded on the north by Nepal, on the east by Bahar, on the south by Allahabad, and on the west by Delhy and Agra. It is 250 miles in length, by 100 in breadth. The whole surface is flat, and well watered by large rivers, or their copious tributary streams. The land yields fine crops of wheat, barley, rice, and other grains, cotton, sugar-cane, indigo, and poppies. It is celebrated for its grapes, mangoes, and other fruits. In some of the districts saltpetre and lapis lazuli are found ; and a variety of cotton cloths and a coarse kind of flannel, is made here ; also bows, arrows, shields, matchlocks, and swords. The rains are not so violent, nor of so long a duration here as in Bengal, and the four cold months of the year are delightful.

The Gogra and Goompty rivers are here both navigable by boats at all seasons of the year ; and the Ganges runs along the western boundary of this province. To the north-east are extensive woods and plains covered with grass, which abound in game. The principal towns are Lucknow, Fyzabad, Oude, Khyrabad, Goorackpore, and Bahreich. The inhabitants are about one-third Mahometans, the remainder are Hindoos of a fine handsome race. Great numbers of them enlist in the British service.

Oude, or Ayodhya, was the kingdom of the famous damigod Rama, said to have extended his empire through the whole south of India, and to have conquered the island of Ceylon. It was conquered by the Mahometan kings of Delhy in the thirteenth century, with little opposition, and was long held as a dependent province by one of the chiefs of that court. It was not till the ancestor of the present nabob's family obtained the government, and the invasion of Nadir Shah in 1739, that it became hereditary. Saadit Khan died at this time by poison, taken in consequence of the humiliating treatment he experienced from Nadir Shah ; and his son-in-law, having possession of all his treasure, was confirmed in the government of Oude. Suffier Jung proved an excellent and brave officer, and in 1747 repulsed the Afghans ; in recompense for which service he was honored with the title of Abul Munsur (the victorious), and appointed prime minister. From this period, Abul Munsur Suffier Jung took a leading part in all the measures of the court ; and, in addition to the government of Oude, he obtained that of the province of Allahabad. At length, finding his influence begin to decline, he retired to Oude, where he died in the year 1753. Shujaa ad Dowleh succeeded to his father without opposition, till the year 1764, when he took part with Cossim Aly Khan against the British, and was defeated at the battle of Buxar ; in consequence of which he was compelled to throw

himself on their clemency. He died in 1775, and was tranquilly succeeded by his eldest son, a weak prince, who died in the year 1797. During his government the seat of authority was transferred from Fyzabad to Lucknow, and Benares ceded to the British. He nominated vizier Aly his successor, but, the illegitimacy of this youth having been proved, he was dethroned by the British, and the eldest brother of the deceased nabob, named Saadet Aly, called to the musnud. This was a shrewd prince; but the government of Oude had now been so mismanaged that the British found it requisite to dismember his territory, and, in lieu of a subsidy for the payment of the army, to take from him a number of districts. Saadut Aly died in the year 1814, and left a treasure of several millions, nominating his second son, Mirza Ahmed, his successor; but the British elevated the eldest son Ghazee addeen Hyder to that honor. This prince, in gratitude to the British, immediately offered a present of £1,000,000 sterling in specie to the governor-general. The donation was refused; but, during the Nepaul war, the sum of £2,000,000 was accepted as a loan; and, on the conclusion of the war, a portion of the conquered territories which adjoined Oude were made over to him in discharge of the loan. A battalion of British infantry is also always stationed at Lucknow.

OUDE, or AYODHYA, the capital of the above-mentioned province, long the residence of a Hindoo dynasty, is situated on the south bank of the Dewah or Gogra River, and said once to have been of an incredible extent. In the Ayceen Akberry, which was compiled in the end of the sixteenth century, we are told that it was situated only two miles below the confluence of the rivers Soorjew and Gogra, whereas the present town is at the distance of nearly forty miles. In the vicinity are two remarkably large tombs of great antiquity, which the Mahometans believe are the tombs of Seth and Job. It is related in the history of this place, that the Afghaun emperor Balin, about the year 1280, ordered the governor to be hanged at the city gate for having been defeated by the rebel governor of Bengal. After the battle of Buxar, in 1764, Shugaa Dowleh founded the city of Fyzabad, on the ruins of the ancient capital, at the distance of two miles from the modern town, which is now in a ruinous state. Long. 82° 10' E., lat. 26° 45' N.

OUDE, a small river of Scotland, in Angyle-shire, which falls into the head of Loch Melfort.

OUDE HASLE, a village in the north-east of the Netherlands, province of Friesland, with 900 inhabitants. Eighteen miles south by east of Leeuwarden.

OUDENARDE, or AUDENARDE, a manufacturing town of the Netherlands on the Scheldt, by which it is divided into two parts. It has sustained several well known sieges, but is best known in history from the victory gained over the French here, in 1708, by prince Eugene and the duke of Marlborough. The battle took place on 11th of July, in the afternoon, the allies having to make a very long previous march, and the position of the French was so favorable, that the duke of Marlborough would have declined it

had not some successes of the enemy made it imperative on him to come to close action. The result, after several fluctuations, was, that at night fall the allies had driven in and surrounded all the posts of the French army. The total loss of the latter was 15,000 men, of whom nearly half were prisoners; that of the allies 5000. The town is unfortified, but well built, and contains 5100 inhabitants, who carry on manufactures of woollen and linen. Fifteen miles south by west of Ghent, and thirty-two west of Brussels.

LOUDIN (Casimir), a French monk, born at Mezieres in 1638. He published a Supplement to Bellarmine, containing an account of the ecclesiastical writers omitted by him. He went to Leyden in 1693, became a protestant, was made librarian to the university, and died there in 1717.

LOUDRI (John Baptist), a painter, born in Paris. He acquired the principles of his art under the celebrated Largillieres, and evinced superior talent for painting animals. He painted several hunting-pieces for the king of France, which adorn some of the royal castles. Loudri was so well acquainted with the magic of his art, that he frequently pleased himself with painting white objects on white grounds, which have a fine effect. He superintended the manufactory of Beauvais, where pieces of tapestry were produced equally brilliant with the pictures which had served for their model. The king gave him a pension and apartments in the Louvre. He died at Paris, May 1st, 1755, aged seventy-four.

OVEN, *n. s.* Sax. open; Goth. *ofon*; Teut. *ofen*; Isl. and Swed. *ofn* (Goth *fon*, is fire, Mr. Thomson observes: but the Sax. *ofne*, a bank or mount, is not an improbable etymology of this word). An enclosed cavity or utensil heated by fire, for baking, &c.

He loudly brayed that like was never heard,
And from his wide devouring oven sent

A flake of fire, that, flashing in his beard,
Him all amazed.

Spenser.

Here's yet in the world hereafter, the kneading, the making of the cake, the heat of the oven, and the baking.

Shakspeare.

Bats have been found in ovens and other hollow close places, matted one upon another; and therefore it is likely that they sleep in the winter and eat nothing.

Bacon.

AN OVEN is a kind of domestic furnace, used for baking, of a circular structure, with a very low roof, well lined, on the top, bottom, and sides, with stone; it has a small entrance in the front, which is exactly fitted by a kind of door. It appears from the kiln-burnt pottery which has been discovered in the British sepulchres, and from the British appellation of an *odyn* or oven, that furnaces for baking were generally known among the original Britons. An *odyn* was generally erected at the mansion of each British baron, for the use of himself and his retainers.

OVER, *prep. & adv.* Saxon *ofne*; Gothic *ufar*, *ofer*; Swed. *ofwer*; Teut. *obere*. Above; across, as applied to a stream; upon; diffused; opposed both to below and under; and applied to place, time (when it sometimes signifies before as in 'over night'). Station in life; rule, or au-

thority; &c. As an adverb, beyond measure, or an assigned quantity; above the top; (hence, extraordinary); from side to side; throughout; completely: on the whole surface; from beyond sea; past in point of time; and, repeated, another time; as in 'over and over.' 'Over and above,' means besides; beyond a first supposition or intention: 'over against,' opposite: 'to give over,' to cease from; also to help or attempt to benefit no longer. Over is used so variously and extensively in composition that we can only refer to the extracts as generally expressive of more than enough, too much, and to the more regular and established compounds that follow.

The first came out red all over, like an hairy garment. *Genesis.*

When they did mete it, he that gathered much had nothing over, and he that gathered little had no lack. *Exodus, xvi. 18.*

On their intended journey to proceed,
And over night whatso thereto did need. *Hubberd.*

Even here likewise the laws of nature and reason be of necessary use; yet somewhat over and besides them is necessary, namely, human and positive law. *Hooker.*

Soliman pausing upon the matter, the heat of his fury being something over, suffered himself to be intreated. *Knolles.*

The street should see as she walkt over head. *Shakspeare.*

Well,
Have you read o'er the letters I sent you? *Id.*

He over and over divides him,
'Twixt his unkindness and his kindness. *Id.*
Devilish Macbeth

By many of these strains hath sought to win me into his power; and modest wisdom plucks me from over-credulous haste. *Id. Macbeth.*

Certain lakes and pits, such as that of Avennes, poison birds which fly over them. *Bacon.*

It hath a white berry, but is not brought over with the coral. *Bacon's Natural History.*

Wise governors have as great a watch over fames, as they have of the actions and designs. *Bacon.*

This golden cluster the herald delivereth to the Tisan, who delivereth it over to that son that he had chosen. *Id.*

Meditate upon the effects of anger; and the best time to do this is to look back upon anger when the fit is over. *Id.*

The ordinary soldiers having all their pay, and a month's pay over, were sent into their countries. *Hayward.*

All the world over, those that received not the commands of Christ and his doctrines of purity and perseverance, were signally destroyed. *Hammond.*

The act of stealing was soon over, and cannot be undone, and for it the sinner is only answerable to God or his viceregent. *Taylor.*

What the garden choicest bears
To sit and taste, till this meridian heat
Be over, and the sun more cool decline. *Milton.*

Angelic quires
Sung heavenly anthems of his victory
Over temptation and the tempter proud. *Id.*

Thrice happy is that humble pair,
Beneath the level of all care;
Over whose head those arrows fly,
Of sad distrust and jealousy. *Waller.*

Young Pallas shone conspicuous o'er the rest;
Gilded his arms, embroidered was his vest. *Dryden.*

Thou, my Hector, art thyself alone,
My parents, brothers, and my lord in one;
O kill not all my kindred o'er again,
Nor tempt the dangers of the dusty plain;
But in this tower for our defence remain. *Id.*

Captain, yourself are the fittest to live and reign,
not over, but next and immediately under the people. *Id.*

He gathered a great mass of treasure, and gained over and above the good will and esteem of all people wherever he came. *L'Extrange.*

When children forget, or do an action aukwardly, make them do it over and over again, till they are perfect. *Locke.*

This part of grammar has been much neglected, as some others over-diligently cultivated. It is easy for men to write one after another of cases and genders. *Id.*

The fan of an Indian king, made of the feathers of a peacock's tail, composed into a round form, bound altogether with a circular rim, above a foot over. *Grew.*

Let them argue over all the topics of divine goodness and human weakness, yet how trifling must be their plea! *South's Sermons.*

The church has over her bishops, able to silence the factious, no less by their preaching than by their authority. *South.*

Over against this church stands a large hospital, erected by a shoemaker. *Addison on Italy.*

If this miracle, of Christ's rising from the dead, be not sufficient to convince a resolved libertine, neither would the rising of one now from the dead be sufficient for that purpose; since it would only be the doing that over again which hath been done already. *Atterbury.*

He will, as soon as his first surprise is over, begin to wonder how such a favour came to be bestowed on him. *Id.*

The eastern people determined their digit by the breadth of barley corns, six making a digit, and twenty-four a hand's breadth: a small matter over or under. *Id.*

These, when they praise, the world believes no more
Than when they promise to give scribbling o'er. *Pope.*

The commentary which attends this poem will have one advantage over most commentaries, that it is not made upon conjectures. *Id.*

It will afford field enough for a divine to enlarge on, by showing the advantages which the Christian world has over the heathen. *Swift.*

The most learned will never find occasion to act over again what is fabled of Alexander the Great, that when he had conquered the eastern world, he wept for want of more worlds to conquer. *Watts.*

They brought new customs and new vices o'er;
Taught us more arts than honest men require. *Philips.*

He crammed his pockets with the precious store,
And every night reviewed it o'er and o'er. *Harte.*

Throw the broad ditch behind you; o'er the hedge,
High bound, resistless; nor the deep morass
Refuse, but through the shaking wilderness
Pick your nice way. *Thomson.*

Forced from home and all its pleasures,
Afric's coast I left forlorn;
To increase a stranger's treasures,
O'er the raging billows borne. *Cowper.*

Oh! who can tell? save he whose heart hath tried
And danced in triumph o'er the waters wide,
The exulting sense—the pulses maddening play,
That thrills the wanderer o'er that trackless way. *Byron.*

Drenched each smart garb, and clogged each struggling limb,
Far o'er the stream the cockneys sink or swim.

Canning.

OVER-ABOUND', v. n. Over and abound. To abound more than enough.

Both imbibe
Fitting congenial juice, so rich the soil,
So much does fructuous moisture o'er-abound.

Philips.

The learned, never over-abounding in transitory coin, should not be discontented.

Pope's Letters.

OVER-ACT', v. a. Over and act. To act more than enough.

You over-act, when you should underdo :
A little call yourself again, and think.

Ben Jonson.

Princes courts may over-act their reverence, and make themselves laughed at for their foolishness and extravagant relative worship.

Stillingsfleet.

Good men often blemish the reputation of their piety, by over-acting some things in religion ; by an indiscreet zeal about things wherein religion is not concerned.

Tillotson.

He over-acted his part ; his passions, when once let loose, were too impetuous to be managed.

Atterbury.

OVERALL (John), a celebrated English bishop, born in 1559, educated at St. John's College, Cambridge ; but, removing to Trinity, was chosen fellow of that college. In 1596 he was made regius professor of divinity and D. D., and elected master of Catherine-hall. In 1601 he was made dean of St. Paul's, London, by the recommendation of Sir Fulk Greville and queen Elizabeth ; and in king James's reign he was chosen prolocutor of the lower house of convocation. In 1612 he was appointed one of the first governors of the Charter-house hospital, and in April 1614 he was made bishop of Litchfield and Coventry ; and in 1618 was translated to Norwich where he died in May 1619, aged sixty. He was buried in that cathedral, where after the restoration, Cosin, bishop of Durham, who had been his secretary, erected a monument to him, with this inscription, *Vir undequaque doctissimus, et omni encomio major.* Wood says, he was the best scholastic divine in England. He is also celebrated by Smith for his distinguished wisdom, erudition, and piety. In the controversy about predestination and grace, he held a middle opinion inclining to Arminianism. He seems indeed to have paved the way for the reception of that doctrine in England. The bishop is known in England chiefly by his Convocation Book.

OVER-ARCH', v. a. Over and arch. To cover as with an arch.

Where high Ithaca o'erlooks the floods,
Brown with o'er-arching shades and pendent woods.

Pope.

OVER-AWE', v. a. Over and awe. To keep in awe by superior influence.

The king was present in person to overlook the magistrates, and to over-awe these subjects with the terror of his sword.

Spenser.

Her graceful innocence, her every air

Of gesture, or least action, over-awed

His malice.

Milton's Paradise Lost.

I could be content to be your chief tormentor, ever paying you mock reverence, and sounding in

your ears the empty title which inspired you with presumption, and over-awed my daughter to comply.

Addison's Guardian.

A thousand fears

Still over-awe when she appears.

Granville's Poems.

Thus free from censure, over-awed by fear,
And praised for virtues that they scorn to wear,
The floating forms of majesty engage
Respect, while stalking o'er life's narrow stage,
Then leave their crimes for history to scan,
And ask with busy scorn, ' Was this the man ?'

Cowper.

OVER-BAL'ANCE, v. a. & n. s. To weigh down ; to preponderate. Something more than equivalent.

Not doubting but by the weight of reason I should counterpoise the over-balancings of any factions.

King Charles.

Our exported commodities would, by the return, encrease the treasure of this kingdom above what it can ever be by other means, than a mighty over-balance of our exported to our imported commodities.

Temple.

The mind should be kept in a perfect indifference, not inclining to either side, any further than the over-balance of probability gives it the turn of assent and belief.

Locke.

The hundred thousand pounds per annum, wherein we over-balance them in trade, must be paid us in money.

Id.

When these important considerations are set before a rational being, acknowledging the truth of every article, should a bare single possibility be of weight enough to overbalance them ?

Rogers.

OVER-BATTLE, adj. From over and battle. Too fruitful ; exuberant.

In the church of God sometimes it cometh to pass, as in over-battle grounds ; the fertile disposition wherof, is good, yet, because it exceedeth due proportion, it bringeth abundantly, through too much rankness, things less profitable, whereby that which principally it should yield, either prevented in place or defrauded of nourishment, faileth.

Hooker.

OVER-BEAR', v. a. Over and bear. To repress : to subdue ; to whelm ; to bear down.

What more savage than man, if he see himself able by fraud to over-reach, or by power to over-bear the laws ?

Hooker.

The Turkish commanders, with all their forces, assailed the city, thrusting their men into the breaches by heaps, as if they would, with very multitude, have discouraged or over-born the Christians.

Knolles.

The ocean, over-peering of his list,
Eats not the flats with more impetuous haste,
Than young Laertes, in a riotous head,
O'er-bears your officers.

Shakespeare. Hamlet.

The point of reputation, when news first came of the battle lost, did over-bear the reason of war.

Bacon.

Yet fortune, valour, all is over-born

By numbers ; as the long resisting bank

By the impetuous torrent.

Denham.

A body may as well be over-born by the violence of a shallow rapid stream, as swallowed up in the gulph of smooth water.

L'Estrange.

The judgment, if swayed by the over-hearing of passion, and stored with lubricious opinions instead of clearly conceived truths, will be erroneous.

Glanville's Serpens.

Take care that the memory of the learner be not too much crowded by a tumultuous heap, or over-bearing multitude of documents at one time.

Watts.

The horror or loathsomeness of an object may over-bear the pleasure which results from its greatness, novelty, or beauty.

Addison.

OVER-BID, *v. a.* Over and bid. To offer more than equivalent.

You have o'er-bid all my past sufferings,
And all my future too. *Dryden's Spanish Friar.*

OVER-BLOW, *v. n. & v. a.* Over and blow. To be past its violence.

Led with delight, they thus beguile the way,
Until the blustering storm is over-blown. *Spenser.*

This ague fit of fear is over-blown,
An easy task it is to win our own.

Shakespeare.

Some angel that beholds her there,
Instruct us to record what she was here;
And when this cloud of sorrow's over-blown,
Through the wide world we'll make her graces known.

Waller.

Seized with secret joy,
When storms are over-blown.

Dryden's Virgils.

OVERBOARD, *adj.* Over and board. See **BOARD**. Off the ship, out of the ship.

The great assembly met again; and now he that was the cause of the tempest being thrown over-board, there were hopes a calm should ensue.

Hemphill.

The trembling dotard to the deck he drew,
And hoisted up and over-board he threw;
This done he seized the helm. *Dryden.*
He obtained liberty to give them only one song before he leaped over-board, which he did, and then plunged into the sea. *L'Estrange.*

A merchant having a vessel richly fraught at sea in a storm, there is but one certain way to save it, which is, by throwing its rich lading over-board.

South.

Though great ships were commonly bad sea-boats, they had a superior force in a sea engagement: the shock of them being sometimes so violent, that it would throw the crew on the upper deck of lesser ships over-board.

Arbutnot.

Then rose from sea to sky the wild farewell,
Then shrieked the timid, and stood still the brave,

Then some leaped over-board with dreadful yell,
As eager to anticipate their grave. *Byron.*

OVER-BULK, *v. a.* Over and bulk. To oppress by bulk.

The feeding pride,
In rank Achilles, must or now be cropt,
Or shedding, breed a nursery of like evils,
To over-bulk us all.

Shakespeare. *Troilus and Cressida.*

OVER-BURDEN, *v. a.* Over and burden. To load with too great weight.

If she were not cloyed with his company, and that she thought not the earth over-burdened with him, she would cool his fiery grief. *Sidney.*

OVERBURY (Sir Thomas), a learned and accomplished English gentleman, was born in 1581, and studied at Oxford. His intimacy with Sir Robert Carr procured him the honor of knighthood, and also occasioned his death. When Sir Robert became viscount Rochester, he contracted an intimacy with the courtess of

Essex, of which Sir Thomas disapproved in so plain terms, that the viscount treacherously used his influence with the king to inspire him with unjust suspicions of the baronet, who was thrown into the tower, where, in the course of a few months, he was poisoned, in 1613. The treachery was afterwards discovered, but the murderers were only punished with a temporary banishment from court. He published an account of his travels on the continent, and several poems.

OVER-BUY, *v. a.* Over and buy. To buy too dear.

He, when want requires, is only wise,
Who slights not foreign aids, nor over-buys;
But on our native strength, in time of need, relies.

Dryden.

OVER-CARRY, *v. a.* Over and carry. To hurry too far; to be urged to any thing violent or dangerous.

He was the king's uncle, but yet of no capacity to succeed; by reason whereof his natural affection and duty was less easy to be over-carried by ambition.

Bayward.

OVER-CAST, *v. a. & part.*, overcast. Over and cast. To cloud; to darken; to cover with gloom. To cover. This sense is hardly retained but by needle women, who call that which is encircled with a thread, overcast; to rate too high.

Their arms abroad with gray moss over-cast,
And their green leaves trembling with every blast.

Spenser.

As they past,

The day with clouds was sudden over-cast. *Id.*
When malice would work that which is evil, and in working avoid the suspicion of an evil intent, the color wherewith it over-casteth itself is always a fair and plausible pretence of seeking to further that which is good.

Hooker.

His, Robin, over-cast the night;
The starry walkin cover thou anon,
With drooping fogs as black as Acheron.

Shakespeare.

Our days of act are sad and over-cast, in which we find that all of our vain passions and affections past, the sorrow only abideth.

Raleigh.

The king, in his account of peace and calms, did much over-cast his fortunes, which proved full of broken seas, tides, and tempests.

Bacon.

I of fumes and humid vapors made,
No cloud in so serene a mansion find,
To over-cast her ever-shining mind. *Waller.*

Those clouds that over-cast our morn shall fly,
Dispelled to farthest corners of the sky. *Dryden.*

The dawn is over-cast, the morning lours,
And heavily in clouds brings on the day.

Addison.

OVER-CHARGE, *v. a.* Over and charge. To burden; to overrate; to fill too full; to oppress; to cloy; to surcharge.

Here's Gloster, a foe to citizens,
O'er-charging your free purses with large fines.

Shakespeare.

They were

As canons over-charged with double cracks. *Id.*

On air we feed in every instant, and on meats but at times; and yet the heavy load of abundance, wherewith we oppress and overcharge nature, maketh her to sink unawares in the mid-way.

Raleigh's History of the World.

Who in deep mines for hidden knowledge toils,
Like guns o'er-charged, breaks, misses, or recoils.

Denham.

If they would make distinct abstract ideas of all
the varieties in human actions, the number must be in-
finite, and the memory *over-charged* to little purpose.

Locke.

The fumes of passion do as really intoxicate,
and confound the judging and discerning faculty, as
the fumes of drink discompose and stupify the brain
of a man *over-charged* with it.

South.

The action of the Iliad and Æneid, in themselves
exceeding short, are so beautifully extended by the
invention of episodes, that they make up an agree-
able story sufficient to employ the memory without
over-charging it.

Addison's Spectator.

A man may as well expect to grow stronger by al-
ways eating, as wiser by always reading. Too much
over-charges nature, and turns more into disease than
nourishment.

Collier.

Our language is *over-charged* with consonants.

Pope.

OVER-CLOUD', v. a. Over and cloud. To
cover with clouds.

The silver empress of the night,
O'er-clouded, glimmers in a fainter light.

Titchel.

OVER-CLOY', v. a. Over and cloy. To fill
beyond satiety.

A swarm of Britons and base lacquey peasants,
Whom their *over-cloyed* country vomits forth
To desperate adventures and destruction.

Shakespeare.

OVERCOME', v. a. } To subdue; to con-
OVERCOMER, n. s. } quer; to surmount or
overflow; to invade suddenly.

Of whom a man is *overcome*, of the same is he
brought in bondage.

2 Peter, ii. 19.

This wretched woman, *overcome*
Of anguish rather than of crime hath been.

Spenser.

Can't such things be
And *overcome* us like a summer's cloud,
Without our special wonder?

Shakespeare.

Fire by thicker air o'ercome,
And downward forced in earth's capacious womb,
Alters its particles : is fire no more.

Prior.

In unfallowed glebe
Yearly o'ercomes the granaries with stores.

Philip.

Miranda is a constant relief to poor people in
their misfortunes and accidents; there are sometimes
little misfortunes that happen to them, which of
themselves they could never be able to *overcome*.

Law.

OVER-COUNT', v. a. Over and count. To
rate above the true value.

Thou knowest how much
We do o'ercount thee.

Shakespeare. Antony and Cleopatra.

OVER-COVER, v. a. Over and cover. To
cover completely.

Shut me nightly in a charnel house,
O'er-covered quite with dead men's rattling bones
With reeky shanks and yellow chapless skulls.

Shakespeare.

OVER-CROW', v. a. Over and crow. To
crow as in triumph.

A base varlet, that being but of late grown out of
the dunghill, beginneth now to *overcrow* so high
mountains, and make himself the great protector of
all outlaws.

Spenser.

OVERDO', v. a. Over and do. To do more
than enough.

Any thing so *over-done* is from the purpose of play-
ing; whose end is to hold the mirror up to nature.

Shakespeare.

Nature, so intent upon finishing her work, much
oftener *over-does* than under does. You shall hear of
twenty animals with two heads, for one that hath
none.

Grass.

When the meat is *over-done*, lay the fault upon
your lady who hurried you.

Swift.

OVER-DRESS, v. a. Over and dress. To
adorn lavishly.

In all, let Nature never be forgot;
But treat the goddess like a modest fair,
Nor *over-dress* nor leave her wholly bare.

Pope.

OVER-DRIVE', v. a. Over and drive. To
drive too hard or beyond strength.

The flocks and herds with young, if men should
over-drive one day, all will die.

Gen. xxxiii. 13.

OVER-EYE', v. a. Over and eye. To super-
intend; to observe; to remark.

I am doubtful of your modesties,
Lest *over-eying* of his odd behaviour,
You break into some merry passion.

Shakespeare.

OVER-EMPTY, v. a. Over and empty. To
make too empty.

The women would be loth to come behind the
fashion in newfangledness of the manner, if not to
costliness of the matter, which might *over-empty* their
husband's purses.

Carver.

OVERFAL', n. s. Over and fall. Cataract.
Tostatus addeth, that those which dwell near those
falls of water, are deaf from their infancy, like those
that dwell near the *overfalls* of Nilus.

Raleigh's History of the World.

OVER-FLOAT, v. n. Over and float. To
swim; to float.

The town is filled with slaughter, and o'erfloats,
With a red deluge, their increasing moats.

Dryden.

OVERFLOW', v. n., v. a., & n. s. } To be
OVERFLOWING, n. s. } fuller than
OVERFLOWINGLY, adv. } the brim
can hold; to abound; deluge, or drown; to
overrun: the noun signifies exuberance, as also
overflowing. Overflowingly is, exuberantly; in
great abundance.

The Scythians, at such time as the northern na-
tions *overflowed* all Christendom, came down to the
sea coast.

Spenser.

Did he break out into tears?
—In great measure.
—A kind *overflow* of kindness.

Shakespeare.

Where there are great *overflows* in fens, the drown-
ing of them in winter maketh the summer following
more fruitful; for that it keepeth the ground warm.

Bacon's Natural History.

Suppose thyself in as great a sadness as ever did
load thy spirit, would'st thou not bear it cheerfully
if thou wert sure that some excellent fortune would
relieve and recompense thee so as to *overflow* all thy
hopes?

Taylor.

When men are young, they might vent the *over-
flowings* of their fancy that way.

Denham.

Nor was it his indigence that forced him to make
the world, but his goodness pressed him to impart
the goods which he so *overflowingly* abounds with.

Boyle.

New milk that all the winter never fails,
And all the summer *over-flows* the pails.

Dryden.

While our strong walls secure us from the foe,
Ere yet with blood our ditches *overflow*. *Id.*

It requires pains to find the coherence of abstruse writings: so that it is not to be wondered that St. Paul's epistles have, with many, passed for disjointed pious discourses, full of warmth and zeal and *over-flows* of light, rather than for calm, strong, coherent reasonings all through. *Locks.*

Had I the same consciousness that I saw Noah's flood, as that I saw the *overflowing* of the Thames last winter, I could not doubt, that I who saw the Thames *overflowed*, and viewed the flood at the general deluge, was the same self. *Id.*

Do not the Nile and the Niger make yearly inundations in our days, as they have formerly done? and are not the countries so *overflowed* still situate between the tropics? *Bentley.*

Sixteen hundred and odd years after the earth was made it was *overflowed* and destroyed in a deluge of water, that overspread the face of the whole earth, from pole to pole, and from east to west. *Burnet.*

After every *overflow* of the Nile there was not all ways a mensuration. *Arbutnot on Coins.*

The expression may be ascribed to an *overflow* of gratitude in the general disposition of Ulysses.

Broome.

When the *overflowings* of ungodliness make us afraid, the ministers of religion cannot better discharge their duty of opposing it. *Rogers.*

Thus oft by mariners are shown,
Earl Godwin's castles *overflowed*. *Swift.*

OVER-FLY', *v. a.* Over and fly. To cross by flight.

A sailing kite
Can scare *o'er-fly* them in a day and night.

Dryden.

OVER-FORWARDNESS, *n. s.* Over and forwardness. Too great quickness: too great readiness.

By an *over-forwardness* in courts to give countenance to frivolous exceptions, though they make nothing to the true merit of the cause, it often happens that causes are not determined according to their merits. *Hale.*

OVER-FREIGHT', *v. a.*; *pret.* overfreighted; *part.* over-fraught. Over and freight. To load too heavily; to fill with too great quantity.

A boat *over-freighted* with people, in rowing down the river, was, by the extreme weather, sunk. *Carow.*

Grief, that does not speak,
Whispers the *o'er-fraught* heart and bids it break. *Shakespeare.*

Sorrow has so *o'er-fraught*
This sinking bark, I shall not live to show
How I abhor my first rash crime. *Denham.*
OVERGET', *v. a.* Over and get. To pass; to leave behind.

With six hours hard riding through so wild places, as it was rather the cunning of my horse sometimes, than of myself, so rightly to hit the way, I *over-got* them a little before night. *Sidney.*

OVER-GLANCE', *v. a.* Over and glance. To look hastily over.

I have, but with a cursory eye,
O'er-glanced the articles.

Shakespeare, Henry V.

OVER-GO', *v. a.* Over and go. To surpass; to excel.

Thinking it beyond the degree of humanity to have a wit so far *over-going* his age, and such dreadful terror proceed from so excellent beauty. *Sidney.*

Great nature hath laid down at last
That mighty birth wherewith so long she went,
And *over-went* the times of ages past,
Here to lie in upon our soft content. *Daniel.*

OVER-GORGE', *v. a.* Over and gorge. To gorge too much.

Art thou grown great
And, like ambitious Sylla, *over-gorged*?

Shakespeare.

OVER-GREAT', *adj.* Over and great. Too great.

Though putting the mind unprepared upon an unusual stress ought to be avoided: yet this must not run it, by an *over-great* shyness of difficulties, into a lazy sauntering about obvious things. *Locke.*

OVER-GROW', *v. a. & v. n.* } Over and grow.
OVER-GROWTH', *n. s.* } To cove: with growth; to grow beyond the fit and natural size, to rise above: overgrowth is exuberant or excessive growth.

Roof, and floor, and walls, were all of gold,
But *over-grown* with dust and old decay,
And hid in darkness that none could behold
The hue thereof. *Spenser.*
One part of his army, with incredible labour, cut away through the thick and *over-grown* woods, and so came to Solymán. *Knolles.*

The *over-growth* of some complexion,
Oft breaking down the pales and forts of reason. *Shakespeare.*

The fortune in being the first in an invention doth cause sometimes a wonderful *over-growth* in riches. *Bacon.*

Suspected to a sequent king, who seeks
To stop their *over-growth*, as inmate guests
Too numerous. *Milton's Paradise Lost.*

The woods and desert caves,
With wild thyme and the gadding vine *o'er-grown*,
And all their echoes mourn. *Milton.*

A huge *over-grown* ox was grazing in a meadow. *L'Estrange.*

If the binds be very strong and much *over-grow* the poles, some advise to strike off their heads with a long switch. *Mortimer.*

Him for a happy man I own,
Whose fortune is not *over-grown*. *Swift.*

OVER-HALE', *v. a.* Over and hale. To spread over.

The welked Phœbus gan avail
His weary wain, and now the frosty night
Her mantle black thro' heaven gan *over-hale*. *Spenser.*

OVER-HANG', *v. a. & v. n.* Over and hang. To jut over; to impend over.

Lend the eye a terrible aspect,
Let the brow overwhelm it,
As fearfully as doth a galled rock
O'er-hang and jutting his confounded base. *Shakespeare.*

The rest was chaggy cliff, that *overhang*
Still as it rose, impossible to climb. *Milton.*
Hide me, ye forests, in your closest bowers,
Where flows the murm'ring brook, inviting dreams,
Where bord'ring hazle *over-hangs* the streams. *Gay.*
If you drink tea upon a promontory that *over-hangs* the sea, it is preferable to an assembly. *Pope.*

OVER-HARDEN', *v. a.* Over and harden. To make too hard.

By laying it in the air, it has acquired such a hardness, that it was brittle, like *over-hardened* steel.

Boyle.

OVER-HEAD', *adv.* Over and head. Aloft; in the zenith; above; in the ceiling.

Over-head the moon

Sits arbitress, and nearer to the earth

Wheels her pale course. *Milton's Paradise Lost.*

The four stars *over-head* represent the four children.

Addison.

Now *over-head*, a rainbow, bursting through

The scattering clouds, shone—spanning the dark sea,

Resting its bright base on the quivering blue.

Byron.

OVER-HEAR', *v. a.* Over and hear. To hear those who do not mean to be heard.

I am invisible

And I will *over-hear* their conference. *Shakespeare.*

They had a full sight of the Infanta at a mask dancing, having *over-heard* two gentlemen who were tending towards that sight, after whom they pressed.

Wotton.

That such an enemy we have who seeks

Our ruin, both by thee informed I learn,

And from the parting angel *over-heard*. *Milton.*

They were so loud in their discourse, that a blackberry from the next bridge *over-heard* them.

L'Estrange.

The nurse,

Though not the words, the murmurs *over-heard*.

Dryden.

The witness, *over-hearing* the word pillory repeated, slunk away privately.

Addison.

OVER-HEAT', *v. a.* Over and heat. To heat too much.

Pleased with the form and coolness of the place, And *over-heated* by the morning chase. *Addison.*

It must be done upon the receipt of the wound, before the patient's spirit be *over-heated* with pain or fever.

Wiseman.

And to confound two things together, which are so essentially different, can be the effect of nothing but great ignorance, inconsideration, or an *over-heated* injudicious zeal.

Mason.

OVER-HEND', *v. a.* Over and hend. To overtake; to reach.

Als his fair leman flying through a brook, He *over-hent* naught moved with her piteous look.

Spenser.

OVER-JOY', *v. a. & n. s.* Over and joy. To transport; to ravish: in the noun, transport; ecstasy.

The mutual conference that my mind hath had, Makes me the bolder to salute my king With ruder terms; such as my wit affords, And *over-joy* of heart doth minister.

Shakespeare.

He that puts his confidence in God only, is neither *over-joyed* in any great good things of this life, nor sorrowful for a little thing.

Taylor's Guide.

The bishop, partly astonished and partly *over-joyed* with these speeches, was struck into a sad silence for a time.

Hayward.

This love-sick virgin, *over-joyed* to find

The boy alone, still followed him behind.

Addison.

OVER-LABOR', *v. a.* Over and labor. To take too much pains on any thing; to harass with toil.

She without noise will *over-see*

His children and his family;

And order all things till he come,

Sweaty and *over-laboured* home. *Dryden.*

OVERLADE', *v. a.* Over and lade. To overburden.

Thus to throng and *over-lade* a soul

With love, and then to have a room for fear,

That shall all that controul,

What is it but to rear

Our passions and our hopes on high,

That thence they may descry

The noblest way how to despair and die?

Suckling.

OVERLARGE', *adj.* Over and large. Larger than enough.

Our attainments cannot be *over-large*, and yet we manage a narrow fortune very unthrifily.

Collier.

OVERLASHINGLY, *adv.* Over and lash. With exaggeration. A mean word, now obsolete.

Although I be far from their opinion who write too *overlashingly*, that the Arabian tongue is in use in two third parts of the inhabited world, yet I find that it extendeth where the religion of Mahomet is professed.

Brerewood.

OVERLAY', *v. a.* Over and lay. To oppress by too much weight or power; to smother; to overwhelm; to cover superficially.

Some commons are barren, the nature is such, And some *over-layeth* the commons too much.

Tusser.

Phœbus' golden face it did attain,

As when a cloud his beams did *over-lay*.

Spenser.

Not only that mercy which keepeth from being *over-laid* and oppressed, but mercy which saveth from being touched with grievous miseries.

Hooker.

When any country is *over-laid* by the multitude which live upon it, there is a natural necessity compelling it to disburden itself and lay the load upon others.

Raleigh.

We praise the things we hear with much more willingness than those we see; because we envy the present, and reverence the past; thinking ourselves instructed by the one, and *over-laid* by the other.

Ben Jonson.

Good laws had been antiquated by the course of time, or *over-laid* by the corruption of manners.

King Charles.

Nor then destroys it with too fond a stay, Like mothers, which their infants *over-lay*.

Milton.

Thou us impowered

To fortify thus far, and *over-lay*,

With this portentous bridge, the dark abyss. *Id.*

By his prescript a sanctuary is framed

Of cedar, *over-laid* with gold. *Id.*

The strong Emetrius came in Arcite's aid,

And Palamon with odds was *over-laid*. *Dryden.*

The stars, no longer *over-laid* with weight,

Exert their heads from underneath the mass,

And upward shoot. *Id.*

They quickly stifled and *over-laid* those infant principles of piety and virtue, sown by God in their hearts; so that they brought a voluntary darkness and stupidity upon their minds.

South's Sermons.

Season the passions of a child with devotion, which seldom dies; though it may seem extinguished for a while, it breaks out as soon as misfortunes have brought the man to himself. The fire may be covered and *over-laid*, but cannot be entirely quenched and smothered.

Addison's Spectator.

In preaching, no men succeed better than those who trust to the fund of their own reason, advanced but not *over-laid* by commerce with books. *Swift.*

OVER-LEAP', v. a. Over and leap. To pass by a jump.

A step
On which I must fall down, or else *o'er-leap*,
For in my way it lies. *Shakespeare. Macbeth.*
In vain did Nature's wise command
Divide the waters from the land;
If daring ships and men prophane
The eternal fences *over-leap*,
And pass at will the boundless deep. *Dryden.*

OVER-LEATHER, n. s. Over and leather. The part of the shoe that covers the foot.
I have sometimes more feet than shoes; or such shoes as my toes look through the *over-leather*.
Shakespeare.

OVER-LIGHT, n. s. Over and light. Too strong light.

An *over-light* maketh the eyes dark, insomuch as perpetual looking against the sun would cause blindness.
Bacon.

OVER-LIVE, v. a. & v. n. Over and live. To live longer than another; to survive; to outlive; to live too long.

Musidorus, who shewed a mind not to *over-live* Pyrocles, prevailed.
Sidney.

He concludes in hearty prayers,
That your attempts may *over-live* the hazard
And fearful meeting of their opposite.

Shakespeare.
They *over-lived* that envy, and had their pardons afterwards.
Hayward.

Why do I *over-live*?
Why am I mecked with death, and lengthened out
To deathless pain? *Milton's Paradise Lost.*

OVER-LOAD, v. a. Over and load. To burden with too much.

The memory of youth is charged and *over-loaded*, and all they learn is mere jargon.
Felton.

Men *over-loaded* with a large estate
May spill their treasure in a nice conceit;
The rich may be polite, but oh! 'tis sad,
To say you're curious, when we swear you're mad.
Young.

OVER-LONG, adj. Over and long. Too long.

I have transgressed the laws of oratory, in making my periods and parenthesis *over-long*.
Boyle.

OVER-LOOK, v. a. } Over and look. To
OVER-LOOKER, n. s. } view from a high place; to revise; to watch over; to pass indulgently over a fault; to neglect: an overlooker is one who watches over others.

He was present in person to *over-look* the magistrates, and to overawe those subjects with the terror of his sword.
Spenser.

In the greater out-parishes many of the poor parishioners, through neglect, do perish for want of some heedful eye to *over-look* them.
Grass.

The time and care that are required,
To *over-look* and file, and polish well,
Fright poets from that necessary toil.

Rowe.
I will do it with the same respect to him as if he were alive, and *over-looking* my paper while I write.
Dryden.

The pils *o'er-looked* the town, and drew the sight,
Surprised at once with reverence and delight. *Id.*
Of the two relations, Christ *o'er-looked* the meaner, and denominated them solely from the more honourable.
South.

Religious fear, when produced by just apprehensions of a divine power, naturally *over-looks* all hu-

man greatness that stands in competition with it, and extinguishes every other terror.
Addison.

This part of good-nature, which consists in the pardoning and *o'er-looking* of faults, is to be exercised only in doing ourselves justice in the ordinary commerce of life.
Id.

In vain do we hope that God will *over-look* such high contradiction of sinners, and pardon offences committed against the plain conviction of conscience.
Rogers.

They *over-look* truth in the judgments they pass on adversity and prosperity. The temptations that attend the former they can easily see, and dread at a distance; but they have no apprehension of the dangerous consequences of the latter.
Atterbury.

To *over-look* the entertainment before him, and languish for that which lies out of the way, is sickly and servile.
Collier.

The original word signifies an *over-looker*, or one who stands higher than his fellows and *over-looks* them.
Watts.

OVER-LOOP, n. s. The same with orlop.

In extremity we carry our ordnance better than we were wont, because our nether *over-loops* are raised commonly from the water; to wit, between the lower part of the port and the sea.
Raleigh.

OVER-MASTED, adj. Over and mast. Having too much mast.

Cleodanthus, better manned, pursued him fast,
But his *o'er-masted* gally checked his haste.
Dryden.

OVER-MASTER, v. a. Over and master. To subdue; to govern.

For your desire to know what is between us,
O'er-master it as you may. *Shakespeare. Hamlet.*
So sleeps a pilot whose poor bark is prest
With many a merciless *o'er-mastering* wave.
Crashaw.

They are *over-mastered* with a score of drunkards, the only soldiery left about them, or else comply with all rapines and violences.
Milton on Education.

OVER-MATCH, v. a. & n. s. Over and match. To be too powerful; to conquer; to oppress by superior force: the noun signifies one of superior power; one not to be overcome.

I have seen a swan
With bootless labour swim against the tide,
And spend her strength with *over-matching* waves.
Shakespeare.

Sir William Lucy, with me
Set from our *o'er-matched* forces forth for aid. *Id.*
Spain is no *over-match* for England, by that which leadeth all men; that is, experience and reason.
Bacon.

Assist, lest I, who erst
Thought none my equal, now be *o'er-matched*.
Paradise Regained.

Eve was his *over-match*, who self-deceived
And rash, before-hand had no better weighed
The strength he was to cope with or his own.
Milton.

He from that length of time dire omens drew,
Of English *o'er-matched*, and Dutch too strong,
Who never fought three days but to pursue.
Dryden.

How great soever our curiosity be, our excess is greater, and does not only *o'er-match*, but supplant it.
Decay of Piety.

In a little time there will scarce be a woman of quality in Great Britain, who would not be an *o'er-match* for an Irish priest.
Addison.

OVER-MIX', v. a. Over and mix. To mix with too much.

Those things these parts over-rule; no joy shall know,

Or little measure *over-mixt* with woe. *Cresch.*

OVERMUCH', adj., adv. & n. s. } Over and *OVERMUCH'NESS, n. s. }* much. More

than enough. In too great a degree: overmuchness is superabundance.

The fault which we find in them is, that they *over-much* abridge the church of her power in these things. Whereupon they recharge us, as if in these things we gave the church a liberty which hath no limits or bounds. *Hooker.*

There are words that do as much raise a style, as others can depress it; superlatation and *over-muchness* amplifies. It may be above faith, but not above a mean. *Ben Jonson.*

Perhaps

I also erred, in *over-much* admiring
What seemed in thee so perfect, that I thought
No evil durst attempt thee.

Milton's Paradise Lost.

By attributing *over-much* to things
Less excellent, as thou thyself perceivest.

Milton.

It was the custom of those former ages, in their *over-much* gratitude, to advance the first authors of an useful discovery among the number of their gods. *Wilkins.*

With respect to the blessings the world enjoys, even good men may ascribe *over-much* to themselves. *Grew.*

An *over-much* use of salt, besides that it occasions thirst and *over-much* drinking, has other ill-effects. *Locke.*

OVER-NAME', v. a. Over and name. To name in a series.

Over-name them; and as thou namest them I will describe them. *Shakespeare. Merchant of Venice.*

OVER-NIGHT', n. s. Over and night. Night before bed-time.

If I had given you this at *over-night*,
She might have been o'erta'en. *Shakespeare.*
Will confesses, that for half his life his head
ached every morning with reading men *overnight*. *Addison.*

OVER-OFFICE', v. a. Over and office. To insult by virtue of an office.

This might be the fate of a politician which this *ass over-offices*. *Shakespeare. Hamlet.*

OVER-OFFICIOUS', adj. Over and officious. Too busy; too importunate.

This is an *over-officious* truth, and is always at a man's heels; so that, if he looks about him, he must take notice of it. *Collier.*

OVERPASS', v. a. Over and pass. To cross; to pass with disregard; to omit.

If the grace of him which saveth *over-pass* some, so that the prayer of the church for them be not received, this we may leave to the hidden judgments of righteousness. *Hooker.*

The complaint about psalms and hymns might as well be *over-past* without any answer, as it is without any cause brought forth. *Id.*

What can'st thou swear by now?

—By time to come.

—That thou hast wronged in the time *o'er-past*.

Shakespeare.

Arithmetical progression demonstrates how fast mankind would increase, *over-passing* as miraculous,

though indeed natural, that example of the Israelites who were multiplied in two hundred and sixteen years, from seventy to sixty thousand able men. *Kaleigh.*

Remember that Pellean conqueror,
A youth, how all the beauties of the east
He slightly viewed, and slightly *over-passed*. *Milton.*

I read the satire thou entitlest first,
And laid aside the rest, and *over-past*,
And swore, I thought the writer was accurst,
That his first satire had not been his last. *Harrington.*

I stood on a wide river's bank,
Which I must needs *o'er-pass*,
When on a sudden Torrimond appeared,
Gave me his hand, and led me lightly *o'er*. *Dryden.*

OVERPAY', v. a. Over and pay. To reward beyond the price:

Take this purse of gold,
And let me buy your friendly help thus far,
Which I will *over-pay*, and pay again,
When I have found it. *Shakespeare.*

You have yourself your kindness *over-paid*,
He ceases to oblige who can upbraid. *Dryden.*
Wilt thou with pleasure hear thy lover's strains,
And with one heavenly smile *o'er-pay* his pains? *Prior.*

A single doit would *overpay*
The expenditure of every day,
And who can grudge so small a grace
To suppliants, natives of the place? *Cowper.*

OVERPERCH', v. a. Over and perch. To fly over.

With love's light wings did I *o'er-perch* these
walls,
For stony limits cannot hold love out. *Shakespeare.*

OVERPEER', v. a. Over and peer. To over-look; to hover above. It is now out of use.

The ocean, *over-peering* of his list,
Eats not the flats with more impetuous haste,
Than young Laertes, in a riotous head,
O'er-bears your officers. *Shakespeare. Hamlet.*
Your argosies with portly sail,
Do *over-peer* the pretty traffickers,
That cur'sy to them, do them reverence.

Shakespeare.

Mountainous error would be too highly heapt,
For truth to *over-peer*. *Id. Coriolanus.*

Thus yields the cedar to the ax's edge,
Whose top branch *over-peered* Jove's spreading tree,
And kept low shrubs from winter's powerful wind. *Shakespeare.*

They are invincible by reason of the *over-peering* mountains that back the one, and slender fortifications of the other to land-ward. *Sandy's Journal.*

OVERPLUS', n. s. Over and plus. Surplus; what remains more than sufficient.

Some other sinners there are, from which that *overplus* of strength in persuasion doth arise.

Hooker's Preface.

A great deal too much of it was made, and the *overplus* remained still in the mortar. *L'Estrange.*

It would look like a fable to report that this gentleman gives away all which is the *overplus* of a great fortune. *Addison.*

OVERPLY', v. a. Over and ply. To employ too laboriously.

What supports me, dost thou ask?
The conscience, friend, 't have lost them *over-plied*,
In liberty's defence. *Milton's Poems.*

OVERPOISE', v. a. & n. s. Over and poise. To outweigh : the noun signifies preponderance of weight.

Whether cripples who have lost their thighs will float ; their lungs being able to waft up their bodies, which are in others *over-poised* by the hinder legs ; we have not made experiment. *Broune.*

Horace, in his first and second book of odes, was still rising, but came not to his meridian till the third. After which his judgment was an *over-poise* to his imagination. He grew too cautious to be bold enough, for he descended in his fourth by slow degrees. *Dryden.*

The scale
O'er-poised by darkness, lets the night prevail ;
And day, that lengthened in the summer's height,
Shortens till winter, and is lost in night. *Creech.*

OVERPOWER', v. a. Over and power. To be predominant over ; to oppress by superiority.

Now in danger tried, now known in arms
Not to be *over-powered*. *Milton's Paradise Lost.*

As much light *over-powers* the eye, so they who have weak eyes, when ground is covered with snow, are wont to complain of too much light. *Boyle.*

After the death of Crassus, Pompey found himself outwitted by Cæsar ; he broke with him, *over-powered* him in the senate, and caused many unjust decrees to pass against him. *Dryden.*

The historians make these mountains the standards of the rise of the water ; which they could never have been, had they not been standing when it did so rise and *over-power* the earth. *Woodward.*

Inspiration is, when such an *over-powering* impression of any proposition is made upon the mind by God himself, that gives a convincing and indubitable evidence of the truth and divinity of it.

Watts's Logic.

OVERPRESS', v. a. Over and press. To bear upon with irresistible force ; to overwhelm ; to crush.

Having an excellent horse under him, when he was *over-pressed* by some he avoided them. *Sidney.*

Michael's arm main promontories flung,
And *over-pressed* whole legions weak with sin.

Roscommon.

When a prince enters on a war, he ought maturely to consider whether his coffers be full, his people rich by a long peace and free trade, not *over-pressed* with many burthensome taxes. *Swift.*

OVERPRISE', v. a. Over and prise. To value at too high price.

Parents *over-prise* their children, while they behold them through the vapours of affection. *Wotton.*

OVERRANK', adj. Over and rank. Too rank.

It produces *over-rank* binds. *Mortimer.*

OVERRATE', v. a. Over and rate. To rate at too much.

While vain shows and scenes you *over-rate*,
'Tis to be feared,
That, as a fire the former house o'erthrew,
Machines and tempests will destroy the new.

Dryden.

To avoid the temptations of poverty, it concerns us not to *over-rate* the conveniences of our station, and, in estimating the proportion fit for us, to fix it rather low than high ; for our desires will be proportioned to our wants, real or imaginary, and our temptations to our desires. *Rogers.*

OVERREACH', v. a. Over and reach. To rise above ; to circumvent ; to go beyond.

What more cruel than man, if he see himself able by fraud to *over-reach*, or by power to overbear the laws whereunto he should be subject ? *Hooker.*

I have laid my brain in the sun and dried it, that it wants matter to prevent so gross *over-reaching*.

Shakespeare.

The mountains of Olympus, Atho, and Atlas, *over-reach* and surmount all winds and clouds.

Raleigh.

A man who had been matchless held
In cunning, *over-reached* where least he thought,
To save his credit, and for very spight,
Still will be tempting him who foils him still.

Milton.

There is no pleasanter encounter than a trial of skill betwixt sharpers to *over-reach* one another.

L'Estrange.

Forbidding oppression, defrauding and *over-reaching* one another, perfidiousness and treachery.

Tillotson.

We may no more sue for them than we can tell a lie, or swear an unlawful oath, or *over-reach* in their cause, or be guilty of any other transgression.

Kettleworth.

Such a principle is ambition, or a desire of fame, by which many vicious men are *over-reached*, and engaged contrary to their natural inclinations in a glorious and laudable course of action. *Addison.*

Sixteen hundred years after the earth was made, it was over-flowed in a deluge of water in such excess that the floods *over-reached* the tops of the highest mountains.

Burnet.

John had got an impression that Lewis was so deadly cunning a man that he was afraid to venture himself alone with him ; at last he took heart of grace ; let him come up, quoth he, it is but sticking to my point, and he can never *over-reach* me.

History of J. Bull.

OVERREAD', v. a. Over and read. To peruse.

The contents of this is the return of the duke ; you shall anon *over-read* it at your pleasure.

Shakespeare.

OVER-RED', v. a. Over and red. To smear with red.

Prick thy face and *over-red* thy fear,
Thou lily livered boy. *Shakespeare. Macbeth.*

OVER-RIPEN', v. a. Over and ripen. To make too ripe.

Why droops my lord, like *over-ripened* corn,
Hanging the head with Ceres' pteuous load ?

Shakespeare.

OVERROAST', v. a. Over and roast. To roast too much.

'Twas burnt and dried away,
And better 'twere that both of us did fast,
Since of ourselves, ourselves are choleric,
Than feed it with such *over-roasted* flesh.

Shakespeare.

OVER-RULE', v. a. From over and rule. To influence with predominant power ; to govern ; to supersede : as, in law, to over-rule a plea is to reject it.

What if they be such as will be *over-ruled* with some one, whom they dare not displease ?

Whitgift.

Except our own private, and but probable resolutions, be by the law of publick determinations *over-ruled*, we take away all possibility of sociable life in the world.

Hooker.

Which humour perceiving to *over-rule* me, I strave against it. *Sidney.*

Wherever does he now come forth and openly *over-rule*, as in other matters he is accustomed? *Hayward.*

His passion and animosity *over-ruled* his conscience. *Clarendon.*

A wise man shall *over-rule* his stars, and have a greater influence upon his own content than all the constellations and planets of the firmament. *Taylor.*

Thirty acres make a farthing land, nine farthings a Cornish acre, and four Cornish acres a knight's fee. But this rule is *over-ruled* to a greater or lesser quantity, according to the fruitfulness or barrenness of the soil. *Curew.*

He is acted by a passion which absolutely *over-ruled* him; and so can no more recover himself than a bowl rolling down a hill stop itself in the midst of its career. *South.*

'Tis temerity for men to venture their lives upon unequal encounters; unless where they are obliged by an *over-ruling* impulse of conscience and duty. *L'Estrange.*

A man may, by the influence of an *over-ruling* planet, be inclined to lust, and yet, by the force of reason, overcome that bad influence. *Swift.*

OVERRUN', v. a. Over and run. To harass by incursions; to ravage; to rove over in a hostile manner; to outrun; to overspread; to pester: among printers, to be obliged to change the disposition of the lines and words in correcting, by reason of the insertions.

With an *over-running* flood he will make an utter end of the place. *Nahum i. 8.*

Those barbarous nations that *over-ran* the world, possessed those dominions, whereof they are now so called. *Spenser.*

We may *out-run*

By violent swiftness, that which we run at, And lose by *over-running*. *Shakspeare.*

Till the tears she shed, Like envious floods *o'er-ran* her lovely face, She was the fairest creature in the world. *Id.*

Galileus noteth, that if an open trough, wherein water is, be driven faster than the water can follow, the water gathereth upon a heap towards the hinder end, where the motion began; which he supposeth, holding the motion of the earth to be the cause of the ebbing and flowing of the ocean; because the earth *over-runneeth* the water. *Bacon.*

Pyrocles, being come to sixteen, *over-run* his age in growth, strength, and all things following it, that not Musidorus could perform any action on horse or foot more strongly, or deliver that strength more nimbly, or become the delivery more gracefully, or employ all more virtuously. *Sidney.*

They err, who count it glorious to subdue By conquest far and wide, to *over-run* Large countries, and in field great battles win, Great cities by assault. *Milton's Paradise Lost.*

The nine

Their fainting foes to shameful flight compelled, And with resistless force *o'er-run* the field. *Dryden.*

To flatter foolish men into a hope of life, where there is none, is much the same with betraying people into an opinion that they are in a virtuous and happy state, when they are *over-run* with passion, and drowned in their lusts. *L'Estrange.*

This disposition of the parts of the earth, shews us the foot-steps of some kind of ruin which happened in such a way, that at the same time a general flood of waters would necessarily *over-run* the whole earth. *Burnet.*

Were it not for the incessant labours of this industrious animal, Egypt would be *over-run* with crocodiles. *Addison.*

Gustavus Adolphus could not enter this part of the empire after having *over-run* most of the rest. *Addison.*

Such provision made, that a country should not want springs as were convenient for it; nor be *over-run* with them, and afford little or nothing else; but a supply every way suitable to the necessities of each climate and region of the globe. *Woodward's Natural History.*

A common-wealth may be *over-run* by a powerful neighbour, which may produce bad consequences upon your trade and liberty. *Swift's Miscellanies.*

OVERSEE', v. a. } Over and see. To superintend; to overlook; to omit; or mistake: any superintendant is an overseer.

He had charge my discipline to frame, And tutors nouriture to *oversee*. *Spenser.*

There are in the world certain voluntary *overseers* of all books, whose censure would fall sharp on us. *Hooker.*

A common received error is never utterly *over-thrown*, till such time as we go from signs unto causes, and shew some manifest root or fountain thereof common unto all, whereby it may clearly appear how it hath come to pass that so many have been *overseen*. *Id.*

Such *overseers*, as the *overseers* of this building, would be so *overseen* as to make that which is narrower, contain that which is larger. *Holyday.*

I, who resolve to *oversee*

No lucky opportunity, Will go to council to advise

Which way t' encounter or surprise. *Hudibras.*

They rather observed what he had done and suffered for the king and for his country, without farther enquiring what he had omitted to do, or been *overseen* in doing. *Clarendon.*

The church-wardens and *overseers* of the poor might find it possible to discharge their duties, whereas now in the greater out-parishes many of the poorer parishioners, through neglect, do perish for want of some heedful eye to overlook them. *Graunt.*

She without noise will *oversee* His children and his family. *Dryden.*

To entertain a guest, with what a care Would he his household ornaments prepare; Harass his servants, and as *o'erseer* stand, To keep them working with a threat'ning wand. Clean all my plate, he cries. *Id.*

A reformer of Luther's temper and talents would, in five years, persuade the people to compel the parliament to abolish tithes, to extinguish pluralities, to enforce residence, to confine episcopacy to the *overseeing* of dioceses, to expunge the Athanasian Creed from our Liturgy, to free Dissenters from test acts, and the ministers of the Establishment from subscription to human articles of faith. *Bp. Watson.*

OVERSET', v. a. Over and set. To turn bottom upwards; to throw off the basis; to subvert; to disorder.

The tempests met, The sailors mastered, and the ship *o'er-set*. *Dryden.*

His action against Catiline ruined the consul, when it saved the city; for it so swelled his soul, that ever afterwards it was apt to be *over-set* with vanity. *Id.*

It is forced through the hiatus's at the bottom of the sea with such vehemence, that it puts the sea into

horrible perturbation, even when there is not the least breath of wind; *oversetting* ships in the harbours, and sinking them. *Woodward.*

Would the confederacy exert itself as much to annoy the enemy, as they do for their defence, we might bear them down with the weight of our armies, and *over-set* the whole power of France. *Addison.*

Nature in arms, her elements at strife,
The storms, that *overset* the joys of life,
Are but his rods to scourge a guilty land,
And waste it at the bidding of his hand. *Cowper.*

OVERSHADE', v. a. Over and shade. To cover with any thing that causes darkness.

Dark cloudy death *o'er-shades* his beams of life,
And he nor sees, nor hears us. *Shakespeare.*
No great and mighty subject might eclipse or *over-shade* the imperial power. *Bacon.*

If a wood of leaves *o'ershade* the tree,
In vain the hind shall vex the threshing floor,
For empty chaff and straw will be thy store. *Dryden.*

Should we mix our friendly talk
O'ershaded in that favorite walk;
Both pleased with all we thought we wanted. *Prior.*

OVERSHAD'OW, v. a. Over and shadow. To throw a shadow over any thing; to shelter; to cover with superior influence.

Weeds choke and *over-shadow* the corn, and beat it down, or starve and deprive it of nourishment. *Bacon.*

Death,
Let the damps of thy dull breath
Overshadow even the shade,
And make darkness self afraid. *Crashaw.*
Darkness must *over-shadow* all his bounds,
Palpable darkness, and blot out three days. *Milton.*

On her should come
The holy ghost, and the power of the highest
O'er-shadow her. *Id.*

OVERSHOOT', v. a. & v. n. Over and shoot. To shoot or fly too far; to pass swiftly over; to venture too far; to assert too much.

For any thing that I can learn of them, you have *overshot* yourself in reckoning. *Whitgift.*
In finding fault with the laws, I doubt me, you shall much *overshoot* yourself, and make me the more dislike your other dislikes of that government. *Spenser on Ireland.*

Leave it to themselves to consider, whether they have in this point or not *overshot* themselves; which is quickly done, even when our meaning is most sincere. *Hooker.*

Every inordinate appetite defeats its own satisfaction, by *overshooting* the mark it aims at. *Tillotson.*
Often it drops, or *over-shoots* by the disproportions of distance or application. *Collier on Reason.*

High-raised on fortune's hill, new apples he spies,
O'ershoots the valley which beneath him lies,
Forgets the depths between, and travels with his eyes. *Harte.*

OVERSIGHT, n. s. From over and sight. Superintendence; mistake; error.

They gave the money, being told unto them that had the *over-sight* of the house. *2 Kings xii.*
Feed the flock of God, taking the *over-sight* thereof, not by constraint, but willingly. *1 Peter.*

Amongst so many huge volumes, as the infinite pains of St. Augustine have brought forth, what one hath gotten greater love, commendation, and

honour, than the book wherein he carefully owns his *over-sights* and sincerely condemneth them? *Hooker's Preface.*

They watch their opportunity to take advantage of their adversaries' *over-sight*. *Kettlewell.*

Not so his son, he marked this *over-sight*,
And then mistook reverse of wrong for right. *Pope.*

OVERSIZE', v. a. Over and size. To surpass in bulk: a compost with which masons cover walls; to plaster over.

Those bred in a mountainous country, *over-size* those that dwell on low levels. *Sandy's Journey.*

He, thus *over-siz'd* with coagulate gore,
Old grandsire Priam seeks. *Shakespeare. Hamlet.*

OVERSKIP', v. a. Over and skip. To pass by leaping; to pass over; to escape.

Presume not, ye that are sheep, to make yourselves guides of them that shall guide you; neither seek ye to *over-skip* the fold, which they about you have pitched. *Hooker.*

Mark if to get them she *o'er-skip* the rest,
Mark if she read them twice, or kiss the name. *Donne.*

When that hour *o'er-ships* me in the day,
Wherein I sigh not, Julia, for thy sake;
The next ensuing hour some foul mischance
Torment me.

Shakespeare. Two Gentlemen of Verona.

Who alone suffers, suffers most i' th' mind;
But the mind much sufferance does *o'er-skip*,
When grief hath mates and bearing fellowship *Shakespeare.*

OVERSLIP', v. n. Over and slip. To pass undone, unnoticed, or unused; to neglect.

The carelessness of the justices in imposing this rate, or the negligence of the constables in collecting it, or the backwardness of the inhabitants in paying the same, *over-slipped* the time. *Carew.*

He that bath *over-slipped* such opportunities is to bewail and retrieve them betimes. *Hammond.*

It were injurious to *over-slip* a noble act in the duke during this employment, which I must celebrate above all his expences. *Wotton.*

OVERSNOW', x. a. Over and snow. To cover with snow.

These I wielded while my bloom was warm,
Ere age unstrung my nerves, or time *o'er-snowed* my head. *Dryden's Æneid.*

OVERSOLD', part. From oversell. Sold at too high a price.

Life with ease I can disclaim,
And think it *over-sold* to purchase fame. *Dryden.*

OVERSOON', adv. Over and soon. Too soon.

The lad may prove well enough, if he *over-soon* think not too well of himself, and will bear away that he heareth of his elders. *Sidney.*

OVERSPENT', part. Over and spend. Wearied; harassed; forespent. The verb *overspend* is not used.

Thestylis wild thyme and garlick beats,
For harvest hinds, *o'er-spent* with toil and heats. *Dryden.*

OVERSPREAD', v. a. Over and spread. To cover over; to fill; to scatter over.

Of the three sons of Noah was the whole earth *overspread*. *Genesis ix. 19.*

Whether they were Spaniards, Gauls, Africans, Goths, or some other which did *overspread* all Christendom, it is impossible to affirm. *Spenser.*

Darkness Europe's face did *overspread*,
From lazy cells, where superstition bred.

Denham.

Not a deluge that only over-run some particular
region; but that *overspread* the face of the whole
earth from pole to pole, and from east to west.

Burnet.

OVERSTAND', v. a. Over and stand. To
stand too much upon conditions.

Her's they shall be, since you refuse the price,
What madman would *o'er-stand* his market twice.

Dryden.

OVERSTARE', v. a. Over and stare. To
stare wildly.

Some warlike sign must be used; either a slo-
venly buskin, or an *over-staring* frowned head.

Ascham.

OVERSTOCK', v. a. Over and stock. To
fill too full; to crowd.

Had the world been eternal, it must long ere this
have been *over-stocked*, and become too narrow for
the inhabitants.

Wilkins.

If rallery had entered the old Roman coins, we
should have been *over-stocked* with medals of this
nature.

Addison.

Since we are so bent upon enlarging our flocks, it
may be worth enquiring what we shall do with our
wool, in case Barnstable should be ever *over-stocked*.

Swift.

OVERSTORE', v. a. Over and store. To
store with too much.

Fishes are more numerous than beasts or birds,
as appears by their numerous spawn; and, if all
these should come to maturity, even the ocean itself
would have been long since *over-stored* with fish.

Hale.

OVERSTRAIN', v. n. Over and strain. To
make too violent efforts.

He wished all painters would imprint this lesson
deeply in their memory, that with *over-straining* and
earnestness of finishing their pieces, they often did
them more harm than good.

Dryden's DuFrenoy.

Crassus lost himself, his equipage, and his army,
by *over-straining* for the Parthian gold.

Collier.

OVERSTRA'IN, v. a. To stretch too far.

Confessors were apt to *over-strain* their privileges,
in which St. Cyprian made a notable stand against
them.

Ayliffe.

OVERSWAY', v. a. Over and sway. To
over-rule; to bear down.

When they are the major part of a general as-
sembly, then their voices, being more in number,
must *over-sway* their judgments who are fewer.

Hooker.

Great command *o'er-sways* our order.

Shakspeare.

Some great and powerful nations *o'er-sway* the
rest.

Heylyn.

OVERSWELL', v. a. Over and swell. To
rise above.

Fill, Lucius; till the wine *o'er-swell* the cup.
I cannot drink too much of Brutus' love.

Shakspeare.

When his banks the prince of rivers, Po,
Doth *o'er-swell*, he breaks with hideous fall.

Fairfax.

OVERT, adj. Fr. *ouvert*. Open; public;
apparent.

To vouch this, is no proof,
Without more certain and more *overt* test,
Than these thin habits and poor likelihoods.

Shakspeare.

Overt and apparent virtues bring forth praise
but there be secret and hidden virtues that bring
forth fortune; certain deliveries of a man's self.

Bacon.

My repulse at Hull was the first *overt* essay to be
made how patiently I could bear the loss of my king-
doms.

King Charles.

The design of their destruction may have been
projected in the dark; but, when all was ripe, their
enemies proceeded to so many *overt* acts in the face
of the nation, that it was obvious to the meanest.

Swift.

Whereas human laws can reach no farther than to
restrain the *overt* action, religion extends to the mo-
tions of the soul.

Rogers.

OVERTAKE', v. a. From over and take. To
catch any thing by pursuit; to come up to some-
thing going before; to take by surprise.

The enemy said, I will pursue, I will *overtake*, I
will divide the spoil.

Exodus xv. 9.

If a man be *over-taken* in a fault, ye which are
spiritual restore such an one in the spirit of meek-
ness.

Galatians vi. 1.

We durst not continue longer so near her con-
fines, lest her plagues might suddenly *overtake* us
before we did cease to be partakers with her sins.

Hooker.

If I had given you this at over night,
She might have been *o'ertaken*; and yet she writes
Pursuit would be but vain.

Shakspeare.

My soul, more earnestly released,
Will out-strip hers; as bullets flown before
A latter bullet may *o'er-take*, the powder being more.

Donne.

To thy wishes move a speedy pace,
Or death will soon *o'er-take* thee in the chase.

Dryden.

How must he tremble for fear vengeance should
over-take him, before he has made his peace with
God!

Rogers.

If it fall out, that through infirmity we be *over-
taken* by any temptation, we must labour to rise
again, and turn from our sin to God by new and
speedy repentance.

Perkins.

OVERTASK', v. a. Over and task. To
burden with too heavy duties or injunctions.

That office is performed by the parts with difficulty
because they were *overtasked*.

Harvey.

OVERTAX', v. a. Over and tax. To tax too
heavily.

OVERTHROW', v. a. & n. s. Over and
throw. To turn up side down; to throw down;
to demolish; to conquer, destroy, or subvert:
the noun follows these significations.

God *overthroweth* the wicked for their wickedness.

Proverbs.

Thou walkest in peril of thy *overthrowing*.

Eccles. xiii. 13.

Our endeavour is not so much to *overthrow* them
with whom we contend, as to yield them reasonable
causes.

Hooker.

Of those christian oratories, the *overthrow* and
ruin is desired, not by infidels, pagans, or Turks, but
by a special refined sect of Christian believers.

Id.

Here Glo'ster

O'er-charging you free purses with large fines,
That seeks to *overthrow* religion.

Shakspeare.

His *overthrow* heaped happiness upon him;
For then, and not till then, he felt himself,
And found the blessedness of being little.

Id.

From without came to mine eyes the blow,
Whereto mine inward thoughts did faintly yield;

Both these conspired poor reason's *overthrow*;
False in myself thus have I lost the field. *Sidney.*

She found means to have us accused to the king,
as though we went about some practise to *overthrow*
him in his own estate. *Id.*

They return again into Florida, to the murder
and *overthrow* of their own countrymen. *Abbott.*

From these divers Scots feared more harm by vic-
tory than they found among their enemies by their
overthrow. *Hayward.*

The *overthrown* he raised, and as a herd
Drove them before him. *Milton.*

O loss of one in heaven, to judge of wise
Since Satan fell, whom folly *overthrew.* *Id.*

Pittacus was a wise and valiant man, but his wife
overthrew the table when he had invited his friends.
Taylor.

To Sujah next your conquering army drew,
Him they surprised, and easilly *o'erthrew.* *Dryden.*

Poor Hannibal is maul'd,
The theme is given, and strait the council's called,
Whether he should to Rome directly go,
To reap the fruit of the fire *overthrow.* *Id.*

Blood is not water; and where shall we find
Feelings of youth like those which *overthrown* lie
By death, when we are left, alas! behind. *Byron.*

OVERTHWART, *adj.* } Over and thwart.
OVERTHWARTLY, *adv.* } Opposite; being
over against: in the adverb transversely; hence
perversely.

Two or three acts disposed them to cross and op-
pose any proposition; and that *over-thwart* humour
was discovered to rule in the breasts of many.
Clarendon.

We whisper, for fear our *overthwart* neighbours
should bear us, and betray us to the government.
Dryden.

The brawn of the thigh shall appear, by drawing
small hair strokes from the hip to the knee shadowed
again *over-thwart.* *Peachment on Drawing.*

OVERTOP, *v. a.* Over and top. To rise
above: to raise the head above; to excel; to
surpass; obscure, or make of less importance by
superior excellence.

Who ever yet
Have stood to charity and displayed the effects
Of disposition gentle, and of wisdom
er-topping woman's power?

Shakespeare. Henry VIII.

Pile your dust upon the quick and dead,
T' *er-top* old Pelion, or the skyish head
Of blue Olympus. *Id. Hamlet.*

Whereas he had been heretofore an arbiter of Eu-
rope, he should now grow less, and be *overtopped* by
so great a conjunction. *Bacon.*

As far as the soul *er-tops* the body, so far its
pains, or rather mournful sensations, exceed those
of the carcass. *Harvey.*

In the dance the graceful goddess leads
The quire of nymphs and *over-tops* their heads.
Dryden.

One whom you love,
Had champion killed, or trophy won,
Rather than thus be *overtop*,
Would you not wish his laurels cropt? *Swift.*

OVERTRIP, *v. a.* Over and trip. To trip
over; to walk lightly over.

In such a night.
Did Thisbe fearfully *o'ertrip* the dew,
And saw the lion's shadow ere himself,
And ran dismayed away.

Shakespeare. Merchant of Venice.

OVERTURE, *n. s.* *Fr. ouverture.* Opening;
disclosure; discovery; proposal; offer.

I wish
You had only in your silent judgment try'd it,
Without more *overture.* *Shakespeare. Winter's Tale.*
Mac Murugh moved Henry to invade Ireland, and
made an *overture* unto him for obtaining of the sove-
reign lordship thereof. *Davies on Ireland.*

All these fair *overtures* made by men well es-
teemed for honest dealing could not take place.
Hayward.

We with open breast
Stand ready to receive them, if they like
Our *overture*, and turn not back perverse.

Milton.
Withstand the *overtures* of ill, and be intent and
serious in good. *Fell.*

The earl of Pembroke, who abhorred the war,
promoted all *overtures* towards accommodation with
great importunity. *Clarendon.*

If a convenient supply offers itself to be seized
by force or gained by fraud, human nature per-
suades us to hearken to the inviting *overture.*

Rogers.
Suppose five hundred men proposing, debating,
and voting according to their own little or much
reason, abundance of indigested, and abortive,
many pernicious and foolish *overtures* would arise.
Swift.

OVERTURN, *v. a.* Over and turn. To
throw down; to topple down; to subvert; to
ruin: an overturner, one who subverts.

He is wise in heart and mighty in strength—which
removeth the mountains, and *over-turneth* them in his
anger. *Job.*

These will sometimes *over-turn*, and sometimes
swallow up towns, and make a general confusion in
nature. *Burnet.*

This he obviates, by saying we see all the ideas in
God; which is an answer to this objection, but such
an one as *overturns* his whole hypothesis, and renders
it useless and as unintelligible, as any of those
he has laid aside. *Locke.*

But he comes round about again, and *overturns*
every stone that he had laid. *Lesley.*

If we will not encourage publick works of benefi-
cence, till we are secure that no storm shall *over-
turn* what we help to build; there is no room left
for charity. *Atterbury.*

A monument of deathless fame,

A woman's hand *overturns.*

Rousseau.
I have brought before you a robber of the publick
treasure, an *overturner* of law and justice, and the
destruction of the Sicilian province. *Swift.*

OVERVAL'UE, *v. a.* Over and value. To
rate at too high a price.

We have just cease to stand in some fear, lest by
thus *over-valuing* their sermons they make the price
and estimation of scripture, otherwise notified, to fall.

Hooker.
To *over-value* human power is likewise an argu-
ment of human weakness. *Holyday.*

OVERVEIL, *v. a.* Over and veil. To
cover.

The day begins to break, and night is fled;
Whose pitchy mantle *over-veiled* the earth.

Shakespeare.

OVERVOTE, *v. a.* Over and vote. To con-
quer by plurality of votes.

The lords and commons might be content to be
over-voted by the major part of both houses, when
they had used each their own freedom.

King Charles. I.

OVERWATCH', v. n. Over and watch. To subdue with long want of rest.

While the dog hunted in the river, he had withdrawn himself to pacify with sleep his *over-watched* eyes. *Sidney.*

Morpheus is dispatched ;
Which done, the lazy monarch *over-watched*,
Down from his popping elbow drops his head,
Dissolved in sleep, and shrinks within his bed.

Dryden.

OVERWEAK', adj. Over and weak. Too weak ; too feeble.

Paternal persuasions, after mankind began to forget the original giver of life, became in all *over-weak* to resist the first inclination of evil ; or after, when it became habitual, to constrain it. *Kaleigh.*

OVERWEARY, v. a. Over and weary. To subdue with fatigue.

Might not Palinurus fall asleep and drop into the sea, having been *over-wearied* with watching ?

Dryden.

OVERWEATHER, v. a. Over and weather. To batter by violence of weather.

How like a younker or a prodigal,
The skarfed bark puts from her native bay,
Hugged and embraced by the strumpet wind !
How like the prodigal does she return,
With *over-weathered* ribs, and ragged sails,
Lean, rent, and beggar'd by the strumpet wind !

Shakespeare.

OVERWEEN', v. n. Over and ween. To think too highly ; to think with arrogance.

Oft have I seen a hot *o'erweening* cur,
Run back and bite, because he was with-held.

Shakespeare.

My eye's too quick, my heart *o'erweens* too much,
Unless my hand and strength could equal them.

Id.

Take heed of *overweening*, and compare
Thy peacock's feet with thy gay peacock's train ;
Study the best and highest things that are,
But of thyself an humble thought retain. *Davies.*

They that *overween*,
And at thy growing virtues fret their spleen,
No anger find in thee. *Milton.*

Satan might have learnt
Less *overweening*, since he failed in Job,
Whose constant perseverance overcame
Whate'er his cruel malice could invent. *Id.*

No man is so bold, rash, and *overweening* of his own works, as an ill painter and a bad poet.

Dryden.

Men of fair minds, and not given up to the *overweening* of self-flattery, are frequently guilty of it : and, in many cases, one with amazement hears the arguings, and is astonished at the obstinacy, of a worthy man who yields not to the evidence of reason.

Locke.

Now enters *overweening* pride,
And scandal ever gaping wide. *Swift.*

OVERWEIGH', v. a. Over and weigh. To preponderate.

Sharp and subtle discourses of wit, procure many times very great applause, but, being laid in the balance with that which the habit of sound experience delivereth, they are *overweighed*. *Hooker.*

My unsoiled name, the' austereness of my life,
Will so your accusation *overweigh*,
That you shall stifle in your own report.

Shakespeare.

OVERWEIGHT', n. s. Over and weight. Preponderance.

Sinking into the water is but an *overweight* of the body, in respect of the water.

Bacon's Natural History.

OVERWHELM', v. a. } To crush under-
OVERWHELMINGLY, adv. } neath something ; violent or weighty ; to overlook gloomily : the adverb signifies irresistibly.

Back do I toss these treasons to thy head,
With the hell hated lie *o'erwhelm* thy heart.

Shakespeare.

Let the brow *o'erwhelm* it,
As fearfully as doth a galled rock
O'erhang and jutty his confounded base. *Id.*

An apothecary late I noted,
In tattered weeds with *overwhelming* brows,
Culling of simples. *Id. Romeo and Juliet.*

What age is this, where honest men,
Placed at the helm,

A sea of some foul mouth or pen,
Shall *overwhelm* ? *Ben Jonson.*

Men should not tolerate themselves one minute in any known sin, nor impertinently betray their souls to ruin for that which they call light and trivial ; which is so indeed in respect of the acquiescent, but *overwhelmingly* ponderous in regard of the pernicious consequents. *Decay of Piety.*

How trifling an apprehension is the shame of being laughed at by fools, when compared with that everlasting shame and astonishment which shall *overwhelm* the sinner, when he shall appear before the tribunal of Christ ! *Rogers.*

Blind they rejoice, though now, even now they fall ;

Death hastes amain ; one hour *o'erwhelms* them all.

Pope.

OVERWISE', adj. Over and wise. Wise to affectation.

Make not thyself *overwise*. *Ecc. vii. 16.*

OVERWROUGHT', part. Over and wrought. Labored too much ; worked all over.

Apelles said of Protegenes, that he knew not when to give over. A work may be *overwrought*, as well as underwrought : too much labour often takes away the spirit, by adding to the polishing ; so that there remains nothing but a dull correctness, a piece without any considerable faults, but with few beauties. *Dryden.*

Of Gothic structure was the northern side,
O'erwrought with ornaments of barbarous pride.

Pope.

OVERWORN', part. Over and worn. Worn out ; subdued by toil ; spoiled by time.

The jealous *o'erworn* widow and herself
Are mighty gossips in this monarchy.

Shakespeare.

With watching *overworn*, with cares oppress,
Unhappy I had laid me down to rest. *Dryden.*

OVERYEARED', adj. Over and year. Too old.

Among them dwelt
A maid, whose fruit was ripe, not *overyeared*.

Fairfax.

OVERYSSEL, a large level province of the Netherlands, having Guelderland on the south-west, and on the east a part of Hanover and Westphalia. It contains large tracts of marshy ground, and the soil is consequently ill fitted for tillage, except along the banks of the Yssel. It is watered by this river, the Vechte, the Zwart water, the Schiepel, and the Linde. The air is damp and in various parts unhealthy, from the exhalations that rise from the large expanses of

water. It produces buck-wheat, potatoes, a little fruit, rape seed; timber; cattle, and sheep. Turf for fuel is found in almost all parts. The chief exports, after cattle, are butter, cheese, tallow, hides, wool, turf, and linen, which is made and bleached in considerable quantities. This is the least populous of the Dutch provinces; its inhabitants amounting only to 147,000, partly Protestants, and partly Catholics. It has no port of consequence; but sends four members to the states-general of the Netherlands; belonging to the second military division, and to the jurisdiction of the high court of the Hague. It is divided into three districts, viz. Zwolle (the capital) in the north-west, Deventer in the south-west, and Almelo in the east.

OVERZEAL'OUS, *adj.* Over and zealous. Too zealous.

It is not of such weighty necessity to determine one way or the other, as some *overzealous* for or against the immateriality of the soul, have been forward to make the world believe. *Locke.*

OUESSENT, ISLE OF, France, situated in the Atlantic Ocean, about eighteen miles from the coast of Brittany, and thirty-six W. N. W. from Brest, which is its port town. It constitutes one of the cantons of the arrondissement of Brest, in the department of Finistère; but it is of small extent, not containing more than eighteen square miles. The soil is rather fertile, and covered in some parts with fine meadows, feeding a great number of horses and sheep. This island contains a few hamlets, a strong castle, and a little port frequented by fishermen. The access to it is very dangerous on account of the rocks which surround it. There are some other smaller islands near it, called by the same name. On the coast there is a fishery for pilchards and other fish.

OUFÁ, a large city of Asiatic Russia, the capital of the government of Orenbourg, was built in 1573, by the czar Ivan Vassilievitch. It is said that there was anciently upon this spot a great Tartar city, the residence of the khans of Nogais; and two mosques of brick, and several remarkable sepulchral monuments, which bear Arabic and Cufic inscriptions, would seem to confirm this tradition. The town is situated on the Belaia, near its junction with the Oufa. Its site is intersected by numerous torrents and ravines. Oufa was once fortified, but the frontier being now extended, the works have fallen into decay. It has seven churches, two convents (one for nuns), an academy, and two schools. It is also the residence of a primate, who bears the title of archbishop of Orenbourg and Oufa. Inhabitants 2500.

OUFA, a considerable river of Asiatic Russia, which rises in the Oural mountains, and flows through a mountainous country, till it falls into the Belaia, near the city of this name. Several of its tributary streams have rich mines of iron on their banks.

UGHT, *n. s.* } Sax. *aphit*. More properly
UGH'TY. } written *ught*. Any thing.

He asked him if he saw *ught*. *Mark*, viii. 23.

For *ought* that I can understand, there is no part but the bare English pale, in which the Irish have not the greatest footing. *Spenser on Ireland.*

To do *ought* good never will be our task;
But ever to do ill our sole delight. *Milton.*

Universal Lord! be bounteous still
To give us only good; and if the night
Have gathered *ought* of evil, or concealed,
Disperse it, as now light dispels the dark. *Id.*

UGHT, *imp. verb. & preter. of owe.* Owed; obliged; to be fit or necessary.

Know how thou *oughtest* to behave. *Timothy.*
Speak boldly as I *ought* to speak. *Ephesians.*

Judges *ought* to remember that their office is to interpret law, and not to make or give law. *Bacon.*

Apprehending the occasion, I will add a continuance to that happy motion, and besides give you some tribute of the love and duty I long have *ought* you. *Spelman.*

This blood which men by treason sought,
That followed, sir, which to myself I *ought*

If grammar *ought* to be taught, it must be to one that can speak the language already. *Locke.*

We *ought* to profess our dependance upon him, and our obligations to him for the good things we enjoy. We *ought* to publish to the world our sense of his goodness with the voice of praise, and tell of all his wondrous works. We *ought* to comfort his servants and children in their afflictions, and relieve his poor distressed members in their manifold necessities; for he that giveth alms sacrificeth praise. *Nelson.*

She acts just as she *ought*,
But never, never, reached one gen'rous thought. *Pope.*

But Reason still, unless divinely taught,
Whate'er she learns, learns nothing as she *ought*. *Cowper.*

Whate'er thou takest, spare awhile poor Beauty!
She is so rare, and thou hast so much prey.

What though she now and then may slip from duty,
The more's the reason why you *ought* to stay. *Byron.*

UGHTRED (William), an eminent mathematician, born and educated at Eton, in 1573, whence he was sent to King's College in Cambridge, of which he afterwards became fellow. Being admitted to holy orders, he left the university about 1603, and was presented to the rectory of Aldbury, near Guildford in Surrey; and about 1628 was appointed by the earl of Arundel to instruct his son in the mathematics. He corresponded with some of the most eminent scholars of his time upon mathematical subjects; and young gentlemen came from all parts to receive his instructions. Upon hearing the news of the vote at Westminster, for the restoration of king Charles II., he expired in a sudden transport of joy, aged eighty-eight. He wrote, 1. *Clavis Mathematica*; afterwards published in English. 2. *A Description of the double horizontal Dial*. 3. *Opuscula Mathematica*; and several other works. He left also behind him a great number of papers upon mathematical subjects, in the museum of William Jones, esq., F. R. S. He had one son, whom he bred a watchmaker.

OVID, a post town, the capital of Seneca county, New York; twenty miles south by east of Geneva, forty-one north of Elmira, 205 west of Albany. Population 4535. It is situated between Seneca and Cayuga lakes, is a large and excellent agricultural town, and contains four houses of public worship. The county buildings

are in a small village called Verona, or Ovid. A weekly newspaper is published here.

VIDIUS NASO (Publius), a celebrated Latin poet of the Augustan age, and a Roman knight, born at Sulmo, A. A. C. 43. He studied rhetoric under Aurelius Fuscus, and for some time frequented the bar. His progress in eloquence was great, but nothing could deter him from pursuing his natural inclination to poetry. Every thing he wrote was expressed in poetical numbers. A lively genius and a fertile imagination soon gained him admirers: the learned became his friends; Virgil, Propertius, Tibullus, and Horace, honored him with their correspondence, and Augustus patronised him with the most unbounded liberality. However, he afterwards incurred his displeasure, and was banished to Tomos, a city on the Pontus Euxinus, near the mouth of the Danube, when he was fifty years of age. The cause of this exile is unknown, but several passages indicate that it was some improper connexion with the family of Augustus. His writings in exile, although full of flattery and impatience, failed to procure him a pardon, and he died in the seventh or eighth year of his banishment, and in the fifty-seventh year of his age. He was buried at Tomos. The greatest part of his poems are extant, consisting of his *Metamorphoses*, his *Fasti*, his *Tristia*, *Elegies*, the *Heroides*, three books *Amorum*, and three *de Arte Amandi*, with the other *de Remedio Amoris*, his *Ibis*, and fragments of other poems, among which are part of a tragedy called *Medea*. His *Epistles* from Pontus are the language of a servile flatterer.

OVIEDA, in botany, a genus of the angiospermia order, and didynamia class of plants; natural order fortieth, personatæ: CAL. quinquefid: cor. tube almost cylindrical above, and very long: BERRY globose and dispersuous.

OVIEDO (John Gonsalvez de), born at Madrid about 1478, was sent by Ferdinand V. to the island of Hayti (now St. Domingo), as intendant and inspector-general of the trade of the New World, and on his return to Spain published *Summario de la Historia general y natural de las Indias Occidentales*.

OVIEDO, an inland town of Spain, the chief place of Asturias, stands in a plain at the confluence of two small rivers called the Ovia and the Nora. It is of a horse-shoe form, with a square in the centre. The streets are straight and regular; and the town a bishop's see, and has an elegant Gothic cathedral, rich in vases, relics, and ornaments. It contains the bones of fourteen kings and queens who reigned in the north of Spain while the rest of the peninsula was in the hands of the Moors. Another church called St. Salvador was built in the eighth century. In the ninth century Oviedo had the title of the City of Bishops, from the great number of prelates who took refuge here from the Saracens. In 877 a general council was held here. The other public establishments are a university, an ancient aqueduct, the episcopal palace, a collegiate chapter, three churches, three monasteries, three convents, three hospitals, and a drawing school. The trade is, or was, chiefly in the colonial produce landed at Gijon. Here are also tanneries;

manufactories of hats, combs, and bone buttons; with a depôt of arms. Population 7500. Sixty miles north of Leon, and 130 W.N.W. of Burgos.

O'VIFORM *adj.* } Lat. *ovum*. Of the shape
OVI'FEROUS. } of an egg: bringing forth eggs.

This notion of the mundane egg, or that the world was *oviform*, hath been the sense and language of all antiquity. *Burnet.*

Birds and *oviparous* creatures have eggs enough at first conceived in them to serve them for many years' laying. *Ray.*

That fishes and birds should be *oviparous* is a plain sign of providence.

More's Antidote against Atheism.

OVILIA, or Septa, a place in ancient Rome, in the Campus Martius, at first railed in like a sheep-pen, whence its name. Afterwards it was mounted with marble, and beautified with walks and galleries, as also with a tribunal, or a seat of justice. Within this precinct, or enclosure, the people were called to give their suffrages for the election of magistrates. The ascent into the ovilia was not by stairs, but by pontes, or narrow boards, laid there for the occasion; on which account, *de ponte de jeci* signified 'to be deprived of the privilege of voting;' and persons thus dealt with were called *de pontani*.

OVIS, the sheep, in zoology, a genus of the class mammalia, and of the order of pecora. The characters are these: the horns are concave, turned backwards, and full of wrinkles; there are eight fore-teeth in the under jaw, and no dog-teeth. The wool of these animals is only a congeries of very long and slender hairs twisted and contorted, and variously interwoven with one another. This, as far as is yet known, is a clothing peculiar to the sheep kind, no other animal having been seen to possess it. It is not, however, the clothing of all the species of sheep, some that are found in distant nations having short hair like that of the goat. Linné enumerates three species, viz.—

1. O. aries, or the ram-sheep, the horns of which are shaped like a half-moon, and compressed.

2. O. Guineensis, the Guinea sheep, which has pendulous ears, lax hairy dewlaps, and a prominence on the hind part of the head. The wool is short like that of a goat. It is a native of Guinea.

3. O. strepsiceros, or the Cretan sheep, which has straight cariated horns, twisted in a spiral manner, and is a native of Mount Ioha.

Pallas, in his very extensive travels in the Russian empire, more particularly in Siberia and amongst the pastoral nations of Great Tartary, found what he regards as only one species of sheep, subdivided into four varieties.

i. O. brachiura, the short-tailed sheep, is called the Russian sheep by the natives. It seems to be the *ovis Islandicus* of authors, with smaller horns. It is reared throughout all the north of Russia, and resembles that of Iceland in size, tail, and coarseness of fleece; but, though this be the case in these few respects, yet it differs from it in a very essential character, that of horns, which are much smaller, and have nothing

of that exuberance which Buffon and others attribute to the sheep of that island. It resembles the Tscherkessian sheep in the form of its head, straight upright ears, and in thickness of fleece; but the quality of the two fleeces is very different, this variety having wool almost as coarse as dog's hair; but the great distinguishing character between them is the tail, which is almost a quarter of a yard shorter than that of the Tscherkessian. The brachiura, or short-tailed sheep, is reared not only by the northern Russians, but likewise by the Fins and other neighbouring nations. Some of this variety have been transported into Siberia, where they have supported themselves on some pastures, though in poor condition; but through all the southern countries they are in less estimation than the long-tailed and fat-tailed varieties, which are much superior to them for size, fat, and good eating.

ii. *O. Bucharica* is by Pallas called Bucharian, from his finding it reared by the Bucharian Tartars in immense flocks. It is also raised by the Persians in great numbers. Pallas regards this as a mixed breed, arising, as he supposes, from the union of the long-tailed and fat-tailed sheep. The head of this variety is like that of the Kirguise; but the muzzle is sharper, resembling the Indian of Buffon: the body is rather smaller than that of the Kirguise sheep; the ears are larger and pendant; they have a small uropygium, like that of the Tartar sheep on the Jenisy, especially when begotten by a Kirguise ram; but in general they have a tail fat and broad at the base, with a long narrow appendage, and resembles the tail of the Tscherkessian sheep.

iii. *O. dolichura*, the long-tailed sheep, is named both by the Tartars and Russians Tscherkessian sheep; it is the *ovis longicauda* of authors. It is a handsome animal, with a noble air, in its native country and the south of Russia, resembling in its habits, horns, fleece, and length of tail, the Spanish, but more particularly the English sheep. Its head is well proportioned, and of an elegant form; ears straight; horns large, even, rounded in the angles, tapering to a point, and bending inwardly towards the back. The rams are seldom without horns, and the ewes have them often bent in a lunar form. The wool, though coarse, is without admixture of hair, which is perhaps but an accidental distinction, and promises to be much meliorated by crossing the breed, and rearing the animal with more care and skill. It is even known to become much finer without the assistance of art, merely from the influence of a temperate climate, as on Mount Caucasus. The tail of the ram is covered with fine long wool, like the Indian sheep described by Buffon, which trails on the ground, so as to efface the prints made by the animal's feet on sand, and it contains often twenty joints or vertebrae. In passing from the state of nature to that of servitude, it seems to have lost its native ferocity, together with its coarse fleece. There are sheep in Morocco which belong to this variety, on account of the distinguishing character of it, a long tail, although otherwise different, in having an ugly look, head covered entirely with hair, little hanging ears, and remarkably long wool.

iv. *O. steatopyga*, the fat-tailed sheep, has appellations as various as the provinces where it is reared; it is the *ovis laticaudata* of authors. This is both the most abundant and largest breed of sheep in the world. It is reared throughout all the temperate regions of Asia, from the frontiers of Europe to those of China, in the vast plains of Tartary. All the Nomade hordes of Asia, the Turkomans, Kirguise, Calmucks, and Mongul Tartars, rear it; and, indeed, it constitutes their chief riches, the number they possess being enormous. The flocks of all the Tartar hordes resemble one another by a large yellowish muzzle, the upper jaw often projecting beyond the lower; by long hanging ears; by the horns of the adult ram being large, spiral, wrinkled, angular, and bent in a lunar form. The body of the ram, and sometimes of the ewe, swells gradually with fat towards the posteriors; where a solid mass of fat is formed on the rump, and falls over the anus in place of a tail, divided into two hemispheres, which take the form of the hips, with a little button of a tail in the middle, to be felt with the finger. The uropygium, or fat-rump, which is made up of this oily species of fat, is so very large as to incommode the animal in walking; but, when the same sheep are carried into the interior parts of Russia, the tail loses half its size and weight; nay, sometimes more, from a change in their food and mode of life. This variety, besides the characters mentioned above, have slender legs in proportion to their bodies, a high chest, large hanging testicles, a large prepuce, and tolerably fine wool mixed with hair. Such are the great characteristic marks by which the flocks of all the Tartar hordes resemble one another; but climate, soil, &c., produce some small difference on this variety, whether reared by the Tartars or the Russians, in the western deserts of Great Tartary, from the river Volga to the Irtysh, and the Altaic chain of mountains.

Mr. Kerr, in his translation of Gmelin's Zoological System of Linné, gives a more complete and satisfactory classification of this genus than any of the authors above quoted. He enumerates four species and fifteen varieties, viz.—

i. *O. ammon*, the argali, or *O. fera* of Pallas; or the wild sheep of Pennant. The horns are large, semicircularly arched backwards and divergent, wrinkled on their upper surface, and flatish on the under side; the neck has two pendent hairy wattles. Pallas paid particular attention to this species. He says, he 'found the *ovis fera*, or wild sheep, in all its native vigor, boldness, and activity, inhabiting the vast chain of mountains which run through the centre of Asia to the eastern Sea, and the branches which it sends off to Great Tartary, China, and the Indies. This wild animal, probably the musimon of Pliny, and the ophion of the Greeks, is called argali, or wild sheep, by the Siberians; and by the Russians *kamennoi barrann*, or sheep of the rocks, from its ordinary place of abode. It delights in the bare rocks of the Asiatic chain just mentioned, where it is constantly found basking in the sun; but it avoids the woods or the mountains, and every other object that would intercept the direct rays of the glorious luminary. Its food is the Alpine plants and shrubs it finds

amongst the rocks. The argali prefers a temperate climate, although he does not disdain that of Asiatic Siberia, as there he finds his favorite bare rocks, sunshine, and Alpine plants; nay, he is even found in the cold eastern extremity of Siberia and Kamtschatka. The argali loves solitude, and flees the haunts of man; gradually abandoning a country in proportion as it becomes peopled. The ewe of the argali brings forth before the melting of the snow. Her lamb resembles much a young kid, except that it has a large flat protuberance in place of horns, and that it is covered with a woolly hair, frizzled, and of a dark gray. When pursued, the argali does not run straight forward, but doubles and turns like a hare, at the same time that it scrambles up and over the rocks with wonderful agility. In the same proportion that the adult argali is wild and untameable, the lamb is easily tamed when taken young, and fed first on milk and afterwards on fodder, like the domestic sheep, as has been found on numerous experiments made in the Russian settlements in these parts. This animal formerly frequented the regions about the upper Irish, and some other parts of Siberia, where it is no longer seen since colonies have been settled in these countries. It is common in the Mongolian, Songarian, and Tartarian mountains, where it enjoys its favorite solitude and liberty. The argali is found likewise on the banks of the Lena, up as high as 60° of lat. N.; and it propagates its species even in Kamtschatka, as noticed before. The argali is also found in the mountains of Persia, and is said to exist in the Kuril islands in great size and beauty. The argali is about the height of a small hart, but its make is much more robust and nervous. Its form is less elegant than that of the deer, and its legs and neck shorter. The male is larger than the female, and every way stouter. Its head resembles that of a ram, with long straggling hairs about the mouth; but no beard. Its ears are rather smaller than those of a ram. The tail is very short. The summer coat consists of short hair, sleek, and resembling that of a deer. The winter coat consists of wool like down, mixed with hair every where an inch and a half long at least, concealing at its roots a fine woolly down, generally of a white color. The color of its coat was in general of a dark grayish brown, with white tips to the longer hairs, and consisted of hair mixed with wool, of a dark iron gray.

ii. *O. Ammon Europæa*, the Corsican argali, is a variety mentioned by Mr. Kerr on the authority of Mr. Pennant, differing from the above chiefly in color; having a large white spot on the neck, and being black on the shoulders. In Corsica it is called *mufro*.

iii. *O. aries*, the common sheep, has the horns spirally twisted outwards. The disposition of the sheep is so mild and gentle, that, although in its wild state, it fears not to defend itself against the most formidable antagonists; yet, when domestic, it is the most timid and apparently defenceless of all animals. It is of the most extensive utility to man. We are clothed by its fleece, and the flesh is a delicate and wholesome food. The skin, dressed, forms different parts of our apparel, and is used for covers of books.

The entrails, properly prepared and twisted, serve for strings for various musical instruments. The milk is thicker than that of cows, and consequently yields a greater quantity of butter and cheese; and in some places is so rich that it will not produce the cheese without a mixture of water to make it part from the whey. The dung is a remarkably rich manure; inasmuch that the folding of sheep is become too useful a branch of husbandry for the farmer to neglect. In short, this animal has nothing that does not redound to our benefit. The ram is capable of generation at the age of eighteen months; and the ewe can be impregnated when a year o.d. One ram is sufficient, according to Buffon, for twenty-five or thirty ewes; they have often been known indeed to beget 100 lambs in a single season. He ought to be large and well proportioned; his head should be thick and strong, his front wide, his eyes black, his nose flat, his neck thick, his body long and tall, his testicles massy, and his tail long. White is the best color for a ram. The ewes whose wool is most plentiful, bushy, long, soft, and white, are most proper for breeders, especially when at the same time they are of a large size, have a thick neck, and move nimbly. In this climate, ewes fed in good pastures admit the ram in July or August; but September or October are the months when the greatest part of our ewes, if left to nature, take the ram. They go with young about five months, and generally bring forth but one at a time, though frequently two; in warm climates they may bring forth twice in a year; but in Britain, France, and most parts of Europe, only once. They give milk plentifully for seven or eight months. They live from ten to twelve years; they are capable of bringing forth as long as they live, when properly managed; but are generally old and useless at the age of seven or eight years. The ram, though he lives twelve or fourteen years, becomes unfit for propagating when eight years old. When the male lambs are not intended to be kept for propagation, but fattened for food, they ought to be castrated at the age of five or six months. After castration they are called *wedders*. The ram, ewe, and *wedder*, when one year old, lose the two fore teeth of the under jaw; six months afterwards they lose the two fore teeth next to these; and, at the age of three years, the teeth are all replaced. The age of a ram may likewise be discovered by his horns, which always appear the first year, and frequently as soon as he is brought forth. These horns uniformly acquire an additional ring every year as long as the creature lives. The ewes commonly have no horns, but a kind of long protuberance in place of them; however some of them have two and some four horns. As white wool is most valued, black or spotted lambs are generally slaughtered. In some places, however, almost all the sheep are black; and black lambs are often produced by the commixture of white rams with white ewes. In France there are only white, brown, black, and spotted sheep; but in Spain there is a reddish kind; and in Scotland there are some of a yellowish color. But all these varieties of color are more accidental than those produced by dif-

ferent races ; which, however, proceed from the influence of climate, and the difference of nourishment. In the northern parts of Europe, as Denmark and Norway, the sheep are not good ; but, to improve the breed, rams are occasionally imported from England. The rams, ewes, and widders of Iceland, differ chiefly from ours by larger and thicker horns. Some of them have three, four, and even five horns. This, however, is not common. In Spain, and the southern parts of Europe, the flocks of sheep are kept in shades or stables during the night : but in Britain, where there is now no danger from wolves, they are allowed to remain without, both night and day ; which makes the animals more healthy, and their flesh a more wholesome food. Dry and mountainous ground, where thyme and sheep's fescue grass abound, are the best for the pasturing sheep. Sheep are subject to many diseases : some arising from insects which deposit their eggs in different parts of the animal : others are caused by their being kept in wet pasture ; for as the sheep requires but little drink, it is naturally fond of a dry soil. The dropsy, vertigo (the pendro of the Welsh), the phthisis, jaundice, and worms in the liver, annually make great havock among our flocks : for the first disease, the shepherd finds a remedy by turning the infected into fields of broom ; which plant has been also found to be very efficacious in the same disorder among the human species. The sheep is also infested by different sorts of insects : like the horse, it has its peculiar cestrus or gadfly, which deposits its eggs above the nose in the frontal sinuses. When these turn into maggots, they become excessively painful. The French shepherds make a common practice of easing the sheep, by trepanning and taking out the maggot ; this practice is sometimes used by the English shepherds, but not always with the same success. Besides these insects, the sheep is troubled with a kind of tick and louse, which magpies and starlings contribute to ease it of, by lighting on its back, and picking the insects off. Mr. Kerr enumerates fifteen varieties of this species.

1. *O. aries Africana*, inhabiting Africa, and has short hair instead of wool.

2. *O. aries Anglica*, the English hornless sheep ; without horns ; the tail and scrotum hang down as low as the second joint of the hind leg, and the wool is fine. This kind is common in most parts of Britain ; those of Lincolnshire are the largest, and very small breeds are found in Wales and Shetland. They have generally either no horns or very small ones ; and many of them have very short tails.

3. *O. aries barbata*, the bearded sheep, or Siberian goat of Mr. Pennant, has a long divided beard, hanging down from the lower part of the cheeks and upper jaw. It is the tragelaphus of Pliny. It inhabits Barbary and Mauritania. The color is a pale rusty brown.

4. *O. aries Bucharica*, the Bucharian sheep of Pallas already described.

5. *O. aries Capensis*, the Cape Sheep, has large pendulous ears, and a large broad tail. The horns are short and bent back ; the body and neck are covered with long hair, or wool not curled ; the legs are black and naked.

6. *O. aries Guineensis*, the Guinea, or waddled sheep, already described.

7. *O. aries hispanica*, the Spanish sheep, has horns twisted into a spiral, which is lengthened outwards ; the wool is very fine and famous all over Europe.

8. *O. aries jubata*, the Chinese morvant, has a short red and gray mane on the neck ; and a long beard on the breast round the neck ; on the shoulders are longish red gray hairs ; the rest of the body is covered with a bright yellow wool, a little curled and soft at the ends, but coarse at the roots ; the legs are deep red ; the tail is yellow and white, with long coarse hairs.

9. *O. aries laticaudata*, the broad-tailed sheep, has a long and very broad tail. This kind is common in Syria, Barbary, Ethiopia, Thibet, and Tartary. The tails are so long as to trail on the ground. They are sometimes pointed at the end, but mostly rounded ; they sometimes weigh fifty pounds, and, being composed of a substance between fat and marrow, are reckoned a great delicacy. Those of Thibet produce the fine wool of which shawls are made.

10. *O. aries longicauda*, the long-tailed sheep, described before.

11. *O. aries nana*, the dwarf sheep, has no horns, is of a very small size, and has a turned up nose. This variety is found in Lincolnshire. The wool forms a ruff round its face. The under jaw is protruded ; the nose crooked upwards ; the ears small and erect.

12. *O. aries polycerata*, the many-horned sheep ; *ovis Gotlandica* of Pallas : the Iceland sheep of Buffon, has more than two horns. This variety is common in Iceland, Siberia, and Tartary ; but in the same flocks in which many are found with three, four, five, or six horns, others have only the usual pair : whence Mr. Kerr thinks they can hardly form a distinct variety.

13. *O. aries rustica*, the rustic, or black-faced sheep, is horned, the tail round and short, and the wool white but rather coarse. This is the most common breed of sheep all over Europe ; the horns are large, wrinkled, turned backwards in a comprised, spiral, screw-like twist, which comes down to the sides of the head, taking several turns, and becoming very large on old rams. The face is covered with short black, dark brown, or gray hair. They are very agile, and exceedingly shy. The mutton is much esteemed. The most perfect breed is found in Tweed-dale.

14. *O. aries steatopyga*, the fat-rumped sheep, described above.

iv. *O. pudu*, the pudu, or *capra puda* of Molina, has round, smooth, divergent horns, and inhabits the Cordilleras in South America. It is about the size of a half-year old kid, and lives in flocks on the mountains ; whence they descend into the south plains of Chili, when the hills are covered with snow. It resembles a goat, but the horns are small, and turned outwards, like those of a sheep. It has no beard ; the female has no horns ; the color is dusky. This is the only animal of the genus which seems indigenous to America.

v. *O. strepsiceros*, the Cretan sheep, or Wallachian sheep of Buffon. Described above. This

species inhabit Candia, and the other Grecian islands, and are common in Hungary and Austria, where they are called zackl.

OUISCONSIN, a river of the United States, which runs south-west into the Mississippi, lat. 43° 40' N. It is connected with Fox River, which flows into Green Bay by a portage of three miles. Length about 300 miles.

OULABAREAH, a trading town of Bengal in Burdwan, pleasantly situated on the west bank of the Hoogly River. On the destruction of the English factory at Hoogly, in 1687, this town was assigned for the residence of the British, but after the expenditure of some money, the president of the factory (Mr. Charnock) took a dislike to the place, and obtained permission to remove to Chuttanutty, a site now occupied by Calcutta. This town, which only consists of thatched houses, is situated eighty miles from the mouth of the river, and twenty below Calcutta.

OUNCE, *n. s.* Fr. *once*; Lat. *uncia*. A small weight.

The blood he hath lost,
Which I dare vouch is more than that he hath
By many an ounce, he dropt it for his country.
Shakespeare.

A sponge dry weigheth one ounce twenty-six grains; the same sponge, being wet, weigheth fourteen ounces six drams and three quarters. *Bacon.*

OUNCE, *n. s.* Fr. *once*; Span. *onsa*. An animal between a panther and a cat.

The ounce,
The libbard, and the tiger, as the mole
Rising, the crumbled earth above them threw
In hillocks. *Milton's Paradise Lost.*

OVOLO, or **OVUM**, in architecture, a round moulding, whose profile or sweep, in the Ionic and Composite capitals, is usually a quadrant of a circle: whence it is also commonly called the quarter-round. It is usually cut with representations of eggs and arrow-heads or anchors placed alternately.

OUPHE, *n. s.* } Teut. *auf*; Goth. *alf*. A
OUPE'N, *adj.* } fairy; elf; sprite: elfish.
Nan Page and my little son, we'll dress
Like urchins, *ouphes*, and fairies, green and white
Shakespeare.

Fairies, black, gray, green, and white,
Ye moon-shine revellers and shades of night,
You *ouphen* heirs of fixed destiny,
Attend your office. *Id.*

OU-POEY-TSE a name given by the Chinese to nests made by certain insects upon the leaves and branches of the tree called yen-fou-tse. These nests are much used in dyeing, and the physicians employ them for curing many distempers. Some of these nests were brought to Europe, and put into the hands of the celebrated Geoffroy. After having examined them with the utmost attention, this learned academician thought he perceived some conformity in them to those excrescences which grow on the leaves of the elm, and which the vulgar call elm-bladders: he found these nests so sharp and astringent to the taste, that he considered them as far superior to every other species of galls used by the dyers. According to him, they are the strongest astringents existing in the vegetable kingdom. It is certain that there is a great affinity between the

ou-poe-y-tse and the elm-bladders. The form of both is unequal and irregular; they are covered on the outside with a short down, which renders them soft to the touch: within they are full of a whitish gray dust, in which may be observed the dried remains of small insects, without discovering any aperture through which they might have passed. These nests or bladders harden as they grow old; and their substance, which appears resinous, becomes brittle and transparent; however, the Chinese do not consider the ou-poe-y-tse, notwithstanding their resemblance to elm-bladders, as excrescences of the tree yen-fou-tse, upon which they are found. They are persuaded that the insects produce a kind of wax, and construct for themselves on the branches and leaves of this tree (the sap of which is proper for their nourishment) little retreats, where they may wait for the time of their metamorphosis, or at least deposit in safety their eggs, which compose that fine dust with which the ou-poe-y-tse are filled. Some of the ou-poe-y-tse are as large as one's fist; but these are rare, and are generally produced by a worm of extraordinary strength, or which has associated with another, as two silk-worms are sometimes seen shut up in the same ball. The smallest ou-poe-y-tse are of the size of a chestnut; the greater part of them are round and oblong; but they seldom resemble one another entirely in their exterior configuration. At first they are of a dark green color, which afterwards changes to yellow; and the husk, though pretty firm, becomes then very brittle. The Chinese peasants collect these before the first hoar-frosts. They take care to kill the worm enclosed in the husks, by exposing them for some time to the steam of boiling water. Without this precaution, the worm might soon break through its weak prison, which would immediately burst and be useless. They are used at Pekin for giving paper a durable and deep black color; in the provinces of Kiang-nan and Tche-Kiang, where a great deal of beautiful satin is made, they are employed for the dyeing of the silk before it is put on the loom. The Chinese literati also blacken their beards with them when they become white. The medicinal properties of the ou-poe-y-tse are very numerous. The Chinese physicians introduce them into the composition of many of their remedies.

OUR, *pron. poss.* } Sax. *ure*; Goth. *uar*;
OURSELF, } Dan. *wor*. Of or belong-
OURSELVES. } ing to us; when placed
after the substantive, it is written ours; or self
is a barbarism formerly used in the regal style or
title: ourselves is the plural reciprocal pro-
noun of we, added to we by way of emphasis,
and used also for us, not others, in oblique
cases.

You shall
Lead our first battle, brave Macduff, and we
Shall take upon us what else remains.
Shakespeare.

Edmund, whose virtue in this instance
So much commands itself, you shall be ours. *Id.*

To make society
The sweeter welcome, we will keep *ourselves*
Till supper-time alone. *Id. Macbeth.*

Not so much as a treaty can be obtained, unless
we would denude *ourselves* of all force to defend us.

Clarendon.

Be *ours*, whose'er thou art,

Forget the Greeks.

Denham.

Taxallan, shook by Montezuma's powers,

Has, to resist his forces, called in *ours*.

Dryden.

Safe in *ourselves*, while on *ourselves* we stand,
The sea is *ours*, and that defends the land.

Dryden.

Reading furnishes the mind only with materials
of knowledge, it is thinking makes what we read
ours : it is not enough to cram ourselves with a great
load of collections ; unless we chew them over again,
they will not give us strength.

Locke.

We *ourselves* might distinctly number in words a
great deal farther than we usually do, would we find
out but some fit denominations to signify them by.

Id.

Our confession is not intended to instruct God,
who knows our sins much better than *ourselves* do,
but it is to humble *ourselves*, and therefore we must
not think to have confessed aright till that be done.

Duty of Man.

Their organs are better disposed than *ours* for re-
ceiving grateful impressions from sensible objects.

Atterbury.

Our soul is the very same being it was yesterday,
last year, twenty years ago.

Beattie.

He is *ours*,

To administer, to guard, to adorn the state,

But not to warp or change it. We are his,

To serve him nobly in the common cause,

True to the death, but not to be his slaves.

Cowper.

Long life to the grape ! for, when summer is flown,
The age of *our* nectar shall gladden *our* own ;

We must die, who shall not ? may *our* sins be for-
given,

And Hebe shall never be idle in heaven.

Byron.

The sword we dread not :—of *ourselves* secure,
Firm were *our* strength, *our* peace and freedom sure.—

Let all the world confederate all its powers,

“ Be they not backed by those that should be *ours*.”

High on his rock shall Britain's genius stand,

Scatter the crowded hosts, and vindicate the land.

Canning.

OURAL. See URAL MOUNTAINS.

OURALSK, the capital city of the Cossacs
of the Oural, is a large and populous place, but
irregularly built. The Cossacs are divided
into seven regiments, the whole commanded by
the ataman of the troops, under the superintend-
ance of the governor-general of Orenbourg.
Their occupation chiefly consists in taking fish,
which are abundant in the Oural, and are sup-
posed to be of a superior quality to those caught
in the Caspian. The place is surrounded with
an irregular rampart. Inhabitants 3700. Long.
52° 6' E., lat. 50° 11' N.

OURCHA, a town, once a famous city, of
Hindustan, in Allahabad, and Bundelcund. The
rajah of Ourcha being once the head of all the
Bondelah tribes; the present family are of the
Rajpoot race, and their ancestor is said to have
obtained possession of his dignity by the murder
of his predecessor, to which it is stated that he
added that of the celebrated Abul Fazil. At his
death he was master of fifty-two forts, which,
with the territories depending, he divided by will
among his eight sons, leaving, however, the
largest portion, with the title of rajah, to his
eldest son, named Hajar or Jijer Sing. This

prince having, in the year 1628, opposed the
measures of the emperor Shah Jehan, his country
was invaded, and himself and son taken prisoner ;
but, by the payment of a sum of money, he was
released, and restored to his dignity. In 1633
he again rebelled, when another Mogul army,
under the command of Aurungzebe, entered the
country, and, having taken several of his forts, at
length besieged him in his strongest fortress,
called Joragur. The rajah, being reduced to
despair, put his women and children to death,
and issuing from the fort, at the head of his
cavalry, cut his way through the besiegers, and,
although closely pursued, effected his escape
into the province of Gundwana, where he and
all his followers were put to death by the inha-
bitants for the sake of the plunder they brought
with them. After this a relation of the present
family was raised to the throne by Aurungzebe,
and this rajah is still the head of the chiefs of
Bundelcund. His revenue is about £2000 per
annum.

OURFA, or ORFA, a pachalic of Asiatic
Turkey, forming a part of the ancient Mesopo-
tamia. It is almost entirely encircled by the
windings of the Euphrates and the Khabour ; and
touches north and east on the pachalic of Diar-
bekir, while on the south and west it is separated
by the Euphrates from the deserts of Syria. The
southern part is, for the most part, sandy and
uncultivated, inhabited by nomade tribes of
Arabs. In the north, being more mountainous
and diversified, it is better inhabited. This divi-
sion of Mesopotamia was taken from the empe-
ror Heraclius, by Yezid, the general of the Sara-
cens ; seized during the first crusade by Baldwin,
brother to Godfrey of Bouillon ; and erected
into a Christian principality. It was included
in the dominions of Saladin, and was subsequently
swallowed up in the Turkish empire. The towns
are Ourfa, Racca, and Soverick.

OURFA, a town of Turkey in Asia, the capi-
tal of the above pachalic. Under the successors
of Alexander it was known as Edessa, and after-
wards became the residence of the Courtneys,
when they erected a kingdom in Asia. It was
sacked by Zingis in the thirteenth century, and
by Timur in the fourteenth. Since falling to
the Turks, it has been the residence of a pacha
with two tails. It is built on two hills, and in
the intermediate valley at the south-west extre-
mity of a fine plain. The town is about three
miles in circumference, surrounded by walls, and
defended by square towers ; and it is adorned
by some fine springs, which rise from the hills.
The castle is on the south side of the city. The
ascent is very steep, and the hill is here about
half a mile in circumference, surrounded by a
deep ditch cut in the rock, which, when neces-
sary, can be filled with water. On the rock are
also the ruins of a building called by the Arabs
the palace of Nimrod, consisting of two lofty and
fine Corinthian pillars, and having some extra-
ordinary subterraneous apartments. Ourfa con-
tains also a magnificent mosque, dedicated to
Abraham, and a handsome but decayed Armenian
cathedral. It is the thoroughfare for the cara-
vans which pass from Aleppo into the interior of
Persia, and noted for the preparation of Turkey

oather. The inhabitants, Turks, Arabs, Armenians, Jews, and Nestorians, are said to be about 20,000.

OURIQUE, a town of Portugal in Alentejo, remarkable for a victory obtained at it by Viriatus over the Romans, in the year of Rome 606, and for another by Alphonso I. over the Moors A. D. 1139. Population 2300. Eighty-nine miles S. S. E. of Lisbon.

OUSE, in geography, a river of Sussex, formed by two streams, which rise, the one in St. Leonard's forest, the other in that of Worth; it then passes by Lewes, and falls into the channel below Newhaven, where it forms a good harbour at its mouth.

OUSZ, a river of Yorkshire, formed by the conflux of the Eure and the Swale, four miles below Boroughbridge; after which it passes by Aldborough, York, Selby, &c., and after receiving the Wharf from the north-west, the Derwent from the north-east, the Aire from the west, the Don from the south-west, joins the Trent on the borders of Lincolnshire; where the united streams form the Humber, seventeen miles west of Hull. See **HUMBER**.

OUSE, GREATER, a river of England, which rises near Fitwell in Oxfordshire, and proceeds to Buckingham, Stony-Stratford, and Newport-Pagnel, in Buckinghamshire; thence it proceeds to Bedford, and turning north-east it passes on to Huntingdon and Ely, till at length it arrives at Lynn-Regis in Norfolk, and falls into the sea. It is navigable to some distance above Downham, where there is a good harbour for barges; and a considerable trade is carried on by it to Lynn and other towns. It is liable to great floods at the equinoxes.

OU'SEL, *n. s.* Sax. *orle*. A blackbird.

The merry lark her mattins sings aloft,
The thrush replies, the mavis descant plays,
The *ousel* shrills, the ruddock warbles soft;
So goodly all agree with sweet consent,
To this day's merriment. *Spenser*.

The *ousel* cock so black of hue,
With orange tawney bill. *Shakespeare*.

Thrushes, and *ousels*, or blackbirds, were commonly sold for three pence a-piece. *Hakewill*.

OUST, *v. a.* Fr. *ouster*; Goth. *austa*. To force or cast out; deprive; eject.

Multiplication of actions upon the case were rare formerly, and thereby wager of law *ousted*, which discouraged many suits. *Hale*.

Though the deprived bishops and clergy went out upon account of the oaths, yet this made no schism. No, not even when they were actually deprived and *ousted* by act of parliament. *Lesley*.

OUSTER, or dispossession, in law, an injury which carries with it the amotion of possession; for by means of it the wrong doer gets into the actual possession of the land or hereditament, and obliges him that has a right to seek a legal remedy, in order to gain possession, together with damages. This ouster may either be of the freehold by abatement, intrusion, disseisin, discontinuance, and forfeiture; or of chattels real, as an estate by statute-merchant, statute-staple or elegit, or an estate for years.

vered; exhaust-

ed; ejected; un-

employed; un-

restrained; to

the end; away;

erroneously; at a loss; deficient; used emphatically with verbs of discovery, as, 'he is found out,' and before *alas!* as in the extract from Suckling: as an interj. it expresses abhorrence or disgust, and commands expulsion: to out, is to deprive by expulsion: out of, is to be regarded as a kind of compound preposition in which *out* modifies the sense of *of*; their joint meaning is from; beyond; without; excluded; dismissed; not or no longer in; past; by means or in consequence of; denoting absence; dereliction; unfitness; extraction; separation; rescue; irregularity; change of state; exhaustion: 'out of hand' means immediately; quickly done: outer, without; opposed to inner: outerly, towards the outside: outermost, remotest from the middle: outmost, a contraction of outermost; utmost: outward is external; extrinsic; visible; foreign; tending towards the outside; to foreign or outer parts; external form: outwardly corresponds: outwards is towards the outside.

If ye will not do so, be sure your sin will find you out. *Numbers xxxii. 23.*

So many Neroes and Caligulas,
Out of these crooked shores must daily rise. *Spenser*.

He bade to open wide his brazen gate,
Which long time had been shut, and out of hand
Proclaimed joy and peace through all his state. *Id.*

The sacred nymph
Was out of Dian's favor, as it then befel. *Faerie Queene*.

Amongst those things which have been received with great reason, ought that to be reckoned which the ancient practice of the church hath continued out of mind. *Hooker*.

That which inwardly each man should be, the church outwardly ought to testify. *Id.*

It was great ign'rance, Gloster's eyes being out,
To let him live; where he arrives he moves
All hearts. *Shakespeare. King Lear.*

Like a dull actor now,
I have forgot my part and I am out,
Even to a full disgrace. *Shakespeare. Coriolanus*.
Court holy water in a dry house, is better than the rain waters out of door. *Id. King Lear.*

Out, varlet, from my sight. *Id.*
She is persuaded I will marry her, out of her own love and flattery, not out of my promise. *Shakespeare. Othello*.

Sweet prince, the' untainted virtue of your years
Hath not yet dived into the world's deceit;
Nor more can you distinguish of a man,
Than of his outward shew! *Id. Richard III.*

I do not think
So fair an outward, and such stuff within,
Endows a man but him. *Id. Cymbeline*.
So we'll live and bear poor rogues
Talk of court news, and we'll talk with them too
Who loses, and who wins, who's in, who's out.
Shakespeare.

When the butt is *out* we will drink water, not a drop before; bear up and board them. *Id.*

Guiltiness

Will speak, though tongues were *out* of use. *Id.*

I am *out* of breath.

—How art thou *out* of breath, when thou hast breath

To say to me that thou art *out* of breath? *Id.*

No more ado,

But gather we our forces *out* of hand,

And set upon our boasting enemy. *Id.*

Out on thee, rude man! thou dost shame thy mother. *Id.*

This youth was such a mercurial, as the like hath seldom been known; and could make his own part, if at any time he chanced to be *out*. *Bacon.*

Juices of fruits are watery and oily: among the watery are all the fruits *out* of which drink is expressed; as the grape, the apple, the pear, and cherry. *Id.*

The pope, *out* of the care of an universal father, had in the conclave divers consultations about an holy war against the Turk. *Id.*

Fruits and grains are half a year in concocting; whereas leaves are *out* and perfect in a month. *Id.*

Try if three bells were made one within another, and air betwixt each; and the *outermost* bell were chimed with a hammer, how the sound would differ from a single bell. *Id.*

It was intended to raise an *outward* war to join with some sedition within doors. *Hayward.*

Grieved with disgrace, remaining in their fears,

However seeming *outwardly* content,

Yet the' inward touch their wounded honour bears. *Daniel.*

Out, alas! no sea I find,
Is troubled like a lover's mind.

Suckling.

The members of both houses who withdrew were counted deserters, and *outed* of their places in parliament. *King Charles.*

Outward appearances are deceitful guides to our judgments or our affections. *Hall.*

When the soul being inwardly moved to lift itself up by prayer, the *outward* man is surprised in some other posture; God will rather look to the inward motions of the mind, than to the *outward* form of the body. *Duppa.*

Let all persons avoid niceness in their cloathing or diet, because they dress and comb out all their opportunities of morning devotion, and sleep *out* the case for their souls. *Taylor.*

Cromwell accused the earl of Manchester of having betrayed the parliament *out* of cowardice. *Clarendon.*

Out, out, hyena; these are thy wonted arts,
To break all faith. *Milton's Agonistes.*

Chaos retired,
As from her *outermost* works a broken foe. *Milton.*

Not *out* of cunning, but a train

Of atoms justling in his brain,

As learned philosophers give *out*. *Hudibras.*

Many handsome contrivances of draw-bridges I had seen, sometimes many upon one bridge, and not only one after, or behind another, but also sometimes two or three on a breast, the *outermost* ones serving for the retreat of the foot, and the middle for the horse and carriages. *Browne.*

As he that hath been often told his fault,

And still persists, is as impertinent

As a musician that will always play,

And yet is always *out* at the same note. *Roscommon.*

Upon the great Bible, he was *out* fifty pounds, and reimburs'd himself only by selling two copies. *Fell.*

Make them conformable to laws, not only for wrath and *out* of fear of the magistrate's power, which is but a weak principle of obedience; but *out* of conscience, which is a firm and lasting principle. *Tillotson.*

With a longer peace, the power of France with so great revenues, and such application, will not increase every year *out* of proportion to what ours will do. *Temple.*

You have still your happiness in doubt,
Or else 'tis past, and you have dreamed it *out*. *Dryden.*

The cavern's mouth alone was hard to find,

Because the path disused was *out* of mind. *Id.*

He is softer than Ovid; he touches the passions more delicately, and performs all this *out* of his own fund, without diving into the sciences for a supply. *Id.*

He took a lowering leave; but who can tell
What *outward* hate might inward love conceal? *Id.*

So many of their orders, as were *outed* from their fat possessions, would endeavour a re-entrance against those whom they account heretics. *Id.*

Distinguish betwixt those that take state upon them, purely *out* of pride and humour, and those that do the same in compliance with the necessity of their affairs. *L'Estrange.*

If the laying of taxes upon commodities does affect the land that is *out* at rack rent, it is plain it does equally affect all the other land in England too. *Lacke.*

The kidney is a conglomerated gland only in the *outer* part: for the *inner* part, whereof the papilla are composed, is muscular. *Grew's Cosmol.*

In the lower jaw, two tusks like those of a boar, standing *outerly*, an inch behind the cutters. *Grew.*

St. Paul quotes one of their poets for this saying, notwithstanding T. G.'s censure of them *out* of Horace. *Stillington.*

Many wicked men are often touched with some inward reverence for that goodness which they cannot be persuaded to practise; nay, which they *outwardly* seem to despise. *Sprat.*

Those that have recourse to a new creation of waters, are such as do it *out* of laziness and ignorance, or such as do it *out* of necessity. *Burnet.*

What they do not grant *out* of the generosity of their nature, they may grant *out* of mere impatience. *Smallbridge.*

Christianity recovered the law of nature *out* of all those errors with which it was overgrown in the times of paganism. *Addison.*

Thoult say my passion's *out* of season,
That Cato's great example and misfortunes
Should both conspire to drive it from my thoughts. *Id.*

The tale is long, nor have I heard it *out*;
Thy father knows it all. *Id. Cato.*

The gown with stiff embroid'ry shining,

Looks charming with a slighter lining;

The *out*, if Indian figures stain,

The inside must be rich and plain. *Prior.*

Do not black bodies conceive heat more easily from light than those of colours do, by reason that the light falling on them is not reflected *outwards*, but enters the bodies, and is often reflected and refracted within them until it be stifled and lost? *Newton's Optica.*

If any man suppose that it is not reflected by the air, but by the *outermost* superficial parts of the glass, there is still the same difficulty. *Id.*

The generality of men are readier to fetch a *run-*

son from the immense distance of the starry heavens,
and the *outmost* walls of the world. *Bentley.*

Our successes have been the consequences of a
necessary war; in which we engaged, not *out* of
ambition, but for the defence of all that was dear to
us. *Atterbury.*

Those lands were *out* upon leases of four years,
after the expiration of which tenants were obliged to
renew. *Arbutnot.*

At all I laugh, he laughs no doubt;
The only difference is, I dare laugh *out*. *Pope.*

My retreat the best companions grace,
Chiefs *out* of war, and statesmen *out* of place. *Id.*

According to Hobbes's comparison of reasoning
with casting up accounts, whoever finds a mistake
in the sum total, must allow himself *out*, though
after repeated trials he may not see in which article
he has misreckoned. *Swift.*

Large coals are properest for dressing meat; and
when they are *out*, if you happen to miscarry in
any dish, lay the fault upon want of coals. *Id.*

Whereas insisting in or *out* of season
Convinces all men, even a politician;
Or—what is just the same—it wears *out*.
So the end's gained, what signifies the route? *Byron.*

OUTACT, *v. a.* Out and act. To do be-
yond.

He has made me heir to treasures,
Would make me *out-act* a real widow's whining. *Otway.*

OUTBALANCE, *v. a.* Out and balance.
To overweigh; to preponderate.

Let dull Ajax bear away my right,
When all his days *outbalance* this one night. *Dryden.*

OUTBAR', *v. a.* Out and bar. To shut out
by fortification.

These to *outbar* with painful pionings,
From sea to sea be heaped a mighty mound. *Spenser.*

OUTBID', *v. a.* Out and bid. To over-
power by bidding a higher price.

If in thy heart
New love created be by other men,
Which have their stocks entire, and can in tears,
In sighs, in oaths, in letters *outbid* me,
This new love may beget new fears. *Donne.*

For Indian spices, for Peruvian gold,
Prevent the greedy, and *outbid* the bold. *Pope.*

OUTBIDDER, *n. s.* Out and bid. One
that *outbids*.

OUTBLOWED', *adj.* Out and blow. In-
flated; swollen with wind.

At their roots grew floating palaces,
Whose *outblown* bellies cut the yielding seas. *Dryden.*

OUTBORN', *adj.* Out and born. Foreign;
not native.

OUTBOUND', *adj.* Out and bound. Des-
tinated to a distant voyage; not coming home.

Triumphant flames upon the water float,
And *outbound* ships at home their voyage end. *Dryden.*

OUTBRAVE', *v. a.* Out and brave. To bear
down and defeat by more daring, insolent; or
splendid appearance.

I would outstare the sternest eyes that look,
Outbrave the heart most daring on the earth,
To win thee, lady. *Shakspeare.*

Here Sodom's towers raise their proud tops on
high,

The towers, as well as men, *outbrave* the sky. *Cowley.*

We see the danger, and by fits take up some
faint resolution to *outbrave* and break through it. *L'Estrange.*

OUTBRAZEN, *v. a.* Out and brazen. To
bear down with impudence.

OUTBREAK, *n. s.* Out and break. That
which breaks forth; eruption.

Breathe his faults so quaintly
That they may seem the taints of liberty,
The flash and *outbreak* of a fiery mind. *Shakspeare.*

OUTBREATHE', *v. a.* Out and breathe.
To weary by having better breath; to expire.

Mine eyes saw him
Rendering faint quittance, wearied and *outbreathed*,
To Henry Monmouth. *Shakspeare.*
That sign of last *outbreathed* life did seem. *Spenser.*

OUTCAST, *n. s. & part.* Out and cast. It
may be observed that both the participle and
the noun are indifferently accented on either syl-
lable. It seems most analogous to accent the
participle on the last, and the noun on the first.
Thrown into the air as refuse, as unworthy of
notice; banished,—hence an exile.

Abandon soon, I read, the captive spoil
Of that same *outcast* carcass. *Spenser.*

Let's be no stoicks, nor no stocks,
Or so devote to Aristotle,
As Ovid, be an *outcast* quite abjured. *Shakspeare.*

O blood-bespotted Neapolitan,
Outcast of Naples, England's bloody scourge! *Id.*

Behold, instead
Of us *outcast*, exiled, his new delight
Mankind created. *Milton's Paradise Lost.*
For me, *outcast* of human race,
Love's anger only waits, and dire disgrace. *Prior.*

He dies sad *outcast* of each church and state!
And harder still flagitious, yet not great. *Pope.*

OUTCHANG-FOU, a city of China, of the
first rank, the capital of the province of Hou-
quang. Hang-yang-fou, a city on the opposite
side of the river Yang-tse-kiang, added to this
constitutes the emporium of the central part of
the empire, and the river, though 500 miles from
the sea, is here navigable for the largest vessels.
The country around is noted for its fine tea, and
bamboo paper.

OUTCRAFT, *v. a.* Out and craft. To excel
in cunning.

Italy hath *outcrafted* him,
And he's at some hard point. *Shakspeare. Cymbeline.*

OUTCRY, *n. s.* Out and cry. Cry of ve-
hemence; cry of distress; clamor; clamor of
detestation.

These *outcries* the magistrates there shun, since
they are readily hearkened unto here. *Spenser.*
So strange thy *outcry*, and thy words so strange
Thou interposest, that my sudden hand
Prevented, spares. *Milton's Paradise Lost.*

I make my way
Where noises, tumults, *outcries*, and alarms
I heard. *Denham.*

There is not any one vice, incident to the mind of man, against which the world has raised such a loud and universal outcry, as against ingratitude.

South.

OUTDARE', v. a. Out and dare. To venture beyond.

Myself, my brother, and his son,
That brought you home, and boldly did outdare
The dangers of the time. *Shakespeare.*

OUTDATE', v. a. Out and date. To antiquate.

Works and deeds of the law, in those places signify legal obedience, or circumcision, and the like Judaical outdated ceremonies; faith, the evangelical grace of giving up the whole heart to Christ, without any such Judaical observances. *Hammond.*

OUTDO', v. a. Out and do. To excel; to surpass; to perform beyond another.

He hath in this action outdone his former deeds, doubly. *Shakespeare.*

What brave commander is not proud to see
Thy brave Melantius in his gallantry?
Our greatest ladies love to see their scorn
Outdone by thine, in what themselves have worn.

Waller.

Heavenly love shall outdo hellish hate,
Giving to death, and dying to redeem,
So dearly to redeem what hellish bate
So easily destroyed. *Milton.*
Here let these who boast in mortal things,
Learn how their greatest monuments of fame,
And strength, and art, are easily outdone
By spirits reprobate. *Id.*

An impostor outdoes the original. *L'Estrange.*
I must confess the encounter of that day
Warmed me indeed, but quite another way;
Not with the fire of youth, but generous rage,
To see the glories of my youthful age
So far outdone. *Dryden.*

The boy's mother, despised for not having read a system of logick, outdoes him in it. *Locke.*

I grieve to be outdone by Gay,
In my own humorous biting way. *Swift.*

OUTDWELL', v. a. Out and dwell. To stay beyond.

He outdwells his hour;
For lovers ever run before the clock.

Shakespeare.

OUTFACE', v. a. Out and face. To brave; to bear down by show of magnanimity; to bear down with impudence; to stare down.

We shall have old swearing
That they did give the rings away to men;
But we'll outface them, and out-swear them too.

Shakespeare.

Dost thou come hither
To outface me with leaping in her grave?
Be buried quick with her, and so will I. *Id.*
Be fire with fire;

Threaten the threatener; and outface the brow
Of bragging horror. *Id. King John.*

We behold the sun, and enjoy his light, as long as we look towards it circumspectly; we warm ourselves safely while we stand near the fire; but if we seek to outface the one, to enter into the other, we forthwith become blind or burnt. *Raleigh.*

They bewrayed some knowledge of their persons, but were outfaced. *Wotton.*

OUTFAWN', v. a. Out and fawn. To excel in fawning.

In affairs of less import
That neither do us good nor hurt,

And they receive as little by,
Outfawn as much and out comply;
And seem as scrupulously just
To bait the hooks for greater trust.

Hudibras.

OUTFLY', v. a. Out and fly. To leave behind in flight.

His evasion winged thus swift with scorn,
Cannot outfly our apprehensions. *Shakespeare.*

Horoscop's great soul,
Raised on the pinions of the bounding wind,
Outflew the rack, and left the hours behind.

Garth.

OUTFORM', n. s. Out and form. External appearance.

Cupid, who took vain delight
In mere outforms, until he lost his sight,
Hath changed his soul, and made his object you.

Ben Jonson.

OUTFROWN', v. a. Out and frown. To frown down; to overbear by frowns.

For thee, oppressed king, am I cast down,
Myself could else outfrown false fortune's frown.

Shakespeare.

OUTGATE, n. s. Out and gate. Outlet; passage outwards.

Those places are so fit for trade, having most convenient out-gates by divers ways to the sea, and ingates to the richest parts of the land, that they would soon be enriched. *Spenser.*

OUTGIVE', v. a. Out and give. To surpass in giving.

The bounteous player outgave the pinching lord.

Dryden.

OUTGO', v. a. *pref.* outwent; *part.* outgone. Out and go. To surpass; to excel; to pass; to circumvent.

Many ran afoot thither out of all cities, and outwent them, and came unto him. *Mark vi. 33.*

For frank, well ordered, and continual hospitality, he out-went all shew of competence. *Carew.*

Molleson

Thought us to have out-gone
With a quaint invention. *Denham.*

While you practised the rudiments of war, you out-went all other captains; and have since found none but yourself alone to surpass. *Dryden.*

Where they apply themselves, none of their neighbours out-go them. *Locke on Education.*

OUTGROW', v. a. Out and grow. To surpass in growth; to grow too great or too old for any thing.

Much their work outgrew,
The hands dispatch of two, gard'ning so wide.

Milton.

When some virtue much outgrows the rest,
It shoots too fast and high. *Dryden.*

This essay wears a dress that possibly is not so suitable to the graver geniuses, who have outgrown all gaieties of stile and youthful relishes. *Chamville.*

The lawyer, the tradesman, the mechanic, have found so many arts to deceive, that they far outgrow the common prudence of mankind. *Swift.*

OUTGUARD, n. s. Out and guard. One posted at a distance from the main body, as a defence.

As soon as any foreign object presses upon the sense, those spirits which are posted upon the outguards, immediately scow off to the brain. *South.*

These outguards of the mind are sent abroad,
And still patrolling beat the neighbouring road.

Or to the parts remote obedient fly,
Keep posts advanced, and on the frontier lye.

Blackmore.

OUTJEST, *v. a.* Out and jest. To overpower by jesting.

The fool labours to outjest
His heart-struck injuries.

Shakespeare. King Lear.

OUTKNAVE, *v. a.* Out and knave. To surpass in knavery.

The world calls it out-witting a man, when he is only outknaved.

L'Estrange.

OUTLAND'ISH, *adj.* Out and land. Not native; foreign.

Yourself transplant

Awhile from hence : perchance *outlandish* ground
Bears no more wit than ours ; but yet more scant
Are those diversions there which here abound.

Donne.

Tedious waste of time to sit and hear

So many hollow compliments and lies,

Outlandish flatteries.

Milton.

Upon the approach of the king's troops, under general Wallis, who was used to the *outlandish* way of making war, we put in practice passive obedience.

Addison.

OUTLAST, *v. a.* Out and last. To surpass in duration.

Good housewives, to make their candles burn the longer, lay them in bran, which makes them harder ; inasmuch as they will *out-last* other candles of the same stuff, half in half.

Bacon.

Summer's chief honour, if thou hadst *outlasted*
Bleak winter's force that made thy blossoms dry.

Milton.

The present age hath attempted perpetual motions, whose revolutions might *outlast* the exemplary mobility, and out-measure time itself.

Browne.

What may be hoped,

When not from Helicon's imagined spring,

But sacred writ, we borrow what we sing ?

This with the fabrick of the world begun,

Elder than light, and shall *outlast* the sun.

Waller.

OUTLAW, *n. s. & v. a.* } Sax. *utlaga*; Goth.

OUTLAWRY. } *utlag*. One excluded

from the benefits or protection of the law ; to deprive of such benefits ; the decree or word of deprivation.

Gathering unto him all the scatterlings and *outlaws* out of the woods and mountains, he marched forth into the English pale.

Spenser.

As long as they were out of the protection of the law, so as every Englishman might kill them, how should they be other than *outlaws* and enemies to the crown of England ?

Davies.

I had a son

Now *outlawed* from my blood ; he sought my life.

Shakespeare.

He that is drunken

Is *outlawed* by himself ; all kind of ill

Did with his liquor slide into his veins.

Herbert.

Like as there are particular persons *outlawed*, and proscribed by civil laws, so are there nations that are *outlawed* and proscribed by the law of nature and nations.

Bacon.

Divers were returned knights and burgesses for the parliament ; many of which had been by Richard III. attainted by *outlawries*.

Id.

You may as well spread out the unsunn'd heaps
Of miser's treasure by an *outlaw's* den,

And tell me it is safe, as bid me hope

Danger will let a helpless maiden pass.

Milton.

VOL. XVI.

A drunkard is *outlawed* from all worthy and creditable converse : men abhor, loath, and despise him.

South.

All those spiritual aids are withdrawn, which should assist him to good, or fortify him against ill ; and like an *outlawed* person he is exposed to all that will assault him.

Decay of Piety.

OUTLAWRY is the punishment of a person who, being called into law, and lawfully, according to the usual forms, sought, does contemptuously refuse to appear. The effect of being outlawed at the suit of another, in a civil cause, is the forfeiture of all the person's goods and chattels to the king, and the profits of his land, while the outlawry remains in force. If in treason or felony, all the lands and tenements which he has in fee, or for life, and all his goods and chattels, are also forfeited ; and, besides, the law interprets his absence as a sufficient evidence of guilt ; and, without requiring farther proof, accounts the person guilty of the fact ; on which ensues corruption of blood, &c. However, to avoid inhumanity, no man is entitled to kill him wantonly or wilfully ; but in so doing he is guilty of murder, unless it happens in endeavouring to apprehend him ; for any body may arrest an outlaw, either of his own head, or by writ or warrant of *capias utlagatum*, in order to bring him to execution. If, after outlawry in civil cases, the defendant publicly appear, he is to be arrested by a writ of *capias utlagatum*, and committed till the outlawry be reversed ; which reversal may be had by the defendant's appearing in court (and in the king's bench by sending an attorney, according to statutes 4 and 5 William and Mary cap. 18), and any plausible circumstance, however trifling, is in general sufficient to reverse it ; it being considered only as a process to force appearance. The defendant must, however, pay full costs, and must put the plaintiff in the same condition as if he had appeared before the writ of *exegi facias* was awarded. It is appointed by magna charta that no freeman shall be outlawed, but according to the law of the land. A minor or a woman cannot be outlawed. In Scotland outlawry anciently took place in the case of refusal to fulfil a civil obligation, as well as in criminal cases. At present, however, it only takes place in the two cases of flying from a criminal prosecution, and of appearing in court attended by too great a number of followers. But the defender, upon appearing at any distance of time, and offering to stand trial, is entitled, *de jure*, to have the outlawry reversed, and to be admitted to trial accordingly, and even to bail, if the offence be bailable.

OUTLEAP, *n. s.* Out and leap. Sally ; flight ; escape.

Since youth must have some liberty, some *outleaps*, they might be under the eye of a father, and then no very great harm can come of it.

Locke.

OUTLET, *n. s.* Out and let. Passage outwards ; discharge outwards ; egress ; passage of egress.

Colonies and foreign plantations are very necessary, as *outlets* to a populous nation.

Bacon.

The enemy was deprived of that useful *outlet*.

Clarendon.

So 'scapes the' insulting fire his narrow jail,

And makes small *outlets* into open air.

Dryden.

Have a care that these members be neither the inlets nor outlets of any vices; that they neither give admission to the temptation, nor be expressive of the conception of them. *Ray.*

OUTLINE, *n. s.* Out and line. Contour; line by which any figure is defined; extremity.

Painters, by their *outlines*, colours, lights, and shadows, represent the same in their pictures. *Dryden.*

But, more or less, the whole's a syncope
Or a singultus—emblems of Emotion,
'The grand Antithesis to great Ennui,
Wherewith we break our bubbles on the ocean,
That watery *outline* of eternity. *Byron.*

OUTLIVE, *v. a.* Out and live. To live beyond; to survive.

Will these mossed trees,
That have *outlined* the eagle, page thy heels,
And skip when thou point'st out? *Shakspeare.*
Die two months ago, and not forgotten!
'Yet then there is hopes a great man's memory
May *outlive* his life half a year. *Id.*
He that *outlives* this day, and comes safe home,
Will stand a tiptoe when this day is named. *Id.*
His courage was so signal that day, that too much
could not be expected from it, if he had *outlined* it. *Clarendon.*

Thou must *outlive*
Thy youth, thy strength, thy beauty, which will
change
To withered, weak, and gray. *Milton.*
Time, which made them their fame *outlives*,
To Cowley scarce did ripeness give. *Denham.*
The soldier grows less apprehensive by computing
upon the disproportion of those that *outlive* a battle,
to those that fall in it. *L'Estrange.*

Since we have lost
Freedom, wealth, honour, which we value most,
I wish they would our lives a period give;
They live too long who happiness *outlive*. *Dryden.*

It is of great consequence where noble families
are gone to decay; because their titles *outlive* their
estates. *Swift.*

Pray *outlive* me, and then die as soon as you
please. *Id.*

Two bacon-flitches made his Sunday's cheer;
Some the poor had, and some *outlived* the year. *Harte.*

OUTLOOK, *v. a.* Out and look. To face down; to brow beat.

I culled these fiery spirits from the world,
To *outlook* conquest, and to win renown,
Even in the jaws of danger and of death. *Shakspeare.*

OUTLUSTRE, *v. a.* Out and lustre. To excel in brightness.

She went before others I have seen, as that diamond of yours *out-lustres* many I have beheld. *Shakspeare. Cymbeline.*

OUTLY'ING, *part. adj.* Out and lie. Not in the common course of order; removed from the general scheme.

The last survey I proposed of the four *out-lying* empires, was that of the Arabians. *Temple.*

We have taken all the *out-lying* parts of the Spanish monarchy, and made impressions upon the very heart of it. *Addison.*

OUTMARCH, *v. a.* Out and march. To leave behind in the march.

The horse *out-marched* the foot, which, by reason of the heat, was not able to use great expedition. *Clarendon.*

OUTMEASURE, *v. a.* Out and measure. To exceed in measure.

The present age hath attempted perpetual motions and engines, and those revolutions might out-last the exemplary mobility, and *out-measure* time itself. *Broome.*

OUTNUMBER, *v. a.* Out and number. To exceed in number.

The ladies came in so great a body to the opera, that they *out-numbered* the enemy. *Addison.*

OUTPARISH, *n. s.* Out and parish. Parish not lying within the walls.

In the greater *outparishes* many of the poorer parishioners, through neglect, do perish for want of some heedful eye to overlook them. *Graunt.*

OUTPART, *n. s.* Out and part. Part remote from the centre or main body.

He is appointed to supply the bishop's jurisdiction and other judicial officers in the *outparts* of his diocese. *Aylife.*

OUTPACE, *v. a.* Out and pace. To outgo; to leave behind.

Orion's speed
Could not *outpace* thee; or the horse Laomedon did breed. *Chapman's Iliads.*

OUTPOUR, *v. a.* Out and pour. To emit; to send forth in a stream.

He looked and saw what number, numberless
The city gates *out-poured*; light arm'd troops
In coats of mail and military pride. *Milton.*

OUTPRIZE, *v. a.* Out and prize. To exceed in the value set upon it.

Either your unparagoned mistress is dead, or
She's *outprized* by a trifle. *Shakspeare. Cymbeline.*

OUTRAGE, *n. s., v. a. & v. a.* *Fr. outrage; Ital. oltraggie;*
OUTRAGEOUS, *adj.*
OUTRAGEOUSLY, *adv.*
OUTRAGEOUSNESS, *n. s.*

barb. Lat. ultragium. Extreme or utmost rage; open violence; tumult: to injure or insult violently; commit exorbitancies or extravagancies; the adjective, adverb, and substantive following take the senses of outrage.

Ah heavens! that do this hideous act behold,
And heavenly virgin thus *outraged* see;
How can the vengeance just so long withhold! *Spenser.*

He wrought great *outrages*, wasting all the country where he went. *Spenser on Ireland.*

As she went, her tongue did walk
In foul reproach and terms of vile despight,
Provoking him by her *outrageous* talk,
To heap more vengeance on that wretched wight. *Spenser.*

That people will have colour of employment given them, by which they will poll and spoil so *outrageously*, as the very enemy cannot do worse. *Id. on Ireland.*

Three or four great ones in court will *outrage* in apparel, huge hose, monstrous hats, and garish colours. *Ancham.*

In that beastly fury
He has been known to commit *outrage*,
And cherish factions. *Shakspeare. Timon.*

Think not, although in writing I preferred
The manner of thy vile *outrageous* crimes,
That therefore I have forged. *Shakspeare.*

Under him they committed divers the most *outrageous* villanies, that a base multitude can imagine. *Sidary.*

The news put divers young bloods into such a fury as the English ambassadors were not without peril to be *outraged*. Bacon.

They viewed the vast immeasurable abyss, *Outragious* as a sea, dark, wasteful, wild. Milton.
My characters of Antony and Cleopatra, though they are favourable to them, have nothing of *outrageous* panegyric. Dryden.

When he knew his rival freed and gone,
He swells with wrath; he makes *outrageous* moan;
He frets, he fumes, he stares, he stamps the ground;
The hollow tower with clamours rings around. Id.

Virgil, more discreet than Homer, has contented himself with the partiality of his deities, without bringing them to the *outrageousness* of blows. Id.

Let lust burn never so *outrageously* for the present, yet age will in time chill those heats. South.

Base and insolent minds *outrage* men, when they have hopes of doing it without a return. Atterbury.

This interview *outrages* all decency; she forgets her modesty, and betrays her virtue, by giving too long an audience. Broome.

See with what *outrage* from the frosty north,
The early valiant Swede draws forth his wings
In battalious array. Philips.

Mercy to him that shows it, is the rule
And righteous limitation of its act,
By which Heaven moves in pardoning guilty man;
And he that shows none, being ripe in years,
And conscious of the *outrage* he commits,
Shall seek it, and not find it, in his turn. Cowper.

OUTRAM, or **OWTRAM** (William), D.D., a divine of the established church, was born in Derbyshire in 1625, and educated at Cambridge. After various promotions, he was collated to the archdeaconry of Leicester, and installed prebendary of St. Peter's church in Westminster. He was also rector of St. Margaret's, in the same city. He died in 1679, celebrated for his rabbinical learning, and his acquaintance with the Fathers of the church. His works are, *De Sacrificiis Libri duo; quorum altero explicantur omnia Judæorum, et nonnulla Gentium profanarum sacrificia; altero Sacrificium Christi, &c.*, recently translated by Mr. Allen; Twenty Sermons preached upon different Occasions.

OUTREACH, *v. a.* Out and reach. To go beyond.

This usage is derived from so many descents of ages, that the cause and author *outraches* remembrance. Carew.

Our forefathers could never dream so high a crime as parricide, whereas this *outraches* that fact, and exceeds the regular distinctions of murder. Browne.

OUTRIDE, *v. a.* Out and ride. To pass by riding.

This advantage age from youth hath won,
As not to be *outridden*, though outrun. Dryden.

OUT-RIDER, *n. s.* Out and rider. A summoner whose office is to cite men before the sheriff.

OUTRIGHT, *adv.* Out and right. Immediately; without delay; completely.

When these wretches had the ropes about their necks, the first was to be pardoned, the last hanged *outright*. Arbuthnot.

By degrees accomplished in the beast,
He neighed *outright*, and all the steed exprest. Addison.

OUTROAR, *v. a.* Out and roar. To exceed in roaring.

O that I were
Upon the hill of Basan, to *outrouare*
The horned herd!

Shakspeare. Antony and Cleopatra.

OUTRODE, *n. s.* Out and rode. Excursion.

He set horsemen and footmen, to the end that, issuing out, they might make *outrodes* upon the ways of Judea. 1 Maccabees xv. 41.

OUTROOT, *v. a.* Out and root. To extirpate; to eradicate.

Pernicious discord seems
Outrooted from our more than iron age;
Since none, not even our kings, approach their temples

With any mark of war's destructive rage,
But sacrifice unarmed.

Rowe's Ambitious Step-Mother.

OUTRUN, *v. a.* Out and run. To leave behind in running; to exceed.

By giving the house of Lancaster leave to breathe, It will *outrun* you, father, in the end. Shakspeare.

The expedition of my violent love

Outruns the pauser reason. Id. Macbeth.

We may *outrun*,

By violent swiftness, that which we run at.

Shakspeare.

When things are come to the execution, there is no secrecy comparable to celerity, like the motion of a bullet in the air, which flieth so swift as it *outruns* the eye. Bacon.

This advantage age from youth hath won,

As not to be *outridden*, though *outrun*. Dryden.

We *outrun* the present income, as not doubting to reimburse ourselves out of the profits of some future project. Addison.

OUTSAIL, *v. a.* Out and sail. To leave behind in sailing.

The word signifies a ship that *outsails* other ships.

Broome.

OUTSCAPE, *n. s.* Out and scape. Power of escaping.

It past

Our powers to lift aside a log so vast,

As barred all *outscape*. Chapman.

OUTSCORN, *v. a.* Out and scorn. To bear down or confront by contempt; to despise; not to mind.

He strives in his little world of man t' *outscorn*
The to and fro conflicting wind and rain.

Shakspeare.

OUTSELL, *v. a.* Out and sell. To exceed in the price for which a thing is sold; to sell at a higher rate than another.

It would soon improve to such a height as to *oussel* our neighbours, and thereby advance the proportion of our exported commodities. Temple.

Her pretty action did *oussel* her gift;

And yet enriched it too.

Shakspeare. Cymbeline.

OUTSHINE, *v. a.* Out and shine. To emit lustre; to excel in lustre.

Witness my son, now in the shade of death;
Whose bright *outshining* beams thy cloudy wrath
Hath in eternal darkness folded up. Shakspeare.

By Shakspeare's, Jonson's, Fletcher's lines,

Our stage's lustre, Rome's *outshines*. Denham.

Beauty and greatness are so eminently joined in your royal highness, that it were not easy for any but a poet to determine which of them *outshines* the other. Dryden.

Homer does not only *outshine* all other poets in the variety, but also in the novelty of his characters.

Addison.

We should see such as would *outshine* the rebellious part of their fellow-subjects, as much in their gallantry as in their cause.

Id.

Such accounts are a tribute due to the memory of those only who have *outshone* the rest of the world by their rank as well as their virtues.

Atterbury.

Happy you!

Whose charms as far all other nymphs *outshine*,

As others' gardens are excelled by thine. *Pope.*

OUTSHOOT', v. a. Out and shoot. To exceed in shooting.

The forward youth

Will learn t' *outshoot* you in your proper bow.

Dryden.

Men are resolved never to *outshoot* their forefather's mark; but write one after another, and so the dance goes round in a circle.

Norris.

OUTSIDE, n. s. Out and side. Superficies; surface; external part; superficial appearance; extreme part; the part beyond.

You shall find his vanities forespent

Were but the *outside* of the Roman Brutus

Covering discretion with a coat of folly.

Shakespeare.

Fortune forbid, my *outside* have not charmed her!

Id.

Your *outside* promiseth as much as can be expected from a gentleman.

Bacon.

Hold an arrow in a flame for the space of ten pulses, and, when it cometh forth, those parts which were on the *outsides* of the flame are blacked and turned into a coal.

Id.

What admiest thou, what transports thee so?

An *outside*? fair, no doubt, and worthy well

Thy cherishing and thy love.

Milton.

What pity that so exquisite an *outside* of a head should not have one grain of sense in it.

L'Estrange.

The leathern *outside*, boisterous as it was,

Gave way and bent.

Dryden.

The ornaments of conversation, and the *outside* of fashionable manners, will come in their due time.

Locke.

Created beings see nothing but our *outside*, and can therefore only frame a judgment of us from our exterior actions.

Addison's Spectator.

I threw open the door of my chamber, and found the family standing on the *outside*.

Id.

Two hundred load upon an acre, they reckon the *outside* of what is to be laid.

Mortimer.

OUTSIT', v. a. Out and sit. To sit beyond the time of any thing.

He that prolongs his meals and sacrifices his time, as well as his other conveniences, to his luxury, how quickly does he *outsit* his pleasure!

South.

OUTSLEEP', v. a. Out and sleep. To sleep beyond.

Lovers, to bed; 'tis almost fairy time:

I fear we shall *outsleep* the coming morn.

Shakespeare.

OUTSPEAK', v. a. Out and speak. To speak something beyond; to exceed.

Rich stuffs and ornaments of household

I find at such proud rate, that it *outspeaks*

Possession of a subject.

Shakespeare. Henry VIII.

OUTSPORT', v. a. Out and sport. To sport beyond.

Let's teach ourselves that honourable stop
Not to *outsport* discretion. *Shakespeare. Othello.*

OUTSPREAD', v. a. Out and spread. To extend; to diffuse.

With sails *outspread* we fly.

Pope.

OUTSTAND', v. a. Out and stand. To support; to resist.

Each could demolish the other's work with ease enough, but not a man of them tolerably defend his own; which was sure never to *outstand* the first attack that was made.

Woodward.

I have *outstood* my time, which is material
To the tender of our present.

Shakespeare. Cymbeline.

OUTSTARE', v. a. Out and stare. To face down; to brow-beat; to out-face with effrontery.

I would *outstare* the sternest eyes that look,
To win thee, lady.

Shakespeare. Merchant of Venice.

These curtained windows, this self-prisoned eye,
Outstares the lids of large-look't tyranny.

Crashaw.

OUTSTREET, n. s. Out and street. Street in the extremities of a town.

OUTSTRETCH', v. a. Out and stretch. To extend; to spread out.

Make him stand upon the mole-hill,
That caught at mountains with *out-stretched* arms.

Shakespeare.

Out-stretched he lay on the cold ground, and oft
Cursed his creation.

Milton's Paradise Lost.

A mountain, at whose verdant feet

A spacious plain, *out-stretched*, in circuit wide

Lay pleasant.

Id. Paradise Regained.

Does Theseus burn?

And must not she with *out-stretched* arms receive
him?

And with as equal ardour meet his vows? *Smith.*

OUTSTRIP', v. a. According to Skinner, out and Germ. *spritzen*, to spout. To outgo; leave behind.

If thou wilt *out-strip* death, go across the seas,
And live with Richmond from the reach of hell.

Shakespeare.

Do not smile at me, that I boast her off;

For thou shalt find, she will *out-strip* all praise.

And make it halt behind her.

Id. Tempest.

Thou both their graces in thyself hast more
Out-striped, than they did all that went before.

Ben Jonson.

My soul, more earnestly released,
Will *out-strip* hers; as bullets flown before

A later bullet may o'ertake, the powder being more.

Donne.

With such array Harpalice bestrode
Her Thracian courser, and *out-strip*'d the rapid flood.

Dryden.

A fox may be out-witted, and a hare out-strip.

L'Estrange.

He got the start of them in point of obedience,
and thereby *out-striped* them at length in point of knowledge.

South.

OUT-SWEETEN, v. a. Out and sweeten. To excel in sweetness.

The leaf of eglantine, which not to slander,
Out-sweetened not thy breath.

Shakespeare. Cymbeline.

OUT-SWEAR', v. a. Out and swear. To overpower by swearing.

We shall have old swearing,
But we'll out-face them, and *out-swear* them too.

Shakespeare.

OUT-TONGUE, *v. a.* Out and tongue. To bear down by noise.

Let him do his spite :

My services, which I have done the signory,
Shall *out-tongue* his complaints. *Shakespeare.*

OUT-TALK, *v. a.* Out and talk. To overpower by talk.

This gentleman will *out-talk* us all. *Shakespeare.*

OUT-VALUE, *v. a.* Out and value. To transcend in price.

He gives us in this life an earliest of expected joys,
that *out-values* and transcends all those momentary pleasures it requires us to forsake. *Boyle.*

OUT-VENOM, *v. a.* Out and venom. To exceed in poison.

'Tis slander;

Whose edge is sharper than the sword, whose tongue

Out-venoms all the worms of Nile. *Shakespeare.*

OUTVIE, *v. a.* Out and vie. To exceed; to surpass.

For folded flocks, or fruitful plains,

Fair Britain all the world *outvies*. *Dryden.*

One of these petty sovereigns will be still endeavouring to equal the pomp of greater princes, as well as to *out-vie* those of his own rank. *Addison.*

OUT-VIL'AIN, *v. a.* Out and villain. To exceed in villany.

He hath *out-villained* villainy so far, that the rarity redeems him. *Shakespeare.*

OUT-VOICE, *v. a.* Out and voice. To out-
-roar; to exceed in clamor.

The English beach

Pales in the flood with men, with wives and boys,
Whose shouts and claps *out-voice* the deep-mouthed sea. *Shakespeare.*

OUT-VOTE, *v. a.* Out and vote. To conquer by plurality of suffrages.

They were *out-voted* by other sects of philosophers, neither for fame nor number less than themselves.

South.

OUT-WALK, *v. a.* Out and walk. To leave one in walking.

OUT-WALL, *n. s.* Out and wall. Outward part of a building; superficial appearance.

For confirmation that I am much more

Than my *out-wall*, open this purse, and take
What it contains. *Shakespeare. King Lear.*

OUT-WEED, *v. a.* Out and weed. To extirpate as a weed.

Wrath is a fire, and jealousy a weed;

The sparks soon quench, the springing weed *out-weed*. *Spenser.*

OUTWEIGH, *v. a.* Out and weigh. To exceed in gravity, or excel in influence.

If any think brave death *out-weighs* bad life,
Let him express his disposition. *Shakespeare.*

These instruments require so much strength for the supporting of the weight to be moved, as may be equal unto it, besides that other super-added power whereby it is *out-weighed* and moved. *Wilk.*

All your care is for your prince I see,

Your truth to him *out-weighs* your love to me.

Dryden.

Whenever he finds the hardship of his slavery *out-weight* the value of his life, it is in his power, by resisting the will of his master, to draw on himself the death he desires. *Locke.*

The marriage of the clergy is attended with the poverty of some of them, which is balanced and *out-weighted* by many single advantages. *Atterbury.*

OUT-WELL, *v. a.* Out and well. To pour out. Not in use.

As when old father Nilus 'gins to swell,
With timely pride about the Egyptian vale,
His fattie waves do fertile slime *out-well*,
And overflow each plain and lowly dale. *Spenser.*

OUTWIT, *v. a.* Out and wit. To cheat; to overcome by stratagem.

Justice forbids defrauding, or going beyond our brother in any manner, when we can over-reach and *out-wit* him in the same. *Kettlevell.*

After the death of Crassus, Pompey found himself *out witted* by Cæsar, and broke with him. *Dryden.*

The truer hearted any man is, the more liable he is to be imposed on; and then the world calls it *out-witting* a man, when he is only out-knaved.

L' Estrange.

Nothing is more equal in justice, and indeed more natural in the direct consequence of effects and causes, than for men wickedly wise to *out-wit* themselves; and for such as wrestle with Providence, to trip up their own heels. *South.*

OUTWORK, *n. s.* Out and work. The parts of a fortification next the enemy.

Take care of our *out-work*, the navy royal, which are the walls of the kingdom; and every great ship is an impregnable fort; and our many safe and commodious ports as the redoubts to secure them.

Bacon.

Death hath taken in the *out-works*,

And now assails the fort; I feel, I feel him

Gnawing my heart-strings. *Denham.*

OUTWORN, *part.* From out-wear. Consumed or destroyed by use.

Better at home lie bed-rid, idle,

Inglorious, unemployed, with age *out-worn*.

Milton.

OUTWREST, *v. a.* Out and wrest. To extort by violence.

The growing anguish

Rankled so sore and feasted inwardly,

Till that the truth thereof I did *out-wrest*.

Spenser.

OUTWROUGHT, *part.* Out and wrought. Out-done: exceeded in efficacy.

In your violent acts,

The fall of torrents and the noise of tempests,

The boiling of Charybdis, the sea's wildness,

The eating force of flames, and wings of winds,

Be all *out-wrought* by your transcendent furies.

Ben Jonson.

OUTWORTH, *v. a.* Out and worth. To excel in value.

A beggar's book

Out-worths a noble's blood.

Shakespeare. Henry VIII.

OWE, *v. a.* } Sax. *ahan*; Goth. *aga*; Isl.

OWING, *part.* } *eg.* To have or be obliged to pay; to be indebted; to be obliged for; hence to have, as from a cause; possess: owing, consequential; imputable to; and, in a passive but improper sense, due as a debt.

I *owe* you much, and, like a witless youth,

That which I *owe* is lost.

Shakespeare. Merchant of Venice.

Not poppy nor mandragora,

Nor all the drowsy syrups of the world,

Shall ever med'cine thee to that sweet sleep

Which thou *owed'st* yesterday. *Id. Othello.*

If any happy eye

This roving wanton shall descry,

Let the finder surely know
 Mine is the wag; 'tis I that owe
 The winged wanderer. *Crashaw.*
 By me upheld, that he may know how frail
 His fallen condition is, and to me owe
 All his deliverance, and to none but me. *Milton.*
 All your parts of pious duty done,
 You owe your Ormond nothing but a son. *Dryden.*
 You are both too bold;
 I'll teach you all what's owing to your queen. *Id.*
 If, upon the general balance of trade, English
 merchants owe to foreigners one hundred thousand
 pounds, if commodities do not, our money must go
 out to pay it. *Locke.*
 The debt, *owing*, from one country to the other,
 cannot be paid without real effects sent thither to
 that value. *Id.*
 If we estimate things, what in them is *owing* to
 nature, and what to labour, we shall find in most of
 them $\frac{2}{3}$ to be on the account of labour. *Id.*
 A son owes help and honor to his father; and is a
 subject less indebted to the king? *Holyday.*
 This was *owing* to an indifference to the pleasures
 of life, and an aversion to the pomps of it. *Atterbury.*
 O deem thy fall not owed to man's decree,
 Jove hated Greece, and punished Greece in thee. *Pope.*
 The custom of particular impeachments was not
 limited any more than that of struggles between
 nobles and commons; the ruin of Greece was *owing*
 to the former, as that of Rome was to the latter. *Swift.*
 But the monarch owes
 His firm stability to what he scorns,
 More fixed below, the more disturbed above. *Cowper.*

For me, who, when I'm happy, owe
 No thanks to fortune that I'm so,
 Who long have learned to look at one
 Dear object, and at one alone. *Sheridan.*
 OWEN (Dr. John), an eminent and learned
 dissenting minister, born in 1616, at Hadham in
 Oxfordshire, of which place his father was vicar.
 At twelve years of age he was admitted into Queen's
 College, Oxford, and in 1635 was made A. M.,
 but soon after, disapproving the new regulations
 made by archbishop Laud, their chancellor, he
 was obliged, in 1637, to leave the university;
 when, taking orders, he became chaplain to Sir
 Robert Dormer of Ascot, in Oxfordshire, and
 tutor to his eldest son. He was afterwards chap-
 lain to John lord Lovelace of Hurley, in Berk-
 shire. When the civil war broke out, he openly
 avowed the cause of the parliament, which caused
 his uncle to disinherit him. When lord Love-
 lace joined the royal army, Mr. Owen went to
 London, and soon after joined the non-conform-
 ists. The earl of Warwick gave Mr. Owen the
 living of Coggeshall; where he soon left the Pres-
 byterians, and formed a church of Independents.
 He was now sent for several times to preach
 before the parliament; and Cromwell was so
 pleased with him that he took him to Ireland,
 where he remained about half a year. Soon
 after Cromwell sent him into Scotland; but he
 also returned thence after about half a year's
 stay at Edinburgh. He was then promoted to
 the deanery of Christ Church, Oxford, whither
 he went in 1651; and Cromwell, being now
 chancellor of the University, nominated him his
 vice-chancellor. The next year he was created

D. D. Dr. Owen enjoyed the post of vice-chancellor five years; during which he behaved with the greatest moderation to the royalists. At the death of Cromwell, he was removed from the vice-chancellorship; and at the Restoration was ejected from his deanery of Christ Church, when he retired to an estate he had purchased at Hadham. Lord Clarendon afterwards offered to prefer him if he would conform, but he declined. He died at Ealing in 1683. His works are printed in 7 vols. folio.

OWEN, (William), R.A., an English artist of considerable reputation, was a native of Shropshire, and born in 1769. He was educated at the grammar-school, Ludlow, where his passionate love of painting attracted the notice of Mr. Payne Knight. By the advice and assistance of that liberal patron he was sent to London, and placed under Charles Catton; he made an excellent copy of one of Sir Joshua Reynolds's portraits, in consequence of which that great painter paid him much attention; and, after some slight pecuniary difficulties, settled, in 1800, at Pimlico. In 1813 our artist was appointed principal portrait painter to the prince regent, on which occasion he was offered, but declined, the honor of knighthood. His professional emoluments, as well as his reputation, continuing to increase, he in 1818 removed to an establishment in Bruton Street, but from this time his health abandoned him; and, although he survived till the February of 1824, yet, during the five last years of his life, he could only bear to be wheeled from his bed-room to his drawing-room. His disease was immediately occasioned by the carelessness of a chemist's apprentice, who, mixing up for his use a cathartic, and a preparation of opium, known by the name of 'Battley's Drops,' transposed the labels of the phials. The whole contents of the one, containing the latter, were in consequence swallowed, and the patient fell into a lethargy that proved fatal. Among his historical pieces, his Blind Beggar of Bethnal Green; The Village Schoolmistress; and Road Side, have been engraved, and are very popular. He was enrolled among the members of the Royal Academy in the spring of 1806.

OWEN (John), an excellent epigrammatist, born in Caernarvonshire, and educated at Winchester, and at New College, Oxford, where he took his degree of L.L.B. He became schoolmaster at Tryleigh, and afterwards at Warwick. His Latin Epigrams, Joannis Audoeni Epigrammata, were much esteemed, both at home and abroad, and went through many editions and translations. He died in 1622.

OWEN (Henry), a learned divine, born in 1715, in Monmouthshire, and educated first at Ruthin, and next at Jesus College, Oxford, where he took the degree of M.D. He afterwards entered into orders, and became vicar of Edmonton, in Middlesex, and St. Olaves, London. His works are, 1. Observations on Scripture Miracles; 2. Remarks on the four Gospels; 3. Enquiry into the LXX. Version; 4. Sermons preached at Boyle's Lecture; 5. Introduction to Hebrew Criticism; 6. Modes of Quotation used by the Evangelists; 7. Sermons, 2 vols. He died in 1795, aged eighty.

OWEN (Thomas), a judge of the common pleas, son of Richard Owen, esq., of Conover in Shropshire. He was educated at Oxford; and, having taken his degree of A. M., he left the university, and entered himself of Lincoln's Inn in London, where he became an eminent counselor. In 1583 he was elected Lent reader to that society. In 1590 he was made serjeant at law, and queen's serjeant soon after. In 1593 he was made judge of the common-pleas; which office he executed with great abilities and integrity. He died in 1598, and was buried in Westminster Abbey, where a monument was erected to his memory. He was a learned man, and a patron of literature. He was the author of Reports in the Common Pleas, London, 1656, folio.

OWEN (John), M.A., a modern divine, one of the earliest members and long the Church of England's secretary of the Bible Society, was educated at Corpus Christi College, Cambridge, where he obtained a fellowship, and proceeded to the degree of master of arts. In 1791 he travelled through Europe, with a pupil, and on his return published an amusing account of his tour, in two volumes octavo. After this he became curate of Fulham, where his exertions procured him the patronage of bishop Porteus, who gave him the living of Paglesham, in Essex. But Dr. Randolph, the successor of that prelate, insisted upon Mr. Owen's residence at his rectory, by which he was obliged to relinquish the curacy of Fulham; when the inhabitants presented him with a purse of nearly £700. He died September 26th, 1822. His other works, besides tracts and sermons, are, *The Retrospect, or Reflections on the State of Religion and Politics in France and Great Britain*, 8vo.; *The Christian Monitor for the Last Days*, 8vo.; *Vindication of the Bible Society*, 8vo.; *History of the same*, 4 vols. 8vo.

OWHYHEE, the easternmost, and by far the largest, of the Sandwich Islands. It is of a triangular shape. The angular points make the north-east and south extremities, of which the northern is in long. $204^{\circ} 2' E.$, lat. $20^{\circ} 17' N.$; the eastern in long. $205^{\circ} 6' E.$, lat. $19^{\circ} 34' N.$; and the southern extremity in long. $204^{\circ} 15' E.$, lat. $18^{\circ} 54' N.$ Its greatest length, which lies in a direction nearly north and south, is eighty-five miles; its breadth is seventy-two miles; and it is about 255 geographical, or 293 English, miles in circumference. It is divided into six large districts; two of which, on the north-east side, are separated by a mountain that rises in three peaks, which are perpetually covered with snow, and may be seen clearly at forty leagues distance. To the north of this mountain the coast consists of high and steep cliffs, down which fall many beautiful cascades. The whole country is covered with cocoa-nut and bread-fruit trees. The peaks of the mountains on the north-east side are about half a mile in height, and entirely covered with snow. To the south of this mountain the coast presents a prospect of the most dreary kind, the whole country appearing to have undergone a total change by some dreadful convulsion. Among the plantations are a few huts, for shelter to the laborers; but there are no villages at a greater distance from the sea than four or five

miles. There are supposed to be on this island above 100,000 inhabitants. The men are above the middle size, stout, well made, and fleshy, but not fat. Their color is brown olive. The women are in general masculine, though there are some exceptions. The features of both sexes are good; and some of the females are really fine women. They are very healthy, and some live to a great age. They are all thieves, without exception. The custom of tattooing prevails greatly among them; but the men have a much larger share of it than the women. Both men and women are very cleanly in their persons; the latter wash their whole bodies in fresh water twice, and sometimes three times, a-day. They are extremely lascivious. Their clothing consists of cloth of different kinds: that worn by the men, which is called marro, is about half a yard wide, and four yards long; that of the women, three-quarters of a yard wide, and of the same length as the men's: thus they call pah-o-ouwa; they both wear it round their middle, but the men pass it between their legs. This is the general dress of both sexes; but the better sort sometimes throw a large piece loosely over their shoulders. Besides the marro, they have several other kinds of cloth; all, however, are made from the Chinese paper mulberry tree. The principal of these is the cappa, which is about ten or twelve feet long, and nearly as many wide, and is thick and warm; they wrap themselves up in this when they retire to sleep. They have another kind, which is white, and much thinner; it is sometimes twenty or thirty yards long, and wide in proportion. The marro and pah-o-ouwa are curiously painted of various patterns; but the others are generally white, or dyed red, black, and yellow. The principal ornaments of the men are feather-caps and cloaks. They have also a kind of fly-flap, made of a bunch of feathers, fixed to the end of a thin piece of smooth and polished wood. The handle is very frequently made of one of the bones of the arm or leg of those whom they have killed in battle, curiously inlaid with tortoise-shell: these they deem very valuable, and will not part with them under a great price. This ornament is common to the superiors of both sexes. The ornament which the women value most is the orai. This is a kind of ruff or necklace, made of red, green, black, and yellow feathers, curiously put together, and in most elegant patterns. Others are composed of small variegated shells; and some consist of several rows of twisted hair, with a piece of carved wood or bone, highly polished, the bottom part forming a curve. They have also the poo-remah or bracelet; the most valuable of which are made of boars' tusks, fastened together side by side with a piece of string, by means of a hole drilled through the middle.

In 1794 this island was ceded by the king and his chiefs to Great Britain. Mr. Puget, lieutenant of the Discovery, accompanied by some of the officers, went on shore, there displayed the British colors, and took possession of the island in his majesty's name, in conformity to the inclinations of Tamahmah and his subjects. On this ceremony being finished, a salute was fired

from the vessels: after which the following inscription on copper was deposited in a very conspicuous place at the royal residence:—‘On the 25th of February 1794, Tamaahmaah, king of Owhyhee, in council with the principal chiefs of the island, assembled on board his Britannic majesty’s sloop *Discovery*, in Karakakooa Bay, and in presence of George Vancouver, commander of the said sloop; lieutenant Peter Puget, commander of his said majesty’s armed tender the *Chatham*; and the other officers of the *Discovery*, after due consideration, unanimously ceded the said island of Owhyhee to his Britannic majesty, and acknowledged themselves to be subjects of Great Britain.’ On this island the celebrated captain Cook fell a sacrifice to a misunderstanding, or sudden impulse of revenge, in the natives, on Sunday the 14th of February, 1779.

Since captain Cook discovered these islands, an astonishingly rapid civilisation has taken place amongst the natives, by their intercourse with Europeans. In 1791 captain Vancouver laid down the keel, and prepared the frame-work, of a vessel for the king, whose size was thirty-six feet by nine and a quarter. Ten years after, this chief had increased his navy to twenty vessels of different sizes, from twenty-five to fifty tons, and some of them coppered, chiefly built by Americans. In 1805 his largest vessel was seventy tons, and he was well supplied with naval stores. His people, from making frequent voyages to the north-west coast of America, and in the South Sea whalers, have become expert seamen, and they talk of opening a direct trade in their own vessels with China; the island producing pearls, pearl-shell, and sandal-wood, all valuable in the China market. The king has a fortification round his house, mounting ten guns; and a guard of 200 native soldiers, well disciplined, and perfect in the use of fire-arms, who do regular duty night and day. He has, besides, 2000 stand of arms, and upwards of 12,000 Spanish dollars, together with other valuable articles, which he has collected in trade, and deposited in regular store-houses. Some horned cattle left at Owhyhee by Vancouver have greatly multiplied.

OWL, *n. s.* } Sax. *ule*; Dan. *ugle*; Sans. Owl’er. } *ooloo*; Lat. *uhula*. (All, perhaps, from the noise of the bird). A well-known bird of night.

Return to her!

No! rather I abjure all roofs, and chuse
To be a comrade with the wolf and owl.

Shakespeare.

’Twas when the dog-star’s unpropitious ray
Smote every brain, and withered every bay;
Sick was the sun, the owl forsook his bower.

Dunciad.

Then lady Cynthia, mistress of the shade,
Goes, with the fashionable owl, to bed. *Young.*

The night (I sing by night—sometimes an owl,
And now and then a nightingale)—is dim,
And the loud shriek of sage Mitherva’s fowl
Rattles around me her discordant hymn. *Byron.*

OWL, in ornithology. See STRIX.

OWL’ER, *n. s.* Supposed to be corrupted from wooller. A contraband dealer in wool.

We understand by some *owlers*, old people die in France.

By running goods, these graceless *owlers* gain. *Taiter.*

Swift.

OWLING, so called from its being usually carried on in the night, is the offence of transporting wool or sheep out of this kingdom, to the detriment of its staple manufacture. This was forbidden at common law, particularly by stat. 11 Edw. III. c. 1, when the importance of our woollen manufacture was first attended to; and there are now many later statutes relating to this offence, the principal of which are those enacted in the reign of queen Elizabeth, and since. The stat. 8 Eliz. c. 3, makes the transportation of live sheep, or embarking them on board any ship, for the first offence, forfeiture of goods, and imprisonment for a year, and that at the end of the year the left hand shall be cut off in some public market, and shall be there nailed up in the openest place; and the second offence is felony. The statutes 12 Car. II. c. 32, and 7 & 8 Will. III. c. 28, make the exportation of wool, sheep, or fullers’ earth, liable to pecuniary penalties, and the forfeiture of the interest of the ship and cargo by the owners, if privy; and confiscation of goods, and three years’ imprisonment to the master and all the mariners. And the statute 4 Geo. I. c. 11 (amended and farther enforced by 12 Geo. II. c. 21, and 19 Geo. II. c. 34) makes it transportation for seven years, if the penalties be not paid.

OWN, *n. s.* & *v. a.* } Sax. *agan*; Goth. *aga*, OWN’ER, } *aihn* (property). Now OWN’ERSHIP. } used as an emphatical addition to personal pronouns, as ‘my own,’ ‘his own,’ &c., meaning his property or possession. See OWE. Also denoting domestic as distinguished from foreign; mine; or his; yours: to own is to claim as property: hence to avow or avouch; confess: owner is he who owns or possesses; rightful possession: ownership, right of property or possession.

Every nation made gods of their own, and put them in high places. *2 Kings*, xvii. 29.

I yet never was forsworn,
Scarce have coveted what was my own.

Shakespeare.

It is not enough to break into my garden,
Climbing my walls in spite of me the owner,
But thou wilt brave me. *Id.*

Here shew favour, because it happeneth that the owner hath incurred the forfeiture of eight years’ profit of his lands, before he cometh to the knowledge of the process against him. *Bacon.*

They intend advantage of my labours,
With no small profit daily to my owners.

Milton.

These toils abroad, these tumults with his own,
Fell in the revolution of one year. *Daniel.*

Nor hath it been thus only amongst the more civilized nations; but the barbarous Indians likewise have owned that tradition. *Wilkin.*

Make this truth so evident that those who are unwilling to own it may yet be ashamed to deny it. *Tillotson.*

I’ll venture out alone,
Since you, fair princess, my protection own. *Dryden.*

Tell me, ye Trojans, for that name you own,
Nor is your course upon our coasts unknown. *Id.*

These wait the *owners* last despair,
And what's permitted to the flames invade. *Id.*
There's nothing sillier than a crafty knave out-
witted, and beaten at his *own* play. *L'Estrange.*
It is conceit rather than understanding, if it must
be under the restraint of receiving and holding opi-
nions by the authority of any thing but their *own*
perceived evidence. *Locke.*

Others will *own* their weakness of understanding.
Id.

In a real action, the proximate cause is the pro-
perty or *ownership* of the thing in controversy.

Ayliffe's Paregon.

That small muscle draws the nose upwards, when
it expresses the contempt which the *owner* of it has
upon seeing any thing he does not like. *Addison.*

It must be *owned*, that, generally speaking, good
parents are never more fond of their daughters, than
when they see them too fond of themselves. *Lau.*

Victory hath not made us insolent, nor have we
taken advantage to gain any thing beyond the honour
of restoring every one's right to their just *owners*.

Atterbury.

Passion and pride were to her soul unknown,
Convinced that virtue only is our *own*. *Pope.*

Others on earth o'er human race preside,
Of these the chief, the care of nations *own*,
And guard with arms divine the British throne. *Id.*

What is this wit, which must our cares employ ?
The *owner's* wife, that other men enjoy. *Id.*

For he that wrote so much, and so fast, would
through inadvertence and hurry, unavoidably have
departed from rules which he might have found in
books : but his *own* truly poetical talent was a guide
which could not suffer him to err. *Cowper.*

But, by each joy of his I've known,
And all I yet shall make my *own*,
Never will I, with humble speech,
Pray to a heaven I cannot reach. *Sheridan.*

Then how, my soul, can we be poor,
Who *own* what kingdoms could not buy ?
Of this true heart thou shalt be queen,

And, serving thee, a monarch I. *Id.*

The patient Sculptor *owns* an humbler part,
A ruder toil, and more mechanic art ;
Content with slow and timorous stroke to trace
The lingering line, and mould the tardy grace. *Id.*

But Virtue's self, with all her tightest laces,
Has not the natural stays of strict old age ;
And Socrates, that model of all duty,
Owned to a penchant, though discreet, for beauty. *Byron.*

Adeline, no deep judge of character,
Was apt to add a colouring from her *own*.

'Tis thus the good will amiably err,
And eke the wise, as has been often shown. *Id.*

France at our doors, he sees no danger nigh,
But heaves for Turkey's woes the 'impartial sigh ;
A steady patriot of the world alone,
The friend of every country—but his *own*.

Canning.

OX, *n. s.* ? Plural OXEN. Sax. *oxa* ; Goth.
OXANG. } Dan. and Swed. *oxe* ; Teut. *ochg* ;
Welsh *ych*. A castrated bull : a general name
for black cattle : an oxgang was an ancient mea-
sure of land, containing twenty acres.

Sheep run not half so tim'rous from the wolf,
Or horse or *oxen* from the leopard,
As you fly from your oft-subdued slaves. *Shakspeare.*

The black *ox* hath not trod on his foot. *Camden.*

The horns of *oxen* and cows are larger than the
bulls ; which is caused by abundance of moisture.

Bacon.

Although there be naturally more males than fe-
males, yet artificially, that is, by making geldings,
oxen, and wethers, there are fewer. *Graunt.*

The field is spacious I design to sow,

With *oxen* far unfit to draw the plough. *Dryden.*

I saw the river Clitumnus, celebrated by the poets
for making cattle white that drink of it. The in-
habitants of that country have still the same opinion,
and have a great many *oxen* of a whitish colour to
confirm them in it. *Addison.*

The frowning bull

And *ox* half-raised. *Thomson's Summer.*

Ox. See Bos.

OXALIC ACID, in chemistry, which abounds
in wood sorrel, and which, combined with a
small portion of potash, as it exists in that plant,
has been sold under the name of salt of lemons,
to be used as a substitute for the juice of that
fruit, particularly for discharging ink spots and
iron-moulds, was long supposed to be analogous
to that of tartar. In the year 1776, however,
Bergman discovered that a powerful acid might
be extracted from sugar by means of the nitric ;
and a few years afterwards Scheele found this to
be identical with the acid existing naturally in
sorrel. Hence the acid began to be distinguished
by the name of saccharine ; but has since been
known in the new nomenclature by that of
oxalic.

Scheele extracted this acid from the salt of
sorrel, or acidulous oxalate of potash, as it exists
in the juice of that plant, by saturating it with
ammonia, when it becomes a very soluble triple
salt, and adding to the solution nitrate of barytes
dissolved in water. Having well washed the
oxalate of barytes, which is precipitated, he dis-
solved it in boiling water, and precipitated its
base by sulphuric acid. To ascertain that no
sulphuric acid remained in the supernatant li-
quor, he added a little of a boiling solution of
oxalate of barytes till no precipitate took place,
and then filtered the liquor, which contained
nothing but pure oxalic acid, which he crystal-
lised by evaporation and cooling.

It may be obtained, however, much more re-
adily and economically from sugar in the follow-
ing way :—To six ounces of nitric acid in a
stoppered retort, to which a large receiver is
luted, add, by degrees, one ounce of lump sugar
coarsely powdered. A gentle heat may be ap-
plied during the solution, and nitric oxide will
be evolved in abundance. When the whole of
the sugar is dissolved, distil off a part of the
acid, till what remains in the retort has a syrupy
consistence, and this will form regular crystals,
amounting to fifty-eight parts from 100 of sugar.
These crystals must be dissolved in water, re-
crystallised, and dried on blotting paper.

Oxalate of lime is found in the roots of the
following plants :—Alkana, apium, bistorta, car-
lina acaulis, curcuma, dictamnus albus, fenicu-
lum, gentiana rubra, vincetoxicum, lapathum,
liquiritia, mandragora, ononis, iris Florentina,
iris nostras, rheum, saponaria, scilla, sigillum
salomonis, tormentilla, valeriana, zedoaria, zingi-
ber. And in the following barks :—berberis,
cassia fistularis, canella alba, cinamomum, cas-

cardilla, cassia caryophyllata, china, culilavan, frangula, fraxinus, quassia, quercus, simaruba, lignum sanctum, ulmus. In the state of binoxylate of potash it exists in the leaves of the oxalis acetosella, oxalis corniculata, different species of rumex, and geranium acidum.

The juice of the cicer parietinum is said to be pure oxalic acid. Bergman procured it from honey, gum-arabic, alcohol, and the calculeous concretions in the kidneys and bladders of animals. Scheele and Hermstadt from sugar of milk. Scheele from a sweet matter contained in fat oils, and also from the uncrystallisable part of the juice of lemons. Hermstadt from the acid of cherries, and the acid of tartar. Goettling from beech-wood. Kohl from the residuum in the distillation of ardent spirits. Westrumb, not only from the crystallised acids of currants, cherries, citrons, and raspberries, but also from the saccharine matter of these fruits, and from the uncrystallisable parts of the acid juices. Hoffmann from the juice of the barberry; and Berthollet from silk, hair, tendons, wool; also from other animal substances, especially from the coagulum of blood, whites of eggs, and likewise from the amylaceous and glutinous parts of flour. M. Berthollet observes that the quantity of the oxalic acid obtained by treating wool with nitric acid was very considerable, being above half the weight of the wool employed. He mentions a difference which he observed between animal and vegetable substances thus treated with nitric acid, namely, that the former yielded, beside ammonia, a large quantity of an oil which the nitric acid could not decompose; whereas the oily parts of vegetables were totally destroyed by the action of this acid: and he remarks that in this instance the glutinous part of flour resembled animal substances, whereas the amylaceous part of the flour retained its vegetable properties. He further remarks that the quantity of oxalic acid furnished by vegetable matters thus treated is proportionable to their nutritive quality, and particularly that, from cotton, he could not obtain any sensible quantity. Deyeux, having cut with scissars the hairs of the chick pea, found they gave out an acid liquor, which, on examination, proved to be an aqueous solution of pure oxalic acid. Proust, and other chemists, had before observed that the shoes of persons walking through a field of chick peas were corroded.

Oxalic acid crystallises in quadrilateral prisms, the sides of which are alternately broad and narrow, and summits dihedral; or, if crystallised rapidly, in small irregular needles. They are efflorescent in dry air, but attract a little humidity if it be damp; are soluble in one part of hot and two of cold water; and are decomposable by a red heat, leaving a small quantity of coaly residuum. 100 parts of alcohol take up nearly fifty-six at a boiling heat, but not above forty cold. Their acidity is so great that, when dissolved in 3600 times their weight of water, the solution reddens litmus paper, and is perceptibly acid to the taste.

The oxalic acid is a good test for detecting lime, which it separates from all the other acids, unless they are present in excess. It has like-

wise a greater affinity for lime than for any other of the bases, and forms with it a pulverulent insoluble salt, not decomposable except by fire, and turning syrup of violets green.

From the oxalate of lead Berzelius infers its prime equivalent to be 4.552, and by igneous decomposition he finds it resolved into 66.534 oxygen, 33.222 carbon, and 0.244 hydrogen. Since Berzelius published his analysis, oxalic acid has been made the subject of some ingenious remarks by Dobereiner, in the 16th vol. of Schweigger's Journal. We see that the carbon and oxygen are to each other in the simple ratio of 1 to 2; or, referred to their prime equivalent, as 2 of carbon = 1.5, to 3 of oxygen = 3.0. This proportion is what would result from a prime of carbonic acid = C + 2. O, combined with one of carbonic oxide = C + O. C being carbon, and O oxygen. The sum of the above weights gives 4.5 for the prime equivalent of oxalic acid, disregarding hydrogen, which constitutes but one-thirty-seventh of the whole, and may possibly be referred to the imperfect desiccation of the oxalate of lead subjected to analysis. Oxalic acid acts as a violent poison when swallowed in the quantity of two or three drachms; and several fatal accidents have lately occurred in London, in consequence of its being improperly sold instead of Epsom salts. Its vulgar name of salts, under which the acid is bought for the purpose of whitening boot-tops, occasions these lamentable mistakes. But the powerfully acid taste of the latter substance, joined to its prismatic or needle-formed crystallisation, are sufficient to distinguish it from every thing else. The immediate rejection from the stomach of this acid by an emetic, aided by copious draughts of warm water containing bicarbonate of potash, or soda, chalk, or carbonate of magnesia, are the proper remedies.

With barytes it forms an insoluble salt; but this salt will dissolve in water acidulated with oxalic acid, and afford angular crystals. If, however, we attempt to dissolve these crystals in boiling water, the excess of acid will unite with the water, and leave the oxalate, which will be precipitated.

The oxalate of strontian too is a nearly insoluble compound.

Oxalate of magnesia too is insoluble, unless the acid be in excess.

The oxalate of potash exists in two states, that of a neutral salt, and that of an acidule. The latter is generally obtained from the juice of the leaves of the oxalis acetosella, wood sorrel, or rumex acetosa, common sorrel. The expressed juice, being diluted with water, should be set by for a few days, till the feculent parts have subsided, and the supernatant fluid is become clear; or it may be clarified, when expressed, with the whites of eggs. It is then to be strained off, evaporated to a pellicle, and set in a cool place to crystallise. The first product of crystals being taken out, the liquor may be farther evaporated and crystallised; and the same process repeated till no more can be obtained. In this way, Schlereth informs us, about nine drachms of crystals may be obtained from two pounds of juice, which are generally afforded by ten pounds

of wood sorrel. Savary, however, says that ten parts of wood sorrel, in full vegetation, yield five parts of juice, which give little more than a 200th of tolerably pure salt. He boiled down the juice, however, in the first instance, without clarifying it; and was obliged repeatedly to dissolve and recrystallise the salt to obtain it white.

This salt is in small, white, needle, or lamellar crystals, not alterable in the air. It unites with barytes, magnesia, soda, ammonia, and most of the metallic oxides, into triple salts. Yet its solution precipitates the nitric solutions of mercury and silver in the state of insoluble oxalates of these metals, the nitric acid in this case combining with the potash. It attacks iron, lead, tin, zinc, and antimony.

This salt, beside its use in taking out ink spots, and as a test of lime, forms with sugar and water a pleasant cooling beverage; and, according to Berthollet, it possesses considerable powers as an antiseptic.

The neutral oxalate of potash is very soluble, and assumes a gelatinous form, but may be brought to crystallise in hexahedral prisms with dihedral summits, by adding more potash to the liquor than is sufficient to saturate the acid.

Oxalate of soda likewise exists in two different states, those of an acidulous and a neutral salt, which in their properties are analogous to those of potash.

The acidulous oxalate of ammonia is crystallisable, not very soluble, and capable, like the preceding acidules, of combining with other bases, so as to form triple salts. But, if the acid be saturated with ammonia, we obtain a neutral oxalate, which, on evaporation, yields very fine crystals in tetrahedral prisms with dihedral summits, one of the planes of which cuts off three sides of the prism. This salt is decomposable by fire, which raises from it carbonate of ammonia, and leaves only some slight traces of a coaly residuum. Lime, barytes, and strontian, unite with its acid, and the ammonia flies off in the form of gas.

The oxalic acid readily dissolves alumina, and the solution gives on evaporation a yellowish transparent mass, sweet and a little astringent to the taste, deliquescent, and reddening tincture of litmus, but not syrup of violets. This salt swells up in the fire, loses its acid, and leaves the alumina a little colored.

OXALIS, wood sorrel, a genus of the pentagynia order, and decandria class of plants: natural order fourteenth, grinales: *CAL.* pentaphyllous, the petals connected at the heels: *CAPS.* pentagonal, and opening at the angles. There are seven species; the only remarkable one is

O. acetosella, common wood sorrel. This grows naturally in moist shady woods, and at the sides of hedges in many parts of Britain, and is seldom admitted into gardens. The roots are composed of many scaly joints, which propagate in great plenty. The leaves arise immediately from the roots upon single long footstalks, and are composed of three heart-shaped lobes. They are gratefully acid, and of use in the scurvy and other putrid disorders.

OXFORD, a city of England, the county town of Oxfordshire, and celebrated for its university,

which in the extent and number of its institutions and the wealth of its endowments is unequalled. The city stands on a gentle eminence, in a valley, at the confluence of the Isis and Cherwell, which descending towards the south, and uniting at an acute angle, nearly encompass it. Between these streams and the city, particularly on the south and west, are beautiful and luxuriant meadows; and beyond them the prospect is bounded on the east, south, and west, by an amphitheatre of hills. From these hills the city presents a noble spectacle. It is of an oval form, and was formerly surrounded by a wall, about two miles in circumference, having bastions at 150 feet distant from each other; very little of these works, however, remain. The city and suburbs now include a circuit of three miles, extending in length a mile and a quarter from east to west, and about as much from north to south. The entrances east, south, and west, present bridges crossing the respective rivers.

Magdalen bridge is an elegant stone building over the Cherwell, 526 feet in length, built in 1779, at an expense of £8000. That over the Isis, on the west, consists of three substantial arches. On the south is another over the same river, on which, till lately, stood a lofty tower, termed Friar Bacon's Study. From Magdalen bridge the High-street stretches westwards, under different names, through the whole city. At Quarte Vois, or Carfax church, this is crossed at right angles by St. Giles's, the other principal street; and from these most of the other streets diverge.

High-street is perhaps the most beautiful in the world for its length and breadth, the number and elegance of its public buildings, and its remarkably graceful curvature, continually presenting new combinations of objects. St. Giles's begins near the church of that name, and is for some distance of a fine width. It contains the town hall and Christ Church. All the streets are well lighted, paved, and watched. The houses originally erected as lodgings for the students or gentry during the occasional residence of the court here, still appear, and are often built of stone on an extensive scale. The best modern houses are situated in St. Giles's.

The university consists of twenty colleges, and four halls, each of which has its own students and teachers, revenues and regulations, while they are all united in a common university government. The students all live in their respective colleges at their own expense or that of the university; and on their entrance qualify as members of the church of England. The university, as a corporate body, acts under a charter of Charles I., and consists of the vice-chancellor, heads of houses, and proctors; of the house of convocation, which is formed by the vice-chancellor, proctors, and all doctors and masters who have taken out their regency; and of the congregation, which is composed of the vice-chancellor, the proctors or their deputies, the necessary regents (doctors in divinity, law, or medicine, or masters of arts for the first two years after they are admitted to their degrees), and the regents ad placitum (all resident doctors, all public professors and lecturers, all heads of

colleges and halls, and in their absence their deputies, the masters of the schools, the public examiners, and deans and censors of colleges). In the first body must originate all new statutes, orders, and regulations; and, being there passed, they are ratified by the house of convocation. The administrative officers of the university are the chancellor, high steward, vice-chancellor and two proctors. The chancellor is elected by the members of the convocation, and is usually a distinguished member of the nobility. His office was once annual, but since the fifteenth century, when Russell, bishop of London, was made chancellor for life, this mode of election has been continued. The chancellor has a court, in which he can preside either in person or by deputy, and his authority is recognised by every one of the colleges. The high steward is nominated by the chancellor. His duty is to assist the chancellor, vice-chancellor, and proctors; and executively under the chancellor to defend the privileges of the university. In the court he sits when required, as legal representative of the chancellor, and holds the court leets of the university. His appointment is for life, and he is generally a man of high birth and eminent talent. The vice-chancellor is nominated by the chancellor, recommended by the heads of houses, and sworn into office before the convocation. He is always the head of some college, and annually nominated. His duty is to superintend the performance of the university discipline, to call convocations, congregations, and courts, to license taverns, &c. He is assisted by four deputies, termed pro-vice-chancellors. The two proctors are masters of arts of at least four years standing, and not more than ten from their regency. They are chosen from the several colleges in turns. The proctors are elected by the common suffrages of all doctors and masters of arts. They assist the vice-chancellor in convocations and congregations, to see that the scholastic exercises are duly performed, the statutes and discipline observed, just weights and measures kept, &c. They name four masters of arts as assistants or pro-proctors. There is also a public orator of the university, who is chosen by the convocation, and must be at least either a bachelor of civil law or master of arts. His duty is to write letters and addresses on public occasions, as the organ of the university; and to present the honorary degree of master of arts; he also is keeper of the archives and charter, and registrar of the convocations, congregations, and other meetings, and acts. He also collects and receives the rents of the university.

There are at Oxford public lecturers and professors of divinity, Hebrew, Greek, civil law, medicine, modern history, botany, natural philosophy, astronomy, geometry, ancient history, anatomy, music, Arabic, poetry, Anglo-Saxon, common law, and chemistry. Four terms are kept in the year at the university, and degrees are taken in divinity, law, physic, music, and the arts. The total number of members in the university books is about 3000, 1000 of whom are maintained on the revenues of the university, and the rest at their own expense.

The twenty colleges are, All Souls, Baliol,

Brazen Nose, Christ Church, Corpus Christi, Exeter, Jesus, Hertford, Lincoln, Magdalen, Merton, New College, Oriel, Pembroke, Queen's, St. John Baptist's, Trinity, University, Wadham, and Worcester. *All Souls* college, founded in the year 1437, by Chichele, archbishop of Canterbury, has a warden, forty fellows, two chaplains, and six clerks and choristers. Two spacious courts, one entering from High-street, and the other from the paved court in which the Radcliffe library stands, are its principal parts. The front, towards High-street, is a low irregular range of building, but the interior has considerable grandeur. One court is 172 feet by seventy-two, and the other 172 by 155. The interior of the chapel was arranged by Sir Christopher Wren and Sir James Thornhill. The hall is a room of striking elegance, and the library is forty feet high, and 198 feet by thirty-two and a half. Sir Christopher Wren and Sir William Blackstone were educated here.

Baliol was founded about the year 1263, by Sir John Baliol of Bernard Castle, father of Baliol, king of Scotland. The society consists of a master, twelve fellows, fourteen scholars, and eighteen exhibitioners; but none of the present buildings are older than the reign of Henry VI. The chapel was built in 1529, and contains fine specimens of painted glass. The hall is a neat building, in the pointed style. The library was lately rebuilt by Wyatt, in the Gothic style.

Brazen Nose was founded in 1509 by William Smyth, bishop of Lincoln, and Sir Richard Sutton. It consists of a principal, twenty fellows, thirty-two scholars, and fifteen exhibitioners, and derives its name from a large brazen face, which was fixed on the door of an ancient hall as a knocker. It is built on the site of several ancient halls, among which was Little University Hall, supposed to have been instituted by Alfred. The court is occupied in the south by the library and the chapel; and besides the quadrangle and court are several new buildings. The hall is spacious: the present chapel was begun in 1656.

Christ Church was founded by Cardinal Wolsey in 1525: in 1529, when he fell into disgrace, Henry VIII. suspended it for three years, when he re-established it under his own name, and in 1546 translated the episcopal see hither from Oseney. Queen Elizabeth converted the grammar scholars into students, whose vacancies should be supplied from the Westminster school. The society consists of a dean, eight canons, 101 students, three professors, eight chaplains, and a suitable choir. The buildings consist of the cathedral, two spacious quadrangles, and two smaller courts. The west, or principal front, has a noble air. From the gateway in the centre rises a stately tower, in which is suspended the famous bell Great Tom, at the sound of which, every evening, the students are directed, by the statutes of the university, to retire for the night. The grand western quadrangle, entered through the gateway, was erected, and the foundation stone laid, by Wolsey. It is nearly a square of 260 feet. The second great quadrangle is termed Peckwater Court, and

the architecture is perfectly classical. The southern side contains the library. Canterbury Square is a small quadrangle, built after the model of Peckwater. Christ Church cathedral is one of the most interesting objects in Oxford. The chief parts can be traced to the reign of Henry I.; and the style is even of an earlier period. It has the form of a cross, with a square tower, surmounted by a spire steeple in the centre. The choir is ornamented with a splendid Gothic roof. The hall was built entirely under the direction of Wolsey; and is 115 feet long, and forty wide; containing several interesting paintings. The oak ceiling is beautifully carved.

Corpus Christi was founded in 1516 by bishop Fox, lord privy seal to Henry VII. and VIII.; and the society consists of a president, twenty fellows, twenty scholars, two chaplains, two clerks, and two choristers. The building is at the east of Christ Church, and to the west of Merton College, and consisted at first of one spacious quadrangle; but various additions have since been made. The library is well furnished.

Exeter, was founded by Walter Stapleton, bishop of Exeter, in 1314; it consists of a rector, twenty-five fellows, one scholar, and ten exhibitioners.

Hertford, formerly called Hert Hall, was founded also by Walter Stapleton in 1312. It consists of a principal, four senior and eight junior fellows, eight probationary students, twenty-four actual students, and four scholars. The buildings are incomplete, and the college has had no principal since 1805. Here the late Mr. Fox was educated.

Jesus was founded in 1571 by queen Elizabeth, and endowed by Hugh Price, treasurer of St. David's, for a principal, eight fellows, and eight scholars, which has been since raised to nineteen fellows, and eighteen scholars, besides exhibitioners.

Lincoln was founded by Richard Fleming, who obtained a license from Henry VI. in 1427, to make All Saints' church collegiate, and to found a college for a rector and seven scholars. It was finished in 1475, by Rotherham, bishop of Lincoln, and consists of a rector, twelve fellows, eight scholars, thirteen exhibitioners, and a Bible clerk. The buildings consist of two quadrangles. The chapel was built in 1631, and the hall in 1636.

Magdalen is one of the noblest institutions in the university. It was founded in 1458 by William Waynflete, bishop of Winchester, and consists of a president, forty fellows, thirty demies, a divinity lecturer, four chaplains, eight clerks, and sixteen choristers. No commoners are admitted. It is situated at the eastern extremity of the city, and the side towards the High-street is ornamented by a lofty tower. The great quadrangle is composed of the chapel, hall, library, a part of the president's lodgings, and chambers for the fellows and demies. The chapel is a beautiful Gothic structure, divided into two parts; the inner chapel retaining much of its original sublimity. The library is a low but extensive room. The interior of the hall is

very elegant. Magdalen is required by its statutes to entertain the kings of England and their eldest sons, whenever they visit Oxford, and has been honored with the presence of many of our kings. Attached to the college on the banks of the Cherwell are beautiful pleasure grounds. Cardinal Wolsey, Cardinal Pope, Hampden, Collins, and Addison, were educated here.

Merton is the most ancient college in Oxford, and was founded in 1264 by Walter de Merton, bishop of Rochester, and chancellor of England. It consists of a warden, twenty-four fellows, fourteen post-masters, four scholars, two chaplains, and two clerks, and is situated to the east of Corpus Christi; consisting of three courts. The first is small and irregular, but a handsome arch leads to the inner quadrangle of a pleasing style of Gothic architecture; the third court is also on a small scale: the library occupies two sides of it. The hall is a plain but respectable structure. The chapel is one of the finest Gothic buildings in the university. It is the parish church of St. John Baptist, and was erected in 1424, on the ruins of a more ancient building.

New College was founded in 1379 by William of Wykeham, bishop of Winchester. It is composed of a warden, seventy fellows, ten chaplains, three clerks, and sixteen choristers, and consists of a quadrangle, with attached chapel, hall, and library, a fine range of cloisters, and a series of buildings for the use of students, termed the Garden Court, which was completed in 1684 on the model of the palace of Versailles. The chapel is, in the interior, one of the most splendid in the university. It has undergone numerous modern alterations, under the direction of Wyatt. The painted windows are a remarkable feature of the building. The library consists of two rooms in different stories, and the gardens are laid out in good taste.

Oriel was founded in 1324 by Adam de Brom, archdeacon of Stow. The society is composed of a provost, eighteen fellows, and thirteen exhibitioners: the buildings consist of a quadrangle, with two ranges on the east and west sides of the garden, between which is placed the library, a chaste and classical structure, begun in 1788.

Pembroke was founded in 1620, by Thomas Teesdale of Glympton, in Oxford, and Richard Wightwick, rector of Isley, Berks, being named after the earl of Pembroke, then chancellor of the university. It consists of a master, fourteen fellows, and thirty scholars and exhibitioners. The chapel is a small building of the Ionic order.

Queen's takes the sixth place in the order of foundation, though the present buildings are of recent date. It was founded in 1340, by Robert Eglesfeld, confessor of queen Philippa, consort of Edward III., and consists of a provost, sixteen fellows, eight taberdars, sixteen scholars, two chaplains, two clerks, and forty exhibitioners. The hall is a fine room, sixty feet by thirty, and the library is one of the largest attached to any university.

St. John's was founded in 1555 by Sir Thomas White, and consists of a president, fifty fellows,

two chaplains, and choir. It stands on the north of the city, and has in front a wide terrace and a beautiful row of elms. It is formed of two Gothic quadrangles; the hall is a fine and well-proportioned room; the library occupies the upper story of the east and south sides of the second quadrangle. In the chapel the Corinthian order prevails.

Trinity was founded in 1554 by Sir Thomas Pope. The members are a president, twelve fellows, and twelve scholars; the chapel has great simplicity of arrangement, and the hall is a plain but noble room.

University College continues erroneously ascribed to king Alfred as its founder, but was founded by William of Durham, rector of Wearmouth, in 1249. It consists of a master, twelve fellows, and seventeen scholars, and is situated on the north side of High-street. The valuable library was completed in 1699. The hall is a spacious and handsome room: in the common room is a fine bust of Alfred.

Wadham was founded in 1611, by Nicholas Wadham, esq., of Edge and Merrifield, in Somersetshire, for a warden, fifteen fellows, fifteen scholars, two chaplains, and two clerks. It consists of a single quadrangle 130 feet square: the chapel is a handsome structure, in the Gothic style, and the library has a fine Gothic window; the hall is capacious, and here the Royal Society originated.

Worcester, originally named Gloucester College, was founded in 1714, by Sir Thomas Coke of Bentley, in Worcestershire. The whole architecture is of a noble character. It has had several endowments since, and now consists of a provost, twenty-one fellows, ten scholars, and three exhibitioners. Being a seminary for educating the novices of Gloucester monastery, it was at the reformation converted for some time into an episcopal palace. It is agreeably situated near the Isis, at the western extremity of the city.

The *halls* at Oxford were originally houses erected by the citizens of Oxford for the accommodation of the students, to whom they were let. After the foundation of so many colleges, they sunk into neglect; four, however, remain, viz. St. Alban's, St. Edmond, St. Mary Magdalen, and New Inn Hall, and have been enriched by various endowments. Each is governed by a principal, and by the university statutes; the students possessing the privileges, and wearing the same dress, with those of the colleges. If entitled to little notice, amidst the blaze of architectural beauty around, the buildings are in general commodious, and the halls have produced a due proportion of eminent characters. Of the other public buildings, the schools form, together with the Bodleian library and the picture gallery, a noble quadrangle. These schools were erected in the fifteenth century, the professors reading lectures in their sciences, and the scholars of the university being enjoined to perform here their exercises for degrees. The Bodleian comprises three extensive rooms, disposed in the convenient form of the letter H. It was founded by Humphrey duke of Gloucester, but greatly augmented by the munificence of Sir Thomas Bodley, and now contains one of the most va-

luable collections of books, MSS., &c. in Europe. In an apartment on the north side of the schools are the famous ARUNDELIAN MARBLES: see that article. The theatre is a fine building, on the plan of the Roman theatre of Marcellus. It was built by Sir Christopher Wren, and is capable of containing 4000 persons. The Clarendon printing-house is also a large and respectable edifice, built in 1711, with the profits of the sale of lord Clarendon's History. The Radcliffe library is another of the ornaments of the university, founded by Dr. Radcliffe, and completed in 1749. The Ashmolean museum was founded in 1682, by Elias Ashmole, for the reception of curiosities both natural and artificial. The observatory is an elegant building, in a retired situation, at the extremity of the north suburb.

At St. Mary's church, the chief members of the university attend divine service; and, besides this, Oxford contains thirteen other churches, belonging respectively to the thirteen parishes into which it is divided, viz. All Saints, Carfax or St. Martin's, St. Clement's, St. Ebb's, St. Giles's, Holywell, St. John's, St. Mary Magdalen's, St. Michael's, St. Peter's in the East, St. Peter's in the Bailey, St. Aldgate's or St. Old's, and St. Thomas's. There are also places of worship for the Roman Catholics, Quakers, Methodists, Baptists, &c. The other public buildings are the town and county-hall and jail, city bridewell, music room, Radcliffe infirmary, and the well-contrived general market. Here are also various charity schools; but no theatrical representations are allowed in the city.

Oxford has no considerable manufacture or branch of trade; the canal, however, has recently opened new sources of commerce; and the city sends four members to parliament, two for the city, elected by the citizens and freemen, and two for the university. The government, subject to the chancellor or vice-chancellor of the university, in all affairs of moment, is vested in a mayor, high steward, recorder, four aldermen, eight assistants, two bailiffs, a town-clerk, two chamberlains, and twenty-four common council. The mayor, at the coronation feasts of the kings and queens of England, receives a gilt bowl and cover as his fee. The history of Oxford would require a volume of no ordinary size to trace: its early portions are involved in obscurity, and no credit can be given to any accounts of it before the reign of Alfred, when it appears to have had a famous monastery dedicated to the Trinity. The name is supposed to be derived from a ford for oxen, being formerly written Oxenford, and it was certainly a town in the tenth century. William the Conqueror was compelled to force an entrance into this city; his successors frequently made Oxford the place of their residence, and summoned both parliaments and councils here. Charles I. spent here the whole winter of 1646. Oxford early attained a degree of distinction from the number of its schools, but no regular corporate institution deserving the name of a university appears to have existed even at the period of the Norman Conquest. Many halls and schools were erected under the patronage of Richard I.; and, in the

reign of king John, the number of scholars is said to have amounted to 3000. In that of Henry III. the students greatly increased; and about this time was introduced the practice of erecting and endowing colleges, which since this reign have gradually accumulated to their present state. Market on Wednesday and Saturday. Fifty-eight miles west by north of London.

OXFORD, a county in the west part of Maine, bounded east by Somerset and Kennebeck counties, south by Cumberland and Oxford counties, and west and north-west by New Hampshire. Population 17,630. Chief town, Paris.

OXFORD, a post town of Chenango county, New York, eight miles south of Norwich, 110 west of Albany. Population 2988. It is a flourishing town, has an academy, and a considerable village. A weekly newspaper is published here. Also a post town of Sussex county, New Jersey, on the east side of the Delaware; seventeen miles N. N. E. of Easton. Population 2470.

OXFORD, a post town and port of entry, Talbot county, Maryland, on the Treadhaven, eight miles above its mouth. Thirteen miles S. S. W. of Easton, forty-eight south-east of Baltimore. It is a place of considerable trade. The shipping belonging to this port in 1816 amounted to 15,720 tons.

OXFORDSHIRE. This county takes its name from the city of Oxford. When the Romans entered Britain under Aulus Plantius, by command of the emperor Claudius, a great portion of the districts now denominated Gloucestershire and Oxfordshire was inhabited by a race of aboriginal Britons termed Dobuni; and during the Saxon heptarchy it formed a part of the kingdom of Mercia. Oxfordshire is an inland county, bounded on the east by Buckinghamshire, on the west by the county of Gloucester; on the S. S. W. and south-east its limits unite with those of Berkshire; the river Cherwell separates Oxfordshire from Northamptonshire on the north-east, while the county of Warwick lies contiguous to the north-west. It is of a very irregular figure; near the centre of the county, at the city of Oxford, it is not more than seven miles across; and yet in the more northern part, at no great distance, its diameter is thirty-eight miles. Proceeding northward it assumes the resemblance of a cone, and terminates at what is called the Three Shire Stone, in a complete point or apex; the part south of Oxford is likewise disproportionately narrow, when compared with the chief central districts of the county; at no point south of the city of Oxford above twelve miles in width: its greatest length is fifty miles. Oxfordshire is divided into fourteen hundreds; and contains one city, twelve market towns, and 207 townships. According to a topographical survey, made by Mr. Davis, there are about 450,000 acres of land in the county. The whole is in the diocese of Oxford, and in the province of Canterbury. It is included in the Oxford circuit. The climate of Oxfordshire may be accounted in general cold, particularly the westward part of the northern division, where the fences consist chiefly of

stone walls, and consequently afford little or no shelter. It is cold also upon and near the Chiltern Hills, especially on the poor white lands at the foot of the hills, where it is always to be observed that the frost will take effect sooner and continue longer on that soil than it does on the deeper lands further situated from the hills. The climate of the Chiltern country is moist, on account of the fogs, which are more frequent on the hills and woods than in the vale. The soil of this county contains (according to Young's Survey) three distinctions of soil, that are so marked by nature as to allow of little doubt respecting them. 1. The red land of the northern district, which in fertility much exceeds that of any other portion of equal extent. 2. The district of Stonebrush. 3. The Chiltern Hills. 4. Miscellaneous loams. The proportionate extent of these soils, taking the total of the county at 450,000 acres, may be thus stated, in the estimation of Mr. Neele:—Red land 79,635 acres, Stonebrush 164,023, Chiltern 64,778, miscellaneous 166,400; total 474,836. In so much as the counties of Oxford and Berks are contiguous, they are separated from each other by the rivers Isis and Thames. The river Thames, which runs through the county, falls into the Isis at Dorchester, and from that place takes the name of Thames. Other rivers in Oxfordshire are the Cherwell, which divides this county from Northamptonshire on a part of the boundary only; the Windrush; the Evenlode; the Glym; and the Ray, besides numerous streams of inferior note: so that this county may be considered as inferior to none in point of being well watered. The Oxford Canal enters the county at its northern extremity, between Claydon and the Three Shire Stone. Approaching the vicinage of the river Cherwell, at Cropredy, it proceeds at a small distance from the banks of that river to the city of Oxford, where it falls into the navigation of the Isis. The advantages derived from this recent cut are incalculably great, as it opens an immediate connexion between the interior of the county and Birmingham, Liverpool, Manchester, and the Wednesday collieries. The produce of this county is chiefly like that in most of the midland farming counties: much butter and cheese are made, and numerous calves are reared and fed for the London markets; it grows also a considerable quantity of corn. The principal manufactures are those of blankets at Witney, shag at Banbury, gloves and polished steel at Woodstock, and some lace-making and spinning by the country people towards the borders of Buckinghamshire. This county returns nine members to parliament, viz. two for the county, two for the city of Oxford, two for the university of Oxford, two for Woodstock, one for Banbury. The dukes of Marlborough have long possessed a great sway over this county; but the Jenkinsons represented it from 1707 to 1734.

OXIDES. Substances combined with oxygen, without being in the state of an acid.

OXIGENE, in chemistry. See OXYGEN.

OX'LIP, *n. s.* Ox and lip. Another name for the cowslip.

A bank whereon the wild thyme blows,
Where *asleep* and the nodding violet grows.

Shakespeare.

OXNAM, formerly called Oxenham, a parish of Scotland, in Roxburghshire, nine miles in length, and upon an average five miles in breadth. It is watered by the rivers Oxnam, Coquet, and various other streams. The number of inhabitants is between 700 and 800.

OXTONGUE, *n. s.* Fr. *buglossa*. A plant. **OXUCIÆ**, in natural history, from Gr. *οξύς*, sharp, and *κων*, a column, a genus of fossils of the class of selenite, but of the columnar, not the rhomboidal, kind. Of this genus there are only two known species:—1. A fine kind with flakes and transverse filaments, found in the clayey banks of the river Nen, near Peterborough in Northamptonshire; and, 2. A dull kind with thick plates and longitudinal filaments. This is common in Yorkshire, and lies sometimes in a yellow and sometimes in a blue clay.

OXUS, a river of Central Asia, the principal part of whose course is through Independent Tartary, rises in the high table land of Pamer, in a narrow valley, enclosed on three sides by a high mountain called Pooshtikhur, where the stream is seen issuing from a vast mass of ice. It first rolls S. S. W., and then W. N. W., but always between lofty mountains, and receiving large accessions of water. It then bursts into the plain, and, being turned by a branch of the Hindoo Coosh, directs its course to the north-west. It now flows through the plain of Bukharia, on passing which it reaches an extensive desert, near the Tartar cities of Khieva and Urgunge, and at length falls into the Aral Sea, after a course of more than 1200 miles. It has been believed that it fell anciently into the Caspian, and was turned artificially into its present receptacle; but this is solely founded upon the ancients being ignorant of the existence of the Aral as a separate sea, and who therefore could find no other termination for the Oxus than the Caspian. It passes through a desert country abounding with sands.

OXYCRATE, *n. s.* Gr. *οξύκρατον*; French *oxycrate*; Gr. *οξύς* and *κρᾶσις*. A mixture of water and vinegar.

Apply a mixture of the same powder, with a compress prest out of *oxycrate*, and a suitable bandage.

Wiseman.

OXYDATION, a term applied by modern chemists to express the process by which bodies are converted into oxides; and it is allowed on all hands to be exactly similar to combustion. The nature of this process has been much disputed; and the question involves in it great part of the controversy between the followers of Stahl and the celebrated Lavoisier, the founders of the phlogistic and antiphlogistic theories, which for some years divided the chemical world. But the latter doctrine has now completely triumphed, and the former is quite exploded. See **CALCINATION**, **CHEMISTRY**, **COMBUSTION**, **INFLAMMATION**, and **PHLOGISTON**.

OXYGEN GAS. This gas was obtained in 1774 from red oxide of mercury exposed to a burning lens, by Dr. Priestley, who observed

its distinguishing properties of rendering combustion more vivid and eminently supporting life. Scheele obtained it in different modes in 1775; and in the same year Lavoisier, who had begun, as he says, to suspect the absorption of atmospheric air, or of a portion of it, in the calcination of metals, expelled it from the red oxide of mercury heated in a retort.

Oxygen gas forms about a fifth of our atmosphere, and its base is very abundant in nature. Water contains 88·88 per cent. of it; and it exists in most vegetable and animal products, acids, salts, and oxides.

This gas may be obtained from nitrate of potash, exposed to a red heat in a coated glass or earthen retort, or in a gun-barrel; from a pound of which about 1200 cubic inches may be obtained; but this is liable, particularly towards the end of the process, to a mixture of nitrogen. It may be expelled, as already observed, from the red oxide of mercury, or that of lead; and still better from the black oxide of manganese, heated red hot in a gun-barrel, or exposed to a gentle heat in a retort with half its weight, or somewhat more, of strong sulphuric acid. To obtain it of the greatest purity, however, the chloride of potash is preferable to any other substance, rejecting the portions that first come over as being debased with the atmospheric air in the retort. Growing vegetables, exposed to the solar light, give out oxygen gas; so do leaves laid on water in similar situations, the green matter that forms in water, and some other substances.

Oxygen gas has neither smell nor taste. Its specific gravity is 1·1111; 100 cubic inches weigh 33·88 grains. It is a little heavier than atmospheric air. Under great pressure water may be made to take up about half its bulk. It is essential to the support of life: an animal will live in it a considerable time longer than in atmospheric air; but its respiration becomes hurried and laborious before the whole is consumed, and it dies, though a fresh animal of the same kind can still sustain life for a certain time in the residuary air.

Combustion is powerfully supported by oxygen gas. Any inflammable substance previously kindled, and introduced into it, burns rapidly and vividly. If an iron or copper wire be introduced into a bottle of oxygen gas, with a bit of lighted touchwood or charcoal at the end, it will burn with a bright light, and throw out a number of sparks. The bottom of the bottle should be covered with sand, that these sparks may not crack it. If the wire coiled up in a spiral like a corkscrew, as it usually is in this experiment, be moved with a jerk the instant a melted globule is about to fall, so as to throw it against the side of the glass, it will melt its way through in an instant, or, if the jerk be less violent, lodge itself in the substance of the glass. If it be performed in a bell glass, set in a plate filled with water, the globules will frequently fuse the vitreous glazing of the plate, and unite with it so as not to be separable without detaching the glaze, though it has passed through perhaps two inches of water.

OXYGENATION. This word is often used instead of oxidation, and frequently confounded

with it; but it differs in being of more general import, as every union with oxygen, whatever the product may be, is an oxygenation; but oxydation takes place only when an oxide is formed.

OX'YMEL, *n. s.* Gl. *οξυμελι, ιξυς*, and *μελι*. A mixture of vinegar and honey.

In fevers, the aliments prescribed by Hippocrates, were pitans and decoctions of some vegetables, with *oxymel* or the mixture of honey and vinegar.

Arbuthnot.

OXYMO'RON, *n. s.* Gr. *οξυμωρον*. A rhetorical figure, in which an epithet of a quite contrary signification is added to any word.

OXYR'RHODINE, *n. s.* Gr. *οξυρροδινον*, *οξυς*, and *ροδον*. A mixture of two parts of oil of roses with one of vinegar of roses.

The spirits, opiates, and cool things, readily compose *oxyrhodines*.

Floyer on the Humours.

OYER and TERMINER, *Fr. Ouir et Terminer*; *Lat. Audiendo et Terminando*. A commission directed to the judges, and other gentlemen of the county to which it is issued, by virtue whereof they have power to hear and determine treasons, and all manner of felonies and trespasses. In our statutes the term is often printed *Oyer and Determiner*.

OYES' *Fr. oyez*, hear ye. Is the introduction to any proclamation or advertisement given by the public criers both in England and Scotland. It is thrice repeated.

Fairies, black, grey, green, and white,

Attend your office and your quality.

Crier hobgoblin, make the fairy *O yes!*

Shakespeare.

O yes! if any happy eye
This roving wanton shall descry;
Let the finder surely know
Mine is the wag.

Crashaw.

OYLETHOLE, *n. s.* See **EYLET**. It may be written *oylet*, from *ocillet*, *Fr.* but *eylet* seems better.

Distinguished slashes deck the great,
As each excels in birth or state;
His *oyletholes* are more and ampler,
The king's own body was a sampler.

Prior.

OYOLAVA, one of the larger Navigator's Islands, in the South Pacific, in long. 121° 24' W., and lat. 14° S., separated from Maouna, or Massacre Island, by a channel about nine leagues wide; and, according to Perouse, Otaheite can scarcely be compared with it for beauty, extent, and fertility. When his vessel was within three leagues of the coast it was surrounded by canoes laden with bread-fruit and other provisions, and the island seemed very populous from the central mountain to the shore.

OYSTER, *n. s.* Belg. *oester*; *Lat. OYSTERWENCH*, } *ostrea*; Gr. *οστρεον*. A }
OYSTERWOMAN, } well-known shell fish: the }
oyster wench and oyster woman are women employed in the sale of this fish; and generally, any low woman.

I will not lead thee a penny,
—Why then the world's mine *oyster*, which I with sword will open.

Shakespeare. Merry Wives of Windsor.

Off goes his bonnet to an *oysterwench*. *Shakespeare.*

VOL. XVI,

Rich honesty dwells like your mber, sir, in a poor house; as your pearl in your foul *oyster*. *Id.*

The *oysterwomen* locked their fish up,
And trudged away to cry no bishop.

Hudibras.

Another mass held a kind of *oyster* shell, and other bivalves.

Woodward.

There may be many ranks of beings in the invisible world as superior to us as we are superior to all the ranks of being in this visible world; though we descend below the *oyster* to the least animated atoms discovered by microscopes.

Watts.

Where *oyster* tube in rows
Are ranged beside the posts, there stay thy haste.

Gay.

OYSTER HARBOUR, a bay in the north part of King George the Third's Sound, New Holland, discovered by Vancouver in the year 1791; and so called from the abundance of oysters there. It will only admit vessels of a middle size, the shallowness of the water on the bar extending from shore to shore, on which were found seventeen feet water only. Long. 118° 15' E.

OYSTER ISLAND, an island in the bay of Bengal, very dangerous to navigation on account of its rising but just above the level of the sea, and being surrounded by rocks. It abounds with rock oysters, which the natives of the opposite coast catch with hammers, and carry to Chittagong, Dacca, and Calcutta; but it is dangerous to eat them till they have been purged in salt. It lies nine miles S.S.W. of the north point of the Arracan River.

OYSTER SHELLS are an alkali far more powerful than is generally allowed, and in all probability much better medicines than many of the more costly and pompous alkalies of the same class. These shells produce very sensible effects on the stomach, when it is injured by acid humors.

OZAMA, a river of Hispaniola, formed by the confluence of the Isabella and Ozama, two streams which unite about a league above the capital, and fall down in a beautiful wood-girted channel, as wide as the Thames at Chelsea. In rainy seasons this stream is of great convenience for bringing down provisions and produce.

OZANAM (James), an eminent French mathematician, born at Boligneux in Bresse, in 1640. His father designed him for the church; but his mathematical genius showed itself so early that he made that study his profession, and taught that science at Lyons. In 1702 he was admitted into the Royal Academy of Sciences; and died of an apoplexy in 1717. He was of a mild and serene temper, and a cheerful disposition. His works are very numerous, and have met with approbation. The principal are, 1. *Practical Geometry*, 12mo. 2. *A Mathematical Dictionary*. 3. *A Course of Mathematics*, 5 vols. 8vo. 4. *Mathematical and Philosophical Recreations*, the most complete edition of which is that of 1724, in 4 vols. 8vo. 5. *An Easy Method of Surveying*. 6. *New Elements of Algebra*, a work much commended by M. Leibnitz. 7. *Theoretical and Practical Perspective*, &c.

2 E

P.

P, a labial consonant, is formed by a slight compression of the anterior part of the lips; and is confounded by the German and Welsh with *b*. It has an uniform sound; but is sometimes mute before *t*; as accomp^t, receipt; but the mute *p* is in modern orthography commonly omitted. **P** is used, 1. as a letter; 2. as an abbreviation; 3. it was anciently used as a numeral. 1. As a letter, **P** is the fifteenth of the alphabet, and the eleventh consonant. The sound is formed by expressing the breath somewhat more suddenly than in forming the sound of *b*; in other respects these two sounds are pretty much alike. When *p* stands before *t* or *s* its sound is lost; as in the words psalms, psychology, ptolemaic, ptisan, &c. When placed before *h* they both together have the sound of *f*; as in philosophy, physic, &c. **P** and **B** are so like each other, that in ancient inscriptions, and old glossaries, these two letters have often been confounded. Several nations still pronounce one for the other. The Welsh and Germans say, *ponum vinum for bonum vinum*. Among the Latins, as often as an *s* followed, the *b* was changed into a *p*, as scribo, scripsi. St. Jerome observes, on Daniel, that the Hebrews had no **P**; but that the *ph* served them instead; adding that there is but one word in the whole Bible read with a **P**. viz. apadno. 2. As an abbreviation, **P** stands for Publius, Pondo, &c. **P. A. DIG.** for Patricia Dignitas; **P. C.** for Patres Conscripti; **P. F.** for Publici Filius; **P. P.** for Propositum, or Propositum publice; **P. R.** for Populus Romanus; **P. R. S.** for Prætoris sententia; **P. R. S. P.** for Præses provincie. **P. M.**, among astronomers, is frequently used for post meridiem, or afternoon; and sometimes for post mane, after the morning, i. e. after midnight. On the French coins, **P** denotes those that were struck at Dijon. In the Italian music, **P** stands for piano, or softly; and **P. P. P.** for pianissimo, or very softly. Among physicians, **P** stands for pugn, or the eighth part of a handful; **P. Æ.** partes æquales, or equal parts of the ingredients; **P. P.** signifies pulvis patrum, or Jesuit's bark in powder; and *ppt.* preparatus, prepared. 3. As a numeral, **P** was used among the ancients to signify the same with the **G**, viz. 100; though Baronius thinks it rather stood for seven. When a dash was added a-top of **P**, it stood for 400,000. The Greek π signified eighty.

PA, a city of China, in Sechuen, of the second rank. It stands in long. 106° 24' E., lat. 31° 31' N.

PA, a fortified city of China, of the second rank, in Pe-che-lee, fifty miles south of Pekin. Also a town of Thibet, 450 miles east of Lassa.

PAARDEBERG, or the Horse Mountain, a division of the district of Drakenstein, Cape of Good Hope, so named from the number of zebras that were formerly found here. Its chief produce is wheat.

PAARLBERG, a mountain in the territory of the Cape, to the north of the peninsula on which Cape Town is situated. A chain of large rocks,

like a necklace, pass over the summit, and present a very remarkable appearance, which gives name to the mountain. Two of them, placed near the central and highest point, are called the Diamond and the Pearl. The Pearl is about 400 feet above the summit of the hill, and the circumference of its base is nearly a mile. The Diamond is larger. See CAPE OF GOOD HOPE.

PAAW (Peter), a Dutch physician, born at Amsterdam in 1564. He became eminent at Leyden, where he wrote several Latin treatises on medicine, and died in 1716.

PABAY, a small island of the Hebrides, about eight miles from Barray, nearly a mile and a half long, one broad, inhabited by three families.

PABBA, a small island of Scotland, two miles from Sky, about a mile long, and three-fourths of a mile broad. It is used only for pasturing cattle. In one place are indications of iron ore; and many of the rocks are of the finest limestone, and exhibit beautiful petrifications. At its northern extremity are the remains of a chapel.

PABBAY, one of the isles which compose the district of Harris, Inverness, Scotland. It has a conical appearance, and rises to a high peak. Its diameter, at the base, may measure about two miles and a half. This island, once fertile in corn, has its south side now covered with sand drift, and exhibits the most desolate appearance. Towards the south-west, indeed, it is partially sheltered, and still productive; but on the north-west again, where exposed to the sea-spray, scarcely any vegetation remains.

PABLO, a small lake of Quito, in the province of Otavalo, on which is situated a settlement of this name. Forty miles east of Quito. It is also the name of other settlements of South America.

PABULAR, *adj.* } Lat. *pabulum*. Afford-
PABULATION, *n. s.* } ing aliment: pabulation
PABULOUS, *adj.* } is the act of feeding or
PABULUM, *n. s.* } procuring food: pabu-
lous, alimental: pabulum, food; support; main-
tenance in regard to food.

We doubt the air is the *pabulous* supply of fire, much less that flame is properly *air* kindled.

Brown's Vulgar Errors.

PACAJES, a province of Peru, bounded north by Chucuito and the great lake, north-east by Omasuayos, east by La Paz and Sicacas, south by Oruro, Paria, and Caramgas, and south-west and west by the lofty chain of the Andes. Its length from the bridge of the Desaguadero, which divides it from Chucuito, to the province of Paria, is fifty-six leagues, and its greatest width forty. The climate is cold, and the population, chiefly Indian, very thinly scattered. A mine of talc, which supplies the whole of Peru with window lights, is its only remarkable production.

PACAMOROS YAGUARSONGO, or San Juan de Salinas, vulgarly called De Bracamoros, a province and government of Quito, bounded north by the territory of Zamora and the province of Loxa, west by Piura, south by the river Amazon, and east by Indian territories. This pro-

vince is thinly peopled, but has rich gold mines. The pastures and tobacco are excellent. It also yields wax, cotton, and the finest cacao.

PACASMAYU, a river and bay of Peru, in the province of Saria, which flows down the mountains of Caxamarca, runs west, and falls into the Pacific. In its mouth are caught excellent fish. Lat. of its mouth $7^{\circ} 24' S$.

PACALONGANG, a European town and fort on the north coast of the island of Java, 282 miles east of Batavia. It is the seat of a resident, a few Dutch families, and a numerous population of natives and Chinese. The great road across the island passes through this place; and near it is a forest many miles in extent, which is so unhealthy that about 4000 people perished in cutting that part.

PACE, *n. s., v. n., & v. a.* } *Fr. pas*; Italian *Pa'cen*, *adj.* } *passo*; Lat *passus*.

Step; manner of step or walk; gait; gradation; degree of celerity; a measure of five feet; a particular movement of a horse: to move regularly or slowly; to measure by steps: paced, is having a particular gait.

He soft arrived on the grassie plain,
And fairly paced forth with easy pain.

Spenser.

To-morrow, and to-morrow, and to-morrow,
Creeps in this petty pace from day to day,
To the last syllable of recorded time;
And all our yesterdays have lighted fools
The way to dusky death. *Shakespeare. Macbeth.*

Where in the horse that doth untread again
His tedious measures with the' unbated fire
That he did pace them first? *Shakespeare.*

If you can pace your wisdom
In that good path that I would wish it go,
And you shall have your bosom on this wretch. *Id.*

Remember well, with speed so pace,
To speak of Perdita. *Id. Winter's Tale.*

Nor her winged speede,
The falcon gentle could for pace exceed.

Chapman.

His teachers were fain to restrain his forwardness;
that his brothers, under the same training, might
hold pace with him. *Wotton's Buckingham.*

The violence of tempests never moves the sea
above six paces deep.

Wilkins's Mathematical Magick.

He mended pace upon the touch. *Hudibras.*

They rode, but authors having not
Determined whether pace or trot;
That's to say, whether tollutation
As they do term it, or succussation. *Id.*

Measuring land by walking over it, they styled a
double step; i. e. the space from the elevation of one
foot to the same foot set down again, mediated by
a step of the other foot; a pace equal to five foot; a
thousand of which paces made a mile. *Holder.*

The first pace necessary for his majesty to make is
to fall into confidence with Spain. *Temple.*

Revenge is sure, though sometimes slowly paced;
Awake, awake, or sleeping sleep thy last. *Dryden.*

The beggar sings, ev'n when he sees the place
Beset with thieves, and never mends his pace. *Id.*
Hudibras applied his spur to one side of his horse,
as not doubting but the other would keep pace with
it. *Addison.*

The moon rose in the clearest sky I ever saw, by
whose solemn light I paced on slowly without inter-
ruption. *Pope.*

A **PACE** is a measure taken from the space between the two feet of a man in walking; usually reckoned two feet and a half, and in some men a yard or three feet. The geometrical pace is five feet; and 60,000 such paces make 1° on the equator.

PACE (Richard), a learned Englishman, born about 1482. Henry VIII. made him secretary of state; and he was admitted prebendary of York, archdeacon of Dorset, and dean of St. Paul's, &c., during his absence on foreign embassies. Falling under the displeasure of Wolsey, he was so ill treated as to drive him mad, and was thrown into the Tower on his complaining to the king. After being confined two years, he was enlarged, resigned his deaneries, and died in retirement, at Stepney, in 1532, after having written several works. He was much esteemed by the learned men of his time, especially Sir Thomas More and Erasmus.

PACHA, a title of honor and command in the east, synonymous with bashaw. See **BASHAW**.

PACHETE, or **PACMER**, a zemindary in the province of Bengal, now incorporated in the surrounding districts of Rangur, Birbhoom, and Burdwan. In 1784 Pachete, Chuta, Nagpoor, Palamow, and Rangur, contained, according to major Rennel's mensuration, 21,732 square miles, of which 16,732 were nearly waste. The revenue was 161,216 rupees. Pachete is bounded by Chuta Nagpoor, and Rangur, containing a jungly territory of about 2779 square miles, which was once a frontier territory towards the western confines of Bengal, and still retains much of the sterility and barbarism of the neighbouring regions to the south. The climate is very unhealthy. The principal towns are Pachete, Rogonauthunge, and Jauldah, which, with the zemindary, were formerly held by the Rajpoot Narrain family. The chief products of this province are rice and cotton.

PACHETE, a town in the province of Bengal, the capital of the zemindary of this name, 126 miles north-west from Calcutta.

PACHODECARHOMBIS, in the ancient system of mineralogy, a genus of fossils, of the class of selenite. The word is derived from the Greek *παχος*, thick, *δισα*, ten, and *ρομβος*, a rhombus, and expresses a thick rhomboidal body, composed of ten planes. The characters are that the selenite of it consist of ten planes; but, as the top and bottom in the leptodecarhombes are broader and larger planes than any of the rest, the great thickness of this genus, on the contrary, makes its four longer planes in all the bodies of it, meeting in an obtuse angle from its sides, its largest planes. There are four species.

PACHUCO, a town and province of the intendancy of Mexico. It has a magnificent parish church; and the royal coffers, where the treasurer and accountant reside, were formerly here. The trade in silver is the principal of the place. The ground on which it stands is 8141 feet high, forty-five miles north-east of Mexico.

PACHYMERUS (George), a Greek historian of the fourteenth century. He wrote a History of the East, which merits the more credit from the share he had in the transactions he records. It commences with the year 1308.

PACIFIC, *adj.* } *Fr. pacifique, paci-*
PACIFICATION, *n. s.* } *fier; Lat. pacificus,*
PACIFICATOR, } *pacifico.* Peaceable;
PACIFICATORY, *adj.* } making peace; mild;
PACIFIER, *n. s.* } gentle: pacification is
PACIFY, *v. a.* } the act of making

peace: pacificator, he who makes peace: pacificatory, tending to make peace: to pacify is to appease; quell anger, resentment, or desire.

Menelaus promised Ptolemy money, if he would *pacify* the king. 2 *Mac.* iv. 45.

The Most High is not *pacified* for sin by the multitude of sacrifices. *Ecclus.* xxiv. 19.

While the dog hunted in the river, he had withdrawn to *pacify* with sleep his over-watched eyes. *Sidney.*

A world was to be saved by a *pacification* of wrath, through the dignity of that sacrifice which should be offered. *Hooker.*

He sent forthwith to the French king his chaplain, chusing him because he was a churchman, as best sorting with an embassy of *pacification*. *Bacon.*

He set and kept on foot a continual treaty of peace; besides he had in consideration the bearing the blessed person of a *pacificator*. *Id.*

In his journey he heard news of the victory, yet he went on as far as York, to *pacify* and settle those countries. *Id.*

God now, in his gracious *pacific* manner, comes to treat with them. *Hammond's Fundamentals.*

Returning, in his bill

An olive leaf he brings, *pacifio* sign! *Milton.*

O villain! to have wit at will upon all other occasions, and not one diverting syllable now at a pinch to *pacify* our mistress. *L'Estrange.*

Nor William's power, nor Mary's charms,

Could or repel, or *pacify* his arms. *Prior.*

David, by an happy and seasonable *pacification*, was took off from acting that bloody tragedy. *South.*

PACIFIC OCEAN, Mare Pacificum, or South Sea, in geography, that vast ocean which separates Asia from America, originally called Pacific from the moderate weather which the first mariners, and particularly Magellan, who sailed in it, met with between the tropics; and it was called the South Sea, because the Spaniards crossed the Isthmus of Darien from north to south. With regard to America it is also sometimes called the Western Ocean. Far from this ocean being less infested with storms than the Atlantic, no sea is subject to rougher storms in high latitudes; but Magellan happening to have a very favorable wind, and not meeting with any thing to ruffle him when he first traversed this vast ocean in 1620, gave it the name which it has retained ever since. Maty adds, that the wind is so regular here that the vessels would frequently go from Acapulco to the Philippine Islands, without shifting a sail. The general trade winds in the Pacific Ocean are similar to those of the Atlantic, blowing constantly between the north and east in the northern tropic, and between the south and east in the southern. Near the west coast of America their limits are strictly confined to the tropics, or even within them, but they widen as they move onwards towards the coast of Asia.

This ocean fills the largest cavity of the globe, occupying nearly half of its surface from the eastern shores of New Holland to the western of America; and it is diversified with several

groups of islands, which seem, as it were, the summits of vast mountains. Separately considered, this ocean receives but few rivers; the chief being the Amur from Tartary, and the Hoan-ho and Kian-ku from China, the principal American rivers running east. As the boundary of the Russian empire, the Pacific washes the shores of the government of Irkutsk, from Tschukotskoy Noss, or Cook's Straits, to the frontiers of China; or from the mouth of the river Aimakan, that is, from 65° to 45° N. lat. It is divided into two great parts. That lying eastwards from Kamtschatka, between Siberia and America, is eminently styled the Eastern or the Pacific Ocean; that on the west side from Kamtschatka, between Siberia, the Chinese Mongoley, and the Kurilly Islands, the sea of Okhotsk. Again, from the place where the river Anadyr falls into it, it is called the sea of Anadyr; about Kamtschatka, the sea of Kamtschatka; and the bay between the districts of Okhotsk and Kamtschatka, is called the sea of Okhotsk, the upper part of which is termed Penjinskoye Mare as it approaches the mouth of the river Penjina. See our articles **GEOGRAPHY** and **OCEAN**.

PACK, *n. s., v. a., & v. n.*

PACK-CLOTH, *n. s.*

PACK'ER,

PACK'ET, *n. s. & v. a.*

PACKHORSE, *n. s.*

PACKSADDLE,

PACKTHREAD,

PACKWAX.

Fr. pacquet;
Ital. pacchetto;
Swed. and Belg.
pack; Dan. packke.
 A bundle; bale;
 band; set;
 number: hence a given
 number of cards

or hounds, party of people, &c.; any great number: to pack is to bind up for carriage or despatch: hence to unite selected persons in a design; sort cards in a particular manner: to tie up goods; go after, or remove, in haste; concert measures (generally applied in an ill sense): a packet is a small pack or bundle; particularly of letters; the vessel which carries a mail bag: to packet is used by Swift for to bind up parcels: a packhorse is, a horse of burden; a horse used for carrying packs: packsaddle and packthread a saddle and thread, used to carry and tie up packages: packwax, an animal secretion.

New farmer thinketh each hour a day,

Until the old farmer be *packing* away. *Tupper.*

You panderly rascals! there's a knot, a gang, a pack, a conspiracy, against me. *Shakespeare.*

He cannot live, I hope, and must not die,
 Till George be *packed* with post horse up to heaven. *Id.*

Enos has

Pack cards with Cæsar, and false played. *Id.*

I rather chose

To cross my friend in his intended drift,

Than, by concealing it, heap on your head

A pack of sorrows. *Id. Merchant of Venice.*

Rogues, hence, avaunt!

Seek shelter, *pack*.

Shakespeare.

Go *pack* with him. *Id. Timon Andronicus.*

In the dark

Groped I to find out them,

Fingered their *packet*, and in fine withdrew.

Shakespeare.

Ere you were queen, ay, or your husband king,
 I was a *packhorse* in his great affairs. *Id.*

Your boards deserve not so honourable a grave as to stuff a butcher's cushion, or to be entombed in an ass's *packsaddle*. *Id.*

About his shelves

Remnants of *packthread*, and old cakes of roses, Were thinly scattered. *Id. Romeo and Juliet.*

There be that can *pack* cards and yet cannot play well; so there are some that are good in canvasses and factions, that are otherwise weak men.

Bacon's Essays.

Themistocles said to the king of Persia, that speech was like cloth of Arras, opened and put abroad, whereby the imagery appears in figures; whereas in thoughts they lie but as in *packs*. *Bacon.*

There passed continually *packets* and dispatches between the two kings. *Id. Henry VII.*

Girding of the body of the tree about with *packthread*, restraineth the sap. *Id. Natural History.*

The wind no sooner came good, but away *pack* the galleys with all the haste they could. *Carew.*

That this so profitable a merchandize, riseth not to a proportionable enhancement with other less beneficial commodities, they impute partly to the eastern buyers *packing*, partly to the owners not vending the same. *Id.*

Had sly Ulysses at the sack

Of Troy, brought these his pedlar's *pack*. *Cleveland.*

The marigold, whose courtier's face Echoes the sun, and doth unlace Her at his rise, at his full stop *Packs* and shuts up her gaudy shop. *Id.*

That brave prancing courser hath been so broken and brought low by her, that he will patiently take the bit and bear a *packsaddle* or panniers. *Howel.*

Upon your late command

To guard the passages, and search all *packets*, This to the prince was intercepted. *Denham.*

Never such a *pack* of knaves and villains, as they who now governed in the parliament. *Clarendon.*

Our knight did bear no less a *pack* Of his own buttocks on his back. *Hudibras.*

When they have *packed* a parliament, We'll once more try the expedient; Who can already muster friends, To serve for members to our ends. *Id.*

A poor merchant driven on unknown land, That had by chance *packed* up his choicest treasures In one dear casket, and saved only that. *Otway.*

The bunch on a camel's back may be instead of a *packsaddle* to receive the burden. *Moss.*

His *packets* returned with large accessions of objections and advertisements. *Fell.*

If they had been an hundred more, they had been all sent *packing* with the same answer. *Stillfleet.*

Resolved for sea, the slaves thy baggage *pack*, Each saddled with his burden on his back. *Dryden.*

Two ghosts join their *packs* to hunt her o'er the plain. *Id.*

The fury fires the *pack*; they snuff, they vent, And feed their hungry nostrils with the scent. *Id.*

Pack hence, and from the covered benches rise, This is no place for you. *Id.*

But when they took notice how stupid a beast it was, they loaded it with *packs* and burdens, and set boys upon the back of it. *L'Estrange.*

A thief kindled his torch at Jupiter's altar, and then robbed the temple: as he was *packing* away with his sacrilegious burden, a voice pursued him. *Id.*

It is not to be expected that a man, who drudges on in a laborious trade, should be more knowing in the variety of things done in the world, than a *pack-*

horse who is driven constantly forwards and backwards to market, should be skilled in the geography of the country. *Loche.*

Several parts peculiar to brutes are wanting in man; as the strong aponeuroses of the neck, called *packwas*. *Ray.*

Brutes, called men, in full cry *packed* by the court or country, run down in the house of commons, a deserted horned beast of the court. *Wycherley.*

The *pack* taken together, composed of fifty-two cards, is palpably a symbol of the solar year, consisting of fifty-two weeks, referring to time in general; and however dealt out, in its speedy revolution, affords a document, that even in our pastimes we should be mindful of its transient and brief duration. *Whyte's Poems, notes.*

It is wonderful to see persons of sense passing away a dozen hours together in shuffling and dividing a *pack* of cards. *Addison.*

What we looked upon as brains, were an heap of strange materials, *packed* up with wonderful art in the skull. *Id.*

His horse is vicious, for which reason I tie him close to his manger with a *packthread*. *Id.*

The expected council was dwindled into a conventicle; a *packed* assembly of Italian bishops, not a free convention of fathers from all quarters. *Atterbury.*

Women to cards may be compared, we play A round or two, when used we throw away, Take a fresh *pack*. *Granville.*

I can compare such productions to nothing but rich pieces of patchwork, sewed together with *packthread*. *Fellon.*

The judge shall jobb, the bishop bite the town, And mighty dukes *pack* cards for half a crown. *Pope.*

Bickerstaff is more a man of honour than to be an accomplice with a *pack* of rascals that walk the streets on nights. *Swift.*

Poor Stella must *pack* off to town, From purling streams and fountains bubbling, To Liffy's stinking tide at Dublin. *Id.*

People would wonder how the news could come, especially if the wind be fair when the *packet* goes over. *Id.*

My resolution is to send you all your letters, well sealed and *packeted*. *Id.*

So many greater fools than they, Will *pack* a crowded audience the third day. *Southern.*

The savage soul of game is up at once, The *pack* full opening various. *Thomson's Summer.*

PACORUS, the eldest of the thirty sons of Orodes, king of Parthia, who defeated Crassus, and took him prisoner, and took Syria from the Romans. He supported Pompey and the republican party; but was at last killed by Bassus, A. A. C. 39. See PARTHA.

PACOS, in zoology, a species of camel, known among many by the name of the Indian sheep, or Peruvian sheep. See CAMELUS. This creature has been accounted a sheep, because its hair is so long as to resemble wool, and it is prodigiously thick, its head and neck alone having more wool on them than the whole body of our largest sheep. Its body is clothed in the same proportion with a woolly hair equally fine.

PACT, *n. s.* } Fr. *pact*; Lat. *pactum*.
PAC'TION, } Both the substantives are
PACTI'OUS, *adj.* } used to signify a bargain or covenant: pactitious is, settled by covenant.

The queen, contrary to her *past* and agreement concerning the marriage of her daughter, delivered her daughters out of sanctuary unto king Richard.

Bacon.

The French king sent for Matthew, earl of Levenox, to remove the earl of Arraine from the regency of Scotland, and reverse such *pactions* as he had made.

Hayward.

There never could be any room for contracts or *pactions*, between the Supreme Being and his intelligent creatures.

Chayne.

PACTOLUS, a river of Lydia, rising in Mount Tmolus, called Chrysorrhoeas, from its rolling down golden sand, according to Herodotus, Plutarch, Pliny, and Strabo. In this river Midas was fabled to have washed himself; and from it Cræsus is thought to have had all his riches. In Strabo's time it ceased to roll down any. It ran through Sardes; after which it fell into the Hermus, and both together into the *Egean* Sea at Phocæa in Ionia. The kings of Persia obtained possession of the Pactolus and its treasures by Cyrus's conquest of Lydia. Xerxes I. drew gold from the Pactolus, and this valuable metal was furnished by it in the time of Herodotus; but it afterwards failed long before the time of Strabo. The gold of the Pactolus was derived from the mines of Mount Emolus; and, when these were exhausted, the supply of the river was discontinued. This river was, according to Varro and Chrysostom, the chief source of the wealth of Cræsus.

PACUVIUS (Marcus), a native of Brundisium in Calabria, a tragic poet in high reputation about the year of Rome 600. He was nephew of Ennius; published several theatrical pieces, though we have only some fragments of his poetry remaining; and died at Tarentum, at above ninety years of age.

PAD, *n. s. & v. n.* } Sax *paad*; Belg. *pad*; PAD'DER, *n. s.* } Teut. *pfad*; Sans. *pad*; Gr. *παρος*. A path; road; footway; an easy-paced horse; a soft saddle; a robber infesting the roads on foot: to tread gently or at a slow pace; beat a way; rob on foot: a *padder* is a foot highwayman.

Tremellius was called *scrophæa* or *sow*, because he hid his neighbour's sow under a *pad*, and commanded his wife to lie thereon; he swore that he had no sow but the great sow that lay there, pointing to the *pad* and the sow his wife.

Camden.

We shall not need to say what lack

Of leather was upon his back;

For that was hidden under *pad*. *Hudibras.*

Spurr'd as jockies use, to break,

Or *padders* to secure a neck. *Id.*

Worse than all the clattering tiles, and worse Than thousand *padders* is the poet's curse; Rogues that in dog-days cannot rhyme forbear; But without mercy read, to make you hear.

Dryden.

Let him walk afoot with his *pad* in his hand; but let not them be accounted no poets who mount and show their horsemanship.

Id.

We have seen this to be the discipline of the state as well as of the *pad*. *L'Estrange.*

A grey *pad* is kept in the stable with great care, out of regard to his past services. *Addison.*

The squire of the *pad* and the knight of the post, Find their pains no more baulked, and their hopes no more crost.

Prior.

If he advanced himself by a voluntary engaging in unjust quarrels, he has no better pretence to honour than what a resolute and successful *padder* may challenge.

Collier.

I would have set you on an easier *pad*, and relieved the wandering knight with a night's lodging.

Pope's Letters.

PADANG, a Dutch settlement on the west coast of Sumatra, to which the factories at Pulo Chincio, Priaman, and Adjerhadja, were formerly subordinate. Lat. 0° 48' S., long. 90° 55' E. The town lies one mile within the river: the land to the northward is low towards the sea, but mountainous up the country. Some pepper, camphor, and benzoin, are furnished; but ever since the establishment of the English settlement at Bencoolen the quantity collected has been small. A considerable quantity of gold is sent to Batavia. Near to Padang is a vein of this metal which formerly was worked; but, not finding the returns adequate to the expense, the Dutch East India Company let it to farm, and it now produces little or nothing. Padang was first visited by the English East India Company's ships in 1649. It was in our possession from 1794 to 1814; but in the last year given up again to the Dutch.

PA'DAR, *n. s.* L. B. *paleatura*. Grouts; coarse flour.

In the bolting and sifting of near fourteen years of such power and favour, all that came out could not be expected to be pure and fine meal, but must have amongst it *padar* and bran in this lower age of human fragility.

Wotton.

PAD'DLE, *v. n. & n. s.* } Fr. *partouiller*; Lat. PAD'DLER, *n. s.* } *patulus*. To row;

beat or play with water, as with oars; to finger: a *paddle* is an oar or broad-ended staff.

Have a *paddle* upon thy weapon. *Deut.* xiii. 13.

Paddling palms, and pinching fingers, And making practised smiles,

As in a looking-glass.

Shakespeare. Winter's Tale.

As the men were *paddling* for their lives.

L'Estrange.

A wolf lapping at the head of a fountain, spied a lamb *paddling* a good way off.

Id.

The brain has a very unpromising aspect for thinking; it looks like an odd sort of bog for fancy to *paddle* in.

Collier.

Paddling ducks the standing lake desire.

Gay.

PAD'DOCK, *n. s.* Sax. *paða*; Danish and Belg. *padde*. A toad: also corrupted from *parok* (see *PARK*), an enclosure for deer.

Where I was wont to seek the honey-bee,

Working her former rooms in waxen frame;

The grisley toad-stool grown there mought I see, And loathing *paddocks* lording on the same.

Spenser.

The *paddock*, or frog *paddock*, breeds on the land, is bony and big, especially the she.

Wotton.

The water-snake, whom fish and *paddocks* fed, With staring scales lies poisoned

Dryden.

A *PADDOCK*, or *PADDOCK-COURSE*, is a piece of ground encompassed with pales or a wall, and taken out of a park, for exhibiting races with grey-hounds, for plates, wagers, or the like. These *paddocks*, from their great extent, were seldom seen but in the royal parks, or upon the demesnes of the most opulent.

The sport has been a long time discontinued, and the word paddock is employed in the present time only to a small enclosure or pasture, having a pale to protect it; or to a small tract of land, surrounding, or appertaining to, a rural mansion, where a few brace of fallow deer may be kept, but not of magnitude sufficient to acquire the appellation of a park.

PADERBORN, i. e. the source of the Pader, an ancient town of Westphalia, subject to Prussia. This place was for a time the residence of Charlemagne, and, on different occasions, the temporary abode of succeeding emperors. It was a member of the Hanseatic confederacy, but fell by degrees into complete subjection to the bishop of Paderborn, who governed a district of above 1000 square miles, adjacent to the landgraviate of Hesse. This bishopric, founded by Charlemagne, has belonged to Prussia since the secularisation of 1802. It contains at present a population of 120,000. The town of Paderborn was taken in 1622 by duke Christian of Brunswick, at the head of a Protestant force. The cathedral is a fine edifice; and there are here no fewer than six hospitals or almshouses. The town is tolerably built, but its trade is insignificant. Population about 5300. Thirty-seven miles south by west of Minden, and fifty-eight south-west of Hanover.

PADLOCK, *n. s. & v. a.* Belgic *padde*. A lock for a gate originally; to fasten with a lock and staple.

Let all her ways be unconfin'd;

And clap your *padlock* on her mind. *Prior.*

Some illiterate people have *padlocked* all those pens that were to celebrate their heroes, by silencing Grub-street. *J. Bull.*

PAD-NAG, *n. s.* From pad and nag. An ambling nag.

An easy *pad-nag* to ride out a mile. *Dr. Pope.*

PADOGI, a punishment used in Russia. The body of the criminal is stripped to the waist, and then laid upon the ground; one slave holds the head of the person to be punished between his knees, and another the lower part of the body; then rods are applied to the back till some person gives notice to desist, by crying out enough! This punishment is considered in Russia merely as a correction of the police, exercised on the soldier by military discipline, by the nobility on their servants, and by persons in authority over all such as are under their command. After the accession of Elizabeth to the throne of Russia, the punishments were reduced to two kinds, viz. the padogi and knout.

PADSTOW, a market and sea-port town of England, on the north coast of Cornwall, on the Camel, near the Bristol Channel. It has a market on Saturday, and a good trade with London, Bristol, and Ireland; from which last it is twenty-four hours' sail distant. The church is an ancient structure, dedicated to the first St. Petrock. In this town is also a Methodist chapel. At the mouth of the Camel is a convenient harbour for vessels of 500 tons burden, at high water; but it is rather difficult of access, having rocks on the east side, and a bar of sand on the west. Padstow has also a small fishery for

herrings, and, during the season, is much frequented for sea-bathing. It has a custom-house and good quays. It is thirty miles west of Launceston, and 243 west by south of London.

PADUA, a province of Austrian Italy, in the government of Venice, adjoining the delegations of Vicenza, Treviso, Venice, Rovigo, and Verona. Its superficial extent is 860 square miles; producing the most abundant crops of corn, of which, however, little is exported, owing to the density of the population. Large quantities of wine, fruit, and silk, are likewise raised; and the pastures are rich and well stocked. The surface is agreeably diversified by the Euganean hills, a chain of moderate height, which passes through the province. It is watered by the Brenta, the Bacchiglione, and several smaller streams. Population 270,000.

PADUA, a city of Austrian Italy, the capital of the above delegation. It stands near the junction of the Brenta and Bacchiglione, and is of a triangular form, surrounded with a mound and ditch. The circuit of these is nearly seven miles; but the interior contains much open space. The town is traversed by several canals, and the streets are bordered on each side with arcades, which, while they afford a pleasant shade in hot weather, give the town a gloomy appearance. The streets are also otherwise dark and ill paved. The houses are, however, in general lofty and well built, and several of the public edifices are magnificent. The town-house is in the form of an oblong quadrangle, supported by galleries resting on marble pillars. At each end are great stair-cases, leading to an arched saloon, said to be the largest hall in Europe, being 300 feet long, 100 broad, and 100 high. It is so constructed that the roof has no support but the walls. The interior contains some fresco paintings, and a bust of Livy, who was a native of Padua. Near the town-house is situated the palace of the Podesta, remarkable for its Doric saloon, and fine paintings. The palace of the commandant is a model of beautiful architecture. The cathedral is less remarkable for its architecture than for its paintings and ornaments. The church of St. Antonio, an ancient Gothic edifice, is likewise rich in sculpture and painting. That of St. Justina is also a fine marble edifice, with a good library and a number of valuable paintings.

The university was at one time resorted to by crowds of students from all parts of Europe. Among its eminent pupils were Galileo, Petrarck, and Columbus. The buildings are the work of Palladio, and the observatory, botanical garden, anatomical theatre, cabinet of natural history, and hall of midwifery, are all on a large well-supported scale. The university was new modelled in 1814, and consists of the faculties of mathematics, philosophy, medicine, and law. The number of professors is thirty-two; the average number of students not above 300. Here is also an academy of sciences, founded by the senate of Venice. Padua is likewise the seat of one of the five sections of the Institute of Austrian Italy.

Padua was a distinguished place when it first submitted to Rome, and was treated not as a

conquered, but as an allied city. In the dark ages it found means to form itself, like a number of other cities in Italy, into an independent state; but finally fell under the sway of the Carrara family. This took place in the fourteenth century, and in the fifteenth it was incorporated into the Venetian republic. In trade it is not conspicuous, its only branches consisting of manufactures on a small scale of silk, woollens, and leather.

'Whoever,' says the lively lady Morgan, 'would judge of the mere materielle of a city, should avoid visiting its public buildings in the society of agreeable people; and I confess that after some hours given to the perambulation of Padua, with the sole exception of its singular and Gothic hall in the Palazzo della Giustizia, the magnificent church of its patron saint, and the venerable cloisters of its ancient university, I have carried away a most imperfect impression of the city of Antenor and Livy, and a most gracious one of the amiable persons who accompanied us.

'The Palazzo della Giustizia was begun in 1172 by Pietro Cozzo, and finished in 1306; it is, therefore, one of the most ancient fabrics in Italy, and has all the air of being so. The salone, or great hall, is a monument of the manners of the middle ages. It was a sort of change for the Paduan merchants, a bazaar for the people, who came there to make purchases of such glittering foreign wares as were exposed to sale on either side of this immense covered space. Its roof, 300 feet long, and 100 wide, is supported only by its own massy walls, which have stood the proof of nearly six centuries, and are still illustrated by the frescoes of Giotto, on which so many successive generations have gazed. A monument, raised to Titus Livius, completes the interest of this forum of the middle ages, whose vastness, when we visited it, was only occupied by scene painters, painting some decorations for the opera. The palace of the university is of much more modern date. It is by Palladio, and contains the public schools, the theatre of anatomy, and the museum of natural history, collected by Valisnieri; attached to the establishment there is a handsome botanical garden.

'The dim gloomy court of the university, and its successive tiers of arcades or porticoes, have out little of the usual cold Greek character of Palladio's architecture, or else the inscriptions and baso-relievs with which these walls are decorated take from their antique severity; for it is in these porticoes that the effigies, names, countries, and ages, of several of the students of Padua, are registered, who came here to—

'happily institute

A course of learning and ingenious studies,' from all parts of the world. Here many an Italian 'Lucentio,' with 'his man Tranio,' arrived

'For the great desire' he had

'To see fair Padua, nursery of arts;'

and here even many a British youth, abandoning the alma-maters of England or Edinburgh, has come thus far

'To suck the sweets of sweet philosophy'

under Italian skies. Among the names which we ran over, inscribed on these old walls, under youthful, but ill-painted heads (long laid low), we read some well-known Scotch and English names—one was 'Thomas Erskine, Scotus,' another, 'A. Henley.'

'St. Anthony of Padua is one of the most notorious saints in the calendar, and his church is one of the most splendid in Italy. We visited it in a happy moment, during the celebration of high mass on a Sunday morning. It was the first time I ever saw a great Italian church filled with an Italian congregation, one-third of which seemed composed of the higher classes: for the women were elegantly dressed à la Française, and yawned, pointed their glasses, and looked about them, with such an air of fashionable ennui, that I almost fancied myself in an English Protestant church; while, as we returned, family groups, with prayer-books and parasols, followed by footmen in respectable liveries, completed the delusion.

The old part of Padua, 'la città vecchia,' with its dark narrow streets and high old palaces, however gloomy and inconvenient, has an interest of its own, well worth the more spacious avenues and Palladian façades of the modern town. Here, doubtless, stood Gremio's house 'within the city,' which was

'Richly furnished with plate and gold,
Basins and ewers to lave the dainty hands
And hangings all of Tyrian tapestry:'

In the inventory of his rich furniture, he observes—

'In ivory coffers I have stuffed my crowns,
In cypress chests my arras, counter-points,
Costly apparel, tents and canopies,
Fine linen, Turkey cushions, 'bossed with pearl,
Valance of Venice, gold in needle-work,
Pewter and brass, and all things that belong
To house or house-keeping.'

'This was the genuine catalogue of an Italian noble's house, in the age of Shakspeare, authenticated by all which time and change have spared in Italy; there is not an article here described, that I have not found in some one or other of the palaces of Florence, Venice, or Genoa—the mercantile republics of Italy—even to the

'Turkey cushions 'bossed with pearl.'

'It has been the fashion to dispute the learning of Shakspeare; but his knowledge was overwhelming—like the frenzied eye of his own poet—

It 'glanced
From heaven to earth,'

and such was its exquisite and appropriate application, that from the Roman capitol to the house of the Paduan merchant, the details were facts, indisputable as they were minute.

The late enterprising traveller Belzoni was a native of this place. It is eighteen miles south-east of Vicenza, and twenty west of Venice.

PADUANI, among medallists, those counterfeits of antique medals that were struck in the seventh century, by an Italian painter born at Padua. See NUMISMATOLOGY.

PADUS, anciently called Eridanus, a river famous for the fable of Phaeton. It rises in Mount Vesulus, in the Alpes Cottiae, from three

springs, dividing the Cisalpine Gaul into the Transpadana and Cispadana—(Strabo); and, swelled by other rivers falling into it on each side from the Alps and Apennines, it discharges itself, with a course from west to east, at seven mouths, into the Adriatic.—Mela. The lake through which it discharges itself into the sea, is called by the natives the Seven Seas; now the Po.

PADUS, in botany. See PRUNUS.

PÆAN, *n. s.* From the songs sung at festivals to Apollo, beginning *Iō Pæan*. A song of triumph.

O may I live to hail the glorious day,
And sing loud *pæans* through the crowded way.

Roscommon.

See from each clime the learned their incense
bring:

Hear, in all tongues consenting *pæans* ring. *Pope.*

PÆAN, among the ancient pagans, was a song of rejoicing sung in honor of Apollo, chiefly used on occasion of victory and triumph. See APOLLO.

PÆAN, in the ancient poetry, a foot consisting of four syllables; of which there are four kinds, the *pæan primus*, *secundus*, &c. *Pæan primus* consists of one long syllable and three short ones, or the trochæus and pyrrhichius, as *temporibus*; *pæan secundus* consists of a short syllable, a long, and two short, or an iambus and a pyrrhichius, as *potentia*; *pæan tertius* consists of two short syllables, a long and a short one, or a pyrrhichius and a trochæus, as *animatus*; *pæan quartus* consists of three short syllables and a long one, or a pyrrhichius and iambus, as *celeritas*.

PÆDEROTA, in botany, a genus of the monogynia order, and diandria class of plants; natural order thirtieth, contortæ. The berry is empty, brittle, and dispermous; the style bifid.

PÆDO-BAPTISM, infant-baptism, or that conferred on children; from *παῖς*, infant, and *βαπτισμός*, baptism. See BAPTISM.

PÆDO-BAPTISTS, of *παῖς*, *παιδοῦς*, infant, and *βαπτίζω*, I baptise, are those who maintain that baptism should be administered to infants.

1. One of their chief arguments in support of this opinion is, that if infants, under the Christian dispensation, were excluded from baptism, the Christian institution must appear, in this respect, to be less complete and perfect than that of the Jews: and it is not (*à priori*) likely that God would appoint an external sign of peculiar distinction and benefit for children under the patriarchal and Jewish constitution, without a similar appointment under the Christian dispensation; more especially as the first proselytes to Christianity, and those in particular who were converted from among the Jews, would naturally expect some token of distinction and privilege, comprehending their children, and resembling in its design, though milder in its nature, that which Christianity had abrogated. This expectation was encouraged by the affectionate manner in which our Lord expresses himself concerning infants, particularly when he says, Mark x. 14, 'of such is the kingdom of God'; which some understand to signify, that the rights and privileges of the Christian church belong to such. With these

views, it is easy to conceive to what subjects they would apply the general charge to baptise proselytes, unless directed and restricted by an express order.

2. Wall, in his History of Infant Baptism, undertakes to show from the books of the Jews themselves, and those of others, that understood the Jewish customs, and have written concerning them, that 'it was the custom of the Jews before our Saviour's time, and, as they affirm, from the beginning of their law, to baptise as well as circumcise any proselyte that joined them from other nations, and with him, at his desire, his infant children likewise.' Upon this argument such occasional stress has been laid by able writers, that it is desirable, perhaps, that it should receive greater attention from the Baptists. See our article BAPTISM.

3. The advocates for infant baptism urge moreover the argument from circumcision, or that the covenant made with Abraham was a covenant of grace, by which spiritual and eternal blessings were promised to him, quoting Matt. xxii. 31, 32; Heb. xi. 6; Rom. iv. 11—17; Gal. iii. 6. 18. 29; and that as such it comprehended both Jews and Gentiles, and their seed. 'This argument,' says Mr. H. F. Burder, 'may be divested of all complexity. The covenant with Abraham is the same in substance with that under which we live. The same blessings of that covenant are denoted both by circumcision and by baptism. The covenant then being the same, and the ordinance being in import the same, the subjects entitled to its administration are also the same. But infants were entitled to circumcision, on the ground of their connexion with their parents; therefore infants, on the ground of their connexion with their parents, are entitled to baptism. This strong, and as we think, conclusive argument founded on the Abrahamic covenant, our opponents endeavour to invalidate, by giving a representation of the nature of that covenant which, we think, degrades its character, impairs the beauty and the harmony of the divine dispensations, and is at variance with the reasonings and conclusions of the apostle Paul. The assertion has been made that our argument fails 'by reason of the essential difference between the Jewish and Christian religions.' What a revolution must be effected in our views of the covenant of grace; what a new system of interpretation must we apply to the apostolic epistles, before we can conceive of the Jewish and the Christian dispensations as two different religions, separated from each other by a difference no less than essential! If, indeed, in order to evade the force of our argument, it be necessary to resort to such a sentiment, or even to identify or confound together the covenant with Abraham and the law of Moses, we may infer from the very character of the arguments employed by our opponents the strength and solidity of our own.

'The point of primary importance in the present argument is—the connexion established under the former economy between parents and their infant-offspring. By virtue of that connexion, infants were circumcised; and if that

connexion has never been, by divine appointment, dissolved or diminished, then, by virtue of that connexion, infants should be baptised. But where in the whole compass of the New Testament do we find the slightest intimation that the connexion is terminated? From what part of Scripture can it be proved that such a change has been introduced into the constitution of the covenant of grace? When were infants excluded, and by what law? On the contrary, do not the addresses of the apostles proceed, in many instances, on the supposition that in this important respect the state of things in the church of God remains unaltered? Observe the manner in which they adduce, on some occasions, the promises made to Abraham in reference to his offspring, and correspondent promises recorded by the prophets. On the day of Pentecost Peter said to the enquiring and agitated multitude, Repent and be baptised every one of you in the name of Jesus Christ, for the remission of sins; for the promise is unto you and to your children. Acts ii. 38, 39. On a subsequent occasion, he said, Ye are the children of the prophets and of the covenant which God made with our fathers, saying unto Abraham, And in thy seed shall all the kindreds of the earth be blessed.—Acts iii. 25. Now the question is, in what sense such an application of the ancient promises would be naturally understood by the Jewish people who were thus addressed. The promise quoted was the promise made to Abraham. That promise, as appears from the seventeenth chapter of Genesis, was given in immediate connexion with the appointment of infant-circumcision, and now the apostle Peter adduces the ancient promise in immediate connexion with baptism. ‘Repent, and be baptised every one of you, for the promise is unto you and to your children; then they that gladly received his word were baptised.’ It is not expressly said that their children were baptised with them; but if the preceding considerations be correct, with regard to the principle, the inference will not be difficult with regard to the fact.

4. We state another argument of the Pædo-baptists in the words of this respectable author: ‘That the connexion established between parent and child remains unaltered under the Christian economy, may, I think, be clearly inferred from the decision of the apostle Paul in the seventh chapter of the First Epistle to the Corinthians. ‘If any brother hath a wife that believeth not, and she be pleased to dwell with him, let him not put her away. And the woman who hath a husband that believeth not, and if he be pleased to dwell with her, let her not leave him. For the unbelieving husband is sanctified by the wife, and the unbelieving wife is sanctified by the husband; else were your children unclean; but now are they holy.’ There are, I think, but three acceptations of the term holy in this passage, which can claim attention. Either it imports purity in the highest sense—that which gives a fitness for the church above; or purity in the lower sense—that which gives a fitness for some external privilege of the church on earth; or purity in the lowest sense—that which

is opposed to illegitimacy of birth. In the first of these senses, neither we nor our opponents can understand it. In the last of these senses it has usually been understood by our Baptist brethren; but is this exposition tenable? Can we suppose either the reality or the profession of the Christian faith essential to the validity of the marriage contract, or the legitimacy of the offspring? Would the apostle have pronounced illegitimate the offspring of parents, both of whom were heathens or unbelievers? And yet, if the faith of one of the parents were requisite to the legitimacy of the children, it must follow that, if neither of the parents believed, the children must be illegitimate, and consequently the marriage contract invalid. As this cannot be maintained, the second acceptation of the term holy remains for our adoption, according to which it denotes a fitness for some external privilege of the church. The Jews considered those children as unholy, and not entitled to circumcision, whose parents were in a state of heathenism; and they considered those as holy and entitled to circumcision who were born of Jews or proselytes. In this sense it seems reasonable to suppose that the words of the apostle would be understood by those to whom they were addressed. His decision, then, proceeds upon the principle of the continuance of the ancient connexion between parent and child in the church of God. His decision is, that if either of the parents be a believer, the children are entitled to the same external privilege as if both the parents were believers. But there is only one external privilege of the Christian economy to which this decision can apply, and that privilege is Infant Baptism. In this sense the passage appears to have been understood by Tertullian and the greater number of the early fathers.’ See *Dr. Wall’s History of Infant Baptism*, part I. ch. 4, 15.

It may be added that Dr. Doddridge regarded this passage in a similar light.

5. Pædo-baptists acknowledge that there is no direct and express command to baptise infants; but appeal to the history of the administration of baptism, as strongly implying their participation of it. They argue that the apostles are said to have baptised whole families (Acts xvi. 15, 33; 1 Cor. i. 16); and, therefore, probably infants were comprehended under this general denomination. And they apprehend that they have been able to trace such intimations at least of infant baptism, in the earliest ages of the church as may, to a high degree of probability, prove it to be an apostolic, and consequently divine institution.

Thus *Irenæus*, born about the time of St. John’s death, and probably of Christian parents, mentions infants among the regenerate, i. e. the baptised, as the word generally signifies in his writings. *Justin Martyr*, about forty years after the time of the apostles, speaks of some who had been made disciples from their infancy. *Tertullian*, about 100 years after the apostles, though he advises parents to defer baptising their children, except when their lives were in danger, speaks of the practice as generally received and observed in his time. *Cyprian*,

about 150 years after the apostles, is allowed by all to speak expressly of infant baptism as generally used in the church; and we learn that, in his time, A. D. 253, a question being agitated among sixty-six bishops in the council of Carthage, whether an infant must be kept till he was eight days old before he be baptised, all unanimously gave their opinion to the contrary. There are also various passages, say these writers, that expressly refer to infant baptism in the works of Origen, who was born of Christian parents; and as his father was martyred in the year 202, when he was seventeen years old, the remoter Christians of his family must have been nearly contemporary with the apostles. Again, in the *apostolic constitutions*, which are allowed to be very ancient, express mention occurs of infant baptism, as commanded by Christ. *Math. xix. 14.* Wall contends that, in the first 400 years after the apostles, there appears to be only one, viz. Tertullian, who, in some cases, advised the delay of infant baptism; and another, viz. Gregory, who practised such delay in the case of his own children: 'but no society of men adopted this opinion, nor did any one person pretend to say it was unlawful to baptise infants: and in the next 700 years there is not so much as one man to be found that either spoke for or practised any such delay; and, if truth were to be determined by numbers, the general and uniform practice of the Christian church is very much in favor of infant baptism.'

'It is of great importance,' says Mr. Burder, 'to understand the nature and value of this species of evidence. If any are disposed to question its validity, let them be reminded that the evidence is precisely of the same character with that by which the authenticity and genuineness of the books of the New Testament have been proved, with so much strength of convincing argument, by Dr. Lardner, Dr. Paley, Dr. Chalmers, and other able and successful advocates of the same class. They have established the authenticity of the books of the New Testament, by proving that they have been quoted or alluded to by a continued series of Christian writers, beginning with those who were contemporary with the Apostles, or who immediately followed them. 'This medium of proof,' observes Dr. Paley, 'is of all others the most unquestionable, and is not diminished by the lapse of ages.' By this species of evidence has been firmly established the fact of the general prevalence of infant baptism in the early ages, and the fact that it was then regarded as a practice derived from Apostolic authority. A full and particular induction of the evidence on this point is obviously incompatible with the narrow limits of a single discourse. Nor is an extended statement on the present occasion requisite. The sources whence it is to be derived are open to the enquirer, and without the necessity of referring to the voluminous writings of the Fathers, ample satisfaction may be obtained by consulting the collection exhibited by the learned and indefatigable Dr. Wall, in his *History of Infant Baptism*. A slight sketch of the mass of evidence is all that I can with propriety attempt.'

The Baptists plead, on the other hand, that in-

fants are incapable of complying with the terms required in order to baptism, i. e. repentance and faith, and of receiving those instructions which Christ directed, as previous to it. *Matt. xxviii. 19*, compared with 1 Peter iii. 21. But the Pædo-baptists, to adopt Dr. Rees's summary of their arguments, reply that those instructions and conditions were required only of those who were capable of them. Besides the word *μαθητευασι*, which some understand of teaching, previous to baptism, may signify make disciples: and that infants may be comprehended under that name, some have argued from *Acts xv. 10*. The word used by Justin Martyr, in the passage above cited, and applied to infants, is *εμαθητευσας*. And it has been farther alleged, that the penmen of Scripture, and other Christian writers, have commonly used the word to signify the reception of any one to the number and degree of disciples, as preparatory to subsequent instruction; so that persons thus received, in order to be taught, were, before the instruction itself denominated disciples. Compare *Luke ix. 57*, and *Matt. viii. 19—21*. Eusebius *Evang. Demost. lib. iii. sect 7*, where he styles those who were desirous of learning of Christ, his disciples.

When it is further objected, that infants are incapable of receiving any benefit from baptism; and that, in this case, the ordinance is exposed to contempt, the Pædo-baptists say that, on the contrary, there are many advantages resulting from baptism administered to infants, both to them and principally to their parents, whose immediate act it is; that an ordinance, as in the case of Christ, who was himself baptised, may sometimes be administered to those who are not capable of all the purposes for which it was originally instituted, and which it may subserve with regard to others; and still farther, that this argument against baptising infants, by proving too much, proves nothing: for if infants are incapable of the ends of baptism, under the Christian dispensation, infants under former dispensations were equally incapable of the ends of circumcision; and, therefore, such an institution was useless and improperly enjoined.

The Pædo-baptists differ from the Baptists also as to the mode of administering the Christian ordinance. The former perform it by sprinkling or pouring on water; the latter by the immersion of the whole body, which they contend to be an essential circumstance, see our article *BAPTISM*. In favor of immersion it is pleaded that the word *βαπτίζω*, being derived from *βαπτω*, properly signifies to plunge: on the other hand it is urged, that in this diminutive and derivative form it may signify any method of washing, and is sometimes used in Scripture for washing things which were not dipped in water, but on which it was poured. Compare *Luke xi. 38*, *Mark vii. 4*, and those passages in which the pouring out of the spirit is called baptism, *Acts i. 5*, ch. xi. 15, 16; to which some add 1 Cor. x. 2.

Another argument in favor of immersion is drawn from the account of Philip and the eunuch, *Acts viii. 38, 39*, who went down (*εε*) into the water; and, after the baptism, they are both said to come up (*εε*) out of the water. But many passages might be cited where *εε* signifies to or

unto, and *ex*, from. Matt. xv. 24, chap. xvii. 27, chap. iii. 11. John ix. 1. 2 Cor. v. 1. Rev. xix. 5. It is farther argued, that plunging alone represents our being buried with Christ in baptism. Compare Rom. vi. 4. Col. ii. 2. The Pædo-baptists, though they allow that there is in these passages an allusion to the mode of baptism which then generally prevailed, maintain that, in the institution of the ordinance, there is no declaration that it was chiefly designed to represent this, and persons were baptised before it was generally known that Christ should die and arise from the dead. Our being cleansed from sin seems to be the thing primarily intended, which may properly be represented by pouring on water; and as this more naturally represents the pouring out of the Spirit, the sprinkling us with it, and the sprinkling of the blood of Jesus, it may answer as valuable purposes as that mode, which, more directly, represents death and a resurrection.

'The position which our Baptist brethren advance and which we dispute is,' says a writer we have already quoted, 'to use the very words of a venerable opponent, "that Baptism is immersion; and that Christian baptism is neither more nor less than an immersion of the whole body in water, solemnly performed in the name of the Father, the Son, and the Holy Spirit." Dr. Ryland's Candid Statement.

'In support of this opinion, they lay great stress on the import of the Greek words employed in the New Testament to express the act of baptising. In reply, we endeavour to prove, by a variety of instances and examples, that these terms do not necessarily and uniformly denote immersion, and that they authorise no decision whatever with regard to the manner in which water should be applied in the administration of baptism.

'Again, our opponents appeal to the descriptions given in the New Testament of the circumstances in which baptism was dispensed. In all the instances which they adduce we can find no proof of even one single case of actual immersion; we can find no description of the performance of the rite, even when a river is specified, which is not explicable on the supposition of the person to be baptised going down from the higher ground to the edge of the water (as the most convenient method under existing circumstances), and having water poured or sprinkled on his head. That this was the ancient method of administering baptism, the learned author of *Facts and Evidences*, already alluded to, has rendered in a high degree probable, by adducing various representations in sculpture and in painting of the mode of baptising which lay claim to remote antiquity. In support of the mode of administration we adopt, we appeal to the analogy between baptism with water, and baptism with the Holy Spirit, whose influences are frequently represented by expressions which denote pouring and sprinkling, and also by allusions to the cleansing properties of water, without reference to any particular mode of its application.

'Finally we urge the characteristic spirit of the Christian economy, and argue that in the absence of direct precept, and of clear and indu-

bitable examples of immersion, it is not to be supposed that immersion can be essential to baptism. On the contrary we maintain, that to attach so much importance to the mode of baptism is uncongenial with the spirit of the Christian dispensation; and that the immersion of the whole person, under the circumstances in which it is usually practised (to say nothing with regard to decorum), seems scarcely compatible with the apostolic assertion, that the commandments of our Saviour are not grievous. Such are the leading considerations which induce us to regard immersion as by no means essential to Christian baptism, and to consider the administration of the ordinance by pouring or sprinkling as equally valid, as decidedly preferable.

PÆDOTRIBA, in antiquity, one of the four officers in the ancient Gymnasium, whose business was to teach the exercises mechanically, without their theory.

PÆONIA, piony, a genus of the digynia order, and polyandria class of plants; natural order twenty-sixth, multisiliquæ: *CAL.* pentaphyllous; the petals five; there are no styles: *CAPS.* are polyspermous: species two, both very hardy, which will flourish in any common soil. They are large and herbaceous flowery perennials, with tuberous roots, sending up strong annual stalks from one to three feet in height; terminated by very large flowers of a beautiful red color, and much larger than any rose.

P. officinalis, the common officinal, or male piony, is remarkable for its capsules turning backward, opening and displaying their red inside, together with the numerous seeds, in a singularly agreeable order, appearing very ornamental after the flower is past. The plants may be propagated either by parting the roots or by seed. This plant was formerly celebrated in nervous distempers.

PÆSTUM, a town of Lucania, on the Sinus Pæstinus; called Posidonia by the Greeks, an ancient colony prior to the first Punic war, according to Livy. The utmost taste for art seems to have reigned in this once famous town, and all which could in those days be imagined of ingenious, of delicate, or voluptuous, was to be found within its walls. The climate conspired to complete the charms and graces of the spot, and during the era of Augustus, Horace, Virgil, Propertius, and Ovid, each vied with the other in singing the praises of

'Pæstum's twice-blowing roses.'

This place is now, and has been for many successive ages, a perfect solitude. Towards the year 930 it was sacked by the Saracens. Still, however, that rude people left standing abundant evidences of its former splendor and magnificence, and it was reserved for Robert Guiscard, nearly two centuries after, to destroy what the barbarians had spared. By the directions of this man, all the ancient edifices were demolished, the temples most of them razed to the ground, and their precious remains, such as beautiful columns of verd antique, &c., transported to Salerno, there to serve towards the construction of a church. From the ashes of the old town, however, arose a new one, which was

denominated Pesti, and which was not finally abandoned until 1580. Since that period the ruins of the ancient city do not appear to have attracted notice until 1745. The first modern author who treated of them was the baron Joseph Antonini, in his work on Lewcania, published at Naples in 1745 and following years.

The first artist who measured and made drawings of them was, according to Millin, J. G. Soufflot, a celebrated architect of his day, who built the basilica of St. Genevieve, afterwards called the Pantheon. 'These drawings,' says Millin, 'although executed in 1750, lay for a long time unused in the artist's portfolio, and were not published until 1764 at Paris, by M. Dumont, professor of architecture.'

The ruins of the ancient town of Pæstum are situated in the gulf of Salerno, twenty-two leagues from Naples, and in a vast and mountainous plain. The precise extent of their antiquity is altogether baffling; in all probability it stretched far beyond the conquest of the town by the Romans.

The circumference of the city, in form an angular oblong, which is contracted towards the west, is enclosed by thick walls, partly ruinous, but still lofty in many places, and their height varying from twelve to twenty-one feet. Substantial square towers flank each angle of the walls, and there are several other intermediate ones between these and the gates. There remained a few years ago one gate (towards the east) quite perfect.

These walls enclose a prodigious multitude of ruins, the principal of which are those of three temples, which were denominated by the discoverers the grand temple, the lesser temple, and the basilica. The latter differs from every other temple in existence, having nine columns in the front, with a central range down the middle of the cell, the use of which appears to have been to support the roof.

PAGAHM, an ancient town of the Birman empire, situated on the east side of the Irawaddy, in lat. 21° 9' N., long. 94° 35' E. In remote times this city, says Mr. Hamilton, was the residence of a long dynasty of kings, and is still famous for its numerous temples, to count which is among the proverbial impossibilities of the Birmans. It is said to have been abandoned 500 years ago in consequence of a divine admonition. Scarcely any thing now remains of ancient Pagahm, except its numerous mouldering temples, and the vestiges of an old brick fort, the ramparts of which are still to be traced. Many of the most ancient temples at this place are not solid at the bottom. A well arched dome supports a ponderous superstructure, within which an image of Gaudma sits enshrined. His general posture is sitting on a pedestal, adorned with representations of the sacred leaf of the lotus—the left hand resting on the lap, and the right pendant. In the bazaar the stalls are well provided with rice, pulse, greens, garlic, onions, and fruit; besides fresh fish, gnapæe (putrid sprats), and dead lizards, which latter the Birmans account a great delicacy when well cooked; but the markets contain no butchers' meat.

PA'GAN, *n. s. & adj.* } Sax. *paganisc*; Lat. PA'GANISM, *n. s.* } *paganus* (*pagus*, a village). A heathen; a worshipper of idols; heathenish: paganism is heathenism.

The name of popery is more odious than very *paganism* amongst divers of the more simple sort.

Hooker.

Their cloaths are after such a *pagan* cut too,
That sure they have worn out Christendom.

Shakespeare.

The secret ceremonies I conceal,
Uncouth, perhaps unlawful to reveal;
But such they were as *pagan* use required.

Dryden.

Our labarum, in a state of *paganism*, you have on
a coin of Tiberius. It stands between two other
ensigns.

Addison.

The Christian faith,

Unlike the timorous creed of *pagan* priests,
Was frank, stood forth to view, invited all.

Pollak.

PAGAN (Blaise Francis, count of), an eminent French mathematician, born at Avignon in Provence, March 3d, 1604. He became a soldier at fourteen, and signalled himself in an extraordinary manner on many occasions. After the loss of his eyesight, which prevented him from continuing to serve his country in the field, he published many valuable treatises chiefly on mathematical subjects. His principal works are, *Geometrical Theorems*, *The Theory of the Planets*, and *Astronomical Tables*. He died in Paris, November 18th, 1665; unmarried.

PAGAN (Peter), professor of history and poetry at Marburg. He wrote a history of the Horatii and Curiatii in Latin verse; and various pieces of miscellaneous poetry. He died at Wanfrid, in Lower Hesse, May 20th, 1576.

PAGANALLA, certain festivals observed by the ancient Romans in the month of January. They were instituted by Servius Tullius, who appointed a certain number of villages (*pagi*), in each of which an altar was to be raised for annual sacrifices to their tutelary gods; at which all the inhabitants were to assist, and give presents in money, according to their sex and age, by which means the number of country people was known. The servants upon this occasion offered cakes to Ceres and Tullus, to obtain plentiful harvests.

PAGANELLUS, a species of gobius.

PAGANICA, a town of Naples, in Abruzzo Ultra; eight miles N.N.W. of Aquila.

PAGE, *n. s. & v. a.* } Fr. *page*; Lat. *pagina*. PAG'INAL, *adj.* } One side of the leaf of a book: to mark the pages of a book: paginal is consisting of pages.

If a man could have opened one of the *pages* of the divine counsel, and seen the event of Joseph's being sold, he might have dried up the young man's tears.

Taylor.

An expression proper unto the *paginal* books of our times, but not so agreeable unto volumes or rolling books, in use among the Jews.

Brown.

Thy name to Phœbus and the muses known,
Shall in the front of every *page* be shown.

Dryden.

A printer divides a book into sheets, the sheets into *pages*, the *pages* into lines, and the lines into letters.

Watts.

PAGE, *n. s. & v. a.*. Fr. and Span. *page*; Ital. *paggio*. An attendant: to attend as a page.

Will these mossed trees,
That have out-lived the eagle, *page* thy heels,
And skip when thou pointest out? *Shakspeare*.
The fair goddess Fortune,
Fall deep in love with thee, and her great charms
Misguide thy opposers' swords!
Prosperity be thy *page*! *Shakspeare. Coriolanus*.
He had two *pages* of honor, on either hand one.

Where is this mankind now? who lives to age
Fit to be made Methusalem his *page*. *Donne*.
This day thou shalt my rural *pages* see,
For I have dressed them both to wait on thee.

Dryden.
Philip of Macedon had a *page* attending in his
chamber, to tell him every morning, Remember, O
king, that thou art mortal. *Wals.*

PAGE (William), D. D., was a native of Harrow, Middlesex, or, according to others, of London, and born in 1590. He was educated at Baliol College, Oxford, but quitted in 1619, on being chosen fellow of All Souls. Ten years after he obtained the head-mastership of Reading grammar-school, and the rectory of East Locking, Berks; but, on the breaking out of the civil war, he was ejected from his school as a loyalist, though the profits of his benefice were not sequestered. He is known as the author of a devotional treatise on Genuflexion, in 4to., printed at Oxford in 1631; a Reply to John Hales's Tract on Schism; and a translation of the De Imitatione, &c. of Thomas à Kempis. He died in 1663.

PAGEANT, *n. s., adj., & v. a.* } Lat. *pag-*
PAGEANTRY, *n. s.* } *ma*; Greek, *παιγμα*. A scenic show; a statue in a show: *pageantry* means, pomp; show.

With ridiculous and awkward action,
Which, slanderer, he imitation calls,
He *pageants* us. *Shakspeare. Troilus and Cressida*.
When all our *pageants* of delight were plaid,
Our youth got me to play the woman's part,
And I was trimmed in madam Julia's gown.

Shakspeare.
Strange and unnatural, let's stay and see
This *pageant* of a prodigy. *Cowley*.
Were she ambitious, she'd disdain to own
The *pageant* pomp of such a servile throne.

Dryden.
Such *pageantry* be to the people shown;
There boast thy horse's trappings and thy own.

Id.
Inconveniences are consequent to dogmatizing,
supporting men in the right; but, if they be in the
wrong, what a ridiculous *pageantry* it is to see such
a philosophical gravity set man out a solecism!

Government of the Tongue.
The poets contrived the following *pageant* or machine for the pope's entertainment; a huge floating mountain that was split in the top in imitation of Parnassus. *Addison*.

The breath of others raises our renown,
Our own as soon blows the *pageant* down. *Young*.
Thus unlamented pass the proud away,
The gaze of fools, and *pageant* of a day. *Pope*.

PAGES (Francis Xavier), a French compiler and romance-writer, was born at Aurillac, in the department of Cantal, in 1745, and settled at Paris a short time before the beginning of the Revolution, of which he professed himself an

admirer. He died at Paris, December 21st, 1802. Among his works may be mentioned, *Histoire Secrete de la Révolution Française*, 1796-1801, 6 vols. 8vo., which was translated into English, Italian, and German; and *Nouveau Voyage autour du Monde, en Asie, en Amérique, et en Afrique, précédé d'un Voyage en Italie*, 1797, 3 vols. 8vo.

PAGES (Pierre Marie François, vicomte de), a French navigator, of a noble family, was born at Toulouse in 1748. He entered into the navy at the age of nineteen, and, in 1767, embarked at Cape François in St. Domingo, on a voyage with a view to explore the Indian Seas, and travel through China and Tartary to the Northern Ocean. He arrived at the Philippine Islands in October 1768, and, it being impossible to penetrate China, went by sea to Bassora, and, travelling through the desert to Syria, reached France in December 1771. In 1773 he sailed in Kerguelin's expedition towards the South Pole; and on his return made a voyage in a Dutch vessel employed in the whale fishery in the North Seas, when he proceeded as far as 81° 30' N. lat. Pages obtained, as the reward of his services, the rank of captain, and the cross of St. Louis, and was chosen a correspondent of the Academy of Sciences. He served in the American war, and after the peace of 1783 retired to St. Domingo, where he was murdered by the negroes in 1793. He published a work which Humboldt mentions with approbation, *Voyages autour du Monde*, 1767-1776, 2 vols. 8vo.

PAGI (Anthony), a very celebrated cordelier, one of the ablest critics of his time, born at Rogne in Provence, in 1624. He took the habit in the convent at Arles, in 1641, and was four times provincial of his order; he died in 1699. His most considerable work is, *A Critique upon the Annals of Baronius*; the best edition of which is that in 4 vols. folio, Geneva, 1705.

PAGI (Francis), nephew of Anthony, and a member of the same order, wrote *A Chronological Abridgment of the History of the Popes*, in Latin, 3 vols. 4to.

PAGNINUS (Sanctes), an Italian Dominican, eminent for his skill in oriental languages and biblical learning, was born at Lucca in 1466, and became afterwards an ecclesiastic of the order of St. Dominic. He was the author of translations of both the Old and New Testaments, of an Hebrew Lexicon, and an Hebrew Grammar. He died in 1536, aged seventy.

PAGO, a small island of the gulf of Quarnero, in the Adriatic, belonging to the circle or district of Zara, in Austrian Dalmatia. It is situated opposite to the coast of Croatia, and is thirty-four miles in length, but narrow; and a great part of the interior is occupied by an inlet of the sea. Its area is about fifty square miles; its population 4000. In the climate the extremes of heat and cold predominate, the island being exposed in winter to the bora, a keen and piercing wind from Croatia, while in the summer the heat is such as to ripen grapes. The chief exports are wine and salt. Sage, aromatic herbs, and coal, are abundant. The inhabitants have been alternately subject to the Venetians, and to

their neighbours on the Greek coast. Pago, the chief place of the island, is situated on a bay in the interior, twenty-two miles north-west of Zara, and contains 1000 inhabitants.

PA'GOD, *n. s.* Pers. and Hind. *boit, khoda*, or *kuda*, i. e. the house of God. An Indian temple or idol.

See thronging millions to the *Pagod* run,
And offer country, parent, wife, or son. *Pope*.
They worship idols called *pagods*, after such a terrible representation as we make of devils.

Stillingfleet.

PAGOD, or PAODA, a name whereby the East Indians call the temple in which they worship their gods. Before they build a pagod they consecrate the ground as follows:—after having enclosed it with boards or palisades, when the grass is grown on the ground they turn an ash-colored cow into it, who stays there a whole day and night; and, as cow-dung is thought by the Indians to be of a very sacred nature, they search for this sacred deposit, and, having found it, they dig there a deep pit, into which they put a marble pillar, rising considerably above the surface of the earth. On this pillar they place the image of the god to whom the pagod is to be consecrated. After this the pagod is built round the pit in which the pillar is fixed. The pagod usually consists of three parts: the first is a vaulted roof supported on stone or marble columns. It is adorned with images, and, being open, all persons, without distinction, are allowed to enter it: the second part is filled with grotesque and monstrous figures, and nobody is allowed to enter it but the brahmins themselves: the third is a kind of chancel, in which the statue of the deity is placed: it is shut up with a very strong gate.

We cannot afford room to go into detail on the several pagodas of different nations and their peculiar circumstances; and shall therefore content ourselves with offering the reader some account of the most interesting structures of this class in existence. An excellent account of the sculptures, &c., at Mavalipuram, a few miles north of Sadras, and known to seamen by the name of the seven pagodas, is given in the *Asiatic Researches*. The monuments appear to be the ruins of some great city decayed many centuries ago. 'They are situated close to the sea, between Covelong and Sadras, somewhat remote from the high road that leads to the different European settlements; and, when visited in 1776, there was still a native village adjoining to them, which retained the ancient name, and in which a number of brahmins resided that seemed perfectly well acquainted with the subjects of most of the sculptures to be seen there.' 'Proceeding on, by the foot of a hill on the side facing the sea, there is a pagoda rising out of the ground, of one solid stone, about sixteen or eighteen feet high, which seems to have been cut upon the spot, out of a detached rock that has been found of a proper size for that purpose. The top is arched, and the style of architecture, according to which it is formed, different from any now used in those parts.' Beyond this a numerous group of human figures in bas relief, considerably larger than life, attract attention.

They represent considerable persons, and their exploits, many of which are now very indistinct through the injuries of time, assisted by the corroding nature of the sea air; while others, protected from that element, are as fresh as when recently finished. The hill, which is at first or easy ascent, 'is in other parts rendered more so by very excellent steps cut out in several places, where the communication would be difficult or impracticable without them. A winding stair of this sort leads to a kind of temple cut out of the solid rock, with some figures of idols in high relief upon its walls, very well finished and perfectly fresh, as it faces the west, and is therefore sheltered from the sea air.' This temple our author conjectures to have been a place of worship appertaining to a palace; some remains of which still exist, and to which there is a passage from the temple by another flight of steps. This finishes the objects 'on that part of the upper surface of the hill, the ascent to which is on the north; but, descending thence, you are led round the hill to the opposite side, in which there are steps cut from the bottom to a place near the summit, where is an excavation that seems to have been intended for a place of worship, and contains various sculptures of Hindoo deities. The most remarkable of these is a gigantic figure of Vishnou (see POLYTHEISM) asleep on a kind of bed, with a huge snake wound about in many coils by way of pillow for his head; and these figures, according to the manner of this place, are all of one piece, hewn from the body of the rock.' These works, however, although they are unquestionably stupendous, are, in our author's opinion, surpassed by others about a mile and a half south of the hill. 'They consist of two pagodas of about thirty feet long by twenty feet wide, and about as many in height, cut out of the solid rock, and each consisting originally of one single stone. Near these also stand an elephant full as big as life, and a lion much larger than the natural size, but very well executed, each hewn also out of one stone. The great rock above described is at some distance from the sea, perhaps fifty or 100 yards, and in that space the Hindoo village before mentioned stood in 1776. But close to the sea are the remains of a pagoda built of brick, and dedicated to Sib, the greatest part of which has evidently been swallowed up by that element; for the door of the innermost apartment, in which the idol is placed, and before which there are always two or three spacious courts surrounded with walls, is now washed by the waves, and the pillar used to discover the meridian at the time of founding the pagoda is seen standing at some distance in the sea. In the neighbourhood of this building there are some detached rocks, washed also by the waves, on which there appear sculptures, though now much worn and defaced. And the natives declared to the writer of this account, that the more aged people among them remembered to have seen the tops of several pagodas far out in the sea, which, being covered with copper (probably gilt), were particularly visible at sun-rise, as their shining surface used then to reflect the sun's rays; but that now that effect was no longer produced, as the copper had since be-

come incruusted with mould and verdigris. From these circumstances it is probable that the magnificent city, of which these appear to be part of the ruins, has been destroyed partly by an earthquake, by which the rock was rent, and partly by a sudden inundation of the sea occasioned by this commotion of the earth.

PAGODA, or PAGOD, is also the name of a gold and silver coin, current in several parts of the East Indies.

PAIL, *n. s.* } Span. *paila*; Ital. *pacol*; Lat. *PAULFUL*. } *patella*. A wooden vessel to carry water or milk.

Yon same cloud cannot chuse but fall by *pailfuls*. *Shakespeare.*

In the country, when wool is new shorn, they set *pails* of water in the same room, to increase the weight. *Bacon.*

New milk that all the winter never falls, And all the summer overflows the *pails*. *Dryden.*

PAILMALL, *n. s.* The same with pall mall, a beater or mall to strike the ball. Violent; boisterous.

A stroke with a *pailmail* beetle upon a bowl makes it fly from it. *Digby on the Soul.*

PAIMBEUF, an important, though small, post-town and sea-port, the chief place of a sub-prefecture in the department of the Lower Loire, France, containing about 4000 inhabitants, with an inferior court of justice, a drawing school, a maritime syndicate, an agricultural society, and a communal college. This town, which is situated in a marshy country, on the left bank of the Loire, at the commencement of the eighteenth century was only a hamlet, inhabited by a few fishermen; its situation at the mouth of a great river, its port, where the largest vessels can anchor, and its proximity to Nantes, have rendered it a very important place. It consists of one well-built street, on a long quay, on which vessels disembark their cargoes, that are then conveyed in lighters as far as Nantes; here also they receive their cargoes on putting out to sea. Here are manufactories of bricks and tiles, and docks for the building and refitting of ships. The trade of the place consists chiefly in grain. It is thirty miles W. N. W. of Nantes, fifteen south of Pornie, twenty-seven south of Bourgneuf, and 315 south-west of Paris.

PAIN, *n. s.* & *v. a.* } Sax. *pin*; Fr. *peine*; *PAINFUL*, } Lat. *pena*. Punish- *PAINFULLY*, *adv.* } ment denounced; pe- *PAINFULNESS*, *n. s.* } nalty; sensation of un- *PAINLESS*, *adj.* } easiness or anguish: in *PAINSTAKER*, *n. s.* } the plural, labor; work; *PAINSTAKING*, *adj.* } toil: to afflict; torment; make uneasy or anxious: with the reciprocal pronoun (little used), to labor: the adjective, adverb, and substantive follow these senses: painless is free from, or void of pain: pains-taking, laborious; industrious.

I am *pained* at my very heart, because thou hast heard, O my soul, the sound of the trumpet. *Jeremiah iv. 19.*

She bowed herself and travelled; for her *pains* came upon her. *1 Samuel iv. 19.*

One labourer and taketh *pains*, maketh haste, and is so much the more behind. *Ecclesi. xi. 11.*

When I thought to know this, it was too *painful* for me. *Psalms lxxiii. 16.*

T'one *pains* in a cottage dothe take, When t'other trim bowers do make. *Tamer.*
Though the lord of the liberty do *pain* himself to yield equal justice unto all, yet can there not but great abuses lurk in so absolute a privilege. *Spenser.*

He soft arrived on the grassy plain, And fairly paced forth with easy *pain*. *Id.*
Painfulness by feeble means shall be able to gain that which in the plenty of more forcible instruments is through sloth and negligence lost. *Hooker.*

Many have taken the *pains* to go out of Europe to reside as friars in America. *Abbot.*

The *painful* service, The extreme dangers, and the drops of blood Shed for my thankless country, are required But with that surname. *Shakespeare. Coriolanus.*

On *pain* of death no person being so bold, Or daring hardy, as to touch the list. *Shakespeare.*
Such as sit in ease at home raise a benefit out of their hunger and thirst, that serve their prince and country *painfully* abroad. *Raleigh's Essays.*

Because Eusebius hath yet said nothing, we will, by way of mulct or *pain*, lay it upon him. *Bacon.*

As the *pains* of the touch are greater than the offences of the other senses; so likewise are the pleasures. *Id.*

There the princesses determining to bathe themselves, thought it was so privileged a place, upon *pain* of death, as nobody durst presume to come thither. *Sidney.*

With diamond in window-glass she graved, Erone die, and end this ugly *painfulness*. *Id.*

When of the dew, which the eye and ear do take, From flow'rs abroad and bring into the brain, She doth within both wax and honey make; This work is hers, this is her proper *pain*. *Davies.*

Robin red-breast *painfully* Did cover them with leaves.

Children in the Wood.
The *pains* they have taken was very great. *Clarendon.*

Pain is perfect misery, the worst Of evils; and, excessive, overturns All patience. *Milton's Paradise Lost.*

Is there yet no other way, besides These *painful* passages, how we may come To death? *Id.*

When a lion shakes his dreadful mane And angry grows, if he that first took *pain* To tame his youth, approach the haughty beast, He bends to him, but frights away the rest. *Waller.*
If health be such a blessing, it may be worth the *pains* to discover the regions where it grows, and the sorings that feed it. *Temple.*

The deaf person must be discreetly treated, and by pleasant usage wrought upon to take some *pains* at it, watching your seasons and taking great care, that he may not hate his task, but do it cheerfully. *Holder.*

They called him a thousand fools for his *pains*. *L'Estrange.*

If the church were once thus settled, we need then be in less *pain* for the religion of our prince. *Lesley.*

He *pained* himself to raise his note. *Dryden.*

He would believe, but yet is still in *pain*; Presses the pulse, and feels the leaping vein. *Id.*
Her nimble feet refuse

Her wonted speed, and she took *pains* to lose. *Id.*

Surat he took, and thence preventing fame, By quick and *painful* marches hither came. *Id.*

To dress the vines new labour is required,
Nor must the *painful* husbandman be tired. *Id.*

Interpose, on *pain* of my displeasure,
Betwixt their swords. *Id. Don Sebastian.*

If philosophy be uncertain, the former will conclude it vain; and the latter may be in danger of pronouncing the same on their *pains*, who seek it, if after all their labour they must reap the wind, mere opinion and conjecture. *Glanceville.*

Excess of cold, as well as heat, *pains* us, because it is equally destructive to that temper which is necessary to the preservation of life. *Locks.*

No custom can make the *painfulness* of a debauch easy or pleasing to a man; since nothing can be pleasant that is unnatural. *South.*

Pleasure arose in those very parts of his leg, that just before had been so much *pained* by the fetter. *Addison.*

None shall presume to fly under *pain* of death, with wings of any other man's making. *Id.*

Evils have been more *painful* to us in the prospect, than by their actual pressure. *Id.*

I'll prove a true *painstaker* day and night,
I'll spin and card, and keep our children tight. *Gay.*

It bid her feel

No future *pain* for me; but instant wed

A lover more proportioned to her bed. *Prior.*

What *pain* do you think a man must feel, when his conscience lays this folly to his charge? *Law.*

The same with *pains* we gain, but lose with ease,
Sure some to vex, but never all to please. *Pope.*

Long abstinence may be *painful* to acid constitutions, by the uneasy sensation it creates in the stomach. *Arbuthnot.*

A reasonable clergyman, if he will be at the *pains*, can make the most ignorant man comprehend what is his duty, and convince him that he ought to perform it. *Swift.*

Great abilities, when employed as God directs, do but make the owners of them greater and more *painful* servants to their neighbours: however they are real blessings when in the hands of good men. *Swift.*

PAINE (Thomas), a celebrated deist and political demagogue of the American and French Revolutions, was born at Thetford, in Norfolk, in 1737, where his father carried on the business of a staymaker. All sects have had their dis-graceful members and offspring. Paine's father, a peaceful and industrious Quaker, connects him with the exemplary sect of the Friends. He received his education at the grammar-school of his native place, but attained to little beyond the rudiments of Latin; but he seems to have paid considerable attention to arithmetic, and to have evinced an early predilection for the mathematics. His first application to business was in the trade of his father, which he followed in London, Dover, and Sandwich, where he married. Afterwards he became a grocer and excise-man at Lewes in Sussex. This situation he lost for some misdemeanor, but was subsequently restored on petition, until finally dismissed for keeping a tobacconist's shop, which was thought to interfere with his official duties. After this, however, so well were the public authorities of his native country disposed to serve him, that one of the commissioners of excise gave him a letter of recommendation to Dr. Franklin, then a colonial agent in London, who recommended him to go to America. At this period

VOL. XVI.

he had first exercised his talents as a writer, by drawing up a pamphlet, recommending the advance of the salaries of excisemen.

His age at this time was thirty-seven. His first engagement in Philadelphia was with Mr. Aitkin, a respectable bookseller, who, in January 1775, commenced the Pennsylvania Magazine, the editorship of which work became the business of Mr. Paine, for which he had a salary of £50 currency a year. According to Mr. Cheetham, this work was well supported by him, and it was here that he published his song upon general Wolfe, which by his biographer is called beautiful; but taste either in prose or poetry does not appear to us to be among Mr. Cheetham's biographical qualifications.—When Dr. Rush of Philadelphia suggested to Paine the propriety of preparing the Americans for a separation from Great Britain, it seems that he seized with avidity the idea, and immediately commenced his famous pamphlet on that measure, which being shown in MS. to Drs. Franklin and Rush, and Mr. S. Adams, was, after some discussion, entitled, at the suggestion of Dr. Rush, Common Sense.

For this production the legislation of Pennsylvania voted him £500.; he also received the degree of M. A. from the university of the same province, and was chosen a member of the American Philosophical Society. We hope the literary honors were communicated in a tongue which he could read; as his mortal aversion to learned languages is well known. To these rewards was soon afterwards added the office of clerk to the committee for foreign affairs, which, although a confidential situation, scarcely justified him, says one of his friendly biographers, in assuming the title of 'late secretary for foreign affairs,' which he did in the title-page of the Rights of Man.

'Bitterly,' says Mr. Cheetham, 'as he pretended to be opposed to titles, when grasping the pillars of the British government he endeavoured to subvert it, he was yet so fond of them, in reality, that he not only assumed to himself a title to which he had no claim, but he seems to have gloried in the fraudulent assumption. In his title-page of his Rights of Man, he styles himself 'Secretary for Foreign Affairs to the congress of the United States, in the late war.' The foreign affairs of the United States were conducted by a committee, or board, of which he was secretary, or clerk; clerk more properly, at a very low salary. His business was merely to copy papers, number and file them, and, generally, to do the duty of what is now called a clerk in the foreign department; he was, however, determined to give himself a higher title. Unsubstantial in essence as superadditions to names are, he nevertheless liked them, and seemed to be aware that, universally, they possess a charm to which he was by no means insensible. From this, and many other circumstances, we may infer that his objections to being himself a lord of the bedchamber, or a groom of the stole, a master of the hounds, or a gentleman in waiting, would not have been stronger than were his wishes to be retained in the excise.'

While in this office, he published a series of

2 F

appeals on the nature of the pending struggle between the colonies and Great Britain, which he denominated the Crisis. In 1779 he was obliged to resign his secretaryship, owing to a controversy with Mr. Silas Deane, whom he detected in a fraudulent attempt to profit by conveying the secret supplies of warlike stores from France. Paine divulged the real state of the case, which was deemed an injurious breach of trust, and one which might alienate the French court from its creditable services to the new republic. The next year, however, he obtained the subordinate appointment of clerk to the assembly of Pennsylvania; and in 1785, on the rejection of a motion to appoint him historiographer to the United States, received from congress a donation of 3000 dollars, and 500 acres of highly cultivated land from the state of New York. In 1787 he embarked for France, with a letter of recommendation from Dr. Franklin to the Duke de la Rochefoucault, in which he calls him 'an ingenious honest man, the author of a famous piece entitled *Common Sense*.' From Paris he returned to England, with a view to the prosecution of a project relative to the erection of an iron bridge, of his invention, at Rotherham, in Yorkshire, and which was in fact the first bridge of this kind suggested in modern times. See *IRON BRIDGES*. In the course of the following year he was arrested for debt, when he was bailed by some American merchants, and went to Paris in 1791 to publish, under the name of Achilles Duchatelliet, a tract recommending the abolition of royalty. On returning to this country, he wrote the first part of his *Rights of Man*, in answer to Mr. Burke's *Reflections on the French Revolution*. The second part was published early in 1792; and, on the 21st of May that year, a proclamation was issued against wicked and seditious publications, alluding to, but not naming, our author's productions. On the same day the attorney-general commenced a prosecution against him.

On these circumstances his American biographer remarks:—'Whatever party and passion, prejudice and malignity, ignorance and injustice, may roundly assert, Paine experienced from the British government a mildness, a forbearance, which no man urging amongst us, in the boldest language of sedition, a dissolution of the union, a destruction of the national government, and a consequent civil war, could expect from the government of the United States. The first part of the *Rights of Man*, not a jot less intemperate and rebellious than the second, was published not only with impunity, but without notice from the government. I do not mention the fact in commendation; Paine ought to have been punished. Alarm, if the government was alarmed, was a poor apology. When did fear beget respect? When did imbecility avert danger?' (p. 124.)

'The king's proclamation was an act of graciousness. The work was clearly seditious in the malice of intention, as well as in the criminality of object. As thousands of persons besides the booksellers had industriously published it, the law, if the administrators of it had been vindictively inclined, had full scope for operation. The proclamation notified to the kingdom

the diabolical intentions of the author, the tendency of his demoralising work, and the penalties which all publishers of it incurred of those admirable laws, not which were made for the case, but of those ancient and free laws which the United States have adopted for the government of the press. It was therefore preventive, not retributive justice.' (p. 156.)

We continue our memoir, in the language of Mr. Cheetham, to the close of his connexion with this country:—'Loyal associations now sprung up to counteract the revolutionary efforts of the revolution clubs. Passion met passion, until, in the struggle, on the one side for a dissolution of the government, on the other for its existence, the nation became more and more agitated. In this state of things, Paine published, about August 1792, his *Address to the Addressors*. This is a miserable lampoon on the orators in parliament who had spoken on the side of the king's proclamation, as well as on those placemen into whose offices Paine would willingly have crept, before he left England, in the year 1774. He states that a prosecution had been commenced against him; declares the incompetency of a jury to decide on work so recondite and important as the *Rights of Man*; talks quite philosophically upon the propriety of taking the sense of the nation upon it, by polling each man; pronounces the laws in relation to the press as fundamentally bad, the administration of them by the courts as notoriously corrupt, and denies that the *Rights of Man* is seditious, for that 'it contains a plan for augmenting the pay of the soldiers, and meliorating the condition of the poor!' While he was preparing this stuff for the press, he published letters to the chairmen of several of the meetings, which were conveyed to compliment the king on his proclamation. He was now evidently awed by the vigor of the government, and the patriotic spirit of the nation. All over England he was carried about in effigy, with a pair of stays under his arm; and the populace, staymakers and all, alternately laughed and swore at the impudent attempts of a staymaker to destroy their government. His trial was to come on in the following December. Whilst he foresaw, and no doubt dreaded, the imprisonment which awaited him, a French deputation announced to him in London, in the preceding September, that the department of Calais had elected him a member of the national convention. This was doubly grateful, grateful in the escape which it afforded him from a just punishment, without the imputation of cowardice; grateful in the honor which bloody anarchists had conferred upon him by electing him a member of their order. Without delay he proceeded to Dover, where a custom-house officer examined his baggage, and finally let him pass. He had not, however, sailed from Dover for Calais more than twenty minutes, when an order was received from the government to detain him. He states his detention and examination at Dover, in a letter to Mr. Dundas, dated Calais, September 15th, 1792.' (p. 160.)

He arrived in this month at Paris and was an advocate in the convention for the trial of Louis XVI.; but he voted against the sentence of

death passed on him, proposing his imprisonment during the war, and his subsequent banishment. This conduct, however, offended the Jacobins, and, towards the close of 1793, he was excluded from the convention on the ground of his being a foreigner (though he had been naturalised), arrested, and committed to the prison of the Luxembourg. Just before his confinement he had finished the first part of his *Age of Reason*, being an investigation of true and fabulous theology; and, having confided it to the care of his friend Joel Barlow, it was published. He was now taken ill, to which circumstance he ascribes his escape from the guillotine; and on the fall of Robespierre was released. In 1795 he published, at Paris, the second part of his *Age of Reason*, and in May, 1796 addressed to the Council of Five Hundred, *The Decline and Fall of the System of Finance in England*; and published his pamphlet entitled *Agrarian Justice*. He remained in France till August, 1802, when he embarked for America. Paine had at this time lost his wife (the year following his marriage), and, after a cohabitation of three years and a half, had separated from a second several years before by mutual consent.

Among his other lucubrations in France we find the following sage eulogy on the number fixed upon to constitute the directory: 'After preferring a plural to an individual executive, the next question is,' he observes, 'What shall be the number of the plurality?' And here we request the grave attention of some of our most accurate calculators of the class of reformists.

'Three are too few, either for the variety or the quantity of business. The constitution has adopted five, and experience has shown that this number of directors is sufficient for all the purposes, and therefore a greater number would only be an unnecessary expense. The number which France had hit upon (and which I agree with him,' says Mr. Cheetham, 'is quite sufficient), he seems to think, designed by nature for all governments, although human wisdom, in no part of the world, except in France, has as yet adopted it. Nature,' he says, 'has given us exactly five senses, and the same number of fingers and toes; pointing out to us, by this kindness, the propriety of an executive directory of five, precisely as in France. If one sense,' he continues, 'had been sufficient, she would have given us no more; an individual executive,' he therefore infers, 'is unnatural and unphilosophical, individuality being exploded by nature.' Surely tyranny never had a more fawning parasite, freedom a more decided enemy,' p. 219.

This writer, 'supposing him (Paine) to be a gentleman,' was employed to engage a room for him at Lovett's hotel, New York. 'On his arrival' (in 1802), he says, 'about ten at night he wrote me a note desiring to see me immediately. I waited on him at Lovett's, in company with Mr. George Clinton, jun. We rapped at the door; a small figure opened it within, meanly dressed, having on an old top coat, without an under one; a dirty silk handkerchief loosely thrown round his neck; a long beard of more than a week's growth; a face well carbuncled,

fiery as the setting sun, and the whole figure staggering under a load of inebriation. I was on the point of enquiring for Mr. Paine, when I saw in his countenance something of the portraits I had seen of him. We were desirous to be seated. He had before him a small round table, on which were a beef-steak, some beer, a pint of brandy, a pitcher of water, and a glass. He sat eating, drinking, and talking, with as much composure as if he had lived with us all his life. I soon perceived that he had a very retentive memory, and was full of anecdote. The bishop of Landaff was almost the first word he uttered, and it was followed by informing us that he had in his trunk a manuscript reply to the bishop's Apology. He then, calmly mumbling his steak, and ever and anon drinking his brandy and beer, repeated the introduction to his reply, which occupied him nearly half an hour. This was done with deliberation, the utmost clearness, and a perfect apprehension, intoxicated as he was, of all that he repeated. Scarcely a word would he allow us to speak. He always, I afterwards found, in all companies, drunk or sober, would be listened to: in this regard there were no *rights of men* with him, no equality, no reciprocal immunities and obligations, for he would listen to no one.'

On the 13th of October 1802 he arrived at Baltimore, under the protection of Mr. Jefferson. But it appears that curiosity induced nobody of distinction to suffer his approach. While at his hotel he was principally visited by the lower class of emigrants from England, Scotland, and Ireland, who had there admired his *Rights of Man*. With them it appears 'he drank grog in the tap-room morning, noon, and night, admired and praised, strutting and staggering about, showing himself to all, and shaking hands with all. The leaders of the party to which he had attached himself paid him no attention.' He had brought to America with him a woman, named Madame Bonneville, whom he had seduced away from her husband, with her two sons; and whom he seems to have treated with the utmost meanness and tyranny. Mr. Cheetham gives the following account of his manner of living at this time:—

'In the spring of 1804 he returned to his farm at New Rochelle, Purdy having left it, taking with him the two Bonneville's, and leaving their mother in the city. Not chosing to live upon the farm himself, he hired one Christopher Derick, an old man, to work it for him. While Derick was husbanding the farm, Paine and the two young Bonneville's boarded sometimes with Mr. Wilburn, in Gold-street, in the city, but principally with Mr. Andrew Dean, at New Rochelle. Mrs. Dean, with whom I have conversed, tells me that he was daily drunk at their house, and that in his few sober moments he was always quarrelling with her, and disturbing the peace of the family. She represents him as deliberately and disgustingly filthy. It is not surprising, therefore, that she importuned her husband to turn him out of the house; but owing to Mr. Dean's predilection for his political writings, her importunities were, for several weeks, unavailing. Constant domestic disquiet very

naturally ensued, which was increased by Paine's peevishness and violence. One day he ran after Miss Dean, a girl of fifteen, with a chair whip in his hand, to whip her, and would have done so but for the interposition of her mother. The enraged Mrs. Dean, to use her own language, 'flew at him.' Paine retreated up stairs into his private room, and was swiftly pursued by his antagonist. The little drunken old man owed his safety to the bolts of his door. In the fall of the year Mrs. Dean prevailed with her husband to keep him in the house no longer. The two Bonnevilles were quite neglected. From Dean's he went to live on his farm. Here one of his first acts was to discharge old Derick, with whom he had wrangled, and to whom he had been a tyrant from the moment of their engagement. Derick left him with revengeful thoughts.

'Being now alone, except in the company of the two Bonnevilles, of whom he took but little notice, he engaged an old black woman of the name of Betty to do his housework. Betty lived with him but three weeks. She seems to have been as intemperate as himself. Like her master she was every day intoxicated. Paine would accuse her of stealing his New England rum, and Betty would retort by calling him an old drunkard. Often, Mrs. Dean informs me, would they both lie prostrate on the same floor, dead-drunk, sprawling and swearing and threatening to fight, but incapable of approaching each other to combat. Nothing but inability prevented a battle.' p. 241.

We must not withhold from our readers part of a letter written to Paine from an illiterate brother democrat and infidel, after a sordid quarrel which had taken place between them:—

'From the first time I saw you in this country, to the last time of your departure from my house, my conscience bears me testimony that I treated you as a friend and a brother, without any hope of extra rewards, only the payment of my just demand. I often told many of my friends, had you come to this country without one cent. of property, then, as long as I had one shilling, you should have a part. I declare when I first saw you here I knew nothing of your possessions, or that you were worth £400 per year, sterling. I, Sir, am not like yourself. I do not bow down to a little paltry gold at the sacrifice of just principles. I, Sir, am poor, with an independent mind, which perhaps renders me more comfort than your independent fortune renders you. You tell me further that I shall be excluded from any thing, and every thing, contained in your will. All this I totally disregard. I believe, if it was in your power, you would go further, and say you would prevent my obtaining the just and lawful debt that you contracted with me; for when a man is vile enough to deny a debt, he is not honest enough to pay without being compelled. I have lived fifty years on the bounty and good providence of my Creator, and I do not doubt the goodness of his will concerning me. I likewise have to inform you that I totally disregard the powers of your mind and pen; for should you, by your conduct, permit this letter to appear in public, in vain may you attempt to print or publish any thing afterwards. Do look back to my

past conduct respecting you, and try if you cannot raise one grain of gratitude in your heart towards me for all the kind acts of benevolence I bestowed on you. I showed your letter, at the time I received it, to an intelligent friend; he said it was a characteristic of the vileness of your natural disposition, and enough to damn the reputation of any man. You tell me that I should have come to you, and not written the letter. I did so three times; and the last you gave me the ten dollars, and told me you were going to have a stove in a separate room, and then you would pay me. One month had passed and I wanted the money, but still found you with the family that you resided with; and delicacy prevented me to ask you for pay of board and lodging; you never told me to fetch the account, as you say you did. When I called the last time but one, you told me to come on the Sunday following, and you would pay or settle with me; I came according to order, but found you particularly engaged with the French woman and her two boys, &c.

'You frequently boast of what you have done for the woman above alluded to; that she and her family have cost you 2000 dollars; and since you came the last time to York you have been bountiful to her, and given her 100 dollars per time. This may be all right. She may have rendered you former and present secret services, such as are not in my power to perform; but at the same time I think it would be just in you to pay your debts. I know that the poor black woman, at New Rochelle, that you hired as a servant, and I believe paid every attention to you in her power, had to sue you for her wages before you would pay her, and Mr. Shute had to become security for you.

'A respectable gentleman from New Rochelle called to see me a few days past, and said that every body was tired of you there, and no one would undertake to board and lodge you. I thought this was the case, as I found you at a tavern, in a most miserable situation. You appeared as if you had not been shaved for a fortnight, and as to a shirt it could not be said that you had one on; it was only the remains of one, and this likewise appeared not to have been off your back for a fortnight, and was nearly the color of tanned leather, and you had the most disagreeable smell possible; just like that of our poor beggars in England. Do you not recollect the pains I took to clean and wash you? That I got a tub of warm water and soap, and washed from head to foot, and this I had to do three times before I could get you clean. I likewise shaved you and cut your nails, that were like birds' claws. I remember a remark that I made to you at that time, which was, that you put me in mind of Nebuchadnezzar, who was said to be in this situation. Many of your toenails exceeded half an inch in length, and others had grown round your toes, and nearly as far under as they extended on the top. Have you forgotten the pains I took with you when you lay sick wallowing in your own filth? I remember that I got Mr. Hooton (a friend of mine, and whom I believe to be one of the best hearted men in the world) to assist me in removing and

cleaning you. He told me he wondered how I could not it; for his part he would not like to do the same again for ten dollars. I told him you were a fellow being, and that it was our duty to assist each other in distress. Have you forgotten my care of you during the winter you staid with me? How I put you in bed every night, with a warm brick to your feet, and treated you like an infant one month old? Have you forgotten likewise how you destroyed my bed and bedding by fire, and also a great coat that was worth ten dollars?

'I remember, during one of your stays at my house, you were sued in the justice's court by a poor man, for the board and lodging of the French woman, to the amount of about thirty dollars; but as the man had no proof, and only depended on your word, he was non-suited, and a cost of forty-two shillings thrown upon him. This highly gratified your unfeeling heart. I believe you had promised payment, as you said you would give the French woman the money to go and pay it with. I know it is customary in England that when any gentleman keeps a lady, that he pays her board and lodging. You complain that you suffered with the cold, and that there ought to have been a fire in the parlour. But the fact is, that I expended so much money on your account, and received so little, that I could not go to any further expense, and if I had I should not have got you away. A friend of yours that knew my situation told you that you ought to buy a load of wood to burn in the parlour; your answer was that you should not stay above a week or two, and did not want to have the wood to remove; this certainly would have been a hard case for you to have left me a few sticks of wood.

'Now, Sir, I think I have drawn a complete portrait of your character; yet to enter upon every minutia would be to give a history of your life, and to develop the fallacious mask of hypocrisy and deception under which you have acted in your political as well as moral capacity of life. There may be many grammatical errors in this letter. To you I have no apologies to make; but I hope the candid and impartial public will not view them 'with a critic's eye.'

'WILLIAM CARVER.'

'Thomas Paine, New York, Dec. 2, 1806.'

'He lived at Ryder's until 4th of May, 1809, about eleven months; during which time, except the last ten weeks, he got drunk regularly twice a day. As to his person, said Mr. Ryder, we had to wash him like a child, and with much the same coaxing; for he hated soap and water. He would have the best of meat cooked for him, eat a little of it, and throw away the rest, that he might have the worth of the money which he paid for his board. He chose to perform all the functions of nature in bed.—When censured for it he would say, 'I pay you money enough, and you shall labor for it.'

'He returned,' says Mr. Cheetham, 'to his farm at New Rochelle, taking with him Madame Bonneville and her sons. On his arrival he hired Rachel Gidney, a black woman, to cook for him. Rachel continued with him about two

months. But as he never thought of paying for services, or for meat, or for any thing else, Rachel had to sue him for five dollars, the amount of her wages. She got out a warrant, on which he was apprehended, and Mr. Shute, one of his neighbours and political admirers, was his bail. The wages were finally obtained, but he thought it hard that he should be sued in a country for which he had done so much!'

It is now time to bring this article to a close. We will conclude it with a passage from a letter written by Dr. Manley, who attended this extraordinary person in his last illness, in answer to enquiries from Mr. Cheetham:—

'During the latter part of his life, though his conversation was equivocal, his conduct was singular. He would not be left alone night or day. He not only required to have some person with him, but he must see that he or she was there, and would not allow his curtain to be closed at any time; and if, as it would sometimes unavoidably happen, he was left alone, he would scream and holla until some person came to him. When relief from pain would admit, he seemed thoughtful and contemplative, his eyes being generally closed, and his hands folded upon his breast, although he never slept without the assistance of an anodyne. There was something remarkable in his conduct about this period (which comprises about two weeks immediately preceding his death), particularly when we reflect that Thomas Paine was author of the *Age of Reason*. He would call out during his paroxysms of distress, without intermission, 'O Lord help me, God help me, Jesus Christ help me, O Lord help me,' &c., repeating the same expression without any the least variation, in a tone of voice that would alarm the house. It was this conduct which induced me to think that he had abandoned his former opinions; and I was more inclined to that belief when I understood from his nurse (who is a very serious, and, I believe, pious woman) that he would occasionally enquire, when he saw her engaged with a book, what she was reading, and being answered, and at the same time asked whether she should read aloud,* he assented, and would appear to give particular attention.

'I took occasion, during the night of the 5th and 6th of June, to test the strength of his opinions respecting revelation. I purposely made him a very late visit; it was a time which seemed to sort exactly with my errand: it was midnight; he was in great distress, constantly exclaiming in the words above mentioned; when, after a considerable preface, I addressed him in the following manner, the nurse being present:—

'Mr. Paine, your opinions, by a large portion of the community, have been treated with deference: you have never been in the habit of mixing in your conversation words of course: you have never indulged in the practice of profane swearing: you must be sensible that we are acquainted with your religious opinions as they are given to the world. What must we think of your present conduct? Why do you call upon Jesus

* The book she usually read was Mr. Hobart's *Companion for the Altar*.

Christ to help you? Do you believe that he can help you? Do you believe in the divinity of Jesus Christ? Come now answer me honestly; I want an answer as from the lips of a dying man, for I verily believe that you will not live twenty-four hours.' I waited some time at the end of every question; he did not answer, but ceased to exclaim in the above manner. Again I addressed him:—'Mr. Paine, you have not answered my questions; will you answer them? Allow me to ask again—Do you believe? or let me qualify the question—do you wish to believe that Jesus Christ is the Son of God?' After a pause of some minutes, he answered, 'I have no wish to believe on that subject.' I then left him, and know not whether he afterwards spoke to any person, on any subject, though he lived, as I before observed, till the morning of the 8th.

'Such conduct, under usual circumstances, I conceive absolutely unaccountable, though with diffidence I would remark, not so much so in the present instance; for, though the first necessary and general result of conviction be a sincere wish to atone for evil committed, yet it may be a question worthy of able consideration whether excessive pride of opinion, consummate vanity, and inordinate self-love, might not prevent or retard that otherwise natural consequence?'

On the 8th of June, 1809, about nine in the morning, died this memorable reprobate, aged seventy-two years and five months.

'For the sake of England and humanity,' says an able anonymous writer, 'it is to be wished that his impostures and his memory may rot together. In speaking of such a man it is impossible to suppress indignation. Decency towards

the dead may draw the curtain of oblivion over transient obliquities of conduct, but duty to the living demands the records of villany to be honestly severe. The examples of the dead either for warning or imitation are the property of the living; and the veritable description of virtue and vice is among the genuine 'Rights of Man.' We shall now leave him to his reckoning with those whom his false and presumptuous theories may have conducted to practical misery; and whom his Rights of Man, and Age of Reason, may have rendered proudly insensible to the concerns of the soul.

PAI'NIM, *n. s. & adj.* Fr. *payen*. Pagan; infidel.

Champions bold,
Defyed the best of Painim chivalry
To mortal combat, or carriere with lance.

Milton.

The cross hath been an ancient bearing, even before the birth of our Saviour, among the Painims themselves.

Peacock.

Whole brigades one champion's arms o'erthrow,
Slay Painims vile that force the fair.

Tickle.

The Solymean sultan he o'erthrew,
His moony troops returning bravely smeared
With Painim blood effused.

Philips.

PAINSWICK, a town of Gloucestershire, with a considerable woollen manufacture of white cloths. It abounds with a kind of stone for pavement, remarkable for its beauty. As the town is seated on a high ground, it has a most extensive prospect every way, of great part of the counties of Salop, Hereford, and Monmouth; of the windings of the Severn, and of Malvern Hills, &c. It is seven miles south-east of Gloucester, and 101 west by north of London.

P A I N T I N G.

PAINT, *v. a., v. n., & n. s.* } Fr. *peindre*;
PAINTER, *n. s.* } Span. *peñtar*,
PAINTING, } from Lat. *pingo*.
PAINTURE. } To delineate; re-
present by lines or colors: painture is from the Fr. *peinteur*, and (rarely) used as synonymous with painting.

Jezebel painted her face and tired her head.

2 Kings ix. 30.

Such is his will that paint
The earth with colours fresh,
The darkest skies with store of starry lights.

Spenser.

Hath not old custom made this life more sweet
Than that of painted pomp? are not these woods
More free from peril than the court? *Shakespeare.*

This is the very painting of your fear;
This is the air-drawn dagger which you said
Led you to Duncan. *Id. Macbeth.*

Painting is welcome;
The painting is almost the natural man:
For since dishonour trafficks with man's nature,
He is but outside: penciled figures are
Even such as they give out. *Id. Timon.*

If any such be here
That love this painting, wherein you see me smeared,
Let him express his disposition. *Shakespeare.*

Live to be the shew and gaze o' the time:
We'll have thee, as our rarer monsters are,
Painted upon a pole. *Id. Macbeth.*

Who fears a sentence or an old man's saw,
Shall by a painted cloth be kept in awe. *Shakespeare.*

The lady is disloyal.

—Disloyal!

—The word is too good to paint out her wickedness.

Id.

In the placing let some care be taken how the
painter did stand in the working. *Wotton.*

The air
Floats as they pass, fanned with unnumbered
plumes:

From branch to branch the smaller birds with song
Solaced the woods, and spread their painted wings,
'Till even. *Milton's Paradise Lost.*

To the next realm she stretched her swaty,
For painture near adjoining lay,
A plenteous province. *Dryden.*

Painting and poesy are two sisters so like, that
they lend to each other their name and office; one
is called a dumb poesy, and the other a speaking
picture. *Id. Dufresnoy.*

Beauty is only that which makes all things as they
are in their proper and perfect nature; which the
best painters always chuse by contemplating the
forms of each. *Dryden.*

Till we from an author's words *paint* his very thoughts in our minds, we do not understand him.

Locke.

The church of the annunciation looks beautiful in the inside, all but one corner of it being covered with statues, gilding, and *paint*.

Addison.

Poets are limners

To copy out ideas in the mind :

Words are the *paint* by which their thoughts are shown,

And nature is their object to be drawn. *Granville.*

'Tis in life as 'tis in *painting*,

Much may be right, yet much be wanting.

Prior.

Oh ! if to dance all night, and dress all day,
Charmed the small-pox, or chased old age away,

To patch, nay ogle, might become a saint,
Nor would it sure be such a sin to *paint*.

Pope.

Her charms in breathing *paint* engage,

Her modest cheek shall warm a future age. *Id.*

Arts on the mind, like *paint* upon the face,
Fright him, that's worth your love, from your embrace.

Young.

The showery arch

With listed colours gay, or, azure, gules,
Delights and puzzles the beholder's eye,
That views the watery brede with thousand shews
Of *paintures* varied.

Philips.

SIR BENJ. NAY now, Lady Sneerwell, you are severe upon the widow. Come, come, 'tis not that she *paints* so ill—but when she has finished her face, she joins it so badly to her neck, that she looks like a mended statue, in which the connoisseur sees at once that the head's modern, though the trunk's antique.

Sheridan.

PAINTING is the art of representing to the eyes, by means of figures and colors, every object in nature that is discernible by the sight ; and of sometimes expressing, according to the principles of physiognomy, and by the attitudes of the body, the various emotions of the mind. A smooth surface, by means of lines and colors, represents objects in a state of projection ; and may represent them in the most pleasant dress, and in a manner most capable of enchanting the senses. The art of painting is extremely difficult in the execution ; and its merit can only be appreciated by devotees to the art.

The painter who is distinguished for noble and profound conceptions ; who by means of a perfect delineation, and colors more capable of fixing the attention and dazzling the eye, conveys to the spectators the sentiments with which he himself was inspired ; who animates them with his genius, and makes a lasting impression on their mind ; this artist resembles a poet, and is worthy to share even in the glories of Homer.

PART I.

HISTORY OF THE ART.

SECT. I.—OF THE RISE AND PROGRESS OF PAINTING IN ANCIENT TIMES.

Painting originally consisted of simple outlines, and long continued in this state before the expression of relieve, or the application of color.

The next step in the art was to render the imitation more complete by applying colors ; which was done in the same way that we color maps ; and several nations, as the Egyptians, the Chinese, and the different nations of India, have never yet painted in a better manner.

Even that great improvement in painting, the Claro-Obscuro, was discovered by the Greeks before the invention and proper application of colors.

Plato, who lived 400 years before the Christian era, states, that painting had been practised in Egypt for 10,000 years. Without regarding his Egyptian chronology as accurate, we may consider it as designed to impress us with the very remote antiquity of the art.

The monuments of Egyptian painting with which we are best acquainted, says Winckelman, are the chests of mummies. These have resisted the injuries of time, and are still submitted to the examination of the curious. The white, made of white lead, is spread over the ground of the piece ; the outlines of the figure are traced with black strokes, and the colors are generally blue, red, yellow, and green, laid on without any mixture or shading. The red and blue prevail most ; and these colors seem to have been prepared in the coarsest manner. The light is formed by leaving those parts of the ground where it is necessary covered with the white lead, as it is formed by the white paper in some of our drawings. This description is sufficient to convince us that the whole art of painting in Egypt consisted in coloring ; but every person knows that without tints, and the mixture of colors, painting can never arrive at perfection. Pliny says, that the Egyptian artists painted the precious metals ; that is, they varnished or enamelled them. It is doubtful what this art was, but most probably it consisted in covering gold or silver with a single color. The Egyptians are supposed to have continued this coarse style till the reign of the Ptolemies.

The ancient Persians were so far from excelling in the arts, that the paintings of Egypt were highly esteemed among them after they had conquered that country. The only ancient painter of Persia, whose name is preserved, is Manes ; and he is more celebrated for his attempt to accommodate the Persian theology of two first principles to the Christian system, than for his skill as a painter. He was famed, however, for drawing straight lines without a ruler. The modern Persians have made no progress in the art.

In India the art seems to be confined to monstrous figures connected with their religion. See POLYTHEISM. And the paintings of Thibet are only remarkable for the fineness of their strokes.

The Chinese seem never to have had the least idea of perspective. Their landscapes have no plan, no variety in the appearance of the clouds, and no diminishing of the objects in proportion to their distance ; and their representations of human beings are caricatures upon the human figure.

It is undoubtedly to the Greeks that we are indebted for the highest cultivation which the imitative arts have known. In sculpture this is even now sufficiently palpable, since at this day their performances remain not only unequalled but unapproached. The same observation holds with respect to architecture ; and it is probable that, so far as relates to the perfect representation of a single figure, it might be applied also to

their painting; but there is great reason to conclude that in many branches of this art they are surpassed by the great names among the moderns. In Egypt the knowledge of that principle which is most desirable in art (selection) never appears to have operated far. When a specific form of character was once adopted, there it remained, and was repeated unchanged for generations. Little action was given to figures, and no attempts at all made at expression. Pliny reports, that the statues executed by the Egyptians in his time differed in no respect whatever from those made by them 1000 years before. Of their paintings a few remain to the present era, but the date of these relics is by no means evident. Two of them (seen at Thebes and described by Bruce) are referred by him to the time of Sesostris (about 700 years B. C.), who is said to have restored and embellished that city; but this is mere conjecture. He remarks of these paintings, that they might be compared with good sign-paintings of his day.

We cannot here detail the reasons and the coincidence of fortunate circumstances which raised the Greeks to be the arbiters of form. 'The standard they erected,' says Fuseli, 'the canon they framed, fell not from heaven: but as they fancied themselves of divine origin, and religion was the first mover of their art, it followed that they should endeavour to invest their authors with the most perfect form; and, as man possesses that exclusively, they were led to a complete and intellectual study of his elements and constitution; this, with their climate, which allowed that form to grow, and to show itself to the greatest advantage; with their civil and political institutions, which established and encouraged exercises and manners best calculated to develop its powers; and above all, that simplicity of their end, that uniformity of pursuit, which in all its derivations retraced the great principle from which it sprang, and, like a central stamen, drew it out into one immense connected web of congenial imitation; these, I say, are the reasons why the Greeks carried the art to a height which no subsequent time or race has been able to rival or even to approach. Great as these advantages were, it is not to be supposed that nature deviated from her gradual progress in the development of human faculties, in favor of the Greeks. Greek art had her infancy, but the graces rocked her cradle, and love taught her to speak. If ever legend deserved our belief, the amorous tale of the Corinthian maid, who traced the shade of her departing lover by the secret lamp, appeals to our sympathy to grant it; and leads us at the same time to some observations on the first mechanical essays of painting, and that linear method which, though passed nearly unnoticed by Winckelman, seems to have continued as the basis of execution, even when the instrument for which it was chiefly adapted had long been laid aside.

'The etymology of the word used by the Greeks to express painting being the same with that which they employ for writing, makes the similarity of tool, materials, method, almost

certain. The tool was a style or pen of wood or metal; the materials a board, or a levigated plane of wood, metal, stone, or some prepared compound; the method, letters or lines.

'The first essays of the art were skiagrams, simple outlines of a shade, similar to those which have been introduced to vulgar use by the students, and parasites of physiognomy, under the name of *Silhouettes*; without any other addition of character or feature but what the profile of the object, thus delineated, could afford.

'The next step was the monogram, outlines of figures without light or shade, but with some addition of the parts within the outline, and from that to the monochrom, or paintings of a single color on a plane or tablet, primed with white, and then covered with what they called punic wax, first amalgamated with a tough resinous pigment, generally of a red, sometimes dark brown, or black color. In, or rather through, this thin inky ground, the outlines were traced with a firm but pliant style, which they called *cestrum*; if the traced line happened to be incorrect or wrong, it was gently effaced with the finger or with a sponge, and easily replaced by a fresh one. When the whole design was settled, and no farther alteration intended, it was suffered to dry, was covered, to make it permanent, with a brown encaustic varnish, the lights were worked over again, and rendered more brilliant with a point still more delicate, according to the gradual advance from mere outlines to some indications, and at last to masses of light and shade, and from those to the superinduction of different colors, or the invention of the polychrom, which, by the addition of the pencil to the style, raised the mezzotinto or stained drawing to a legitimate picture, and at length produced that vaunted harmony, the magic scale of Grecian color.

'If this conjecture, for it is not more, on the process of linear painting, formed on the evidence and comparison of passages always unconnected, and frequently contradictory, be founded in fact, the rapturous astonishment at the supposed momentaneous production of the Herculean dancers, and the figures on the earthen vases of the ancients, will cease; or rather, we shall no longer suffer ourselves to be deluded by palpable impossibility of execution: on a ground of levigated lime, or on potter's ware, no velocity or certainty attainable by human hands can conduct a full pencil with that degree of evenness equal from beginning to end with which we see those figures executed, or, if it could, would ever be able to fix the line on the glassy surface without its flowing: to make the appearances we see possible, we must have recourse to the linear process that has been described, and transfer our admiration to the perseverance, the correctness of principle, the elegance of taste that conducted the artist's hand, without presuming to arm it with contradictory powers: the figures he drew, and we admire, are not the magic produce of a winged pencil, they are the result of gradual improvement, exquisitely finished monochroms.

'How long the pencil continued only to

assist, when it began to engross, and when it at last entirely supplanted the cestrum, cannot, in the perplexity of accidental report, be ascertained. Apollodorus, in the ninety-third olympiad, and Zeuxis in the ninety-fourth, are said to have used it with freedom and with power. The battle of the Lapithæ and the Centaurs, which, according to Pausanias, Parrhasius painted on the shield of the Minerva of Phidias, to be chased by Mys, could be nothing but a monochrome, and was probably designed with the cestrum, as an instrument of greater accuracy. Apelles and Protogenes, nearly a century afterwards, drew their contested lines with the pencil; and that alone, as delicacy and evanescent subtlety were the characteristics of those lines, may give an idea of their mechanic excellence. And yet in their time the diagraphic process, which is the very same with the linear one we have described, made a part of liberal education. And Pausias of Sicyon, the contemporary of Apelles, and perhaps the greatest master of composition amongst the ancients, when employed to repair the decayed pictures of Polygnotus at Thespiz, was adjudged by general opinion to have egregiously failed in the attempt, because he had substituted the pencil for the cestrum, and entered a contest for superiority with weapons not his own.

‘Here it might seem in its place to say something on the encaustic method used by the ancients; were it not a subject by ambiguity of expression and conjectural dispute so involved in obscurity that a true account of its process must be despaired of: the most probable idea we can form of it is, that it bore some resemblance to our oil-painting, and that the name was adopted to denote the use of materials, inflammable or prepared by fire, the supposed durability of which, whether applied hot or cold, authorised the terms *εγκαυτος* and *inussit*.’ See our article ENCAUSTIC PAINTING.

The ancient inhabitants of Etruria were among the first who connected the arts with the study of nature. In some of their monuments, which still remain, there is to be observed a first style, which shows the art in its infancy; and a second which, like the works of the Florentine artists, shows more of greatness and exaggeration in the character than precision or beauty. Pliny says that painting was carried to great perfection in Italy before the foundation of Rome; but it appears that even in his time the painters of Etruria were held in great reputation. The only Etrurian paintings which remain have been found in the tombs of the Tarquins. They consist of long painted friezes, and pilasters adorned with huge figures, which occupied the whole space from the base to the cornice. These paintings are executed on a ground of thick mortar, and many of them are in a state of high preservation.

Winckelman is of opinion that the Greek colonies established at Naples and Nola had at a very early period cultivated the imitative arts, and taught them to the Campanians established in that country. He considers as works purely Campanian certain medals of Capua and Teanum, cities of Campania into which the Greek colo-

nies never penetrated. But there have been discovered, adds he, a great number of Campanian vases covered with painting. The design of the greatest part of these vases, says he, is such, that the figures might occupy a distinguished place in the works of Raphael. Those vases, when we consider that this kind of work admits of no correction, and that the stroke which forms the outline must remain as it is originally traced, are wonderful proofs of the perfection of the art among the ancients. But the count de Caylus is persuaded that the Campanian vases are of Greek origin.

The name of Phidias is as familiar to every man of education as his own. That of Panæus, his brother, is known only to the few who trace back to their starting-post the early and obscure footsteps of the muse of painting. The performances of Phidias, particularly those in the temple of Minerva, called the Parthenon, remain even to the present day a source of admiration, of wonder, and envy. Those of Panæus exhibited his art still in its infancy, and have been for many revolving ages buried in the stream of oblivion.—To this man, however, Greece appears to have been indebted for an anxious zeal, at least, to advance the art he practised to a more equal station with sculpture; and in his time there were prizes established both at Delphos and Corinth, for its encouragement, whereto he himself contended, but was excelled by Timogras of Chalcis.

The first great name of that epoch of the preparatory period, when facts appear to overbalance conjecture, is that of Polygnotus of Thasos, who painted the *Pœcile* at Athens, and the *Lesche*, or public hall, at Delphi. Of these works, but chiefly of the two large pictures at Delphi, which represented scenes subsequent to the eversion of Troy, and Ulysses consulting the spirit of Tiresias in Hades, Pausanias gives a minute and circumstantial detail; by which we are led to surmise that what is now called composition was totally wanting in them as a whole; for he begins his description at one end of the picture, and finishes it at the opposite extremity—a senseless method, if we suppose that a central group, or a principal figure to which the rest were in a certain degree subordinate, attracted the eye; it appears as plain that they had no perspective, the series of figures on the second or middle ground being described as placed above those in the foreground, and the figures in the distance above the whole: the honest method, too, which the painter chose of annexing to many of his figures their names in writing, savors much of the infancy of painting. This circumstance, however, we should be cautious in imputing either to ignorance or imbecility, since it might rest on the firm base of permanent principles. The genius of Polygnotus was, more than that of any other artist before or after, a public genius, his works monumental works, and these very pictures the votive offerings of the Gnidians. Polygnotus was, in fact, a man endowed with uncommon ability, and certainly advanced his art very far in point of expression and action in his figures, and in ideal coloring. Of the truth of this observation, his figure of the demon Euryonimus, in one of the

pictures abovementioned, namely, Ulysses consulting the shade of Tiresias in Hades, affords sufficient proof. 'His color,' says Pausanias, 'is between black and azure, like that of the flies which infest meat; he shows his teeth, and sits upon the skin of the vulture.' Lucian and Pliny both speak in high commendation of this artist; the former, in particular, invoking his aid to finish his perfect woman, exclaims:—'Polygnotus shall open and spread her eyebrows, and give her that fine, glowing, decent blush, which beautifies so irresistibly his Cassandra. He also shall give her a flowing, unconstrained attire, which, with all its delicate wavings, shall partly adhere to her body and partly flutter in the wind.'

Polygnotus, says Aristotle, improves the model. His invention reached the conception of undescribed being in the demon Eurynomus; filled the chasm of description in Theseus and Pirithous, in Ariadne and Phœdra; and improved its terrors in the spectre of Tityus; whilst color to assist it became in his hand an organ of expression; such was the prophetic glow which still crimsoned the cheeks of his Cassandra in the time of Lucian. The improvements in painting which Pliny ascribes to him, of having dressed the heads of his females in variegated veils and bandeaus, and robed them in lucid drapery; of having gently opened the lips, given a glimpse of the teeth, and lessened the former monotony of face; such improvements were surely the most trifling part of a power to which the age of Apelles and that of Quintilian paid equal homage: nor can it add much to our esteem for him, to be told by Pliny that there existed, in the portico of Pompey, a picture of his with the figure of a warrior in an attitude so ambiguous as to make it a question whether he were ascending or descending. Such a figure could only be the offspring of mental or technic imbecility, even if it resembled the celebrated one of a Diomedes carrying off the palladium with one, and holding a sword in the other hand, on the intaglio inscribed with the name of Dioscorides.

With this simplicity of manner and materials the art seems to have proceeded from Polygnotus, Aglaophon, Phidias, Panæus, Colotes, and Evenor, the father of Parrhasius, during a period of more or less disputed olympiads, till the appearance of Apollodorus the Athenian, who applied the essential principles of Polygnotus to the delineation of the species, by investigating the leading forms that discriminate the various classes of human qualities and passions. The acuteness of his taste led him to discover that as all men were connected by one general form, so they were separated each by some predominant power, which fixed character, and bound them to a class: that, in proportion as this specific power partook of individual peculiarities, the farther it was removed from a share in that harmonious system which constitutes nature, and consists in a due balance of all its parts: thence he drew his line of imitation, and personified the central form of the class to which his object belonged; and to which the rest of its qualities administered without being absorbed: agility was not suffered

to destroy firmness, solidity, or weight; nor strength and weight agility; elegance did not degenerate to effeminacy, or grandeur swell to hugeness; such were his principles of style: his expression extended them to the mind, if we may judge from the two subjects mentioned by Pliny, in which he seems to have personified the characters of devotion and impiety; that in the adoring figure of a priest, perhaps of Chryses, expanding his gratitude at the shrine of the god whose arrows avenged his wrongs and restored his daughter; and this, in the figure of Ajax wrecked, and from the sea-swept rock hurling defiance unto the murky sky. As neither of these subjects can present themselves to a painter's mind without a contrast of the most awful and the most terrific tones of color, magic of light and shade, and unlimited command over the tools of art, we may with Pliny and with Plutarch consider Apollodorus as the first assertor of the pencil's honors, as the first colorist of his age, and the man who opened the gates of art which the Heracleot Zeuxis entered. From the essential style of Polygnotus, and the specific discrimination of Apollodorus, Zeuxis, by comparison of what belonged to the genius and what to the class, framed at last that ideal form, which, in his opinion, constituted the supreme degree of human beauty, or, in other words, embodied possibility, by uniting the various but homogeneous powers scattered among many, in one object, to one end. Such a system, if it originated in genius, was the considerate result of taste refined by the unremitting perseverance with which he observed, consulted, compared, and selected, the congenial but scattered forms of nature.

Quintilian remarks of Zeuxis that he considered the poetic unity of character adopted by Homer, in the descriptions of his heroes, as his model; giving to each individual he painted the peculiar distinction of a class. It is said, and the anecdote bears on the remark, that, previously to commencing a picture of Juno for her temple at Agrigentum, he requested to see all the most beautiful maidens of the city naked, and from them selected five whose shape he most admired; purposing to exhibit the most perfect combination of female forms, by selecting and adopting the most beautiful parts of each. Of the coloring employed by Zeuxis, little is known with certainty; but it may doubtless be inferred with some fairness that it rivalled the excellencies of his design; and, from his alleged method of painting monochroms on a black ground, adding the lights in white, we may deduce that he understood the extension of light and shade to masses.

Timanthes, Eupompus, Androcides, and Parrhasius the Ephesian, all flourished during the same era with Zeuxis. The latter, however, is the only one who may be said to have rivalled that eminent artist; and indeed it is hard to tell which of the two bore the palm, or most sufficiently claimed it. The story related by Pliny of their contest is not decisive on the former point, since those pictures had little to do with the real excellencies of either artist, except in the one quality of coloring. Zeuxis painted grapes; and, on exhibiting his picture,

the birds came with the greatest avidity to pluck them. The rival artist then proceeded to display his performance, and, on being introduced to the spot, Zeuxis exclaimed, 'Remove your curtain that we may see the painting.' The curtain was the painting, and Zeuxis confessed himself vanquished, exclaiming, 'Zeuxis has deceived birds, but Parrhasius has deceived Zeuxis himself.' Now, how does this fact, if it be regarded as one, tally with the limitation of Pliny as to the colors used by the ancient artists? A curtain may, it is true, be of a dull color, and such a one might possibly have been imitated by Parrhasius with such materials, and so perfectly, as to have deceived Zeuxis: but it is to be presumed that the luscious transparency, color, and brilliancy of the grape, in those days, were not very widely different from what it now exhibits; and those pure qualities can only be represented by the purest and most perfect of colors. Parrhasius is reported to have had a surer eye than this celebrated rival for proportion and symmetry: he circumscribed the ample style of Zeuxis, and, by subtle examination of outline, established that standard of divine and heroic form which raised him to the authority of a legislator from whose decisions there was no appeal. He gave to the divine and heroic character, in painting, what Polyclethus had given to the human in sculpture, by his Doryphorus, a canon of proportion. Phidias had discovered in the nod of the Homeric Jupiter the characteristic of majesty, inclination of the head: this hinted to him a higher elevation of the neck behind, a bolder protrusion of the front, and the increased perpendicular of the profile. To this conception Parrhasius fixed a maximum; that point from which descends the ultimate line of celestial beauty, the angle within which moves what is inferior, beyond which what is portentous. From the head conclude to the proportions of the neck, the limbs, the extremities; from the father to the race of gods; all the sons of one, Jupiter; derived from one source of tradition, Homer; formed by one artist, Phidias: on him measured and decided by Parrhasius. In the simplicity of this principle, adhered to by the succeeding periods, lies the uninterrupted progress, and the unattainable superiority, of Grecian art. With this prerogative, which evidently implies a profound as well as general knowledge of the parts, how are we to reconcile the criticism passed on the intermediate parts of his forms as inferior to their outline? or how could Winckelman, in contradiction with his own principles, explain it, by a want of anatomic knowledge? how is it possible to suppose that he who decided his outline with such intelligence that it appeared ambient, and pronounced the parts that escaped the eye, should have been uninformed of its contents? Let us rather suppose that the defect ascribed to the intermediate forms of his bodies, if such a fault there was, consisted in an affectation of smoothness bordering on insipidity, in something effeminately voluptuous, which absorbed their character and the idea of elastic vigor; and this Euphranor seems to have hinted at, when, in comparing his own Theseus with that of Parrhasius, he pronounced the Ionian's to have fed

on roses, his own on flesh: emascuate softness was not in his opinion the proper companion of the contour, or flowery freshness of color an adequate substitute for the sterner tints of heroic form.

None of the ancients seem to have united or wished to combine, as man and artist, more qualities seemingly incompatible than Parrhasius:—the volubility and ostentatious insolence of an Asiatic with Athenian simplicity and urbanity of manners; punctilious correctness with blandishments of handling and luxurious color; and with sublime and pathetic conception a fancy libidinally sportive. If he was not the inventor, he surely was the greatest master of allegory, supposing that he really embodied, by signs universally comprehended, that image of the Athenian ΔΗΜΟΕ or people, which was to combine and to express at once its contradictory qualities. Perhaps he traced the jarring branches to their source, the aboriginal moral principle of the Athenian character, which he made intuitive. This supposition alone can shed a dawn of possibility on what else appears impossible. We know that the personification of the Athenian Δημος was an object of sculpture, and that its images by Lyson and Leochares were publicly set up; but there is no clue to decide whether they preceded or followed the conceit of Parrhasius. It was repeated by Aristolaus, the son of Pausias. The decided forms of Parrhasius, Timanthes the Cythnian, his competitor for fame, attempted to inspire with mind and to animate with passions. No picture of antiquity is more celebrated than his immolation of Iphigenia in Aulis, painted, as Quintilian informs us, in contest with Colotes of Teos, a painter and sculptor from the school of Phidias; crowned with victory at its rival exhibition, and since the theme of unlimited praise from the orators and historians of antiquity, though the solidity or justice of their praise relatively to the art has been questioned by modern criticism.

The art now continued to advance with rapid strides. Nature was the guide; and to develope her various charms, in expression, shape, and color, the object of the artists. The leading principle of Eupompus may be traced in the advice which he gave to Lysippus, as preserved by Pliny, whom, when consulted on a standard of imitation, he directed to the contemplation of human variety in the multitude of characters who were passing by. 'Behold,' said the painter, 'behold my models! From nature, not from art, by whomsoever wrought, must he study who seeks to acquire reputation and extend the scope of his art.' The doctrine of Eupompus was adopted by Pamphilus the Amphipolitan, the most scientific artist of his time, and by him transmitted to Apelles of Cos, or, according to Lucian, of Ephesus, his pupil. This wonderful person was, if we may credit the tradition respecting him, gifted with such a combination of natural and acquired endowments as never, perhaps, either before or since, fell to the lot of another individual. In addition, he had the happiness to live at that period wherein the genius of his country had reached its highest point of elevation. The name of Apelles in

Pliny is the synonyme of unrivalled and unattainable excellence; but, in our estimate of his talents, we must candidly consider what modifications may be requisite on an enumeration of his actual works. It is very difficult to ascertain how far real value may be attached to the panegyrics on works of art. These will always be bestowed, in the highest strain, on the best works of the writer's time: and thus we observe that, at all periods, contemporary authors have expressed the same degrees of approbation, and in the same terms, of the pictures they have seen produced; whilst we know that, as art was slow in its progress, it is impossible that in every stage it could have merited equal commendation. The works of Apelles, so far as it is possible to comprehend their nature, exhibit neither the deepest pathos of expression, the widest sphere of comprehension, nor the most acute discrimination of character: his great prerogative consisted, perhaps, more in the unison than in the extent of his powers: he knew better what his capabilities could achieve, and what lay beyond them, than any other artist. Grace of conception, and refinement of taste, were his elements, and went hand in hand with grace of execution, and completeness in finish, irresistible when found united. The Venus of Apelles, or, as it may rather be called, the personification of the birthday of Love, was esteemed as the most splendid achievement of art; the outline of the goddess baffled every attempt at improvement, whilst imitation shrunk from the purity, the force, the brilliancy, the evanescent gradations of her tints. The pictures produced by this consummate artist appear to have been numerous, and the reader will find, in Pliny, lib. xxxv. cap. 10, a pretty extensive list. A brief enumeration of some of them will serve to convey a just idea of the class of subjects generally chosen by him.

The portraits painted by him both of Alexander the Great and his father Philip were numerous; some of them single, some accompanied by other figures. Alexander launching thunder, in the temple of Diana at Ephesus, has been greatly extolled for its effect and the boldness of its relief, 'the hand which was raised appearing to come forward, and the lightning to be out of the picture.' In another portrait of the same prince he was represented in a triumphal chariot, and near him the figure of war, with his hands tied behind his back.

This, and another Alexander, accompanied by Castor and Pollux, and a figure of Victory, were presented by Augustus to the forum.

Many other portraits are alluded to: namely, Antiochus, king of Syria; Antigonus; Archelaus, with his wife and daughter; Abron, an effeminate debauchee; Clatus, on horseback armed (except his head), with an attendant delivering his helmet to him; and Megabysus, a priest of the temple of Diana at Ephesus, sacrificing, in his pontifical vestments. In fanciful subjects we find:—Diana attending a sacrifice, surrounded by her nymphs; Neoptolemus, son of Achilles, on horseback, contending with Persians; Hercules, with his back towards the observer, and his head turned round so as to show his face; and lastly his renowned picture of Venus

rising from the sea, already mentioned, which, being taken to Rome, was dedicated by Augustus in the temple of Julius Cæsar; and upon which several Greek epigrams are to be found in the Anthologia.

The refinements of the art were by Aristides of Thebes applied to the mind. The passions which history had organised for Timanthes, Aristides caught as they rose from the breast or escaped from the lips of nature herself; his volume was man, his scene society: he drew the subtle discriminations of mind in every stage of life, the whispers, the simple cry of passion, and its most complex accents. Such, as history informs us, was the suppliant whose voice you seemed to hear, such his sick man's half extinguished eye and laboring breast, such the sister dying for her brother, and, above all, the half-slain mother shuddering lest the eager babe should suck the blood from her palsied nipple. This picture was probably at Thebes, when Alexander sacked that town; what his feelings were when he saw it we may guess from his sending it to Pella. Its expression, poised between the anguish of maternal affection and the pangs of death, gives to commiseration an image which neither the infant piteously caressing his slain mother in the group of Epigonus, nor the absorbed feature of the Niobe, nor the struggle of the Laocoon, excite. Timanthes had marked the limits that discriminate terror from the excess of horror; Aristides drew the line that separates it from disgust. His subject is one of those that touch the ambiguous line of a squeamish sense.—Taste and smell, as sources of tragic emotion, and, in consequence of their power, commanding gesture, seem scarcely admissible in art or on the theatre, because their extremes are more nearly allied to disgust, and loathsome or risible ideas, than to terror. The prophetic rance of Cassandra, who accents the prepared murder of Agamemnon at the threshold of the ominous hall; the desperate moan of Macbeth's queen on seeing the visionary spot still uneffaced infect her hand—are images snatched from the lap of terror—but soon would cease to be so were the artist or the actress to enforce the dreadful hint with indiscreet expression or gesture. This, completely understood by Aristides, was as completely missed by his imitators, Raffaele in the Morbetto, and Poussin in his Plague of the Philistines. In the group of Aristides our sympathy is immediately interested by the mother, still alive though mortally wounded, helpless, beautiful, and forgetting herself in the anguish for her child, whose situation still suffers hope to mingle with our fears: he is only approaching the nipple of the mother. In the group of Raffaele the mother dead of the plague, herself an object of apathy, becomes one of disgust, by the action of the man, who bending over her, at his utmost reach of arm, with one hand removes the child from the breast, whilst the other, applied to his nostrils, bars the effluvia of death. Our feelings alienated from the mother, come too late even for the child, who by his languor already betrays the mortal symptoms of the poison he imbibed at the parent corpse. It is curious to observe the permutation of ideas which takes

place, as imitation is removed from the sources of nature: Poussin, not content with adopting the group of Raffaele, once more repeats the loathsome attitude in the same scene; he forgot, in his eagerness to render the idea of contagion still more intuitive, that he was averting our feelings with ideas of disgust.

At the same era flourished Protogenes of Rhodes, towards whom the generous conduct of Apelles deserves particular attention. Protogenes had painted a picture of Jalytus, which so delighted Apelles that he sailed to Rhodes on purpose to visit his accomplished contemporary. There, finding him in poverty and obscurity, he is reported to have bought several of the performances of Protogenes with the avowed intention of selling them as his own, and thus succeeded in exciting the notice of the people of Rhodes towards the abilities of their fellow citizen, who thence rose from his hitherto humble situation to fame and fortune. The well known friendly contest of Apelles and Protogenes respecting the lines has been described elsewhere, and stands as a fact on undeniable testimony. The tablet whereon they were drawn, having been taken to Rome, was there seen by Pliny himself, who speaks of it as having the appearance of a large blank surface, the extreme delicacy of the lines rendering them invisible except on close inspection. They were drawn with different colors—one upon, or rather within the other. Judging from Pliny's account it might be imagined that all the beauty lay in the extreme delicacy of the points which had been used, and of the hands which had applied them; but it is reasonable to suppose that the first direction of the line might have some principle of beauty for its guide, by which, as well as by the neatness of its execution, Protogenes was immediately moved to the declaration, that none but Apelles could have drawn it.

In comparing the performances of modern painters with the character of those the names and description of which ancient authors have handed down to us, it will appear pretty clearly that the Greek artists surpassed the moderns in sentiment, in invention or imagination, in expression, in position of figures, in proportion, and contour. With regard to color, although they are remarkable for vividness, the case is by no means so evident. Pliny allows them the use of but four, and yet at other times makes allusions which palpably imply their means of that kind to be far more extensive. The use of oils has however given to moderns a decided advantage in this particular.

In A. R. 259, and A. A. C. 494, Appius Claudius consecrated a number of shields in the temple of Bellona, which contained in basso relievo the portraits of his family. This example was followed; and in process of time it was common among the Romans to place those images in private houses. The execution in basso relievo is a proof that they had an idea of painting, at least with one color. As long as the Romans employed artists of other nations, they had little desire to cultivate the arts; but about the year of Rome 450, and 303 years before Christ, one of the Fabii employed himself in

painting. He painted the temple of Safety; and his works remained till that temple was burnt, in the reign of Claudius. The example of Fabius, surnamed Pictor from his profession, did not excite his fellow citizens to imitation. A century and a half elapsed before the tragic poet Pacuvius, nephew of Ennius, painted the temple of Hercules in the forum boarium. The glory which he had acquired by his dramatic works shed some lustre on the art which he exercised; but did not confer on it that respect which could recommend it to general practice. The paintings of Fabius were the recreations of his youth; those of Pacuvius the amusements of his old age; but painting is a difficult art, which requires a man's whole time and attention to be solely devoted to it.

There were in fact no eminent painters at Rome till the time of the emperors; but, as the national spirit was changed, the profession of the fine arts acquired more respectability. The Romans, during the time of the republic, were animated with the spirit of liberty and the desire for conquest. When these two passions were weakened, the love of the arts obtained among them. As a proof of this, Nero himself gloried in being an artist. A Colossian picture of 120 feet was painted at Rome by his command, which was afterwards destroyed by lightning. The name of the painter is not recorded, but this is the only painting on cloth mentioned by ancient authors.

The paintings of the ancient artists were either moveable, or on the ceilings or compartments of buildings. According to Pliny, the most eminent were those who painted moveable pictures. The latter were either on fir wood, larch, boxwood, or canvas, sometimes on marble. When they employed wood, they laid on first a white ground. Among the antiquities of the Herculaneum are four paintings on white marble. Their immoveable paintings on walls were either in fresco, or on dry stucco in distemper. Indeed all the ancient paintings may be reduced to, 1st, fresco painting; 2dly, water color, or distemper painting on a dry ground; and, 3dly, encaustic painting. The ancient fresco paintings appear to have been always on a white stucco ground, the colors inlaid very deep, and the drawing much more bold and free than any similar performance of modern art. The outlines of the ancient paintings on fresco were probably done at once, as appears from the depth of the incision, and the boldness and freedom of the design, equal to the care and spirit of a pencilled outline.

In general the ancients painted on a dry ground, even in their buildings, as appears from the Herculanean antiquities, most of which are executed in this manner. At Rome and Naples the first (deepest) coat is of true Puzzolana, of the same nature with the terras now used in mortar, required to keep out wet, about one finger thick: the next of ground marble or alabaster, and sometimes of pure lime or stucco, in thickness about one-third of the former. Upon this they appear to have laid a coat of black, and then another of red paint; on which last the subject itself was executed. Such seems to have been

their method of painting on walls; but in their moveable pictures, and in the performance of their first artists, and where the effects of shade and light were necessary, they doubtless used white. The colors employed they seemed to have mixed up with size, of which they preferred that made by boiling the ears and genitals of bulls. This appears to have made the colors so durable and adhesive, that the ancient paintings lately found bear washing with a soft cloth and water; and sometimes even diluted aquafortis is employed to clean their paintings on fresco. Pliny says, that glue, dissolved in vinegar and then dried, is not again soluble.

The ancient colors, we have said, were vivid: it is obvious also that they were remarkably enduring, from the fact of the Greek paintings having existed uninjured, and become objects of admiration to the Romans several ages after they were executed. They were in the habit of employing a sort of varnish called *atramentum*, which served to secure their paintings from the influence of the atmospheric air.

Whether the art of composition, at least in the scientific way now practiced, was ever understood by them, or whether they possessed any knowledge whatever of the laws of *chiaro-scuro*, is wrapped up in doubt and mystery which it is next to impossible any opportunity will occur of unravelling. The accounts of these performances by ancient writers do not seem to have sprung from any practical acquaintance with the rules of the art, and hence they are, as will be readily imagined, very vague and unsatisfactory to the painter. According to the light which is thus afforded us we are led to conclude that the chief aim of the Greek artists was to impress on the mind of the spectator in the most energetic way the effect of one particular image; we do, it is true, occasionally encounter descriptions of pictures containing many figures, but in general the subject is confined to the introduction of two or three. Nothing is said by these writers of what we term background, and little on the contrasts of light and shade, &c. That they had some knowledge of this kind, however, is apparent from an observation of Plutarch, namely, that 'painters heighten the brilliancy of light colors by opposing them to dark ones, or to shades;' and from another of Pliny, who, speaking of painters in the monochromatic style, adds:—'In process of time the art assumed new powers, and discovered light and shadow, by gradating which the colors are alternately kept down or heightened. Afterward splendor was added, which was different from light, and which, being a medium between light and shade, was denominated *tonon*; while the union of colors, and transition from one to another, they called *harmogen*;' lib. xxxv. c. 5. Hence we find that the great requisites for the science of *chiaro-scuro*, viz. contrast, tone, and harmony, were comprehended by them; that the various degrees of light and shade, distinctly and in combination, were duly felt; and that the value of middle or half tint was perceived and attended to. Led away by these facts, M. du Bos and others have concluded that *chiaro-scuro* was scientifically comprehended and practised by

them. It will not fail, however, to strike the artist that every thing stated by Pliny to have been known by the ancient artists is resolvable into that which is requisite for the due execution of a single figure on a plain ground, and in the most simple style of execution. In the best of the paintings found at Herculaneum there is exhibited an unusually skilful management of *chiaro-scuro* in the reduction of tone on parts, both of the flesh and drapery, but it is inconclusive on the general point at issue.

With respect to their knowledge of perspective similar uncertainty appears to exist. Vitruvius, indeed, reports it to have been practised by Agatharcus (a contemporary of Æschylus and Polygnotus) in the theatre at Athens; and to have been shortly after reduced to principles, and treated as a science by Anaxagoras and Democritus. The deductions, however, are made from premises of a similarly inconclusive nature to those enumerated in our observations on *chiaro-scuro*.

Lastly, we may remark that no mention, at all events none of consequence, is made of a ground of relief on the ancient writers on painting. Landscape also appears to have been wholly disregarded. There are attempts at background made in several of the paintings of Herculaneum, but undeserving of any commendation; and the most beautiful of those productions of ancient art which have hitherto been displayed to the eyes of the moderns are of figures relieved off plain grounds, or rather amalgamated into them. In none of the criticisms or observations of ancient authors is a secondary object ever mentioned as being in the distance.

We shall not dwell on the degree of cultivation bestowed on the art of painting by the ancient Romans, but pass on to enumerate the several colors stated by Pliny to have been known to them. See lib. xxxv., caps. 6 and 7.

WHITES.—*Melinum*. A native white earth from the island of Melos, used by Apelles before white lead prepared with vinegar was invented.

Parætônium. An Egyptian white earth used in distemper, and similar, probably, to the white now called Cremenitz white, from Hungary. Pliny complains that *parætônium* was often adulterated with Cimolian earth, which was used by the fullers at Rome.

Eretria. An ashy white. It is so named from a town of Eubœa, now Trocco.

Cerussa. White lead.

Amulære. Gypsum. *Creta*. Chalk.

YELLOW.—*Sil*. Ochre of four kinds; named Atticum, Lucidum, Syricum, and Marmorosum.

Auripigmentum, or *Arsenicum*. Orpiment.

Cerussa usta. Masticot, first discovered by the fire at the Piræus.

REDS.—*Minium*. Red lead, both natural and artificial. The best native minium was found in a quicksilver mine near Ephesus; and, in endeavouring to extract gold from it, Callias the Athenian discovered vermilion.

Vermilion. The same as now used.

Sinapis. A red earth. The best was found near Lemnos, and was so valuable as to be sold sealed up. It approached near, in color, to minium.

Rubrica. A red earth.

Cinnabar. Native Indian name for dragon's blood.

Sandaracha. A red orpiment.

Sandyx. By some thought to be vegetable red, and obtained somewhat after the manner of our lakes, viz. absorbing the coloring matter of a decoction of the vegetable matter in chalk.

Purpurissum. A lake made from the ingredient used in dyeing purple, being absorbed in tripoli.

Syricum. A mixture of sinopis and sandyx.

Armenium, or Azure, also called *Ceruleum*. Verd'azur, or blue vitriol. Pliny calls it a sand; and says there were three kinds, viz. the Egyptian, the Scythian, and the Cyprian.

Indicum. Indigo.

GREENS.—*Chrysocolla.* Malachite, or mountain green.

Appianum. Another of the same nature.

BLACKS.—*Atramentum.* A common name for all black colors. Pliny speaks of one kind as oozing from the earth; and it may possibly have been some kind of bitumen: of another as being made from smoke of resin and pitch. Burnt lees of wine, or husks of grapes, produced a third, used by Polygnotus and Mycon, under the name of *truginin*; and a fourth was invented and used by Apelles, by burning ivory. That, being made thin by some process, was probably the atramentum or varnish, which he is said to have laid over the surface of his pictures. What this process was is unknown: perhaps, as the mode of painting with wax by heat was practised, it might have been some modification of that material. Of the above coloring substances, Apelles and other ancient artists employed, if we are to give credit to Pliny, only four. Here, however, he seems to have placed himself between the horns of a dilemma: since we are compelled to question either his correctness as to their limitation of colors, or the abundant encomiums which he bestows on their works. Four perfect colors, it is true, with all their modifications and combinations, may be regarded as adequate to every purpose the art of coloring might require. But the celebrated historian has forbidden us to speculate on the possibility of this perfection, by naming the substances; and since the present practice of art, although possessed of substances far more powerful than those enumerated above, denies the knowledge of any four pigments equal to the production of a really fine piece of coloring, we are, as before observed, compelled to suspend our judgment on the subject.

SECT. II.—OF MODERN PAINTING.

The art of painting was revived in Europe about the end of the thirteenth, or beginning of the fourteenth, century. It might have been practised in an humble and obscure manner somewhat earlier; but it was not until a still later period that it made any thing like progress. The human mind, having been plunged into profound ignorance, was destitute of every principle of sound philosophy which enables it to determine on the object of the arts; and consequently the painters contented themselves with works adapted to the general taste, without proportion

and without beauty. In Italy, where the first attempts were made, they were employed chiefly on subjects connected with religious feelings, such as the mysteries of the passion, &c.; and their labors were principally in the adornment of ecclesiastical buildings. Painting, however, did not long continue in the imperfect condition in which it was left by those who first cultivated it among the moderns. It was to be expected that their successors would endeavour to surpass them by joining some degree of theory to the barbarous practice they had adopted. Among the first points of art discovered after its restoration was the principle of perspective, a knowledge of which made the artists capable of expressing what is denominated foreshortening, by means of which a greater degree of truth and effect was afforded to their performances. Cimabue, Giotto, Masaccio, Mantegna, and Luca Signorelli, successively upheld the dawning glories of revived art. The latter, in particular, appears to have been the first who contemplated objects with a discriminating eye; perceived what was accidental, what essential; balanced light and shade, and decided the motion of his figures. He foreshortened with equal boldness and intelligence; and thence it is, probably, that Vasari fancies to have discovered, in the Last Judgment of Michael Angelo, traces of imitation from the Lunetta, painted by Luca in the church of the Madonna, at Orvieto; but the powers which animated him there, and before at Arezzo, are no longer visible in the Gothic medley with which he filled two compartments in the chapel of Sextus IV. at Rome.

Two years after the death of Masaccio, namely, in 1445, was born *Leonardo da Vinci*, whose genius broke forth with a splendor which distanced former excellence: 'made up of all the elements that constitute the essence of genius, favored by education and circumstances, all ear, all eye, all grasp; painter, poet, sculptor, anatomist, architect, engineer, chymist, machinist, musician, man of science, and sometimes empiric, he laid hold of every beauty in the enchanted circle, but, without exclusive attachment to one, dismissed in her turn each. Fitter to scatter hints than to teach by example, he wasted life, insatiate in experiment. To a capacity which at once penetrated the principle and real aim of the art, he joined an inequality of fancy that at one moment lent him wings for the pursuit of beauty, and the next flung him on the ground to crawl after deformity: we owe him chiaro-scuro with all its magic, we owe him caricature with all its incongruities. His notions of the most elaborate finish, and his want of perseverance, were at least equal;—want of perseverance alone could make him abandon his cartoon destined for the great council chamber at Florence, of which the celebrated contest of horsemen was but one group; for to him who could organise that composition, Michael Angelo himself ought rather to have been an object of emulation than of fear: and, that he was able to organise it, we may be certain from the remaining sketch in the Etruria Pittrice lately published, but still more from the admirable print of it by Edelinck, after a drawing of Rubens, who was Leonardo's great ad-

mirer, and has done much to impress us with the beauties of his Last Supper, in the Refectory of the Dominicans at Milan, which he abandoned likewise without finishing the head of Christ, exhausted by a wild chase after models for the heads and hands of the apostles: had he been able to conceive the centre, the radii must have followed of course.' Towards the beginning of the century in which Leonardo da Vinci was born, the use of oil was adopted as a vehicle for painting, and afforded the means of most extensive improvements, particularly in color and effect. The methods to which the former execution of the art had been restricted (namely, distemper, in colors mixed with size and water, and afterwards fresco) were of a limited nature, especially the latter, in which, no means being given to change or retouch the colors without manifest detriment to the work, the artist was hampered in his plan of conduct and management of design. The invention of oil-painting remedied this disadvantage; and, as it allowed endless variety in effects as well as disposition of colors, together with complete harmony throughout the whole, the fancy of the artist was now permitted to take its full swing, and to produce enchantments which successive ages have not been sufficient to dissolve or even weaken.

The circumstance of varnishing over pictures which had been painted in water colors is thought, and perhaps justly, to have been that which led to this important discovery. John Van Eyck, who flourished at Brussels in 1410, is the artist to whom the first exercise of painting with colors ground and mixed with oil has been attributed. At all events, if he was not the first who actually applied it to the purposes of his art, it was he who first made effectual use of it. In any other case, his application of the system would not, to use the words of Vanmander, 'have made as much noise in the world as the discovery of gunpowder by Bertoldo Schwartz had done nearly a century before.' According to this same writer, the art of painting had been carried into Flanders, about the time of Giotto, by some Flemings, who went to Italy for the purpose of receiving instruction in it; and he goes on to describe it as having been practised 'with gum and eggs, at its first commencement, by Cimabue.' The Germans, likewise, acquired the art about the same time; but its most successful progress and achievements were confined to the classic countries of Italy.

'Bartolomeo della Porta, or di S. Marco, the last master of this period, first gave gradation to color, form and masses to drapery, and a grave dignity, till then unknown, to execution. If he was not endowed with the versatility and comprehension of Leonardo, his principles were less mixed with base matter, and less apt to mislead him. As a member of a religious order, he confined himself to subjects and characters of piety; but the few nudities which he allowed himself to exhibit show sufficient intelligence and still more style: he foreshortened with truth and boldness; and, whenever the figure admitted of it, made his drapery the vehicle of the limb it invests. He was the true master of Raffaello,

whom his tuition weaned from the meanness of Pietro Perugino, and prepared for the mighty style of Michel Angiolo Buonarrotti.

'Sublimity of conception, grandeur of form, and breadth of manner, are the elements of Michel Angiolo's style. By these principles he selected or rejected the objects of imitation. As painter, as sculptor, as architect, he attempted, and above any other man succeeded, to unite magnificence of plan, and endless variety of subordinate parts, with the utmost simplicity and breadth. His line is uniformly grand: character and beauty were admitted only as far as they could be made subservient to grandeur. The child, the female, meanness, deformity, were by him indiscriminately stamped with grandeur. A beggar rose from his hand the patriarch of poverty; the hump of his dwarf is impressed with dignity; his women are moulds of generation; his infants teem with the man; his men are a race of giants. This is the 'terribil via' hinted at by Agostino Caracci, though perhaps as little understood by the Bolognese as by the blindest of his Tuscan adorers, with Vasari at their head. To give the appearance of perfect ease to the most perplexing difficulty was the exclusive power of Michel Angiolo. He is the inventor of epic painting, in that sublime circle of the Sistine chapel, which exhibits the origin, the progress, and the final dispensations of theocracy. He has personified motion in the groups of the cartoon of Pisa; embodied sentiment on the monuments of St. Lorenzo; unravelled the features of meditation in the prophets and sybils of the chapel of Sextus; and in the Last Judgment, with every attitude that varies the human body, traced the master-trait of every passion that sways the human heart. Though, as sculptor, he expressed the character of flesh more perfectly than all who went before or came after him, yet he never submitted to copy an individual, Julio the second only excepted, and in him he represented the reigning passion rather than the man. In painting he contented himself with a negative color; and, as the painter of mankind, rejected all meretricious ornament. The fabric of St. Peter, scattered into an infinity of jarring parts by Bramante and his successors, he concentrated; suspended the cupola, and to the most complex gave the air of the most simple of edifices. Such, take him all in all, was M. Angiolo, the salt of art: sometimes he no doubt had his moments of dereliction, deviated into manner, or perplexed the grandeur of his forms with futile and ostentatious anatomy: he met with armies of copyists, and it has been his fate to have been censured for their folly.

'The inspiration of Michel Angiolo was followed by the milder genius of Raffaello Sanzio, the father of dramatic painting, the painter of humanity; less elevated, less vigorous, but more insinuating, more pressing on our hearts, the warm master of our sympathies. What effect of human connexion, what feature of the mind, from the gentlest emotion to the most fervid burst of passion, has been left unobserved, has not received a characteristic stamp from that examiner of man? M. Angiolo came to nature, nature came to Raffaello—he transmitted her

features like a lucid glass unstained, unmodified. We stand with awe before M. Angiolo, and tremble at the height to which he elevates us—we embrace Raffaele, and follow him wherever he leads us. Energy, with propriety of character and modest grace, poise his line, and determine his correctness. Perfect human beauty he has not represented; no face of Raffaele's is perfectly beautiful; no figure of his, in the abstract, possesses the proportions that could raise it to a standard of imitation: form to him was only a vehicle of character or pathos, and to those he adapted it in a mode and with a truth which leaves all attempts at emendation hopeless. His invention connects the utmost stretch of possibility with the most plausible degree of probability, in a manner that equally surprises our fancy, persuades our judgment, and affects our heart. His composition always hastens to the most necessary point as its centre, and from that disseminates, to that leads back, as rays, all secondary ones. Group, form, and contrast, are subordinate to the event, and common-place ever excluded. His expression, in strict unison with, and decided by, character, whether calm, animated, agitated, convulsed, or absorbed by inspiring passion, unmixed and pure, never contradicts its cause, equally remote from tameness and grimace: the moment of his choice never suffers the action to stagnate or to expire; it is the moment of transition, the crisis big with the past and pregnant with the future.—If, separately taken, the line of Raffaele has been excelled in correctness, elegance, and energy; his color far surpassed in tone, and truth, and harmony; his masses in roundness, and his *chiaro-scuro* in effect—considered as instruments of pathos, they have never been equalled; and in composition, invention, expression, and the power of telling a story, he has never been approached.

Whilst the superior principles of the art were receiving the homage of Tuscany and Rome, the inferior but more alluring charm of color began to spread its fascination at Venice, from the pallet of Giorgione da Castel Franco, and irresistibly entranced every eye that approached the magic of *Titiano Vecelli* of Cadore. To no colorist before or after him did nature unveil herself with that dignified familiarity in which she appeared to Titiano. His skill, universally and equally fit for all her exhibitions, rendered her simplest to her most compound appearances with equal purity and truth. He penetrated the essence and the general principle of the substances before him, and on these established his theory of color. He invented that breadth of local tint which no imitation has attained; and first expressed the negative nature of shade: his are the charms of glazing, and the mystery of reflexes, by which he detached, rounded, connected, or enriched his objects. His harmony is less indebted to the force of light and shade, or the artifices of contrast, than to a due balance of color, equally remote from monotony and spots. His backgrounds seem to be dictated by nature. Landscape, whether it be considered as the transcript of a spot, or the rich combination of congenial objects, or as the scene of a phenomenon, dates its origin from him: he is the father of

Vol. XVI.

portrait painting, of resemblance with form, character with dignity, and costume with subordination.

Another charm was yet wanting to complete the round of art—harmony: it appeared with Antonio Lati, called Correggio, whose works it attended like an enchanted spirit. The harmony and the grace of Correggio are proverbial: the medium which by breadth of gradation unites two opposite principles—the coalition of light and darkness by imperceptible transition—is the element of his style. This inspires his figures with grace, to this their grace is subordinate: the most appropriate, the most elegant attitudes were adopted, rejected, perhaps sacrificed to the most awkward ones, in compliance with this imperious principle: parts vanished, were absorbed, or emerged in obedience to it. This unison of a whole predominates over all that remains of him, from the vastness of his cupolas to the smallest of his oil pictures. The harmony of Correggio, though assisted by exquisite hues, was entirely independent of color: his great organ was *chiaro-scuro* in its most extensive sense; compared with the expanse in which he floats, the effects of Lionardo da Vinci are little more than the dying ray of evening, and the concentrated flash of Giorgione discordant abruptness. The bland central light of a globe, imperceptibly gliding through lucid demitints into rich reflected shades, composes the spell of Correggio, and affects us with the soft emotions of a delicious dream.

The patronage which the art had enjoyed in Italy, from the commencement of its restoration, kept pace with its progress, and was at length perfected by Julius II. and Leo X. at Rome, and by the truly illustrious family of the Medici at Florence. Cosmo di Medici, at the same time that his care and thoughts were directed to the state affairs of the latter province, still found time and means to watch over the development of the fine arts. His grandson Lorenzo (surnamed the Magnificent), who became his successor A.D. 1464, carried these elegant tastes to a still greater extent, and increased, among other praiseworthy actions, that mass of ancient relics which the industrious search prescribed by his predecessor had collected, and which adorned the Medici palace. Desirous of stimulating his countrymen to a successful rivalry with these invaluable treasures, Lorenzo threw open his gardens, wherein they had been deposited, as a school for study, and honored both his own discrimination and the consummate ability of the artist by placing Michel Angiolo at the head of it. By the influence of this potentate, principally, the council hall of the Florentine republic (which had been shortly before rebuilt), was adorned with paintings by Michel Angiolo and Lionardo da Vinci, each being allotted one side of the hall for the exercise of his talents. This may be considered as the first instance of any moment of public civil employment being given to the painters of Italy; their chief exertions having been previously restricted to the decoration of religious edifices.

The internal discords which about this period began to engross the attention of the Florentines

2 G

prevented them from continuing to patronise the arts as they had done; and, added to this, Julius II., who then filled the papal chair, aware of the splendor and glory attached to a state by the successful cultivation of the fine arts, summoned to Rome both Raffaele and Michel Angiolo, who, under his auspices, began those innumerable works in the Vatican which every judicious artist or amateur both thinks and speaks of with enthusiasm. Leo X., his successor, was son of Lorenzo di Medici, and thus possessed a double stimulus, both from the example of his father and his predecessor, to encourage and preside over art. We use but weak words when we say this stimulus was not disregarded. It served to direct the efforts of painting towards the service and splendor of the church over which he swayed, of his rank as a secular sovereign, and of himself as one of the Medici. Thus was the principal seat of the arts transferred from Florence to Rome; which gradually became, in consequence of its many combined advantages, a complete university of art, and the resort of all such as were ambitious to excel therein; and thus may be said to have terminated in the reign of Leo X. the second grand epoch of the art.

‘The resemblance which marked the two first periods of ancient and modern art vanishes altogether as we extend our view to the consideration of the third, or that of refinement, and the origin of schools. The pre-eminence of ancient art, as we have observed, was less the result of superior powers, than of simplicity of aim and uniformity of pursuit. The Hælladic and the Ionian schools appear to have concurred in directing their instruction to the grand principles of form and expression: this was the stamen which they drew out into one immense connected web. The talents that succeeded genius applied and directed their industry and polish to decorate the established system, the refinements of taste, grace, sentiment, color, adorned beauty, grandeur, and expression.’ The Tuscan, the Roman, the Venetian, and the Lombard schools, whether from incapacity, want of education, of adequate or dignified encouragement, meanness of conception, or all these together, separated, and in a short time substituted the medium for the end. Michel Angiolo lived to see the electric shock which his design and style had given to art, propagated by the Tuscan and Venetian schools, as the ostentatious vehicle of puny conceits and emblematic quibbles, or the palliative of empty pomp and degraded luxuriance of color. He had been copied but was not imitated by Andrea Vannuchi, surnamed del Sarto, who in his series of pictures on the life of John the Baptist, in preference adopted the meagre style of Albert Durer. The artist who appears to have penetrated deepest to his mind was Pellegrino Tibaldi of Bologna; celebrated as the painter of the frescoes in the Academic Institution of that city, and as the architect of the Escorial under Philip II. The compositions, groups, and single figures of the Institute exhibit a singular mixture of extraordinary vigor and puerile imbecility of conception, of character and caricature, of style and

manner. Polypheme groping at the mouth of his cave for Ulysses, and Æolus granting him favorable winds, are striking instances of both: than the Cyclops, Michel Angiolo himself never conceived a form of savage energy with attitude and limbs more in unison; whilst the god of winds is degraded to a scanty and ludicrous semblance of Thersites, and Ulysses with his companions travestied by the semibarbarous look and costume of the age of Constantine or Attila; the manner of Michel Angiolo is the style of Pellegrino Tibaldi; from him Goltzius, Hemskirk, and Spranger, borrowed the compendium of the Tuscan’s peculiarities. With this mighty talent, however, Michel Angiolo seems not to have been acquainted: but by that unaccountable weakness incident to the greatest powers, and the severe remembrancer of their vanity, he became the superintendent and assistant tutor of the Venetian Sebastiano, and of Daniel Ricciarelli, of Volterra; the first of whom, with an exquisite eye for individual, had no sense for ideal color, whilst the other rendered great diligence and much anatomical erudition useless, by meagreness of line and sterility of ideas: how far Michel Angiolo succeeded in initiating either in his principles, the far famed pictures of the Resuscitation of Lazarus, by the first (once in the cathedral of Narbonne, and now one of the chief ornaments of the British National Gallery), and the fresco of the Descent from the Cross (in the church of La Trinità del Monte), at Rome, by the second, sufficiently evince: pictures which combine the most heterogeneous principles. The group of Lazarus in Sebastiano del Piombo’s, and that of the women, with the figure of Christ, in Daniel Ricciarelli’s, not only breathe the sublime conception that inspired, but the master hand that shaped them: offsprings of Michel Angiolo himself, models of expression, style, and breadth, they cast on all the rest an air of inferiority, and only serve to prove the incongruity of partnership between unequal powers; this inferiority, however, is respectable when compared with the depravations of Michel Angiolo’s style by the remainder of the Tuscan school, especially those of Giorgio Vasari, the most superficial artist, and the most abandoned mannerist of his time, but the most acute observer of men, and the most dexterous flatterer of princes. He overwhelmed the palaces of the Medici and of the popes, the convents and churches of Italy, with a deluge of mediocrity, commended by rapidity and shameless ‘bravura’ of hand: he alone did more work than all the artists of Tuscany together, and to him may be truly applied, what he had the insolence to say of Tintoretto, that he turned the art into a boy’s toy.’

Giulio Romano was the most eminent of the pupils of Raffaele; but though, like his illustrious master, impressed with the stupendous views and style of Buonarroti, he had by no means equal force of judgment, or delicacy of taste, to guide him in his application of these qualities. It is not so much from his tutored works in the Vatican that we are to judge of the best achievements of Romano as from the grand conceptions, the pathetic or sublime allegories,

and the luxurious reveries which constitute the principal charm of the palace del T, near Mantua: had the artist united purer taste with loftiness of imagination, the magnitude of these performances would perhaps have distanced all competition: but, as it is, they have been likened to a mighty stream, sometimes flowing in a full and limpid vein, but oftener turbid with rubbish. Besides this celebrated artist, Parmegiano, Tintoretto, Polydori, and Caravaggi, were amongst the most skilful of those who continued to uphold the practise of art with ability. No artist ever painted his own mind so powerfully as did Michel Angiolo Amerigi, surnamed Il Caravaggi. To none did nature ever set limits with a more decided hand. Darkness gave him light; into his melancholy cell light stole only with a pale reluctant ray, or broke on it as flashes in a stormy night. The most vulgar forms he recommended by ideal light and shade, and a tremendous breadth of manner.'

Titian and Correggio had, in point of the adoption of their respective principles, fates widely different. That of the former being less pure in itself, and less decided in its object of imitation, than either Angiolo's or Raffaele's, suffered comparatively less from the various applications of it by his followers. It had besides for its support the irresistible fascinations of color, which speak to every spectator, and hence was successfully pursued for a considerable time. But the principle of Correggio was not calculated for this species of longevity. It vanished with its author. His expansive breadth of light; His inexpressible grace (so much talked of, yet so little understood); his perfect harmony and depth of tone have never been otherwise than partially imitated. Parmegiano may be considered to have imbibed his style the most fully. This admirable artist, was, like Raffaele and Giorgione, abstracted from this world in early manhood, and perhaps before the complete capabilities of his mind had been developed.

Such was the condition of the art when, towards the end of the sixteenth century, the Caracci (Ludovico, Agostino, and Annibale), founded at Bologna that *Eclectic School*, the aim of which was, by selecting the beauties, correcting the faults, supplying the defects, and avoiding the extremes of the different styles then practised, to establish a perfect system. The plan was laid down by Agostino Caracci in the following sonnet:—

Chi farsi un buon Pittor cerca, e desia,
Il disegno di Roma habbia alla mano.
La mossa coll' ombrar Veneziano,
E il degno color di Lombardia.
Di Michel' Angiol la terribil via,
Il vero natural di Tiziano,
Del Correggio lo stil puro, e sovrano,
E di un Rafel la giusta simetria.
Del Tibaldi il decoro, e il fondamento,
Del dotto Primaticcio l'inventare,
E un po di gratia del Parmigianino.
Ma senza tanti studi, e tanto stento,
Si ponga l'opre solo ad imitare,
Che qui lascioci il nostro Niccolino.

'Take,' says Agostino, 'the design of Rome, Venetian motion and shade, the dignified tone of

Lombardy's color, the terrible manner of Michel Angiolo, the just symmetry of Raffaele, Titiano's truth of nature, and the sovereign purity of Correggio's style: add to these the decorum and solidity of Tibaldi, the learned invention of Primaticcio, and a little of Parmegiano's grace; but to save so much study, such weary labor, apply your imitation to the works which our dear Nicolo has left us here.' This tone of advice has, it must be confessed, very much the character of a good receipt for making blacking; and it is the more curious that it should be so, inasmuch as the object proposed by these celebrated relatives, although not effectually attained, yet was sufficiently so to arrest for awhile the backward progress of the art. Ludovico, indeed, instead of blindly following the dictates of any master or masters, was the decided pupil of nature: by the simplicity and purity of his taste and execution not only surpassing his kinsmen, Annibale and Agostino, but in a considerable degree restoring the art once more to its first and greatest principles. Annibale, it is true, disputed the point vigorously by his energetic execution and academic acquirement; but the work on which his fame chiefly reposes (the gallery of the Farnese palace at Rome), proves, that if superior to both of his kinsmen in those accomplishments, he was inferior to either in taste, sentiment, or discrimination.

Sir Joshua Reynolds, who saw the works of Ludovico Caracci at Bologna, holds him out, in his Discourses, as the best model for what is more specifically denominated style in painting. 'Ludovico Caracci,' says he ('I mean in his best works'), appears to me to approach the nearest to perfection. His unaffected breadth of light and shadow, the simplicity of coloring, which, holding its proper rank, does not draw aside the least part of the attention from the subject, and the solemn effect of that twilight which seems diffused over his pictures appears to me to correspond with grave and dignified subjects better than the more artificial brilliancy of sunshine which enlightens the pictures of Titian. The school formed by the Caracci for the improvement of their art was entitled *l'Academi degli Desiderosi*, but is better recognised as the Academy of the Caracci, and gave rise to many artists of high name and merited celebrity. But these individuals soon threw aside, at least as completely as they could, the heterogeneous principle on which it was founded, each following the dictates of his own uncontrolled imagination, and differing from his fellow students as well in manner as in objects of imitation. The greatest of these names is that of Guido Rheni, whose grace, although exquisite, was yet artificial; his female forms, more especially, may be considered as abstracts of antique beauty, attended by languishing attitudes, and dressed in voluptuous attire. Domenichino comes next, who, unusually obedient to the prescription of his master, strove to combine with the expression of Raffaele the energy of Annibale Caracci, and the color of Ludovico. Schidone, Lanfranco, Guercino, each studied in the school of the Caracci; but the indefinite nature of its system soon wrought its downfall.

From this period is to be dated the rapid decline of the art in Italy. Da Cortona and Giordana both possessed great powers, but abused them by yielding implicitly to the tasteless suggestions of their employers. Nicholas Poussin, a Frenchman, but grafted on the Roman stock, placed himself in the gap, and endeavoured to stem the torrent of corrupted taste. He reverted, for his models to the pure source of Grecian art: indeed, such was his attachment to the ancients, that he has been said to have copied their relics rather than imitated their spirit. The costume, the mythology, the rites of antiquity, were his elements; his scenery, his landscape, are pure classic ground. The wildness of Salvator Rosa opposes a striking contrast to the classic regularity of Poussin. Terrific and grand in his conceptions of inanimate nature, he was reduced to attempts of hiding, by boldness of hand, his inability of exhibiting her impassioned, or in the dignity of character. With Poussin and Salvator closes all record worth notice of the history of the art in Italy.

The first name which claims our attention, in noticing the progress of painting in *Germany*, is that of Albert Durer. This man's talents were various, his compositions the result of deep study, his thoughts ingenious, his colors brilliant. On the other hand he has been blamed for stiffness and aridity in his outlines, for the absence of taste or grandeur in his expression, for ignorance of costume, of aerial perspective, and of gradation of colors. Lucas of Leyden was Durer's most successful rival, unless we except Holbein, who, if he did not equal him in composition, unquestionably surpassed him, and that greatly, in portrait.

The history of the art in the neighbouring countries of *Flunders* and *Holland* is not distinct from that of Germany until the appearance of those two meteors of art Peter Paul Rubens and Rembrandt Van Rhyn. The former of these extraordinary men produced an immense number of works. He excelled alike in historical painting, in portrait and landscape, in fruit, flowers, and animals. He both invented and executed with the utmost facility; and, to show the extent of his powers, frequently made a great number of sketches of the same subject altogether different, and without allowing any time to elapse between them. His figures appear to be the exact counterpart of his conceptions, and their creation nothing more than a simple act of the will. He had great knowledge of anatomy, but was often hurried away by the impetuosity of his imagination, and his ardor for execution. He preferred splendor to beauty of form, and occasionally sacrificed correctness of design to the magic of color. In short, the qualities of Rubens, generally speaking, indicate a mind full of fire and vigor rather than accuracy or profound thought.

It appears evident, from the works of Rubens, that his method of painting was to lay the colors in their place one at the side of another, and mix them afterwards by a slight touch of the pencil. Titian mingled his tints as they are in nature, in such a manner as to render it impossible to discover where they began or terminated;

the effect is evident, the labor is concealed. Thus Rubens is more dazzling, and Titian more harmonious. In this respect, the first excites the attention, the second fixes it. The carnations of Titian resemble the blush of nature; those of Rubens are brilliant and polished like satin, and sometimes even his tints are so strong and separate, as to have the effect of spots. 'Rubens,' says Sir Joshua Reynolds, 'is a remarkable instance of the same mind being seen in all the various parts of the art. The whole is so much of a piece, that one can scarce be brought to believe but that, if any one of them had been more correct and perfect, his works would not be so complete as they appear. If we should allow a greater purity and correctness of drawing, his want of simplicity in composition, coloring, and drapery would appear more gross.' He was truly the father of Flemish art, so remarkable for brilliancy of coloring, for exactness of drawing, and the magic of their *chiaroscuro*. To these may be added profound arrangement, though not exercised on the most beautiful forms; a composition not destitute of grandeur, a certain air of nobleness in the figures, strong and natural expression; in short, to speak generally, a species of art neither copied from the ancients, nor from the Roman or Lombard schools, and indeed unknown to any other part of the world; and which, during the course of the seventeenth century, furnished those countries wherein it arose with innumerable works of the greatest perfection in their kind.

Rembrandt was a genius of the first order, if we except what relates to form, and in him the choice of low figures is the more offensive, as his compositions frequently required the very opposite. As his father was a miller near Leyden, his education must altogether have depended on the exertion of great talents, and the study of nature. He studied the grotesque figure of a Dutch peasant, or the servant of an inn, with as much application as the greatest masters of Italy would have studied the Apollo Belvidere or the Venus de Medici. In spite, however, of the most portentous deformity, and without dwelling on the spell of his *chiaroscuro*, such were his powers of nature, such the grandeur, pathos, or simplicity of his composition, from the most elevated or extensive arrangement to the meanest or most homely, that the best cultivated eye, the purest sensibility, and the most refined taste, are equally fascinated by them. Like Shakspeare he combined transcendent excellence with many even unpardonable faults, and reconciled us to them. 'He possessed the complete empire of light and shade, and of all the tints which float between them. He tinged his pencil, with equal success, in the cool of dawn, in the noontide ray, in the livid flash, in evanescent twilight, and rendered darkness visible. Though made to bend a stedfast eye' on the bolder phenomena of nature, he knew how to follow her into her calmest abodes, gave interest to insipidity or baldness, and plucked a flower in every desert.' 'Rembrandt's manner of painting (says M. Descamps) is a kind of magic. No artist knew better the

effects of different colors mingled together, nor could better distinguish those which did not agree from those which did. He placed every tone in its place with so much exactness and harmony, that he needed not to mix them, and so destroy what may be termed the flower and freshness of the colors. He made the first draft of his pictures with great precision, and with a mixture of colors altogether particular. He proceeded on his first sketch with vigorous application, and sometimes loaded his lights with so great a quantity of color that he seemed to model rather than to paint. His workshop was occasionally made dark, and he received, through a hole, the light, which fell as he chose to direct it. On particular occasions, he placed behind his model a piece of cloth of the same color with the ground he wanted, and this piece of cloth, receiving the same ray which enlightened the head, marked the difference in a sensible manner, and allowed the painter the power of augmenting it according to his principles.

It is difficult to determine the progress of painting in *France*. Miniature painting, and painting on glass, were early cultivated in that country; and in these two kinds the Italians had often recourse to the French artists. The art, for some time encouraged by Francis I., fell into a state of languor from which it did not recover till the reign of Louis XIII. Jaques Blanchard, who has been called the French Titian, flourished about this period; but, as he died young, and without educating any pupils to perpetuate his manner, he cannot be regarded as the master of any school. We have already spoken of Nicholas Poussin, in our review of Italian art, to which he more properly belonged. But the seeds of mediocrity which the Caracci had attempted to scatter over Italy found a more congenial soil, and reared an abundant harvest, in France: 'to mix up a compound from something of every excellence in the catalogue of art was the principle of their theory, and their aim in execution. It is in France where Michel Angelo's right to the title of a painter was first questioned. The fierceness of his line, as they call it, the purity of the antique, and the characteristic forms of Raffaele are only the road to the academic vigor, the librated style of Annibale Caracci, and from that they appeal to the model; in composition they consult more the artifice of grouping, contrast, and richness, than the subject or propriety; their expression is dictated by the theatre. From the uniformity of this process, not to allow that the school of France offers respectable exceptions would be unjust; without recurring again to the name of Nicholas Poussin, the works of Eustache le Sueur, Charles le Brun, Sebastien Bourdon, and sometimes Pierre Mignard, contain original beauties and rich materials. Le Sueur's series of pictures in the Chartreux exhibit the features of contemplative piety, in a purity of style and a placid breadth of manner that moves the heart. His dignified martyrdom of St. Laurence, and the burning of the magic books at Ephesus, breathe the spirit of Raffaele. The powerful comprehension of a whole, only equalled by the fire which pervades every part of the battles of Alexander,

by Chas. le Brun, would entitle him to the highest rank in history, had the characters been less mannered; had he not exchanged the Argyraspsids and the Macedonian phalanx for the compact legions of the Trajan pillar; had he distinguished Greeks from barbarians rather by national feature and form than by accoutrement and armour. The seven works of charity by Seb. Bourdon teem with surprising, pathetic, and always novel images; and in the plague of David, by Pierre Mignard, our sympathy is roused by energies of terror and combinations of woe, which escaped Poussin and Raffaele himself.

The obstinacy of national pride, perhaps more than the neglect of government or the frown of superstition, confined the labors of the *Spanish* school, from its obscure origin at Sevilla to its brightest period, within the narrow limits of individual imitation. But the degrees of perfection attained by Diego Velasquez, Joseph Ribera, and Murillo, in pursuing the same object by means as different as successful, impresses us with deep respect for the variety of their powers. That the great style ever received the homage of Spanish genius, appears not; neither Alfonso Beruguette nor Pelegrino Tibaldi left followers: but that the eyes and the taste, fed by the substance of Spagnuolo and Murillo, should without reluctance have submitted to the gay volatility of Lucca Giordano, and the ostentatious flimsiness of Sebastian Conca, would be matter of surprise, did we not see the same principles successfully pursued in the plafonds of Antonio Raphael Mengs, the painter of philosophy, as he is styled by his biographer D'Azara. The cartoons of the frescoes painted for the royal palace at Madrid, representing the apotheosis of Trajan and the temple of Renown, exhibit less the style of Raffaele in the nuptials of Cupid and Psyche in the Farnesina, than the gorgeous but empty bustle of Pietro da Cortona.

We conclude this sketch of the history of painting by a brief notice of its progress in *our own country*. But little is known respecting the existence of painting in England previously to the reign of Henry VIII., who patronised the talents of Holbein and Torregiano, and invited Titian to visit his court. It was but a short period before that these islands had begun to cultivate the elegant arts of life, and to shake off the influence of rude and ignorant manners. The choice of subjects, however, prescribed by Henry and his courtiers to those eminent men who then resided in England, was unquestionably to be lamented, and suffers extremely from a contrast with what was done by his rival, Francis I., the French king, who employed and enriched Andrea del Sarto, Rustici, Rosso, Primaticcio, Cellini, and Niccolo, not to aggregate a mass of painted and chiselled treasures for the mere gratification of his own vanity, but to scatter the seeds of real taste throughout France; while, on the other hand, Torregiano and Holbein under Henry, as well as Frederigo Zuchere under Elizabeth, were condemned to Gothic work and portrait painting. The Reformation, however great the satisfaction with which the English people justly regard it, was, without doubt, highly injurious to the cultivation of the prin-

ciples of art. The stern spirit of the early reformers led them not only into a total disregard, but into an absolute condemnation, of every thing ornamental or superfluous; and the arts of painting and sculpture, more particularly, owing their principal splendor and success to the munificent patronage of the mother church, fell under the peculiar and powerful ban of her revolted daughter. If, on the contrary, at this juncture, when the national spirit was remodelled, and when that stupendous change laid open almost all that was grand in intellect or spirited in action, the fine arts had participated in the vigorous upspringing, and had received the encouragement instead of the reprobation of those lofty-minded theologians, it is more than probable that England would at this day have had to boast, in addition to her brilliant and recognised claims on the score of literature and science, the glory of exhibiting a national and superior style of historical painting. But, as it was, the injunction of Henry against images (which had been made the instruments of idolatrous delusions in churches), and still more the rigid edicts of Edward VI. and Elizabeth against statues and pictures in general, while they suddenly checked the career of historical and religious painting, seem to have set a mark of disgrace on the arts themselves, and to have left them, for a considerable length of time, a prey to indifference and scorn.

Charles I., it is true, strove to introduce a feeling for the art; and, whilst Rubens sojourned amongst us in the character of an ambassador from the court of Madrid, employed him to paint the ceiling of his newly erected banquetting room (now the chapel) at Whitehall. He also, by countenancing and patronising that prince of portrait painters, Vandyck, as well as other foreigners of talent, conferred on his country a treasure for which we trust she is at length grateful. Charles collected a very considerable gallery of pictures, and, at the instance of Rubens, bought the invaluable cartoons of Raffaele, now the chief and envied ornament of Hampton Court: he likewise, at a cost of £20,000, purchased the cabinet of the duke of Mantua, and commissioned an artist to copy for him the works of Titian in Spain. But the exertions of Charles were frustrated and intercepted by his unhappy destiny; and the whole of his artistical collection was sold and dispersed by the parliament of 1643, which issued a mandate 'that all pictures which had the representation of the Saviour or the Virgin Mary in them should be burnt.' As if to complete this unfortunate distribution, so prejudicial to the interests of the art in England, a large part of this magnificent collection, which had been on the Restoration replaced in the palace of Whitehall, was utterly destroyed by the fire which consumed that edifice.

Charles II., with the cartoons of Raffaele in his possession, and with the splendid pictorial ornaments of Whitehall before his eyes, permitted the absurdities of Verrio, and the dull mimicries of Gennaro to render unsightly the walls of his palaces, whilst the genuine talent of Sir Peter Lely was degraded in painting the Cymons or Iphigenias of his voluptuous court. This distin-

guished artist, the rival, and in many instances the successful rival, of Vandyck, was succeeded by Sir Godfrey Kneller, who, with undoubted natural abilities, suffered the love of gain, when those abilities had lifted him into notice, to pervert his taste and deaden his ambition.

In historical painting no British artist had appeared to rival the performances of foreign excellence until Sir James Thornhill, born in 1677, arose to dispute the honors of the palette with La Guerre, whom many among our nobility had employed to decorate their halls and staircases. Sir James Thornhill received a commission from the state to decorate St. Paul's cathedral and Greenwich Hall, in which performances he was assisted by a German artist of the name of Andre. It will not, however, be imagined that much value was set on the talents of these gentlemen, when we state that Sir James's engagement was £2 per square yard! Thornhill's merits, indeed, as an historical painter, cannot be said to demand any very great commendation; still he was the father of English art in that particular, and for a long time had no successful imitator. 'In the commencement of the reign of George I. (says Sir Horace Walpole) the arts of England were sunk almost to the lowest ebb.' Portraiture, it is true, had been successfully practised by Dobson, Riley, Cooper, Greenhill, Jervas, and Richardson, but by none with any remarkable eminence.

It was not, however, to continue always thus; and the time at length arrived when the English artists appeared not only desirous but capable of raising the character of their country in this respect, at least, to a level with that of any other nation of Europe. The principal difficulty in the outset of this event was to rescue the art from the degrading influence of a vicious taste, to retrace the steps of our predecessors (or rather to burst the bandages in which they had enthralled us), and resort at once to the original principle of imitation; which, when pure and select, is the only sound basis of the art. The first step towards this reformation was the establishment of a school for drawing from the living figure. This had been begun by Sir James Thornhill, in most inexplicable conjunction with Sir Godfrey Kneller, who, one would imagine, from his latter works, had left all consideration of the value of such a thing far behind. Thus, however, he assisted in laying the foundation of a remedy for the evil which he, more than any other man, had occasioned. This school Sir James continued at his own house in the Piazza for some years. His death, in 1734, obliged the artists to procure another situation, which was not effected without some difficulty; for the people were so unprepared to regard the study from the naked figure as necessary to artists, that their meetings were even suspected to be held for immoral purposes. Another school was at length formed by Michael Moser, a native of Schaffhausen, and a chaser by profession, and six other artists, principally foreigners, the management resting with Moser. After a while they were visited by Hogarth and others, and a larger body was formed in consequence, who established themselves in Peter's Court, St. Mar-

tin's Lane, in the year 1739. Having acquired some property by combined exhibitions of their works they solicited a charter of incorporation, and, the scheme being sanctioned by his late majesty, their charter was granted in 1765. But, dissensions arising in the body, a secession of many of its principal members took place, and the result was the establishment of the Royal Academy in 1768, under the more immediate patronage of the king; Sir Joshua Reynolds being nominated its first president.—*Introduction to Edwards's Anecdotes of Painters.*

The general taste of the country was, in fact, awakened and purified with respect to art, and, on the success of Hogarth, Reynolds, and Wilson, several societies were formed throughout the kingdom for the avowed purpose of patronising and cultivating it.

Richardson, whose tracts ought to be known to every student and amateur of painting, died in 1745, at the advanced age of eighty. He was a bad painter, but his treatises on the art are full of enthusiasm, and of judicious observations on the theory of the art. Of one of these Sir Joshua Reynolds declared, that it had confirmed him in his love of the art, and elevated his ideas of its professors. Richardson contended strenuously for the propriety of painting portraits in the costume of their time; thus striking at the absurd system of flowing robes which had been adopted by Kneller. This suggestion of Richardson's, dictated by common sense, produced the happiest effects. The nonsensical draperies which had invested the represented persons of the gentlemen, together with the ungraceful silk robe which they contrived to throw negligently over the shoulders of the ladies, were laid aside; and the succeeding portrait painters, headed by a son-in-law of Richardson (Hudson, and a Frenchman of the name of Van Loo brother of Carle Van Loo), began to dress their sitters in all the formality of the day; Hudson being assisted by a Fleming of the name of Van Alken, in the representation of the silks and laces. Nor did the reformation stop here: it extended into the region of historical painting; and Hayman, the successor of Sir James Thornhill, perceived the propriety of retaining the costume properly appertaining to those figures introduced into his paintings; no longer, by an unmeaning affectation, changing them into Grecian heroes or Roman centurions. This period might be denominated the infancy of English art; and it is not a little curious, that at the time when painting was verging towards a state of hopeless decline all over the continent of Europe, it should have revived, and that to no small purpose, in these islands, the inhabitants of which had been frequently taunted by foreigners as unable to execute a fine painting.

We shall not dwell on its incipient state of improvement; indeed, the commendations bestowed on the painters alluded to above regard the principle of imitation rather than the thing imitated, since nothing could possibly be more untasteful or repulsive than the stiff, starch, and unsightly uniform (both male and female) of those days. But the principle of attention to actual representation once established, it soon

produced the fruits of a better taste in the art generally; and, accordingly, it was not long before the matchless talent of Hogarth beamed forth in unapproachable splendor to gild the onward progress of the muse of painting, and to herald the appearance of a kindred genius in the person of Sir Joshua Reynolds.

Hogarth traced out a department in painting which was at once novel and exciting—and he filled it:

Within that circle none durst walk but he!

His pictures are pregnant with meaning. Each one tells you a whole history. He had the faculty to grasp all the minutiae of the scene which he placed before you—nothing was suffered to escape.

'It is the fashion,' says Mr. Charles Lamb, 'with those who cry up the great historical school in this country, to exclude Hogarth from that school, as an artist of an inferior and vulgar class. Those persons seem to me to confound the painting of subjects in common or vulgar life with the being a vulgar artist. The quantity of thought which Hogarth crowds into every picture would alone unvulgarise every subject which he might choose. Let us take the lowest of his subjects, the print called Gin Lane. Here is plenty of poverty and low stuff to disgust upon a superficial view: and accordingly a cold spectator feels himself immediately disgusted and repelled. I have seen many turn away from it, not being able to bear it. The same persons would perhaps have looked with great complacency upon Poussin's celebrated picture of the Plague at Athens. Disease and death and bewildering terror, in Athenian garments, are endurable, and come, as the delicate critics express it, within the 'limits of pleasurable sensation.' But the scenes of their own St. Giles's, delineated by their own countryman, are too shocking to think of. Yet if we could abstract our minds from the fascinating colors of the picture, and forget the coarse execution (in some respects) of the print, intended as it was to be a cheap plate, accessible to the poorer sort of people, for whose instruction it was done, I think we could have no hesitation in conferring the palm of superior genius upon Hogarth, comparing this work of his with Poussin's picture. There is more of imagination in it—that power which draws all things to one—which makes things animate and inanimate, beings with their attributes, subjects and their accessories, take one color, and serve to one effect. Every thing in the print, to use a vulgar expression, tells. Every part is full of 'strange images of death.' It is perfectly amazing and astounding to look at. Not only the two prominent figures, the woman and the half-dead man, which are as terrible as any thing which Michel Angiolo ever drew, but every thing else in the print contributes to bewilder and stupify—the very houses, as I heard a friend of mine express it, tumbling all about in various directions, seem drunk—seem absolutely reeling from the effect of that diabolical spirit of phrenzy which goes forth over the whole composition. To show the poetical and almost prophetic conception in the artist, one little

circumstance may serve. Not content with the dying and dead figures, which he has strewed in profusion over the proper scene of the action, he shows you what (of a kindred nature) is passing beyond it. Close by the shell, in which, by direction of the parish beadle, a man is depositing his wife, is an old wall, which, partaking of the universal decay around it, is tumbling to pieces. Through a gap in this wall are seen three figures, which appear to make a part in some funeral procession which is passing by on the other side of the wall, out of the sphere of the composition. This extending of the interest beyond the bounds of the subject could only have been conceived by a great genius. The faces of Hogarth have not a mere momentary interest, as in caricatures, or those grotesque physiognomies which we sometimes catch a glance of in the street, and, struck with their whimsicality, wish for a pencil and the power to sketch them down—and forget them again as rapidly; but they are permanent abiding ideas. Not the sports of nature, but her necessary eternal classes. We feel that we cannot part with any of them, lest a link should be broken. It is worthy of observation, that he has seldom drawn a mean or insignificant countenance. If there are any of that description, they are in his *Strolling Players*, a print which has been cried up by lord Orford as the richest of his productions; and it may be, for what I know, in the mere lumber, the properties, and dead furniture of the scene; but in living character and expression it is (for Hogarth) lamentably poor and wanting; it is, perhaps, the only one of his performances at which we have a right to feel disgusted. Hogarth's mind was eminently reflective; and, as it has been well observed of Shakspeare, that he has transfused his own poetical character into the persons of his drama (they are all more or less poets), Hogarth has impressed a thinking character upon the persons of his canvas. This remark must not be taken universally. The exquisite idiotism of the little gentleman in the bag and sword beating his drum in the print of the *Enraged Musician*, would of itself rise up against so sweeping an assertion. But I think it will be found to be true of the generality of his countenances. The knife-grinder and Jew flute-player in the plate just mentioned may serve as instances, instead of a thousand. They have intense thinking faces, though the purpose to which they are subservient by no means required it; but indeed it seems as if it was painful to Hogarth to contemplate mere vacancy or insignificance. This reflection of the artist's own intellect from the faces of his characters is one reason why the works of Hogarth, so much more than those of any other artist, are objects of meditation. Our intellectual natures love the mirror which gives them back their own likenesses. The mental eye will not bend long with delight upon vacancy.

'Another line of eternal separation between Hogarth and the common painters of droll or burlesque subjects, with whom he is often confounded, is the sense of beauty, which in the most unpromising subjects seems never wholly to have deserted him. 'Hogarth himself,' says

Mr. Coleridge, from whom I have borrowed this observation, speaking of a scene which took place at Ratzeburg, 'never drew a more ludicrous distortion, both of attitude and physiognomy, than this effect occasioned; nor was there wanting beside it one of those beautiful female faces which the same Hogarth, in whom the satirist never extinguished that love of beauty which belonged to him as a poet, so often and so gladly introduces as the central figure in a crowd of humorous deformities; which figure (such is the power of true genius) neither acts nor is meant to act as a contrast, but diffuses through all, and over each of the group, a spirit of reconciliation and human kindness; and even when the attention is no longer consciously directed to the cause of this feeling, still blends its tenderness with our laughter: and thus prevents the instructive merriment at the whims of nature, or the foibles or humors of our fellow-men, from degenerating into the heart-poison of contempt or hatred.' To the beautiful females in Hogarth, which Mr. C. has pointed out, might be added the frequent introduction of children (which Hogarth seems to have taken a particular delight in) into his pieces. They have a singular effect in giving tranquillity and a portion of their own innocence to the subject. The baby riding in its mother's lap in the *March to Finchley* (its careless innocent face placed directly behind the intriguing time-furrowed countenance of the treason-plotting French priest) perfectly sobers the whole of that tumultuous scene. The boy mourner winding up his top with so much unpretending insensibility in the plate of the *Harlot's Funeral* (the only thing in that assembly that is not a hypocrite) quiets and soothes the mind that has been disturbed at the sight of so much depraved man and woman kind.'

Sir Joshua Reynolds was the first president of the Royal Academy; and on his return from Rome, at a previous part of his life, carried the art (at least as far as regards portrait-painting) to its very highest point of perfection. The life, the grace, the truth of his portraits have, for a long series of years, demanded and received the tribute of universal admiration. His best specimens are perhaps inferior to no pictures of the same kind in existence, and in some points may be said to exceed the performances of any preceding artist. He not only appears to have always aspired to attain the highest excellence of coloring, but in very many instances he did attain it; there being no one particular in which, generally speaking, he left his contemporaries so far behind him as in the richness and mellowness of his tints, when his colors were successful and permanent.

Though the landscapes Sir Joshua has given in the background of many of his portraits are eminently beautiful, he seldom exercised his hand in regular landscape-painting; but in the historical department he took a wider range; and, by his successful exertions in that higher branch of his art, he not only enriched various cabinets at home, but extended the fame of the English school to foreign countries.

And here it may not be amiss to observe

upon the notion which prevails of the coloring having faded and perished in the majority of Sir Joshua Reynolds's works. This is not correct: far the greater part of his pictures preserve their original hue, and are in perfect preservation. Those which have failed have been mentioned again and again, and thus have been multiplied in the imaginations of connoisseurs.—Nor should it be forgotten, that the pictures of other considerable painters have not been more durable than his. As many perished pictures of Gainsborough are, it has been affirmed, to be found in cabinets as of Sir Joshua Reynolds. Even the great colorists of the continent were not wholly free from this defect. Several pictures of Titian and Vanduyck, and more particularly of the exquisite French painter Watteau, have entirely lost that brilliancy which, without doubt, they once possessed.

What Reynolds did for portrait-painting, his distinguished contemporary, Wilson, did for landscape. He also had studied at Rome, and brought home thence a refined taste, and a power of execution at once chaste, glowing, and brilliant: while, in the historical department, Sir Joshua's successor, the late lamented Mr. West, without rivalling either of the three great names just mentioned, yet displayed sufficient ability to throw completely into the background what had been previously produced by the successors of Sir James Thornhill, Hayman, Pine, and Whale. Besides West, we cannot forbear to make honorable mention of the names of Romney, Opie, and Barry.

The present state of painting in this country is very encouraging to the lover of art. In portrait, besides the highly-gifted president of the academy, Sir Thomas Lawrence, we have several other eminent professors: in landscape and marine subjects, Turner and Callcott are at the head of a numerous body of followers. The pencil of Wilkie throws a brilliant lustre over both the humorous and pathetic departments of art; and in the arduous walk of history (a walk of art which, although it is entitled, when successfully pursued, to the highest honors, is too often followed without either profit or distinction,) there are several names which we might select, whose bearers appear to us qualified to elevate the national reputation far higher than it has ever hitherto been raised. For the truth of these observations, we need only appeal to the annual exhibitions both at Somerset House and at the British Institution.

It would lead us beyond the limits of this work to go much at large into the theory and practice of painting. This article would be, however, incomplete did we not subjoin a few observations on these subjects.

PART II.

THEORY AND PRINCIPLES OF THE ARTIST'S STUDIES.

SECT. I.—GENERAL PRINCIPLES.

And first, of *anatomy*. It would be unnecessary to cite what the greatest authorities have declared with respect to the requisiteness of this

point of knowledge. It must be obvious that a man unacquainted with the construction and form of the several bones that govern and support the human frame, or who does not understand the way in which the muscles moving these bones are fixed to them, can make nothing of what appears to them through the integuments with which they are covered; which appearance, however, is one of the noblest objects of the pencil. It seldom happens that the painter's business is limited to the mere exact copying of an object before him. For instance, if he has to depict gestures any way sudden, or motions any way violent, a living model would scarcely answer his purpose, since it holds but two or three instants, soon growing languid, and settling into a fixed attitude, which is produced by an instantaneous concourse of the animal spirits. Here then the painter's acquaintance with anatomy should come into play, his knowledge not only of the skeleton, but of the origin, progress, and shape of the muscles which cover the bones, and also the different degrees in which nature has clothed these muscles with fat.

It was the intention of Michael Angelo to give the public a complete treatise on this subject, and it is much to be regretted that he never should have accomplished so desirable a purpose. This sublime painter having observed (as appears in *Conditi's* life of him) that Albert Durer was deficient with respect to anatomy, resolved to compose a theory founded on his long practice: and surely no one could be better qualified to furnish anatomical precepts than he who, as competitor of Leonardo da Vinci, formed that famous cartoon of naked bodies which was studied by Raffaele himself, and subsequently obtained the approbation of the Vatican. The want of Michael Angelo's precepts may be in some measure compensated by books written on the same subject by Moro, Cesio, and Tortelat; and more recently by Boucherdon, one of the most famous statuarys of France. Nothing, however, can be of equal service with the lessons of some able dissector, besides which a good deal of improvement may be acquired by the study of anatomical casts.

It was the particular happiness of the Greeks to be capable of characterising and expressing the various parts of the human body much better than we can pretend to do; towards this end their earnest study of the naked figure mainly contributed, as did also the constant exercise taken by the Grecian youth in gymnastic games, which, by development and display of the muscular system, afforded the painter and statuary far more perfect models than those at present employed. It has been well suggested, that the student might make himself more thoroughly master of the science of anatomy by taking one part of any well-known figure, the thighs of the *Laocoon*, for instance, and adding to them legs suitable to that state in which the muscles of the thighs are represented. To the simple contour of an anatome, or statue, he might add the parts included by it, and give it a system of muscles conformable to the quality of that particular contour. Exercises of this nature would soon establish him in the most fundamental principles

of painting, especially if he had an opportunity of comparing his drawings with the statue or cast from which the parts given him to work upon were taken. See ANATOMY.

It cannot fail to appear obvious that the study of *symmetry* should immediately succeed that of anatomy; since it would not much avail us to be acquainted with the different parts of the human body, and their several offices, were we, on the other hand, ignorant of the relative order and proportion of those parts to one another. The Greek sculptors were as eminent for the just symmetry of members as for anatomical skill. Polygnotus executed a statue which he denominated the Rule, from which other artists might take measures for every part of the human body. These measures, not to speak of those books which professedly treat of them, may now be derived from the Apollo Belvedere, the Laocoon, the Venus de Medici, and particularly the Antinous, which was the rule adopted by Nicholas Poussin. See SYMMETRY.

Perspective, according to Leonardo da Vinci (an authority from which there can be no appeal) is to be considered as the reins and rudder of painting. It teaches the proportion in which the parts fly from, and lessen on, the eye; how figures should be marshalled upon a plane surface, and foreshortened. It contains, in a word, the whole rationale of design.

As the demonstration of the rules of perspective depends on the doctrine of proportions, on the properties of similar triangles, and on the intersection of planes, it is desirable that an abridgment of Euclid should be put into the hands of the young painter, in order that he may understand these rules fundamentally, and not stand confined to a blind practice of them: at the same time, there is nothing in this author relative to the art of painting which might not easily be acquired in a few months. See PERSPECTIVE.

The study of *optics*, so far as it is requisite to determine the proportion in which objects are to be illuminated or shaded, should proceed hand in hand with that of perspective: and this in order that the shades cast by figures upon the planes on which they stand may fall properly, and be neither too strong nor too light:—in a word, that those most beautiful effects of the *chiaro-scuro* may run no risk of ever deviating from truth, which, sooner or later, is sure to render itself visible. See OPTICS.

'Coloring,' says Sir Joshua Reynolds, 'though it may at first sight appear a part of painting merely mechanical, yet it still has its rules, and those grounded upon that presiding principle which regulates both the great and the little in the study of a painter. By this, the first effect of the picture is produced; and, as this is performed, the spectator, as he walks the gallery, will stop, or pass along. To give a general air of grandeur at first view, all trifling, or artful play of little lights, or attention to a variety of tints, is to be avoided; a quietness and simplicity must reign over the whole work; to which a breadth of uniform and simple color will very much contribute. Grandeur of effect is produced by two different ways, which seem

entirely opposed to each other. One is, by reducing the colors to little more than *chiaro-scuro*, which was often the practice of the Bolognian school; and the other, by making the colors very distinct and forcible, such as we see in those of Rome and Florence; but still the presiding principle of both these manners is simplicity. Certainly, nothing can be more simple than monotony; and the distinct blue, red, and yellow colors which are seen in the draperies of the Roman and Florentine schools, though they have not that kind of harmony which is produced by a variety of broken and transparent colors, have that effect of grandeur which was intended. Perhaps these distinct colors strike the mind more forcibly, from there not being any great union between them; as martial music, which is intended to rouse the nobler passions, has its effect from the sudden and strongly marked transitions from one note to another, which that style of music requires; whilst, in that which is intended to move the softer passions, the notes imperceptibly melt into one another.

Drapery, being also a most important branch of the art, accordingly requires the greatest study and attention. It but seldom occurs that a painter has only naked figures to represent; and it may be observed, that the flowing of the folds in every garment depends principally on the relief of the parts which lie under it. A certain author, whose name we do not recollect, remarks, that as the inequalities of a surface are discoverable by the inequalities in the water that runs over it, so the shape and posture of the members must be discernible by the folds of the vestment which covers them.

Of landscape and architecture.—The most eminent landscape painters are Claude Lorraine, Poussin, and Titian. The former of these celebrated men, although he reigns triumphantly in every department of landscape, and in marine subjects also, yet might be said to have applied himself principally to express the various phenomena of light, particularly those observable in the heavens; and thanks to the delicious climate of Italy, where he studied and practised, he has bequeathed us the brightest skies, and the most splendid horizons, that can be imagined. Poussin was distinguished, and deserved to be so, for his uncommon application. His compositions are fraught with imagery of a classical as well as delightful character, being set off with learned episodes, such as poets reciting their verses in the woods, Grecian youths exercising gymnastic games, &c. Titian may be styled the Homer of landscape painting. One of the finest landscapes that perhaps ever issued from mortal hands is the background of his Martyrdom of St. Peter; which has so much truth, so much variety, so much bloom, that it is almost impossible to behold without desiring to make an excursion into it. Paolo Veronese is, in architecture, what Titian is in landscape. To excel in landscape, we must, above all things, study nature; to excel in architecture we must regard principally the finest among the works of art: such, for instance, as the elevations of ancient edifices, together with the fabrics of those moderns who have best studied and best copied antiquity.

'Invention in painting does not,' according to Sir Joshua Reynolds, 'imply the invention of the subject; for that is commonly supplied by the poet or historian. With respect to the choice, no subject can be proper that is not generally interesting. It ought to be either some eminent instance of heroic action or heroic suffering. There must be something either in the action, or in the object, in which men are universally concerned, and which powerfully strikes upon the public sympathy. As it is required that the subject selected should be a general one, it is no less necessary that it should be kept unembarrassed with whatever may any way serve to divide the attention of the spectator. Whenever a story is related, every man forms a picture in his mind of the action and expression of the persons employed. The power of representing this mental picture on canvas is what in a painter we call invention. And as, in the conception of this ideal picture, the mind does not enter into the minute peculiarities of the dress, furniture, or scene of action; so, when the painter comes to represent it, he contrives those little necessary concomitant circumstances in such a manner, that they shall strike the spectator no more than they did himself in his first conception of the story. The great end of the art is to strike the imagination. The painter therefore is to make no ostentation of the means by which this is done; the spectator is only to feel the result in his bosom. An inferior artist is unwilling that any part of his industry should be lost upon the spectator. He takes as much pains to discover, as the greater artist does to conceal, the marks of his subordinate assiduity. In works of the lower kind, every thing appears studied and encumbered; it is all boastful art, and open affectation. The ignorant often part from such pictures with wonder in their mouths, and indifference in their hearts. But it is not enough in invention that the artist should restrain and keep under all the inferior parts of his subject; he must sometimes deviate from vulgar and strict historical truth, in pursuing the grandeur of his design. How much the great style exacts from its professors to conceive and represent their subjects in a poetical manner, not confined to mere matter of fact, may be seen in the cartoons of Raffaele. In all the pictures in which the painter has represented the apostles, he has drawn them with great nobleness; he has given them as much dignity as the human figure is capable of receiving; yet we are expressly told in Scripture they had no such respectable appearance; and of St. Paul, in particular, we are told by himself that his bodily presence was mean. Alexander is said to have been of a low stature: a painter ought not so to represent him. Agesilaus was low, lame, and of a mean appearance: none of these defects ought to appear in a piece of which he is the hero. In conformity to custom, I call this part of the art history painting; it ought to be called poetical, as in reality it is.

'As in invention, so likewise in expression, care must be taken not to run into particularities. Those expressions alone should be given to the figures which their respective situations generally produce. Nor is this enough; each

person should also have that expression which men of his rank generally exhibit.—The joy or the grief of a character of dignity is not to be expressed in the same manner as a similar passion in a vulgar face. Upon this principle Bernini, perhaps, may be subject to censure. This sculptor, in many respects admirable, has given a very mean expression to his statue of David, who is represented as just going to throw the stone from the sling; and, in order to give it the expression of energy, he has made him biting his under lip. This expression is far from being general, and still farther from being dignified. He might have seen it in an instance or two; and he mistook accident for generality.'

Of Portraiture.—There are four things necessary to make a portrait perfect; viz. air, coloring, dress, and attitude.

1. The *air* respects the lines of the face, the head attire, and the size. The lines of the face depend upon exactness of draught, and agreement of the parts; for it is not exactness of design in portraits that gives spirit and true air, so much as the agreement of the parts at the very moment when the disposition and temperament of the sitter are to be caught. We see several portraits, which, though correctly designed, have a cold, languishing, and stupid air; whilst others, less correct in design, strike us, however, at first sight, as a resemblance.

Few painters are careful enough to put the parts well together: Sometimes the mouth is smiling, and the eyes are sad; at other times the eyes are cheerful, and the cheeks lank; by which means their work has a false air, and looks unnatural. Of all the parts of the face, that which contributes most to likeness is the nose; it is therefore of great moment to set and draw it well. Though the hair of the head seems to be part of the dress which is capable of various forms without altering the air of the face; yet the head attire which one has been most accustomed to, creates such a likeness, that we scarce know a familiar acquaintance on his putting on a wig, or any other head attire, different from that which he used to wear. It is necessary, therefore, as far as possible, to take the air of the head ornament, and make it accompany and set off that of the face.

As to the stature, it contributes so much to likeness, that we very often know people without seeing their face: it is, therefore, extremely proper to draw the size of a full length portrait, after the sitter himself, and in such an attitude as he usually appears in. In sitting, the person appears to be of a less free make, through the heaving of his shoulders: wherefore, to adjust his size, it is proper to make him stand for a short time in the posture we would give him, and then make our observations. All deformities, when the air and temper may be discovered without them, ought to be either corrected or omitted in portraits. But in some faces we cannot be too exact, whether the parts be beautiful or not; as every thing in an important picture is precious that is faithful. But, after whatever manner the painter acquits himself in this point, let him never forget good air and grace; and that there are moments particularly advantageous for hitting them off.

2. *Coloring*, in portraiture, is an effusion of nature, often connected with the true tempers of persons; and, the temper being essential to likeness, it ought to be handled as exactly as the design. This part is the more valuable, as it is rare and difficult to hit. Many painters have come to a likeness by strokes and outlines; but few have shown in colors the tempers of persons. Two points are necessary in coloring; exactness of tints, and the art of setting them off. The former is acquired by practice, in examining and comparing the colors we see in life with those by which we would imitate it; and the art of those tints consists in knowing what one color will produce when set by another, and in making good what either distance or time may abate on the glow and freshness of the colors. A painter who does nothing more than what he sees, will never arrive at a perfect imitation; for, though his work may seem on the easel to be good to him, it may not appear so to others, nor perhaps even to himself at a distance. A tint, which, near, appears disjoined, and of one color, may look of another at a distance, and be confounded in the mass it belongs to. If you would have your work, therefore, to produce a good effect in the place where it is to hang, both the colors and lights must be a little loaded, but with discretion. In this point consult Titian, Rubens, Vandyck, and Rembrandt's methods: for indeed their art is wonderful. The tints usually require three times of observation. The first is at the person's first sitting down, when he has more spirit and color than ordinary. The second is when, being composed, his look is as usual. And the third is when, through tiredness by sitting in one posture, his color alters to what weariness usually creates. On which account, it is best to keep to the sitter's usual tint, a little improved.

3. In the *dress and draperies* of men's portraits, we need only observe great truth and force; but in women's there must also be charms; whatever beauty they possess must appear in a fine light, and their blemishes must be softened. For this reason a white, lively, and bright tint, ought never to be set off by a fine yellow, which would make it look like plaster; but rather by colors inclining to green, blue, or gray, or such others as, by their opposition, may make the tint appear more fleshy than usual in fair women. Vandyck often made a fillemot-colored curtain for his ground; but that color is soft and brown. Brown women, on the other hand, who have yellow enough to support the character of fleshiness, may very well have yellowish draperies, to bring down the yellow of their tints, and make them look the fresher; and, near very high-colored and lively carnations, linen does wonders.

In *grounds*, two things are observable; the tone and the color. The color is to be considered in the same manner as those of draperies, with respect to the head. The tone must be always different from the mass it supports, and of which it is the ground, that the objects coming upon it may not seem transparent, but solid and raised. The color of the hair of the head usually determines the tone of the ground; and, when

the former is a bright chestnut, we are often embarrassed, unless helped by means of a curtain, or some accident of the *claro-obscuro*, supposed to be behind, or unless the ground is a sky. Where a ground is neither curtain nor landscape, but is plain like a wall, it ought to be very much party-colored, with almost imperceptible patches or stains; for, besides its being so in nature, the picture will look the more grand.

4. *Attitudes* ought to suit the ages and qualities of persons and their tempers. In old men and women they should be grave, majestic, and sometimes bold: and generally, in women, they ought to have a noble simplicity and modest cheerfulness: a charm infinitely beyond coquetry: and indeed coquettes themselves care not to be painted such. Attitudes are of two kinds: one in motion, the other at rest. Those at rest may suit every person: but those in motion are proper for young people only, and are hard to be expressed; because a great part of the hair and drapery must be moved by the air; motion, in painting, being never better expressed than by such agitations. The attitudes at rest must not appear so much so as to seem to represent an inactive person, and one who sits for no other purpose but to be a copy. And, though the figure that is represented be at rest, yet the painter, if he think fit, may give it a flying drapery, provided the scene or ground be not a chamber or close place.

It is above all things necessary that the figures which are not employed should appear to satisfy the spectator's curiosity; and for this purpose show themselves in such an action as suits their tempers and conditions, as if they would inform him what they really were. In a word, attitude is the language of portraits; and the skilful painter ought to give great attention to it. The best attitudes are such as induce the spectator to think that the sitter took a favorable opportunity of being seen to advantage, but yet without affectation. With regard to women's portraits, in whatever attitude they are placed, they should sway in such a manner as to give their face but little shade; and we should carefully examine whether the face appear more beautiful in a smiling or in a serious air.

According to De Piles, portraiture requires three different sittings and operations: viz. dead coloring, second-coloring, and retouching or finishing. Before the painter dead-color, he must attentively consider what aspect will best suit the sitter, by putting him in different positions, if he have not any settled design; when this is determined, it is of the utmost consequence to put the parts well together, by comparing always one part with another; for not only the portrait acquires a greater likeness when well designed, but it is troublesome to make alterations at the second sitting, when the artist should only think of painting, that is, of disposing and uniting his colors.

i. The dead-coloring ought to be clean, because of the slope and transparency of the colors, especially in the shades; and when the parts are well put together, and become clammy, they must be judiciously sweetened and melted in

each other; yet without taking away the air of the picture, that the painter may finish it, in proportion as he draws. But if fiery geniuses do not like this method of scumbling, let them only mark the parts slightly, and so far as is necessary for giving an air. In dead-coloring it is proper to put in rather too little than too much hair about the forehead; that, in finishing, we may be at liberty to place it where we please, and to paint it with all possible softness and delicacy. If, on the contrary, you sketch upon the forehead a lock which may appear to be of a good taste, and becoming the work, you may be puzzled in finishing it, and not find the life exactly in the same position as you would paint it.

ii. The business of the second sitting is to put the colors well in their places, and to paint them in a manner that is suitable to the sitter and to the effect we propose; but, before they are made clammy, we ought to examine afresh whether the parts are rightly placed, and here and there to give some touches towards likeness, that, when we are assured of it, the work may go on with greater satisfaction. If the portrait be justly designed, the painter ought, as much as possible, to work quick, as the work will thus have the more spirit and life. But this readiness is only the effect of long study and experience.

iii. Before we retouch or finish, it is proper to terminate the hair, that, on finishing the carnations, we may be able to judge of the effect of the whole head. If, at the second sitting, we cannot do all we intended, which often happens, the third makes up the loss, and gives both spirit, physiognomy, and character. If we would paint a portrait at once, we must load the coloring; but neither sweeten nor drive, nor very much oil it; and, if we dip the pencil in varnish as the work advances, this will readily enable us to put color on color, and to mix them without driving. There is nothing so rare as fine hands, either in the design or coloring. It is, therefore, convenient to cultivate a friendship with some women, who will take pleasure in serving for a copy. But if an opportunity occurs of copying hands after Vandyck, it must not be let slip; for he drew them with a surprising delicacy and an admirable coloring. It is of great service to copy after the manners which come nearest to nature; as are those of Titian and Vandyck.

Before we begin coloring, we must catch the very first moments, which are commonly the most agreeable and most advantageous, and to keep them in our memory for use when we are finishing; for the sitter, growing tired with being long in the same place, loses those spirits which, at his first sitting down, gave beauty to the parts, and conveyed to the tint more lively blood, and a fresher color. In short, we must join to truth a probable and advantageous possibility, which, far from abating likeness, serves rather to set it off. For this end, we ought to begin with observing the ground of a tint, as well what it is in lights as in shades; for the shades are only beautiful as they are proportioned to the light. We must observe, if the tint be very lively, whether it partake of yellowness, and where that yellowness is placed; because usually, towards the

end of the sitting, fatigue diffuses a general yellowness, which makes us forget what parts were of this color, and what were not, unless we had taken due notice of it before. For this reason, at the second sitting, the colors must be every where readily clapped in, and such as appear at the first sitting down; for these are always the finest. The surest way to judge of colors, is by comparison; and, to know a tint, nothing is better than to compare it with linen placed next it, or else placed next to the natural object if there is occasion. The portrait being now finished, nothing remains, but, at some distance of time, to view both the picture and sitter together, to determine with certainty, whether there is any thing still wanting to the work.

Of theatrical decorations, &c.—Theatrical decorations require a particular art which unites several of the general parts of painting with the knowledge of architecture, perspective, &c. They who apply themselves to it would do well to design their decorations by day, and to color them by candle light, as they will be much better able to judge of the effect of a painting intended to be viewed by that light.

The designs for furniture, carriages, porcelain, and other branches of manufacture, form also a very important article of painting in general, and of academy painting in particular. This is a distinct branch of the art; and without doubt not the least useful, as it contributes so essentially to the success of manufactures, and consequently to the prosperity of a state; and it is an art to which it were much to be wished that youth of ability and invention would apply themselves. See JAPANING and PORCELAIN.

These may be deemed the chief principles of the art of painting, which it behoves the student indispensably to acquire not only the knowledge but likewise the practice of. There are also others, which must not by any means be overlooked, and among these are to be enumerated—disposition, costume, and illusion. This latter quality cannot, perhaps, in its strictest sense, be attained by painting: there is, however, a species of it (although probably the name is not fairly applied) which demands the greatest attention, and forms one of the chief fascinations of the art. It is this: that the painting shall resemble truth to such an extent, by the justness of its forms, the combination of its colors, and all its general effects, that the image thereby presented shall afford all the gratification resulting from the imitation of reality. This, it is admitted, is not illusion in the stricter sense of the word; for it exists as well in pictures on a small scale as in those of equal dimensions with the thing represented: but it is that exactness of imitation of which painting is susceptible, even in pictures which comprise any number of figures at a reasonable distance from each other.

We shall now proceed to illustrate the theoretical part of our subject by a few practical observations.

And, first:—Let us warn the young artist against being led astray by the ambition of composing facilely, or acquiring that which is termed a masterly handling of the chalk or pencil. To this mistaken aim, however, young men are incited in various ways. There is something dash-

ing and fine about the notion in the first place; and in the next they are tempted to it by that slothful feeling too natural to us all. They are terrified at the prospect of the toil required to obtain exactness; not considering that the lives of all those painters who attained eminence furnish instances and recommendations of unceasing industry and application. When these great masters imagined a subject, they first executed a variety of sketches; afterwards a finished drawing of the whole; after that a more correct drawing of every separate part:—they then painted the picture, and concluded the whole by retouching it from the life. At the same time a student is not always advancing because he is employed; he must exert his strength in those parts of the art where the real difficulties lie; in those parts which distinguish it as a liberal art, and not in such as may be resolved into the merely ornamental.

It is, secondly, a matter of considerable importance, that those drawings on which the young artist first exercises his ability, should be of the very best kind; that the profiles, the hands, the feet, &c., given him to copy be of the first masters, in order that both his eye and his hand may become early acquainted with the most exquisite proportions and the most charming shapes.

Thirdly, It would be desirable that the student should copy some of the fine heads to be met with on Greek and Roman medals: he will hence become acquainted (if we may be allowed the phrase) with the personages whom he may in course of time transplant into his pictures; and, above all, improve himself in the important art of copying from relief. Hence, also, he will become initiated into the doctrine of light and shade, and the nature of that *chiaro-scuro* by which the different forms of things may, justly speaking, be said to be distinguished.

The chief divisions of the art of painting are into historical (comprising mystical and allegorical), grotesque, portrait, fancy, animals, fruits and flowers, battles, landscapes, sea views, still life, and architecture.

Grotesque paintings are to be found in the celebrated loggia of the Vatican palace at Rome, painted from the designs of Raffaele, and on the ceiling of the portico of the capitol, carved from those of Michel Angiolo.

The other departments are sufficiently explained by their respective names: it may be as well, however, to observe, that the term still life refers to all inanimate objects, and chiefly to household furniture, instruments of use, &c.

SECT. II.—MODES AND MATERIALS OF PAINTING.

The different methods of painting at present practised are—

Oil painting, which is preferable to any other mode, since it allows a complete gradation of tints, in the most enduring of all materials, except those of mosaic.

Fresco is performed with colors diluted in water, and laid on a wall newly plastered, with which they incorporate, becoming often as durable as the stucco itself. See the following section.

Crayons, in which colors, either simple or compound, are ground in water, mixed with gum, and made into small rolls of a hard paste, which are then used on paper or parchment.

Miniature, consisting of colors prepared with water or gum, and laid on vellum or ivory. A smaller kind of portrait.

Enamel, performed on copper or gold, with mineral colors dried by fire. This method is likewise extremely durable. See ENAMEL.

Encaustic, executed by the mixture of wax with the varnish and colors. See ENCAUSTIC.

Water colors, more properly denominated limning. This is performed with colors mixed with water, gum, size, or paste, on silk, paper, and sundry other materials.

Besides these various methods we may add the painting in distemper; namely, with colors mixed with size, white of eggs, or any thin glutinous substance, and used on paper, linen, silk, board, or wall. There are also painting on GLASS (which word see), and clydoaic painting, consisting of a mixed use of oil-colors and water.

The various pigments at present in use, and fitted for the general purposes of oil painting, are:—Cremnitz white, white lead of different sorts; a fine yellow, recently discovered from chromate of iron; king's yellow or orpiment; patent yellow, Naples' yellow, ochres, Dutch pink, terra di Sienna, yellow lake, red lead, vermilion, red ochre, Indian red, Venetian red, lakes of various kinds, brown pink, Vandyck's brown, umber, burnt and unburnt; terra di Sienna, burnt; Prussian and Antwerp blue, ultra marine, ivory black, blue black, asphaltum. These may be reckoned the chief colors for the palette; there are, however, several others, which are employed for particular purposes, such as verdigris, &c.

The oils best adapted to the ends of painting are poppy, nut, and linseed oils; and in this climate a preparation of the latter, by boiling it with some siccative, is in common use. See OIL.

We will subjoin two or three observations, made by a quaint old writer on art (Richardson), with respect to the method of distinguishing a genuine picture of one of the old masters from a copy:—“There are some pictures and drawings which are seen to be originals, though the hand and manner of thinking are neither of them known; and that by the spirit and freedom of them; which sometimes appears to such a degree as to assure us it is impossible they should be copies. But we cannot say, on the contrary, when we see a tame, heavy handling, that it is not original merely upon that account, because there have been many bad originals, and some good masters have fallen into a feebleness of hand, especially in their old age. The best counterfeit hands can rarely do it so well as to deceive a good connoisseur; the handling, the coloring, the drawing the airs of heads, some, nay, all of these discover the author; more or less easily, however, as the manner of the master happens to be: what is highly finished, for example, is more easily imitated than what is loose and free. Copies made by a master after his own work are discoverable by being well ac-

quainted with what that master did when he followed nature; these shall have a spirit, a freedom, a naturalness which even he cannot put into what he copies from his own work. To conclude, there is one qualification absolutely necessary to him that would know hands, and distinguish copies from originals; as it also is to any one who would judge well of the goodness of a picture or drawing; or indeed of any thing else whatsoever; and that is—he must know how, and accustom himself, to take in, retain, and manage, clear and distinct ideas.

SECT. III.—OF PAINTING IN FRESCO.

Of all kinds of painting, fresco is the most durable, the most speedily executed, and the most proper to adorn great buildings. It appears, that most of the fragments of ancient painting handed down to us by the Romans are in fresco. Norden, quoted by Winckelman, speaks of the ruins of Egyptian palaces and temples, in which are Colossian paintings on walls eighty feet high. The description which those authors have given of these paintings, of the prepared ground, and of the manner in which the colors have been employed, &c., shows plainly that they have been thus executed. The stability of fresco is demonstrated, therefore, by the existence of these fragments of the highest antiquity. There are no other kinds of painting which could equally have resisted the injuries of the weather, the excessive aridity of certain elements, the moisture of subterraneous situations, and the destructions by barbarians.

In making paintings in fresco, the choice of place, when they are without doors, is of the greatest importance. In countries where there is little or no frost, an exposure to the north is the most favorable; and in cold climates a western exposure should be made choice of, because the first rays of the rising sun have a very pernicious effect after frost.

The choice of materials is the next thing of importance. To make it durable, the ground is the object of chief attention; and, to make this perfect, the mortar used by the ancients, now unknown, would be necessary. It is easy to perceive that a minute detail of forms, an extensive mixture and gradation of tints, and the merit of a delicate and gentle touch, can make no part of the excellencies of this kind of painting. It cannot bear a close examination like a picture in oil. There is always something dry and rough which displeases. An artist who would flatter himself with success in a fresco placed near the eye would be grossly deceived; a common spectator would find it coarse and badly finished.

Fresco is chiefly employed in palaces, temples, and public edifices. In these vast places no kind of painting can be preferred to it; large, vivid in its strokes, and constantly fresh, it enriches the architecture, animates it, and gives relief to the eye from the repetition of the same forms, and the monotony of color, in a place where colored marbles and bronzes are not employed. A fine fresco gives the greatest effect to a lofty building, which serves as a frame and support to this enchanting art, which fixes the

attention of every person of sensibility and taste. Fresco has a freshness, splendor, and vigor, not to be found in oil or water colors.

A known principle in all painting is, that the coloring is more perfect in proportion as it approaches to the lights and shades in nature. As colors applied to any subject can never reach this degree of perfection, the illusion which painters produce consists in the comparison and opposition of the tones of colors among themselves.

If the white of the finest and purest oil appears heavy and gray, compared with great lights in natural whites, it follows, that, in order to copy them with fidelity, the tones which follow the first white must be degraded in an exact proportion. Thus it is necessary that the shades of a picture be considerably deeper than those of the model; especially, if, from the greatest lights to the browns, one hath proportionably followed the distance which is found between the colors on the pallet and the tones of the object copied. Now, if the white of fresco be infinitely more bright than that of oil, the same effect will be obtained in a brown tone. On the other side if it constantly happens that the brown tones of fresco are much more vigorous than those of water colors, and equal even to the browns of oil itself, it is certain that it possesses a splendor and vigor more extensive than any other kind of painting. Thus, in the hands of an artist who is well acquainted with the colors fit for fresco, it is more susceptible of the general effect, and more capable than any other kind of giving projection and the semblance of life to the figures.

If we enquire why painting in fresco is now seldom or never practised, we may ascribe it to the great talents required to execute it. 'Many of our painters,' says Vasari, 'excel in oil and water colors, and yet fail in fresco; because of all kinds this requires the greatest strength of genius, boldness in the strokes, and resolution.' If in an age abounding in great masters it was difficult to excel in this kind, it must be much more so in ours; but we should not require the characters of sublimity and style to which men were accustomed in the time of Vasari.

We should execute in fresco as we do in oils; for Italy herself along with Michel Angiolo, and Zuicharo, had Cortonni Giardano and Francischini as middling fresco-painters. And in France, Lafosse, Bon Bologne, and Perur, performed several works in fresco, which might be imitated by the painters of our times. But the real causes for abandoning this art proceed from the want of knowledge and taste in the persons who employ the artists, and from the manners of the age. As a pleasant or licentious conceit, unfinished coloring, and bold effects of shade, are the chief objects of consideration, a very smooth painting, enlivened by gentle touches, completely gratifies the person who pays the price; and therefore the philosophical principles of the art, which require study, are not cultivated.

The mechanical process of this useful and beautiful kind of painting is as follows: before painting it is necessary to apply two layers. If the wall on which you are to paint is of brick,

the layer is easily applied; but if it is of free-stone closely united, it is necessary to make excavations in the stone, and to drive into them nails or pegs of wood in order to hold the first layer. The first layer is made of good lime and a cement of pounded brick, or, which is still better, river sand; this latter forms a layer more uneven, and better fitted to retain the second smooth and polished layer applied to its surface. There should be experiments to discover a layer still more compact, and more independent of the variations of the air; such, for example, as covers the aqueducts and ancient reservoirs constructed by the Romans in the neighbourhood of Naples.

Before applying the second layer, or what you are to paint, it is necessary that the first be perfectly dry; for there issues from the lime, when it is moist, a smell both disagreeable and pernicious to the artist. When the first layer is perfectly dry, it is wet with water in proportion to its dryness, that the second layer may the more easily incorporate with it. The second layer is composed of lime, slaked, and long exposed in the air, and of river sand, of an equal grain, and moderately fine. It requires an active and intelligent mason to apply this layer, as the surface must be altogether equal. The operation is performed with a trowel; and the operator requires to have a small piece of wood to take away the large grains of sand, which, remaining, might render the surface uneven. To give a fine polish to this layer, one ought to take a sheet of paper, apply it to the wall, and pass and repass the trowel over the paper. By these means the little inequalities which hurt the exactness of the stroke, and which produce false appearances at a distance, are entirely smoothed. The artist must not lay more than the painter can finish in a day, as this kind of painting must be executed on a fresh ground.

The layer being thus prepared, the painter begins his operation; but as painting in fresco must be executed rapidly, and as there is no time to retouch any of the strokes, the painter takes care to provide himself with large cartoons, on which he has drawn, with exactness, and in their full size, the figures which he is to paint, which leaves him nothing to do but to copy them on the wall.

The cartoons are composed of several sheets of large paper pasted one on another, neither too thick nor too slender. The painter traces the tracks of the figures on the plaster by passing a steel point over the tracks in the cartoons, or in pricking them. Having thus attained an exact and speedy drawing, it now remains to execute the painting. But it is essential, when one wishes to finish any small work of this kind, in the first place, to be informed of the proper colors, and of those which cannot be used.

In general, the colors extracted from earthen, and those which have passed through the fire, are the only ones which can be employed in this kind of painting. The colors are white, made of lime, the white of egg-shells, ultramarine, the black of charcoal, yellow ochre, burnt vitriol, red earth, green of Verona, Venetian black, and burnt ochre.

There are others which require to be used with great precaution, such as enamel blue, cinnabar, and white marble dust. When enamel blue is used, it requires to be applied instantaneously, and when the lime is very moist, otherwise it does not incorporate with the plaster; and, if one retouch with this color, it must be done an hour or more after the first application, to increase its lustre. With regard to the white marble dust, it is apt to turn black if it be not mixed up with a proper quantity of white lime.

Cinnabar, which has a splendor almost superior to all other colors, loses it almost entirely when mixed with lime. At the same time it may be employed in places not exposed to the air, with a little degree of care in the preparation. Reduce a quantity of the purest cinnabar to powder, put it into an earthen vessel, and pour lime-water on it for two or three times. By this process the cinnabar receives some impression of lime-water, which makes it capable of being employed in fresco-painting.

One of the best colors, and the one most used in fresco for the gradation of tints, and for giving the requisite tone, is white of lime. This white is prepared by mixing lime slaked long before with good water. The lime deposits a sediment at the bottom of the vessel; when the water is poured off, this sediment is the white of lime.

Another kind of white might be used, the effects of which would be known by experience, namely, the white of egg-shells. To prepare this white, one must take a great quantity of shells of eggs, which must be pounded and boiled in water along with a quantity of quick lime; after this, they are put into a strainer, and washed repeatedly with fountain water. The shells are again pounded until the water employed for that purpose becomes pure and limpid; and, when they are in this manner reduced to powder, this powder is grinded in water, and formed into small pieces, and dried in the sun.

All the different kinds of ochres make excellent colors for fresco, and take different shades, being previously burned in iron chests. With regard to the Naples yellow, it is dangerous to use it where the painting is much exposed to the air. The blacks of charcoal, of peach stones, and of vine twigs, are good; but that extracted from bones is of no value.

Roman vitriol gathered at the furnaces, and called burnt vitriol, ground afterwards in spirit of wine, resists the air extremely well when employed in lime. There is also a red extracted from this preparation somewhat like that produced from lac. This color is very proper for preparing the layers to be colored with cinnabar; and the draperies painted with these two colors will vie in splendor with those painted with fine lac in oil.

The ultramarine is the most faithful color; and it not only never changes, but it communicates this precious quality to those colors with which it is mixed.

The manner of employing these colors is to grind them in water, and to begin by arranging them into the principal tints to be employed; these are afterwards put into pots; and it is necessary to use many pallets raised at the edges

to form the intermediate shades, and to have under one's eye all the shades required. As all the tints, except burnt ochre, violet, red, and blacks of all kinds, are apt to become clear, the painter must have beside him some pieces of brick or new tile very dry. A dash of the colors is applied to one of these with the pencil, before using them; and, as tile instantaneously imbibes the water, one perceives what the shade will be after the fresco is dry.

SECT. IV.—OF PAINTING WITH CRAYONS.

The student must provide himself with strong blue paper, the thicker the better, if the grain is not too coarse. The knots should be levelled with a penknife or razor, otherwise they will prove exceedingly troublesome. The paper must be pasted very smooth on a linen cloth, previously strained on a deal frame, the size according to the artist's pleasure; on this the picture is to be executed; but it is most eligible not to paste the paper on till the whole subject is first dead-colored. The method of doing this is by laying the paper, with the dead-color on its face, upon a smooth board, when, by a brush, the back side of the paper must be covered with paste; the frame with the strained cloth must then be laid on the pasted side of the paper; after which, turn the painted side uppermost, and lay a piece of clean paper upon it, to prevent smearing it: this being done, it may be stroked gently over with the hand; by which means all the air between the cloth and the paper will be forced out.

When the painters want to make a very correct picture, they generally use tiffany or black gauze, strained tight on a frame, which they lay flat on the subject to be imitated, and with a piece of chalk, trace all the outlines on the tiffany. They then lay the canvas to be painted on, flat upon the floor, placing the tiffany with the chalked lines upon it, and with a handkerchief brush the whole over; this presents the exact outlines of the picture on the canvas. The crayon-painter may also use this method when the subject of his imitation is in oils; but, in copying a crayon picture, he must have recourse to the following method, on account of the glass.

The picture being placed on the easel, let the outlines be drawn on the glass with a small camel's hair pencil, dipped in lake, ground thin with oils, with great exactness. After this, take a sheet of paper of the same size, and place it on the glass, stroking over all the lines with the hand, by which means the color will adhere to the paper, which must be pierced with pin-holes pretty close to each other. The paper intended to be used for the painting must next be laid upon a table, and the pierced paper placed upon it; then, with some fine pounded charcoal tied up in a piece of lawn, rub over the pierced lines, which will give an exact outline; but great care must be taken not to brush this off till the whole is drawn over with sketching chalk, which is a composition made of whiting and tobacco-pipe clay, rolled like the crayons, and pointed at each end. When a student paints from the life, it is proper to make a correct drawing of the outlines on another paper, the size of the picture he is going to

VOL. XVI.

paint, which he may trace by the preceding method.

The student will find the sitting posture, with the box of crayons in his lap, the most convenient in which to paint. The part of the picture he is painting should be rather below his face, else the arm will be fatigued. Let the windows of the room be darkened, at least to the height of six feet from the ground; and the subject to be painted should be placed so that the light may fall with every advantage on the face.

The features being correctly drawn with chalks, take a crayon of pure carmine, and carefully draw the nostril and edge of the nose next the shadow; then, with the faintest carmine teint, lay in the highest light upon the nose and forehead, which must be executed broad. Then proceed gradually with the second teint, and the succeeding ones, till he arrives at the shadows, which must be enriched with much lake, carmine, and deep green. The several pearly teints discernible in fine complexions must be imitated with blue verditer and white, which answers to the ultramarine teints used in oils. But, if the parts of the face where these teints appear are in shadow, the crayons composed of black and white must be substituted in their place.

Let the student be careful when he begins the eyes, to draw them with a crayon inclined to the carmine teint, of whatever color the irises are; he must lay them in brilliant, and at first not loaded with color, but executed lightly. The student must let the light of the eye incline very much to the blue cast, avoiding a staring white appearance, but preserving a broad shadow thrown on its upper part by the eye-lash.

The student should begin the lips with pure carmine and lake, and in the shadow use some carmine and black; the strong vermilion teints should be laid on afterwards. He must form the corner of the mouth with carmine, brown ochre, and greens, variously intermixed. If the hair is dark, he should preserve much of the lake and deep carmine teints therein.

After he has dead-colored the head, he is to sweeten the whole together, by rubbing it over with his finger, beginning at the strongest light upon the forehead, passing his finger very lightly, and uniting it with the next teint, which he must continue till the whole is sweetened together, often wiping his finger on a towel, to prevent the colors being sullied. When the head is brought to some degree of forwardness, let the back ground be laid in, which must be done by covering it as thin as possible, and rubbing it into the paper with a leathern stump. Near the face the paper should be almost free from color. The ground, being painted thin next the hair, affords an opportunity of painting the edges of the hair over in a light and free manner in finishing.

The above method, properly executed, produces the appearance of a painting composed of three colors, viz. carmine, black, and white, which is the best preparation a painter can make for the producing a fine crayon picture. The next step is, to complete the back ground and the hair; thence proceed to the forehead, finishing downward.

In painting over the forehead the last time, begin the highest light with the most faint vermilion teint, in the same place where the faint carmine was first laid, keeping it broad in the same manner. In the next shade, the student must work in some light blue teints, composed of verditer and white, intermixing with them some of the deeper vermilion teints, insensibly melting them into one another. Some brilliant yellows may also be used, and, towards the roots of the hair, strong verditer teints, intermixed with green, will be of singular service. Cooling crayons, composed of black and white, should succeed these, and melt into the hair. Beneath the eyes, the sweet pearly teints are to be preserved, composed of verditer and white, and under the nose, and on the temples, the same may be used; beneath the lips, teints of this kind also are proper, mixing them with the light greens and some vermilion. In finishing the cheeks, let the pure lake clear them from any dust contracted from the other crayons; then with the lake may be intermixed the bright vermilion; and, last of all, a few touches of the orange-colored crayon, but with caution.

The eye is the most difficult feature to execute in crayons, as every part must be expressed with the utmost nicety, to appear finished; at the same time that the painter must preserve its breadth and solidity while he is particularising the parts. To accomplish this, the student should use his crayon in sweetening as much, and his finger as little as possible. When he wants a point to touch a small part with, he may break off a little of his crayon against the box, which will produce a corner fit to work with in the minutest parts. When the eye-balls are sufficiently prepared, the shining speck must be made with a pure white crayon, which should be first broken to a point, and then laid on firm; but, as it is possible they may be defective in neatness, they should be corrected with a pin, taking off the redundant parts, by which means they may be formed as neat as can be required.

The difficulty, with respect to the nose, is to preserve the lines properly determined, and at the same time so artfully blended into the cheek as to express its projection, and yet no real line to be perceptible upon a close examination; in some circumstances it should be quite blended with the cheek, which appears behind it, and determined entirely with a slight touch of red chalk. The shadow caused by the nose is generally the darkest in the whole face. Carmine and brown ochre, carmine and black, and such brilliant crayons, compose it best.

The student having prepared the lips with the strongest lake and carmine, &c., must with these colors make them completely correct; and, when finishing, introduce the strong vermilions, but with caution. This, if properly touched, will give the lips an appearance equal if not superior to those executed in oils, notwithstanding the seeming superiority the latter has, by means of glazing, of which the other is entirely destitute.

When the student paints the neck, he should avoid expressing the muscles too strong in the stem; nor should the bones appear too evident

on the chest. The most necessary part to be expressed is a strong marking just above the place where the collar bones unite; and, if the head is much thrown over the shoulders, some notice should be taken of the large muscle that rises from behind the ear, and is inserted into the pit between the collar bones. All inferior muscles should be avoided. In coloring the neck, let the student preserve the stem of a pearly hue, and the light not so strong as on the chest. If any part of the breast appears, its transparency must also be expressed by pearly teints; but the upper part of the chest should be colored with beautiful vermilions delicately blended with the other.

Dark blue, purple, black, pink, and all kinds of red draperies also should be first tinged with carmine, which will render the colors much more brilliant than any other method; over this should be laid on the paper the middle teint, except the dark masses of shadow, which should be laid on at first as deep as possible; these, sweetened with the finger, will exhibit a masterly breadth, which the lesser folds, when added, ought by no means to destroy. With the light and dark teints, the smaller parts are next to be made with freedom, executing as much with the crayon, and as little with the finger as possible; in each fold touching the last stroke with the crayon, which stroke the finger must never touch. In the case of reflections, the simple touch of the crayon will be too harsh, therefore fingering will be necessary afterwards, as reflected lights are always more gentle than those which are direct. With respect to reflections in general they must always partake of the same color as the object reflecting, but in the case of single figures, it may be useful to make some particular observations. In a blue drapery, let the reflections be of a greenish cast; in green draperies, make them of a yellow teint; in yellow, of an orange; in orange, reflect a reddish cast; in all reds, something of their own nature, but inclined to the yellow: black should have a reddish reflection; the reflection of a reddish teint will also present purples to the best advantage. Of whatever color the drapery is, the reflection on the face must partake thereof, otherwise the picture, like paintings on glass, will have but a gaudy effect. Linen, lace, fur, &c., should be touched spiritedly with the crayon, fingering very little except the latter; and the last touches even of this, like all other parts, should be executed by the crayon, without sweetening with the finger.

The methods above recommended have been practised by the most celebrated crayon-painters, whose works have been held in public estimation; but the knowledge of, and ability to execute each separate part with brilliancy and truth, will be found very insufficient to constitute a complete painter, unless he unite them with each other by correctness of drawing, propriety of light and shadow, and harmony of coloring. To accomplish this, the student should carefully avoid finishing one part, till he has properly considered the connexion it is to have with the rest.

MATERIALS.—The perfection of the crayons consists, in a great measure, in their softness; for it is impossible to execute a brilliant picture with

them if they are otherwise; on which account great care should be observed in the preparing them, to prevent their being hard. In all compositions flake white and white lead should be wholly rejected, because the slightest touch with either of these will unavoidably turn black. They are subject to change; but, whenever this happens, it is entirely owing to an injudicious use of the above mentioned whites, which will stand only in oils. To obviate the bad effect of such crayons use common whiting, prepared as follows:—

Take a large vessel of water, put the whiting into it, and mix them well: let this stand about half a minute, then pour off the top into another vessel, and throw the gritty sediment away; let what is prepared rest about a minute, and then pour it off as before, which will purify the whiting. When this is done let the whiting settle, pour the water from it, after which lay it on the chalk to dry, and keep it for use, either for white crayons, or for preparing teints with other colors, for with this all other teints may be safely prepared. All colors of a heavy or gritty nature, especially blue verditer, must be purified by washing after this method.

The student must have a large flexible pallet-knife, a large stone and muller to levigate the colors, two or three large pieces of chalk to absorb the moisture from the colors after they are levigated, a piece of flat glass to prevent the moisture from being absorbed too much, till the colors are rolled into form, and vessels for water spirits, &c., as necessity and convenience shall direct.

I. REDS. Good carmine is inclined to the vermilion tint, and good lake to the carmine tint. The carmine crayons are thus prepared:—

1. *Carmine*. As their texture is inclinable to hardness, instead of grinding and rolling them take a sufficient quantity of carmine, lay it upon the grinding stone, mix it with a levigating knife with spirit of wine till it becomes smooth and even. The chalk-stone being ready, lay the color upon it to absorb the spirit, but be careful that it is laid on in a proper shape for painting. If it is levigated too thin the crayons will be too flat; and if too thick it will occasion a waste of color by their adhering to the pallet-knife. The next step is to compose the different teints by a mixture with whiting; the proportion consists of twenty gradations to one. Take some of the simple color, and levigate it with spirit of wine, adding about one part of washed whiting to three parts of carmine, of which, when properly incorporated, make two parcels. The next gradation should be composed of equal quantities of carmine and whiting, of which four crayons may be made. The third composition should have one-fourth carmine and three-fourths whiting; of this make six crayons, which will be a good proportion with the rest. The last tint should be made of whiting very faintly tinged with carmine, of which make about eight crayons which will complete the above mentioned proportion.

2. *Lake* is a color very apt to be hard; to prevent which take about half the quantity of lake intended, and grind it very fine with spirit

of wine; let it dry, and then pulverise it, which is easily done if the lake is good: then take the other half, and grind it with spirits, after which mix it with the pulverised lake, and lay it out directly in crayons on the chalk. This color will not bear rolling. The simple color being thus prepared, proceed with the compound crayons as directed before, and in the same degrees of gradation as the carmine teints.

3. *Vermilion*. The best is inclined to the carmine tint. Nothing is required to prepare this color more than to mix it on the stone with soft water or spirits, after which it may be rolled into crayons. Various teints are produced by a mixture of the simple color with whiting.

II. *BLUES*. 1. Prussian blue is apt to bind, and is rendered soft with more difficulty than carmine and lake. The same method of preparation is to be followed with this as directed with respect to lake. 2. Blue verditer is naturally gritty, and therefore should be washed well. Its particles are so coarse as to require to be united by slaked plaster of Paris about the size of a pea. This blue is extremely brilliant, and will be of great use in heightening draperies, &c. The teints must be formed with whiting, as above directed.

III. *GREENS*. In Switzerland they have a method of making greens superior to ours. We usually take yellow ochre, grind it with spirits, mix it with the powder of Prussian blue, then temper it with a knife, and lay the crayons on the chalk, without rolling them. Instead of this some use king's yellow mixed with Prussian blue, and others brown ochre and Prussian blue. The crayons made of the two last may be rolled.

IV. *YELLOW*S. 1. King's yellow is the most useful and the most brilliant, levigated with spirits of wine. Yellow ochre, and Naples yellow, ground with spirits, make useful crayons. 2. Orange is produced with king's yellow and vermilion ground together with spirits, and the teints formed as in other cases, but no great quantity of them is required.

V. *BROWNS*. 1. Cullen's earth is a fine dark brown. After six or eight of the simple crayons are prepared, several rich compound teints may be produced from it, by a mixture with carmine in various degrees. Roman or brown ochre is an excellent color, either simple or compounded with carmine. Whiting tinged with either of these proves very serviceable in painting. 2. Umber may be treated in the same manner, only it is necessary to levigate it with spirit of wine.

VI. *PURPLES*. Prussian blue ground with spirits, and mixed with pulverised lake, will produce a good purple. Carmine, thus mixed with Prussian blue, will produce a purple something different from the former.

VII. *BLACK*. 1. Lamp-black is the only black that can be used with safety, as all others are subject to mildew; but, as good lamp-black is very scarce, the student should make it himself; the process is as follows:—Provide a tin cone, fix it over a lamp at such a height that the flame may just reach the cone for the soot to gather within it. When a sufficient quantity is collected take it out, and burn all the grease from it in a

crucible. It must then be ground with spirits, and laid on the chalk to absorb the moisture. 1. Various gray teints may be formed from this by a mixture of whitening. 2. Vermilion mixed with carmine is a composition of great use. 3. Carmine and black is another good compound, and various gradations should be made. 4. Vermilion and black is also a very useful compound. 5. Prussian blue and black is another good compound, and will be found of singular service in painting draperies.

The different compositions of colors must be cut into a proper magnitude, after they are prepared, to be rolled into pastils, for use. Each crayon should be formed in the left hand with the ball of the right, first formed cylindrically, and then tapered at each end. If the composition is too dry, dip the finger in water; if too wet, the composition must be laid upon the chalk again to absorb more of the moisture. The crayons should be rolled as quick as possible; and when finished must be laid upon the chalk again to absorb all remaining moisture.

SECT. V.—OF HOUSE PAINTING.

Painting, as applied to buildings, comprises in the first place the coloring over all the several kinds of wood, iron-work, &c., employed therein with mineral colors, rendered fluid by saturation with oils, oil of turpentine, &c. A pigment so prepared is spread over them with a brush, and by the repetition of several coats they together operate to their protection, and at the same time give a variety and neatness to the general appearance of a house. This kind of painting will be divided in this section under its several heads as it is practised in London, and will embrace the working in common colors, also graining of its several kinds, ornamental painting, inscription writing, &c. &c. All the prismatic colors are occasionally called into use by the painter, and he varies these to suit the taste of his employer into almost every gradation of teint. But the ground-work of all house-painting is formed by a paint prepared from lead, known in the arts as ceruse, or white-lead. This is manufactured for use at places called the White-lead Works, and is performed in the following manner, viz. by rolling leaden plates spirally up, so as to leave the space of about an inch between each coil, and afterwards placing them vertically in earthen pots, at the bottom of which is some good vinegar. The pots are then to be covered, and exposed for a length of time to a gentle heat in a sand bath, or by bedding them in hot dung. The vapor of the vinegar, assisted by the tendency of the lead to combine with the oxygen which is present, corrodes the lead, and converts the external portion of it into a white substance which comes off in flakes when the lead is uncoiled. The plates are thus treated repeatedly until they are corroded through, and completely reduced to an oxide; this is called ceruse or white lead. It is afterwards bleached, ground, and saturated with linseed oil. It is then put into tubs resembling butter firkins, each containing about 3 cwt.; in such tubs it is dispensed at the color shops. But at such places it is frequently adulterated with powdered chalk,

so that an experienced painter, who is desirous that his work should retain its color, prefers purchasing his lead at the works, where he is sure of having it pure. Lead improves by keeping, and all the best whites are performed by it when it is at least two or three years old. The Nottingham ceruse is most esteemed for house work when it is required to be finished in what is technically called flattening or dead white.

Litharge is employed by painters to render their colors more drying, and is composed of the ashes of lead, or a kind of dusky powder that first appears in its oxidation. When in this state it is called by the chemists a subcarbonate of lead, and is afterwards saturated with linseed oil to render it more drying.

Linseed oil is obtained by pressure from the seed of flax; it is afterwards filtered to clear it of any of the feculæ of the seed, and then suffered to remain in tubs to precipitate and clarify. The more colorless the oil is the better, and this is greatly promoted by keeping, as linseed oil will, by being kept a year or two, deposit all its coloring particles, and be as transparent as water: the best painting is made with oil in this state. In Holland they whiten their linseed oil by a very simple process, which is said by them to answer every purpose to be derived from its age. They take an earthen pot well glazed, into which they put one-third of fine white sand and one-third of water with the linseed oil they wish to whiten; and after having covered the vessel with glass they expose it to the sun, taking care to stir it at least once a day. When the oil has become very white it is left at rest during two days, after which it is taken away for use.

Of drying oils.—The substances most usually employed to produce them are the oxide of lead called litharge, plaster, and umber. The process consists in taking of these several materials in the proportions as follow, viz. to one pound of oil add half an ounce of litharge with as much ceruse, umber, and plaster. The oil is boiled on these four drugs over a gentle fire, taking care to skim it from time to time; this matter so skimmed off is called by the house-painter smudge, or dryer; it is of a lead color, and is used by him in his outside work, and sometimes mixed in the dark colors to render them more susceptible of fixing and drying. As soon as this scum begins to rarify and become red, the fire is stopped, and the oil being left at rest gradually settles and clarifies. Linseed oil so prepared is vended at the color shops under the name of boiled oil. All the best house-painting is done with it.

Mr. Vanherman has lately laid before the Society of Arts a method of rendering fish-oil applicable to painting; and it appears to make a good and cheap vehicle for colors exposed to the weather, though it dries but slowly. To thirty-two gallons of vinegar he adds twelve pounds of litharge and twelve pounds of sulphate of zinc, shaking the mixture well twice a day for a week. The mixture is then put into a tun of fish-oil, with which it is well shaken and mixed, and the next day the clearer part, about seven-eighths of the whole, is poured off. Twelve gallons of linseed oil, and two of oil of turpen-

tine are then added to the clear part, and this being well shaken together is left to settle for two or three days, when it will be fit to grind white lead and all fine colors in: these, however, are to be thinned for use with linseed oil and oil of turpentine. For cheap paints exposed to the weather, whitening and road dirt finely sifted are to be mixed with lime water to the consistence of mortar. To this composition may be added almost any pigment ground with the sediment of the prepared oil, in the proportion of one part to two of the lime water already used, and the whole is to be thinned for use, by adding to every eight pounds a quart of linseed oil and as much of a mixture of the prepared oil with lime water. The proportions of the mixture are not mentioned. If two ounces of litharge be added to a gallon of linseed oil and well shaken every day for a fortnight, and the clearer part mixed with half a pint of oil of turpentine be exposed to the sun for two or three days in shallow pans, Mr. Vanherman says 'it will be as white as nut oil.' If half a pound of frankincense be dissolved in a quart of oil of turpentine and added to a gallon of this bleached oil, and white lead ground in oil of turpentine be thinned for use with the mixture, he asserts that it will be quite dry and void of smell in four hours.

Oil of turpentine, or, as it is called, turps, is in general use among us in house-painting, and is the ingredient by which the flattening, as it is termed, is performed. All the larch and fir trees furnish a resin known by the general name of turpentine. Commerce distinguishes several qualities according to its degree of goodness. The larch tree furnishes what is called Venice turpentine; it is obtained by being made to flow from the trunk of the tree through holes made with an auger in which small pipes are fixed, that conduct the juice into buckets placed to receive it. This turpentine has a yellowish and limpid color, a strong aromatic smell, and bitter taste. In Canada the peasants collect it from the fir tree by perforating the sacs which contain it under the bark, with the point of a horn which is filled with this juice. It is afterwards distilled, in which it liberates an oil more or less volatile, according to the degree of heat employed. When the operation is done by a bath, a white, limpid, and odoriferous oil is obtained, which is called essence of turpentine. The residue from this distillation forms the boiled turpentine of commerce. This is sold at the color shops in the same way in which oil is, viz. by the gallon. This as well as the oil considerably improves by age.

Of the colors.—The colors used by painters may be classed as follows:—

| | | |
|-----|---|--|
| Red | Vermilion, Native cinnabar, Red-lead, Scarlet-ochre, Common Indian red, Spanish brown, Terra di Sienna, burnt, Carmine, Lake, Rose-pink, Red-ochre, Venetian-red | Color red, tending to orange. |
| | | Color crim- son tending to purple. |

| | |
|--------|--|
| Blue | Ultramarine, Ditto, ashes, Prussian-blue, Verditer, Indigo, Smalt. |
| | King's-yellow, Naples ditto, Yellow-ochre, Dutch-pink, English ditto, |
| Yellow | Light pink, Gamboe, Masticot, Common orpiment, Gall-stone, Terra di Sienna. |
| | Verdigris, Crystals of ditto, |
| Green | Prussian green, Terra verte, Sap-green. |
| | Orange-lake. |
| Orange | True Indian red, Archil, Logwood wash. |
| | Brown-pink, Bistre, Brown-ochre, Umbre, Cologne earth, Asphaltum. |
| Brown. | White-flake, White-lead, Calcined hartshorn, |
| | Pearl white, Troy white, Eggshell white, Flowers of bismuth. |
| White. | Lamp-black, Ivory ditto, Blue ditto. |
| | |

These embrace almost the whole of the colors employed by the house-painter, and which by experience he is enabled to mix in proportions to effect almost every tint.

Vermilion is a bright scarlet pigment, and is formed of common sulphur and quicksilver prepared for use by a chemical process. The best vermilion comes from China, where it is said the secret of making it is alone known. The Dutch pretend to have obtained it, and much of the vermilion at the shops is of their manufacture. It is so dear that the painters have recourse to every expedient to avoid using it: hence it is that the true Chinese pigment of this color is seldom seen.

Cinnabar is a similar pigment, differing only from vermilion by a more crimson coloring.

Red-lead, or minium, is lead calcined till it acquire a proper degree of color by exposing it with a large surface to the fire.

Scarlet-ochre is an earth with a base of green vitriol, and is separated from the acid of the vitriol by calcination.

Common Indian red is of a hue verging to scarlet, and is imported from the East Indies.

Venetian-red is a native ochre rather inclining

to scarlet; this is the pigment which is selected for the graining, as it is called by the house-painters, of doors, &c., in imitation of mahogany.

Spanish-brown is a native earth, found in the state and of the color in which it is used.

Terra di Sienna is a native ochre, and is brought from Italy in that state in which it is generally found. It is yellow originally, and in this state it is often made use of, and is accordingly placed among the yellow colors. It changes to an orange red by calcination, though not of a very bright tint, for which property it is sought to produce a pigment of that color.

Carmine is a bright crimson color, and is formed of the tinging substance of cochineal with nitric acid. It is not well calculated to mix up with oil, as its color changes rapidly by exposure to the air and light.

Lake is a white earthy body, as cuttle fish-bone, the basis of alum or chalk tinged with some vegetable dye, such as is obtained from cochineal or Brasil wood, taken up by an alkali and precipitated on the earth by the addition of an acid.

Rose-pink is a lake like the former, except that the earth or basis of the pigment is principally chalk, and the tinging substance is extracted from Brasil or Campeachy wood.

Red-ochre is a native earth, but that which is in common use is colored red by calcination, being yellow when dug out of the earth, and the same with the yellow ochre commonly used. This latter substance is chiefly brought from Oxfordshire, where it is found in great abundance.

Ultramarine is a preparation of calcined lapis lazuli, which is, when perfect, of a brilliant blue color, of an extremely beautiful and transparent effect in oil, and will retain this property with whatever vehicle or pigment it may be mixed. It is excessively dear, and is frequently sold at the color shops in an adulterated state.

Ultramarine ashes are the residuum or remains of the calcined lapis-lazuli.

Prussian blue is a brilliant pigment; it is the fixed sulphur of animal or vegetable coal chemically combined with the earth of alum.

Verditer is the mixture of chalk with the precipitated copper, which is formed by adding the due proportion of chalk to the solution of copper made by the refiners in precipitating the silver from the nitric acid in the operation called parting, in which they have occasion to dissolve it in order to its purification.

Indigo is a tinging matter extracted from certain plants which are found in both the Indies, and from whence the indigos of commerce are imported.

Smalt is glass colored with zaffer, and afterwards ground to a powder.

Kings-yellow is a pure orpiment, or arsenic colored with sulphur.

Naples-yellow is a warm yellow pigment rather inclining to orange.

Yellow-ochre is a mineral earth, which is found in many places, but of different degrees of purity.

Dutch-pink is a pigment formed of chalk, colored with the tinging particles of French

berries. It is not well adapted to work in oil by reason of its color soon flying off.

English and light pink are merely a lighter and coarser kind of Dutch pink.

Gamboge is a gum brought from the East Indies; it is dissolved in water to a milky consistence, and is then of a bright yellow color.

Masticot, as a pigment, is flake-white, or white-lead gently calcined, by which it is changed to a yellow, which varies in tint according to the degree of the calcination.

Orpiment is a fossil body of a yellow color, composed of arsenic and sulphur, with a mixture frequently of lead, and sometimes other metals.

Gall-stone is a concretion of earthy matter formed in the gall bladder of beasts. It is but little used.

Verdigris is an oxide of copper formed by a vegetable acid; it is used in most kinds of painting where green is required.

Crystals of verdigris is the salt produced by the solution of copper or common verdigris in vinegar.

Prussian green is a composition similar to blue of the same name.

Terra verte is a native earth; it is of a bluish green color, resembling the tint called sea-green.

Sap-green is the concreted juice of the buckthorn berry.

Orange-lake is the tinging part of annatto, precipitated together with the earth of alum.

True Indian red is a native ochrous earth of a purple color, but so scarce as seldom to be met with at the color shops.

Archil is a purple tincture prepared from a kind of moss.

Logwood is brought from America, and affords a strong purple tincture.

Brown-pink is the tinging part of some vegetable of an orange color precipitated upon the earth of alum.

Bistre is a brown transparent color of a yellowish tint.

Brown-ochre is a warm brown or foul orange color.

Cologne earth is a fossil substance of a dark blackish-brown color, a little inclining towards purple.

Asphaltum is sometimes employed by the painters to answer the end of brown pink.

White flake is a ceruse prepared by the acid of grape.

Troy white is simply chalk, neutralised by the addition of water in which alum has been dissolved.

Lamp-black is the soot of oil collected as it is formed by burning.

Ivory-black is the coat of ivory or bone formed by giving to them a great heat, all access of the air being excluded.

Blue-black is the coal of some kind of wood burnt in a close heat where the air can have no access.

Such are the several colors employed by painters; they are all to be found in the color shops both in a crude and prepared state. Preparing the colors consists in the first place of grinding them on slabs of porphyry till the particles are reduced to the finest imaginable state;

this is done by saturating them with oil or water, according as the color ground is to be used with either of them.

House-painting is known in the trade by the number of coats of paint applied, and the painting is divided into work in oil and what is technically called flatting. This latter description of work differs from the former only in the color being mixed up with turpentine instead of oil. Good painting is known by the fullness and solidity of its appearance without any marks of the brush; whereas cheap painters care little about this. To give a fresh appearance, and get their work out of hand, and be paid, is their only concern.

In the division of house-painting, as understood between the surveyors and workmen, the chief terms are as follows:—

Clearcole and finish signifies that the work is to be done in the cheapest way, and the process of doing which consists in first dusting and cleaning what is to be painted, and stopping and filling up all cracks and defects with putty. After which the whole is painted over with a paint prepared of whitening and size, which forms the ground for the finish, as it is termed. This finish consists of a coat of oil color prepared with lead. Where the work is not very dirty this kind of painting will answer every purpose, but it is by no means adapted for outside work.

Bringing forward, a term used by painters, applies to such new wood or other work as may have been added to old wood-work; or in cases in which the old wood-work has been repaired, and in consequence partly replanned, the priming and painting such parts to form a ground for the color, so as that it shall appear alike when finished, is the process intended by this term.

Stopping is no more than that the painter is to well fill up all the defects in the work he may have to paint, with putty.

Twice in oil is simply that the work has been twice painted over.

Thrice in oil, and flat, signifies that the work has been done twice over in oil colors and once in color mixed or prepared in turpentine.

Three times and flat may be similarly explained, that is, three coats of oil color and one of turpentine. This latter description of painting is generally that which is required to new wood-work.

The painter's tools are few in number, and they are found for the journeymen by the masters. They consist of a tool, or pound brush as it is called, which is composed of hogs' hair; this they use as a duster, until the ends of the hair of which it is composed are worn away; and become soft; it is then used in the color, being better adapted to spread it evenly by such previous wear. The other brushes vary in size, as the mouldings and work to be painted do; the smallest are to paint over the bars of sashes, or draw out lines which are intended to be left of a different tint from the general tone of the other work.

In mixing up the colors for oil-painting, white-lead forms the base of all ingredients; this the color-preparer modifies and changes by adding colored substances to it, till it is tinged so as to

produce a paint of the color he wishes. All those colors which are derived from vegetable bodies have, at first being spread, a more brilliant effect than those of mineral ones; but no vegetable color will long stand the combined effect of air and light; while the mineral colors, so exposed, remain unchanged. This defect in the vegetable colors is owing to that spontaneous oxidation or carbonization which is effected by the oxygen of the atmosphere on all vegetable matter which it can operate upon freely. To make this phenomenon more obvious, the air occasions a slow combustion or burning to take place, which dissipates the lighter or hydrogenous particle of color, and turns to a state of charcoal those which remain combined in the paint; hence all painting made with colors obtained from vegetable bodies soon appear black and discolored.

Graining is understood among painters to be the imitating of the several different species of scarce woods, such as are used for the best articles of furniture, viz. satin-wood, rose-wood, king-wood mahogany, &c. &c. Imitations of this nature, when well performed, are calculated to give a zest to painting: at Paris every species of wood-work used in their houses, as a part of the building, is done in this manner. The dead-white so much in vogue amongst us is not practised there. To grain satin-wood a ground is previously laid, composed of Naples yellow and ceruse, diluted with oil of turpentine; this is spread very evenly over the work to be grained, and is then left a day or two to get fixed and dry. The painter then prepares his pallet-board with small quantities of the same yellow and ochre, with a little brown, having some boiled oil and oil of turpentine mixed together, to saturate the colors to be used in the operation. He is also provided with several different sized camels' hair pencils, and also with one or more flat hogs' hair brushes. When he has mixed the colors he spreads it over a pannel, or any other small part of the work, first, to see the effect of the tints, and, if it suit what he is about to perform, he perseveres by doing a pannel at a time; and, in the instance of doors and other framing, the pannels are done first, and the margins round them afterwards. The flat hogs' hair brushes, by being dipped in the mixture of oil and turpentine, and drawn down the newly-laid color, occasions the shades and grainings in it: this effect takes place in the color from the brush supplying an excess of saturation to the color it touches; and to produce the mottled appearance, the camels' hair pencils are applied; and, when it is all finished, it is left to fix and dry, after which it is covered by a coat or two of good oil-varnish. The other fancy woods are performed in a similar manner, the painter varying the colors to produce them only. Some of our painters are so expert at this kind of imitation, and also in that of marbles, as to prevent their easy detection, except by the touch. Such kinds of painting are well calculated to last a great many years by being occasionally re-varnished only. It is not greatly dearer than good work in the common way, but it will last ten times as long, without appearing to lose any of its freshness.

Ornamental painting embraces the executing of friezes and the decorative parts of architecture in *chiara obscura*, or light and shade on walls and ceilings. It requires, in the first place, a ground to be well painted of the tint it is proposed to remain, and exactly drawn into the width it is intended to be left on such a ground so formed. The ornament to be painted is to be drawn out neatly with a black-lead pencil, and then to be painted and shaded, to give it its due effect.

Such kind of painting is often painted on slips of paper, or Irish cloth, and pasted up afterwards; some artists also, to facilitate their work, and when the ornament is of a similar pattern all through, do it by what is termed *stinselling*; this method consists in drawing out a certain length of the pattern to be painted very accurately on paper, and then pricking a large sized needle in regular distances all round the pattern through the paper, which they afterwards lay smoothly against the wall to be ornamented and strike its outer surface, which has been pricked through with a small linen bag containing powdered chalk: the powder enters the apertures in the pattern, and fixes itself against the wall, exhibiting the exact outline of the ornaments which the painter immediately fixes by painting it on the wall; by this means a great saving of his time is accomplished. Some paintings in this manner are heightened with gold; this is performed after the ornament is painted in, as it is termed, by the process known as gilding in oil.

Letter or inscription writing is performed by persons known in the trade as letter-writers. The process is similar to ornament painting, excepting the superior ability and taste required in the one, whereas the other is a mere mechanical operation. The letter writer sketches out in pencil the words he has to write, and afterwards corrects the outline by the color which he applies with a camel's hair pencil. When the letters are to be gilt, the process is similar, and as the letters are painted, they are covered with leaf-gold, and when completely covered it is left to fix itself by the drying of the painting on which it has been laid. After which a sponge and water is used to clear away the superfluous gold; the whole is then covered by a coat of good oil varnish. Letter writing is charged by the inch, viz. the height of one of the letters being taken, will, by being multiplied by the number on the whole inscription, denote exactly the quantity of inches which has been written. The price varies, inasmuch as shadowed letters are a halfpenny an inch more than plain ones, and gilt letters are treble the price of either. Twopence an inch is about the average price of inscription letters.

Painters' work is measured by the yard superficial, of nine square feet, and the painter is allowed to take his dimensions over and into every part where the brush has passed. Sash frames are valued at per piece, and sash squares at per dozen, as well as window bars, balusters of stairs, stay bars, &c. Painting done on new stucco is allowed one penny per yard more than when on wooden work, and colors are charged an additional penny more than when done in

plain whites. The painters' charges are regulated in London by the surveyors, and their regulations are made from an average of the price of the best materials of every kind; but painting is frequently offered to be done at from fifteen to twenty per cent. less than the price so regulated. But, perhaps, no branch of trade requires more exact description than painting, as oil and colors may be purchased of all degrees of purity: hence painting, like the gold of the jewellers, will vary in its quality, or fineness, as it varies in the ratio of its alloy or adulteration.

We add, from Mr. Elmes's Dictionary of the Fine Arts, a copious list of books on painting. In the work of Junius, *De Picturâ Veterum*, book 2, chap. iii. sect. 3, and in the *Bibliotheca Græca* of Fabricius, book 3, chap. xxiv. sect. 10, are catalogues of Greek authors who have written upon painting; of which, however, few have reached our times. Among this number are the *Icones* of the two Philostrates; which have been translated into French under the title of *Les Tableaux de Plate Peinture*, &c., by Blaise de Vigenere, corrected and augmented by Th. Embry, Paris, 1615, 1617, in fol. An excellent commentary upon this work may be found in a Memoir of Count Caylus, inserted in the twenty-ninth volume of *Mémoires de l'Académie des Belles Lettres*. To some editions of the works of Philostrates are added a work of Callistrates, entitled *Ἑρμῆας* (that is, explanations or descriptions).

The ancient work which gives the most detailed accounts of the art of painting among the ancients is the Natural History of Pliny, who, in speaking of minerals, takes occasion to speak of colors, and their use in painting; in which subject he treats of the history of ancient painting, in several chapters of the thirty-fifth book. These chapters have been published separately, and commented upon by Durand, in a work entitled *Histoire de la Peinture ancienne*, published at London in 1725, in fol. M. Falconet has also published a translation of the thirty-fourth, thirty-fifth, and thirty-sixth, books of Pliny, with notes, Amsterdam, 1772, 8vo. These chapters of Pliny have also been commented upon, in several articles inserted in the Memoirs of the Academy of Inscriptions and Belles Lettres. (An English translation of the whole work, by P. Holland, was published in 2 vols. fol., London, 1634.)

Count Caylus has given, in the nineteenth volume of the same work, *Eclaircissements sur quelques Passages de Plin qui concernent les Arts dependans du Dessin*; and, in the twenty-fifth volume, three Memoirs, entitled *Réflexions sur quelques Chapitres du trente-cinquième Livre de Plin*. In the second of these memoirs the reflections of the author are particularly directed to the kind and manner of ancient paintings; and in the third the character and manner of the Greek painters. The twenty-fifth volume contains also a Memoir of M. de la Nauze, upon the manner in which Pliny has treated the art of painting. M. Quatremere de Quincy, the learned author of part of the *Encyclopédie Méthodique*, and of Letters from London, in 1818, to Canova, on the Elgin Marbles, announced in 1805 a

new translation of this book; but we are not certain that he published it.

Among modern works upon painting we will first mention those which are written in Latin; among the principal of which are:—L. Bapt. Alberti, de Pictura, libri iii. Basil, 1540, in 8vo. Among the best translations of this work are, one in Italian, published in Venice, 1547, 8vo.; one in French by Jean Martin, among the works of Alberti upon architecture, Paris, 1553, fol.; and one in English, in the edition of his work upon architecture, by Leoni, 1726 and 1739, 3 vols. fol. Also, Joh. Molani de Picturis et Imaginibus Sacris, libri ii., Leovard, 1570 and 1594, 8vo. Robert Fludd, or De Fluctibus, Tractatus de Arte Picturæ, Francof., 1624, fol. Jul. Cæs. Bulenger, de Pictura, Plasticæ, et Statuaria Veterum, printed in his Opuscula, Ludg. Batav. 1621, 8vo.; and also separately under the same title, in 8vo. 1627, as well as in the ninth volume of Trésor de Gronovius. Of this work Thomas Malie has given an English translation, London, 1657, fol. It is merely a nomenclature of the various articles used in painting, and of the manner in which they are prepared. The next in chronological order is the work of Franciscus Junius (Francis Dujong, or Young), entitled de Pictura Veterum, Amst. 1637, in 4to. A new edition of it, much augmented and corrected, was published by Grævius at Rotterdam, in 1694, fol., which is reckoned preferable to the first. At the end of the work is a list of ancient artists, in alphabetical order, which is, perhaps, one of the best parts of the work.

Among the Latin works which treat of the theory and practice of the art, we find:—Speculum Imaginum Veritatis occultæ per Symbola et Emblemata, Auct. Jac. Mosenio, Col. 1661, 1681, 8vo. De Graphice sive Arte Pingendi; which is the fifth chapter of the work of Ger. J. Vossius, entitled de Natura Artium. Joannes Schefferi, Argentinensis, Graphice, id est de Arte pingendi, Norimb. 1669; Upsal, 1699, 8vo. This is an interesting little work, and is well written. De Inanibus Picturis, Diss. Joa. Fr. Jungeri, Lips. 1679, in 4to. By 'picturæ inanes' the author appears to mean those paintings which represent imaginary beings, or scandalous subjects. Dissert. de Pictura, Auct. Hulderic. Sigism. Rothmaler, Jen. 1692, 4to. De Lectione Poetarum recentiorum Pictoribus commendanda, Programma, Joh. G. Jacobi; Hal. 1766, 4to. De pictura contumeliosa, Diss. Joh. Lud. Kluber, Erl. 1787, in 4to. Car. Hodoby de Hoda, Ars delineandi Coloribusque localibus adumbrandi, 1790, 8vo. Car. Adol. Du Fresnoy, de Arte graphica, Paris, 1658.—A poem on the art, with the French version by De Piles, of which Dryden published a prose translation in 1694; Wills, an English painter, a metrical translation without rhymes; and again Mason, in 1782, a translation, with notes by Sir Joshua Reynolds.

Among the works written in Italian are, Discorso eruditissimo della Pittura, con molte segrete Allegorie, circa le mause, published in the Instituzione al comporre in ogni Sorte, di Rima, &c., of Mar. Equicola, Milan, 1541, 4to. Dialogo de Pittura, di Paolo Pino, Ven. 1548, 4to.

Trattatello della nobilissima Pittura, e della sua Arte, della Doctrina, e del Modo per conseguirla agevolmente, da Mich. Ang. Biondi, Ven. 1549, 8vo.: a little and very superficial work. Il Disegno del Anton. Franc. Doni, dove si tratta della Scoltura, Pittura, de Colori, de Getti, de Modegli, con molte cose appartenenti a quest' Arti, Venegia, 1549, 8vo. —a useful little work stored with excellent directions. Della nobilissima Pittura, e della sua Arte, del modo e della Dottrina di conseguirla agevolmente e Presto, da Biondo, Venice, 1549, 8vo. Introduzione alle tre Arti del Disegno, thirty-five chapters (for an account of which see Vite de Pittori da Vasari. L'Aretino, Dialogo della Pittura, di Lod. Dolce, nel quale si raginano della Dignità di essa Pittura, e di tutte le Parte necessarie che a perfetto Pittore si acconvegano: con Esempi di Pittori ant. e Mod. e nel Fine si fa menzione delle Virtù e delle Opere del divin Tiziano, Venice, 1557; of which there is a more modern edition, with a French translation (printed at Rome, 8vo.), and a long preface by the translator; also an English translation published in London, 1782, 12mo. Osservazioni nella Pittura, di M. Cristofano Sorte, Venice, 1580, 4to. Lettera di Bartolomeo Ammanati, sopra le Pitture men che oneste, Firenze, 1582, 4to. Il Riposo di Raffaello Borghini, in cui si favella della Pittura e delle Scoltura, et de più illustri Pittori e Scultori, antiche e moderni, Firenze, 1584, in 8vo.; of which there has been a new edition, augmented and corrected by Antonio Maria Biscioni, Firenze, 1730, 4to.; and a much later one in 3 vols. 8vo. Parere sopra la Pittura, di M. Bernard. Campi, Pittore Cremonese, Cremona, 1584, 4to. Discorso d'Allessandro Lamo intorno alla Scoltura et Pittura, Cremona, 1584, 4to. Trattato dell' Arte della Pittura, ne' quali si contiene tutta la Teorica e la Pratica di essa Pittura, da Giovanni Paolo Lomazzo, Mil. Pittori, div. in vii. libri, Milano, 1584 4to. The same work is also to be found under the following title, Trattato dell' Arte della Pittura, Scoltura, et Architettura, da G. P. Lomazzo, Mil. Pitt. div. in vii. libri ne' quali si discorre della Proporzione, de' Moti, de Colori, de' Lumi, della prospettiva, della Pratica, della Pittura, e finalmente de le Istorie d'essa Pittura, con una Tavola de' Nomi de tutti le Pittori, Scultori, Architetti, e Matematici, antichi e moderni, Milan, 1585 and 1590, in 4to. There is an English translation of this work by Haydok, London, 1598, fol.; and a French translation of the first book, which appeared at Toulouse in 1649, in folio. To this work we must add another by the same author, entitled Idea del Tempio della Pittura nella quale si discorre dell' Origine e del Fondamento delle cose contenente del trattato, dell' Arte della Pittura, Milan, 1571, in 4to. De' veri Precetti della Pittura de Giovanni Bat. Armenini da Faenza, lib. iii. ne' quali con bell' Ordine d' utili e buoni Avvertimenti per chi desidera in essa Farsi con prestezza eccellente si dimostrano, i Modi principali del disegnare e del dipingere, di fare le Pitture che si convengono alle Condizioni de' Luoghi e delle Persone, Ravenna, 1587, in 4to., and Venice, 1678, in 4to. Il Filogino, Ovvero del

Fine della Pittura; Dialogo del P. D. Gregorio Commanino, Canon. Later. nel quale s' mostra qual sia l'imitare più perfetto, o il Pittore, o il Poeta, Mantova, 1591, 4to. Definizione e Divisione della Pittura, di Giovan. Batt. Paggi, Nobile Genov. e Pittore, Geneva, 1607, folio. L'Idèa de' Pittori, de' Scultori, e degli Architetti, del Cav. Feder. Zuccheri, in due libri, Torino, 1607, 4to. This work is to be seen also in the sixth volume of the Raccolta di Lettere sulla Pittura, Scultura, e Architettura, Rome, 1754, 7 vols. 4to. Avvertimenti e Regole sopra l'Architettura, civile e militare, la Pittura, Scultura, e Prospettiva, da Pier' Antonio Barca, Milan, 1620, folio. Trattato della Pittura, fatto a commune Beneficio de' Virtuosi, da Fra. Dom. Francesco Bisagno, Cavaliere di Malta, Ven. 1642, 8vo. La prima Parte della Luce del dipingere, di Crisp. del. Passo, Amsterd. 1643, folio. Trattato della Pittura, de Lionardo da Vinci, dato in Luce con la Vita dell' istesso Autore scritta da Raff. Du Fresne, Paris, 1651, and Naples, 1733, folio, with engravings after designs made by Poussin. There was a new edition of it published at Florence, 1792, 4to., augmented with the life of the author by Franc. Fontani. There is also a translation of it into French by Rol. Freart. de Chambray, 1651, fol. 1716, 1724, &c., and an English translation, London, 1721, 8vo. Trattato della Pittura e Scultura, uso ed abuso loro, composto da un Teologo (Pere Ottonelli), e da un Pittore (Pietro di Cortona), in cui si risolvono molti Casi di Coscienza intorno al fare e tenere, le Immagine sacre e profane; si riferiscono molte Historie antiche e moderne, si considerano alcune Cose d' alcuni Pittori morti e famosi del nostro Tempo, e si notano certi avvisi e certi particolarità circa l'operare secondo l'Osservazioni fatte in alcune Opere, di Valent. Luomi Firenze, 1652, 4to. Il Microcosmo della Pittura, di Franc. Scanelli da Forlì; Cesena, 1657, 4to. Carta del Navigar pittoresco, dial. in quarta Rima, in Dialetto Venez. da Marco Boschini, Venezia, 1660, 8vo. Le Minere della Pittura, di M. Boschini, Venice, 1664, 4to. In the Prodomo alle Arte maestra, di. Franc. Lana, Brescia, 1670, fol.: the author treats of invention, of design, of colors, and of the different kinds of painting. Riflessioni sopra la Pittura di Nicolas Poussin, printed in the Vite de' Pittori, de' Scultori, ed Architetti moderni, par Bellori, Rome, 1672, 4to. Il Vocabolario Toscano dell' Arte del Disegno, co' propri Termini e Voci non sola della Pittura, Scultura, e d'Architettura, ma Ancora di altre Arti, e che hanno per Fondamento il Disegno, di Fil. Baldinucci, Firenze, 1681, 4to., of which Ant. Mar. Biscioni has given a new edition, published at Florence, 1730, 4to. Baldinucci is also the author of Lettera nelle quale si risponde ad alcuni quesiti in Materie di Pittura e Scultura, Rome, 1681, 4to.; and of La Veglia, Dialogo di Sincero Vero (Philip Baldinucci), in cui si disputano, e scogliono varie Difficoltà pittoriche, Lucca, 1684, 8vo., and in the Raccolta di alcuni Opuscoli, da Fil. Baldinucci, Fir. 1765, 4to. Bellori, della Pittura antica, Venez. 1697. Le Pittura in Parnasso, da Giovanni Maria Ciocchi, Pittore,

Firenze, 1725, 4to. La Teorica della Pittura, ovvero Trattato delle Materie più necessarie per apprendere con Fondamento quest' Arte, composto da Ant. Franchi, pittore Lucchese, Lucca, 1739, 8vo. Sfogamenti d'ingegno sopra la Pittura e la Scultura, da P. Franc. Minozzi, Venice, 1739, 12mo. Dialoghi sopra le Arti del Disegno, by Bottari, Lucca, 1754, 8vo. Avvertimenti di Giampa. Cavezzoni Zanotti, per lo incamminamento di un Giovane alla Pittura, Bal. 1756, 8vo. Dissertazione sopra l'Arte della Pittura dell' Abbate Giovanni Andrea Lazzarini, in the ninety-seventh and following pages of the second volume of the Nuova Raccolta d'Opuscoli scientif. e filol. reprinted at Pesaro, 1763, 4to.; and in the Catalogo delle Pitture nelle chiese di Pesaro, Pes. 1783, 8vo. Saggio sopra la Pittura, by count Algarotti, Livorno, 1763, 8vo.; of which there is a French translation by Pingeron, Paris, 1769, 12mo., and an English translation, 12mo. London, 1783. L'Idèa del profetto Pittore del servire di Regola nel Guidizio, che si deve formare Intorno all' Opere de' Pittori, accresciuta della Maniera di dipingere sopra le Porcellane, Smalto, Vetro, Metalli, e Pietre, Venice, 1771, 4to. Dell' Arte di vedere nelle bell' Arti del Disegno, secondo li Principi di Sulzer e di Mengs, Venice, 1781, 8vo. The works of Mengs, in their various editions and translations. A poem, entitled dell Arte Pittorica, in eight cantos, by count Ad. Chiusole, Venice, 1768, 8vo., will afford some pleasure; it has been abridged into four cantos, under the title of Precetti della Pittura, Vic. 1781, 8vo. Storia della Pittura in Italia da Luigi Lanzi. The best edition of which is in six volumes 8vo., Bassano, 1809. Vincenzo Requeno, saggi sul Ristabilimento dell' antica Arte de' Greci e Romani Pittori, Rome, 1786. A second edition of which appeared in 2 vols. Parm. 1787. Storia della Pittura e della Scultura dai Tempi antichi. This work, which is written in Italian and English, has also the following title:—The History of Painting and Sculpture, by Thomas Hickay, and was published at Calcutta in 1788, 4to.

Among the works written in Spanish upon the theory of painting are the following, namely:—Arte dei Pintura, symmetria y perspectiva, por Phil. Nunnez, in Lisbon, 1615, 4to. Memorial informatorio, por los Pintores, Madrid, 1629, 4to. Dial. de la Pintura, su Defensa, Origen, Essencia, Definicion, Modos, y Diferencias, por Vinc. Carducho, Firent. Madrid, 1633 and 1637, 4to. Trattato de la Pintura, su antiguedad y grandezas, por Franc. Pacheco, Seville, 1649, in 4to. El Museo pintorico, y escala Optica, por Ant. Palamino Velasco, Madrid, 1715, 1724, 3 vols. fol. Under the title of La Pittura, Diego Ant. Regon de Silva has printed in 1788, at Segovia, a poem in three cantos, of which painting is the subject.

Among the works of French authors on this subject are the following:—Idée de la Perfection de la Peinture démontrée par les Principes de l'Art et par des Exemples conformes aux Observations que Plin et Quintilien ont faits sur les plus célèbres Tableaux des anciens Peintres, mis en Parallèle avec quelques Ouvrages de nos

meilleurs Peintres modernes, Lion. da Vinci, Raffaele, Jules Romain, et Le Poussin, par Roland Freart, Sieur de Chambray, au Mans, 1662, 4to.; Paris, 1672, 8vo. Le Peintre converti aux Règles précises et universelles de son Art, avec un Raisonnement au Sujet des Tableaux, by Abr. Bosse, Paris, 1667, 4to. Des Principes de l'Architecture, de la Peinture, Sculpture, et des autres Arts qui en dépendent, avec un Dictionnaire propre à chacun de ces Arts, par André Felibien, Paris, 1669, 1697, 4to. Conférences de l'Académie royale de Peinture et de Sculpture pendant l'Année 1667, Paris, 1669, 4to.; Amst. 1706, in 12mo.; and in the fifth volume of *Entretiens sur les Vies des Peintres*, by the same, Trev. 1725, in 12mo. *Traité de la Pratique de la Peinture*, par Philippe de la Hire, in l'Histoire de l'Académie des Sciences de Paris, 1666—1669, vol. ix. page 635, and following. L'Académie de la Peinture nouvellement mise au jour pour instruire la Jeunesse à bien peindre en Huile et en Miniature, par la Fontaine, Paris, 1679, 12mo. Conférence de l'Académie, avec les Sentimens des plus habiles Peintres sur la Pratique de la Peinture et de la Sculpture, avec plusieurs Discours academiques, par Henry Testelin, Paris, 1696, fol. Livre de Secrets pour faire la Peinture, 1682, 12mo. Cours de Peinture par Principes, by M. Roger de Piles, Paris, 1708, 1720, 12mo. This work forms the second volume of his *Œuvres diverses*, Amsterdam, 1766, 12mo. *Elémens de la Peinture-pratique*, by the same, Paris, 1684, 12mo.; 1708, 12mo. Ch. Ant. Jombert has given an enlarged edition of it, 1766, 8vo., which forms the third volume of his *Œuvres diverses*, Amster. 1766, 12mo. Many authors, and among others M. de Murr, in his *Bibliothèque de Peinture*, at page 151, have attributed this work to Jean Baptiste Corneille, who is not the author of the engravings which are in it. *Traité sur la Peinture, pour en apprendre la Théorie et se perfectionner dans la Pratique*, par Barnard Dupui du Grez, Toulouse, 1699, 4to. *Réflexions sur la Poésie et sur la Peinture*, by the Abbé Jean Baptiste Dubos, Paris, 1719, 2 vols. 12mo. There have appeared enlarged editions of it in 1733, and 1740, in 3 vols. 12mo. Discours prononcés dans les Conférences de l'Académie royale de Peinture et de Sculpture, by Antoine Coypel, Paris, 1721, 4to. *Dialogues sur la Peinture*, by Fenelop. They are joined to the *Life of Mignard*, by the abbot Monville, Amst. 1731, in 12mo. In the *Choix des Mercurès*, vol. ii. p. 167, is a letter upon painting, M. Brossard de Mantenei. *Observations sur la Peinture*, London, 1736, 8vo. *Réflexions sur la Peinture*, by M. de la Font de Saint Yenne, 1746, 12mo. *Lettres sur la Peinture*, à un Amateur, par Louis Guillaume Baillet de Saint Julien, Genève, 1750, 12mo. *Essai sur la Peinture, Sculpture, et Architecture*, by Louis de Bachaumont, Paris, 1752, 8vo. Jaq. Gautier, *Observations sur l'Hist. naturelle, sur la Physique, et sur la Peinture*, Paris, 1752, 6 vols. *Observations sur la Peinture et sur les Tableaux anciens et modernes*, by the same, Paris, 1753, 2 vols, 12mo. In the *Recueil de quelques Pièces concernant les Arts*, by Cochin, Paris,

1757, 12mo. page 121, is a *Mémoire sur la Peinture*, which had already appeared in the *Mercur de France*. *Discours sur la Peinture et sur l'Architecture*, by M. du Perron, Paris, 1758, 8vo. *Réflexions sur les différentes Parties de la Peinture*, is found with l'Art de Peindre of Watelet, Paris, 1760, 4to. 1761, 12mo. In l'Amateur; ou, *Nouvelles Pièces et Dissertations pour servir aux Progrès du Goût et des Beaux Arts*, Paris, 1762, 8vo., are some reflections upon colors. *Traité de la Peinture*, suivi d'un *Essai sur la Sculpture*, pour servir d'Introduction à une *Histoire universelle relative à ces beaux Arts*, by André Bardon, Paris, 1765, 2 vols. in 12mo. *Observations raisonnées sur l'Art de la Peinture appliquées à la Galerie de Dusseldorf*, by Fredon de la Bretonniere, Dusseldorf, 1776, 8vo. *Principes abrégés de Peinture*, par M. Duterns, Tours, 1779, 8vo. *Traité des Principes et des Règles de la Peinture*, by M. Liotard, Genève, 1781, 8vo. *Réflexions sur la Peinture et la Gravure*, by C. F. Joullain, 1785, 12mo. The author of this work speaks particularly of the dealing in pictures. There are also several memoirs upon this matter in the *Bibliothèque des Artistes et des Amateurs*, by the Abbé Jean Raymond de Petit, 1766, 3 vols. 4to.

Many French didactic poems have been written on painting; such are:—*La Peinture*, a poem, 1755, 12mo. *L'Art de peindre*, by Watelet, Paris, 1760, 4to., Amst.; 1761, 12mo. *La Peinture*, a poem, crowned at the floral games in 1767, by M. Mich. d'Avignon, Lyons, 12mo. *La Peinture*, a poem in three cantos, by La Mierre, Paris, 1770, 4to.; Amst. 1770. 12mo. There are also to be found some interesting articles in the *Grand Livre des Peintres ou l'Art de la Peinture*, considéré dans toutes ses Parties et démontré par Principes avec des *Réflexions sur les Ouvrages de quelques bons Maîtres et sur les Défauts qui s'y trouvent*, par Gerard de Laresse, Paris, 1787, 2 vols. 8vo.

Among the older works in the English language upon this subject are:—A proper Treatise wherein is briefly set forth the Art of Limning, London, 1625, 4to. *Ars Pictoria*; or, an Academy treating of Drawing, Painting, Limning, and Etching; to which are added thirty copper plates, expressing the choicest, neatest, and most exact grounds and rules of symmetry collected out of the most eminent Italian, German, and Netherland authors, by Alexander Brown, London, 1660, 8vo.; 1669 and 1675, small folio. *Introduction to the general Arts of Drawing and Limning*, London, 1674, 4to. *Painting illustrated*, in three Dialogues, containing some choice Observations upon the Art; together with the lives of the most eminent Painters from Cimabue to the time of Raffaele and Michel Angiolo, with an explication of the difficult terms, Lond. 1685, 4to., 1719, 4to., 1785, 4to., by Will. Aglionby, and the lives of painters are corrected after Vasari. *Polygraphice*; or the Art of Drawing, Engraving, Etching, Limning, Painting, Washing, by Salmon, Lond. 1678, 2 vols. 8vo.; 1701, 2 vols. 8vo. *The Art of Painting of the best Italian, French, and German Masters*, London 1692, fol. Art of

Painting in Oil, and Method of Coloring, by J. Smith, London, 1753, 12mo. Art of Painting after the Italian Manner, by M. Elsum, London, 1704, 8vo. Essay upon the Theory of Painting, by Richardson, London, 1719, 8vo. This work forms the first volume of a Treatise on Painting, of the same author, which has been translated into French by A. Rutgers; Amst. 1728, 8vo. 4 parts in three vols. The Art of Drawing and Painting in Water Colors, by J. Smith, London, 1730, 1732, 1757, and 1779, in 12mo. Essay upon Poetry and Painting, with relation to the Sacred and Profane History, by Charles La Motte, London, 1730, 12mo. The Principles of Painting, London, 1744, 8vo. Polymetis; or, an Enquiry concerning the Agreement between the Works of the Roman Poets and the Remains of the ancient Artists, by John Spence, London, 1747, 1755, and 1774, fol. Tindal has given an abridgment of it, London, 1765, republished in 1786, 8vo. Plan of an Academy of Painting, Sculpture, &c., London, 1755, 4to. Practice of Painting and Perspective, in which is contained the Art of Painting in Oil, with the method of Coloring; first Painting or Dead Coloring, second Painting, third or last Painting, Painting Backgrounds, Copying, Drapery, and Landscape Painting, by Th. Bardwell, London, 1756, 1773, and 1782, 4to. Enquiry into the Beauties of Painting, and into the Merit of the most celebrated Painters, ancient and modern, by Dan. Webb, London, 1777, 4to. A Letter on Poetry, Painting, and Sculpture, by King, London, 1768, 12mo. Seven Discourses delivered in the Royal Academy by the President Sir Joshua Reynolds, London, 1778, 8vo. There was a French translation of it published in Paris in 1787, 2 vols. 12mo. Several other Discourses of Reynolds have since been published, and are now collected in his works, London, 4to., 1796, &c. Sketches on the Art of Painting, by Talbot Dillon, 1782, 8vo. The Artist's Repository and Drawing Magazine, exhibiting the Principles of the polite Arts in their various Branches, London, 1784, in 4to. There are to be found also some curious details upon painting in the Handmaid to the Arts, by M. Dossie, London, 1764, 2 vols. 8vo., as in the School of Arts, London, 1785, 8vo.

Among the English poems upon painting are—A Poetical Epistle to an eminent Painter, 1778, 4to., by W. Hayley, Esq.; and the Beauties of Painting, by Pollinger. Robinson, 1783, 4to.

More modern works by Opie, Fuseli, West, and others, are so well known that they are omitted to make room for the enumeration of others less common.

In the Dutch language are—Inleyding tot de hooghe School der Schilderkonst door Sam. Van Hoogstraeten, Middelb. 1641. 4to; Rotterd. 1678, 4to. Willh Gære, Natuurlyk en schilder-konstig Ontwerp der Menschenkunde: leerende niet alleen de Kennis van de Gestalte, Proportie, Schoonheyd, Muskelen, Bewegingen, Actien, Passien en Welstand des menschenbeelden, tot de Teykenkunde, Schilderkunde, Beldhouwery, Botseer en Giet-Oeffening toe passen; maar ook hoe sich een mensch na deselve Regelen, in al-

lerhand Doeningh van Gaan, Staen, Loopen, Torssen, Dragen, Arbeyden, Spreken en Andere gebeerden bevallig en verstandelijk aanstelen zal, Amst. 1682. An excellent work, with many fine engravings. Der leermester der schilder-konst, eertyds in rym gestelt door Karel van Mender, weder aan't licht gegeven en ontrymi'd door Wibrandus de Geest, Schilder, Leawarden, 1712, 8vo.

Among works upon painting written in German, whose titles we have been able to collect, we shall mention—Le Livre curieux des Arts à l'Usage des Peintres, Sculpteurs, et Orfèvres, par Henri Vogtheren, Strasburg, 1543, 4to. Le Manuel des Arts de Sébald Beham, propre à apprendre à peindre et à dessiner d'après les véritables Proportions et Divisions du Cercle à l'usage des Peintres et des Artistes, Francfort, 1605, 4to., with fifty-seven engravings in wood. L'Academia tedesca della Architettura, Scultura, e Pittura, Nurembourg, 1675, 1679, 2 vols. fol. Le vrai Chemin à suivre pour apprendre à peindre, par Guillaume Stettler, Berne, 1679, 12mo. Le Peintre curieux, Dresden, 1679, 8vo., with engravings. Le Peintre instruit, habile, galant, et édifiant, par J. Dauw, Copenhagen, 1721, 8vo.; an enlarged octavo edition by Charles Bertrand, ib., 1755, 8vo. Principes de la Peinture et du Dessin, par Joseph Widtmaisser, Vienna, 1731, 4to. Le Peintre instituteur, montrant aux Amateurs comment il faut s'y prendre pour apprendre à peindre en Huile, en Pastel, en Fresque, &c., by Jean Melchior Croecker, Jena, 1778, 8vo. Idées sur l'Imitation des Monumens Grecs en Peinture et Sculpture, Dresden, 1754 and 1756. Epître au Sujet de l'Ouvrage précédent, Dresden, 1755, 4to. Dissertations upon the work: Idées sur l'Imitation des Monumens Grecs, ib. 1756, 4to., Jean Winckelmann. La Manière d'apprendre à peindre: Ouvrage dans lequel on montre l'Excellence et l'Utilité de cet Art, l'Usage qu'on doit en faire, et comment on doit s'y perfectionner, &c., Leipsic, 1756, 8vo. Réflexions sur la Peinture, by Chrétien Louis de Hagedorn, Leipsic, 1762, 2 vols. 8vo. This work has been translated by Huber, Leipsic, 1775, 8vo. Du Laocoon; ou, des Limites respectives de la Poésie et de la Peinture, by G. E. Lessing, Berlin, 1766. M. Charles Vanderbourg has given a French translation of it, Paris, Renouard, 1802, 8vo. Dissertations sur la Théorie de la Peinture et du Dessin, où on établit les vrais Principes propres pour former le Goût dans les Arts, Francfort et Leipsic, 1769, in 8vo. Sur la Nature et l'Art dans les Tableaux, la Sculpture, l'Architecture, et la Gravure, Leipsic, 1770, 2 vols. 8vo. par Christophe Scheyb. The same author has also published another work upon this subject: it is entitled Orestrio sur les Arts du Dessin, avec un Appendix sur la Manière de faire des Empreintes en Souffre, Plâtre, et Verre, et graver en Pierres dures, &c., Vienna, 1764, 2 vols. 8vo. Instruction sur l'Etude de la Peinture en tant qu'elle appartient aux beaux Arts, et la Peinture comme métier, prouvée d'une Manière pratique, par E. L. D. Huch, Halle, 1773, 8vo. L'Etude du Dessin et de la Peinture, à l'Usage des Commencans, suivi d'une Liste des plus célèbres Peintres, Sculpteurs, et Archi-

tectes, ainsi que des Académies et Ecoles, par Chrétien Louis Reinhold, Goetingue, 1773, 8vo., with forty-five engravings. *Système des Arts du Dessin*, suivi d'une Introduction à l'Etude des Antiques, Hiéroglyphes, et Attributs allégoriques modernes, by the same, Munster, 1784, 8vo., with forty engravings. We may regard, as a continuation and supplement of this work, *L'Ecole du Dessin et de la Peinture*, Munster, 1786, 8vo., with forty-five engravings: and *l'Académie des beaux Arts*, &c., with fourteen engravings, Munster, 1788, 8vo., both by the same author. *Principes de la Peinture*, par Junker, Zurich, 1775, 8vo. *Académie des Arts du Dessin*, par Chrétien Frédéric Prangen, Halle, 1778, 2 vols., 8vo. *Leçons sur les Arts du Dessin*, destinés aux Elèves des Académies des Arts, par H. A. Mertens, Leipsic, 1783, 8vo. *Instruction sur la Théorie et la Pratique du Dessin et de la Peinture*, pour les Commencans de cet Art, Altona, 1778, in 8vo., with engravings. *Bibliothèque des Arts*, destinée aux Peintres, Dessinateurs, Graveurs, et Sculpteurs, en Forme de Lettres, par C. Lang, Erlangen, 1779. The same author has given a continuation of this work under the title of *Lettres à l'Usage des Peintres, Dessinateurs, &c.*, Francf. 1791 et 1792, 2 vols. 8vo. *Magasin pour les Arts du Dessin*, Munich, 1791, 8vo. *Théorie de la Peinture*; ou, *l'Instruction sur la Peinture d'Histoire à l'Usage des Commencans*, par Christophe Fescl, Wurtzbourg, 1792, 8vo.

Among the best Latin works which treat on various subjects connected with the art of painting, or in praise of the arts in general, may be enumerated *Martin Frisius, de Erroribus Pictorum*, Hafnie, 1703, 4to. *Muller, de Pictura, Dissertatio juridica*, Jen. 1712, 4to. *Brunquell, de Pictura honesta ac utili*, Jen. 1733, 4to. C. F. Voita Berg, *de Pictura famosa*, Jen. 1703, 4to. *Fichtner, de eo quod justum est circa Picturam*, Altorf, 4to. *Theoph. Boerner super Privilegiis Pictorum*, Lipsiæ, 1751, 4to. *Durr Franc. Ant. de Probatione per Picturas in sacris, Moguntiae*, 1779, 4to. *Kluber Joannes Ludov. de Pictura contumeliosa*, Erlangen, 1787, 4to.

The best Italian works on the same subjects are:—*Trattato della Nobiltà della Pittura*, composto ad istanza della Venerab. Comp. di S. Luca, et della Nob. Acad. de' Pittori di Roma, da Rom. Alberti, Roma, 1585, 4to. Another edition of the same work was published at Pavia in 1604, also in 4to. The second of the *Lezioni* di M. Ben. Varchi, Firenze, 1549 and 1590, 4to., is entitled, *Qual sia più nobile la Pittura o la Scultura?* Gli Onori della Pittura, e della Scultura, *Discorso* di Gianb. Bellori, Lucca, 1677, 4to. *Pregi della Pittura*, di Dom. Palletta, Roma, 1688, 8vo. *La Pittura in Giudizio*, ovvero il Bene delle oneste Pitture, ed il Male delle Oscene, di C. Gregor. Rosignoli, Venezia, 1696, 12mo., and another edition at Bologna, 1697, also in 12mo. *Le tre belle Arti in Lega con l'Armi per difesa della Religione*, Oraz. di Vinc. Lucchesini, Roma, 1716, 8vo. *Orazione in Lode della Pittura, Scultura, ed Architettura*, da Nicolas Fontingueri. This tract is printed in the second volume of the *Prose degli Arcadi*, Rome, 1718, 8vo. *Orazione della Pittura, Scul-*

tura, ed Architettura, giovano per l'acquisto delle Scienze, da Vinc. Santini, printed in the third volume of the same work. *Orazione in Lode della Pittura, Scultura, ed Architettura* di Giambattista Alessandro Moreschi, Bologna, 1781, 8vo. *Esame ragionato sopra la Nobiltà della Pittura e della Scultura*, per Nicolas Passeri, Napoli, 1783, 8vo.

In the Spanish language the most esteemed works on the same subjects are—*Discursos apologeticos en quese defiende la Ingenuidad del Arte de la Pintura*, que es liberal y noble de todos Derechos, por Juan de Butron, Madrid, 1626, 4to. *Por el Arte de la Pintura*, por D. Juan Xanregui, Madrid, 1633, 4to.

In French—*Eloge de la Peinture*, par Philippe Angele, Paris, 1642, 12mo. *Ichnographie*; ou, *Discours sur les quatre Arts d'Agriculture, Peinture, Sculpture, et Gravure*, avec des Notes historiques, cosmographiques, chiffres, Lettres initiales, Logogripes, &c., par M. Hebert, Paris, 1767, 5 vols., 12mo.

In English—*A Parallel between Poetry and Painting*, by Dryden, Lond. 1695, 4to., inserted as a preface to that great poet's translation of *Du Fresnoy*. The various editions of the *Lectures of Reynolds, Barry, Fuseli* (some passages from whose work have been extracted in the course of this article), *Opie, West, &c.* The *Artist*; a Collection of *Essays on Art*, by various English artists, edited and conducted by Prince Hoare, Esq., London, 1809, 2 vols. 4to. Our intention being more to direct our readers to scarce and valuable foreign works than to well known English treatises, this portion is rendered necessarily brief.

In the German language are to be found—a reply to the following question:—*Does Painting possess any influence over a state?* Hamburg, 1763. *Advice to young Artists to apply themselves to Literature*, by H. de Sonnenfels, Vienna, 1768, 8vo. *An Enquiry whether Painting produces a greater effect than Music*. A Dialogue, by Herder, inserted among the *Miscellaneous Works* of that author, published at Gotha, 1785, in 8vo.

The principal Lexicons and Dictionaries on Painting are:—*Dictionnaire Abrégé de Peinture et d'Architecture*, où l'on trouve les principaux Terms de ces deux Arts, avec leur Explication, la Vie abrégée des grands Peintres et des Architectes célèbres, et une Description succincte des plus beaux Ouvrages de Peinture, de Sculpture, et d'Architecture, soit antiques, soit modernes, par l'Abbé Marsy, Paris, 1746, 2 vols. 8vo. *Dictionnaire portatif des beaux Arts*, par Lacombe, Paris, 1766, 8vo. *Dictionnaire portatif de Peinture, Sculpture, et Gravure*, avec un *Traité pratique des différentes Manières de peindre*, par D. Ant. Joseph Pernetty, Paris, 1757, 8vo. *Dictionnaire Iconologique*; ou, *Introduction à la Connoissance des Peintres, Sculptures, Estampes*, par M. Prezel, Gotha, 1758, 8vo. *Dizionario portatile delle belle Arti*, che contiene quanto è di più rimarchevole nella Pittura, Scultura, Intaglio, &c., colla Vita de' più celebri Professori delle medesime Arte, Venezia, 1758, 8vo. *Nouveau Dictionnaire des Peintres*, pour acquérir une Connoissance exacte des bons Tableaux anciens et modernes, avec un Appen-

dix de quelques Monogrammes, par Louis de Winckelmann, Aug. 1796, 8vo. (in German). Dictionnaire des Arts de Peinture, Sculpture, et Gravure, par Watelet et Levesque, Paris, 1792, 5 vols. 8vo. Théorie générale des beaux Arts, rédigée par Ordre alphabétique, par J. G. Sulzer, Leipsic, 1793, 4 vols. 8vo. (in German).

On the preservation of pictures we may consult, Recueil des Mémoires et diverses Expériences, faites au Sujet de la Conservation des Tableaux, avec un Discours sur l'Incorruptible, par G. Dagly, Berlin, 1706, 8vo.

On the origin, antiquity, and history of painting among different nations, we may cite, Joa. Nicolai Funnii, Diss. de Picturæ Usu et Origine, with his Dissertationes academicæ, 1746, 8vo., 470th and following pages. Lettere dell' Origine, Uso, ed Abuso della Pittura, in the Lettere scelte del Abbate Pietro Chiari, Venice, 1750, 8vo. page 172. De l'Ancienneté de la Peinture, par Fraguier, to be found in the first volume of Mémoires de l'Académie des Belles Lettres. On the Origin and History of the Art, by Studemund. Jena, 1767, 8vo.

On the history of painting in general—Histoire des Arts qui ont rapport au Dessin, divisée en trois Livres, où il est traité de son Origine, de son Progrès, de sa Chute; et de son Rétablissement, par Monier, Paris 1705, 8vo. The Perfect Painter; or a History of the Origin, Progress, and Improvement of Painting, 1730, 12mo. Introductio ad Historiam Artis Delineatorie, by Peter Ciner, included in his Dissertationes Literariæ, Florence, 1742, 8vo. Essai d'une Histoire des Arts du Dessin, par A. F. Busching, Hamburgh, 1761, 8vo. Della Patria degli Arti del Disegno del Gherardo d'Arco, Cremona, 1785, 8vo. Anecdotes des Beaux Arts, contenant tout ce que la Peinture, la Sculpture, la Gravure, l'Architecture, et la Vie des Artistes offrent de plus curieux et de plus piquant chez tous les Peuples du Monde, depuis l'Origine de ces différens Arts jusqu'à nos Jours, Paris, 1776, 8vo. 3 vols. Domenico Manni, del vero Pittore Luca et del Tempo del suo fiorire, Florence, 1764, 4to. Dell' Errore che persiste di attribuirsi la Pittura al S. Evang. by the same, Florence, 1766, 4to.

On the state of painting among the Greeks and Romans:—De l'Amour des beaux Arts, et de l'extrême Considération que les Grecs avoient pour ceux qui les cultivoient avec Succès, par Caylus, &c., in the twenty-first volume of Mémoires de l'Académie des Belles Lettres. Histoire de la Peinture ancienne, extraite de l'Histoire naturelle de Plin, avec le Texte Latin, corrigé sur les Manuscrits de Vossius et sur la première Edition de Venise, et traduite en François par D. Durand. London, 1725, folio. We may recognise, as a continuation of this work, the Treatise of the count de Caylus, on the Pictures of Polygnotus, on several passages of Pliny relating to the Arts, on the Picture of Venus, by Apelles, &c., in the 19th, 27th, 29th, and 30th, vols. of Mémoires de l'Acad. des Inscriptions et Belles Lettres. The third and fourth parts of the work entitled Gallus Romæ Hospes, par L. Mont Josieu, Rome, 1585, 4to. (and to be found in the ninth volume of the Trésor of Gronovius),

treat of antique sculpture and painting. De l'Origine de la Peinture et des plus excellens Peintres de l'Antiquité, Paris, 1660, 4to. Des Peintres anciens et de leurs Manières, in the tenth volume of Nouveaux Choix des Mercur. Joann. Fonseca, de Pictura veterum. Delle Pittura antica, da G. B. Bellori, Venice, 1697, 4to. Treatise on ancient Painting, containing Observations on the Rise, Progress, and Decline of that art among the Greeks and Romans, &c., by George Turnbull; adorned with fifty pieces of ancient painting discovered in the ruins of old Rome, accurately engraved from drawings of Camillo Paderni, Lond. 1740, folio. Enquiry into the Causes of the extraordinary Excellency of ancient Greece in the Arts, London, 1767, 8vo. In the Archaeologia Literaria of Ernesti, in that of Martini, and in that of Siebenkees, appear chapters on painting among the ancients. Sur la Peinture des Anciens, par Falconet, in the sixth volume of his works, Lausanne, 1781. Recherches sur l'Origine, l'Esprit, et le Progrès des Arts de la Grèce, sur leur Connexion avec les Arts et la Religion des anciens Peuples de l'Inde, de la Perse, du reste de l'Asie, de l'Europe, et de l'Egypte, London, 1785, 4to. Sur la Peinture des Anciens, servant de Supplément à l'Histoire de l'Art, par A. Riem, Berlin, 1787, 4to. Observations on the Art of Painting among the Ancients, by Cooper, in the third volume of Memoirs of the Literary and Philosophical Society of Manchester, 1790, 8vo.

Works which treat in general of the lives of painters of every age and country:—Entretiens sur les Vies et sur les Ouvrages des plus excellens Peintres, anciens et modernes, by André Felibien, Paris, 1696, 5 vols. 4to., and London, 1705, 4 vols. 8vo. The second part of the first volume of the Academia tedesca della Architettura, Scultura, e Pittura, of Sandart, Nuremberg, 1675, folio. Noms des Peintres les plus célèbres, anciens et modernes, Paris 1679, 12mo. Abrégé de la Vie des Peintres, avec des Réflexions sur leurs Ouvrages, par R. de Piles, Paris, 1747, 12mo. Abecedario Pittorico, o sia serie degli Uomini i più illustri in Pittura, Scultura, ed Architettura, da F. P. A. Orlandi, Bologna, 1704, 4to. Account of the most eminent Painters, ancient and modern, continued down to the present Times according to the Order of their Succession, by R. Graham, London, 1716, 8vo. Table historique et chronologique des plus fameux Peintres anciens et modernes, par A. F. Harms, Brunswick, 1742, folio. Dictionnaire générale des Artistes, by Fuessli, Zurich, 1767, 4to. Extraits des différens Ouvrages publiés sur la Vie des Peintres, by M. Papillon de la Ferté, Paris, 1776, 12mo. Pet. Opmerii Opus Chronogr. Orbis universi à Mundi Exordio usque ad Annum 1611, Antwerp, 1611, folio.

Works expressly on the ancient painters:—Vite de' Pittori antichi, scritte ed illustrate da Carlo Dati, 1667, 4to. Lezione detta nella Accademia della Crusca intorno a' Pittori, Greci e Latini, de Filippo Baldinucci, 1692, 4to. In the tenth edition of Junius's work entitled De Pictura Veterum (Rotterdam, 1694) there will be found an extensive catalogue of the painters and other artists of antiquity.

Respecting modern painters in general we find details in *L'Académie des Sciences et des Arts*, contenant les Vies et les Eloges des Hommes illustres, par J. Bullart, Brussels, 1695, folio. *Le Vite de' Pittori, de' Scultori, e degli Architetti moderni*, con loro Ritratti al naturale, da Giovanni Pietro Bellori, Rome, 1672, 4to. Accresciuta colla Vita e Ritratto del Car. Luc. Giardano, Rome, 1728, 4to. *Vite de' Pittori, Scultori, ed Architetti moderni*, da Liono Pascoli, Rome, 1730—6, 2 vols. 4to. (The names of all other painters, save Italian, are dreadfully mangled in this book). Portraits of the most eminent painters and other famous artists that have flourished in Europe, curiously engraved on above 100 copper plates, from original paintings of Van Dyck, Jansens, Guido, Teniers, and other celebrated masters; with an account of their Lives, Characters, and most considerable Works, London, 1739, 4to. *Abrégé de la Vie des plus fameux Peintres, avec leurs Portraits gravés en taille-douce, les Indications de leurs principaux Ouvrages, quelques Réflexions sur leurs Caractères, et la Manière de connoître les Dessins et les Tableaux des grands Maitres*, par M. A. J. Dezallier d'Argenville, Paris, 1745, 3

vols. 8vo. *The Gentleman and Connoisseur's Dictionary of Painters*, containing a complete Collection and Account of the most distinguished Artists, who have flourished in the Art of Painting in Europe from 1250 to 1767; to which is added, a Catalogue of the Disciples of the most famous Masters, &c., by Pilkington, London 1767, 4to. *Dictionnaire des Artistes*, par M l'Abbé L. A. Fontenay, Paris, 1776, 2 vols. 8vo. *Biographical Memoirs of extraordinary Painters*, exhibiting not only Sketches of their principal Works and professional Characters, but a variety of romantic Adventures and original Anecdotes, London, 1780, 12mo. *Abrégé de la Vie des Peintres, dont les Tableaux composent la Galerie Electorale de Dresde*, Dresden, 1782, 8vo. *Manuale de' Pittori*, for the Year 1792, Florence, 8vo.

Our biography will be found to contain the lives of the most distinguished painters of all ages and countries, in their alphabetical places; but the following catalogue *Raisonnée* of celebrated painters, from the revival of the art to the beginning of the last century, may be found a useful compendium to students.

| Names. | Studied under. | Painted. | Died. | Excelled in. |

PAINTS. See COLOR-MAKING.

PAIR, *n.s.*, *v.n.* & *v.a.* Fr. *pair*; Lat. *par*, equal. Two things alike, of a sort, or suitable to each other; a couple; brace; hence a married couple: to be joined in pairs or coupled; to suit; fit: as an active verb, to join in couples; unite as corresponding or as a remarkable contrast.

Our dance, I pray;

Your hand, my Perdita; so turtles pair.

Shakespeare.

Had our prince seen the hour, he had paired
Well with this lord; there was not a full month
Between their births. *Id. Winter's Tale.*

All his lovely looks, his pleasing fires,
All his sweet motions, all his taking smiles,
He does into one pair of eyes convey. *Suckling.*

O when meet now

Such pairs in love and mutual honour joined?

Milton.

Baucis and Philemon there

Had lived long married and a happy pair;

Now old in love. *Dryden.*

Minds are so hardly matched, that ev'n the first,
Though paired by heaven, in Paradise were cursed.

Id.

The many pairs of nerves, branching themselves to
all the parts of the body, are wonderful to behold.

Ray.

Ethelinda!

My heart was made to fit and pair with thine,
Simple and plain, and fraught with artless tenderness.

Rowe.

Turtles and doves with differing hues unite,
And glossy jet is paired with shining white. *Pope.*

Their sentiment, so well expressed,

Influenced mightily the rest;

All paired, and each pair built a nest. *Cowper.*

Ah sure a pair was never seen,

So justly formed to meet by nature!

The youth excelling so in mien,

The maid in every grace of feature.

Sheridan.

PAIRING, in zoology, the union of animals in couples for the purpose of rearing their young. All wild birds pair; but with a remarkable difference between such as place their nests on trees and such as place them on the ground. The young of the former, being hatched blind and without feathers, require the nursing care of both parents till they are able to fly. The male feeds his mate on the nest, and cheers her with a song. As soon as the young are hatched, singing yields to a more necessary occupation, that of providing food for a numerous issue; a task that employs both parents. Eagles, and other birds of prey, build on trees, or on other inaccessible spots. They not only pair, but con-

tinue in pairs all the year round; and the same pair procreates year after year. This at least is the case with the eagles: the male and female hunt together, unless during incubation, at which time the female is fed by the male. A greater number than a single pair are never seen in company. Gregarious birds pair, probably to prevent discord in a society confined to a narrow space. This is the case particularly with pigeons and rooks. The male and female sit on the eggs alternately, and divide the care of feeding their young. Eider ducks pair like other birds that place their nests on the ground; and the female finishes her nest with down, plucked from her own breast. If the nest is destroyed for the down, which is remarkably warm and elastic, she makes another nest as before. If she is robbed a second time, she makes a third nest; but the male furnishes the down. The black game never pair: in spring, the cock, on an eminence, crows and claps his wings; and the females within hearing resort to him. Pairing birds, excepting those of prey, flock together in February to choose their mates. They soon disperse; and are not seen afterwards but in pairs. Pairing is unknown to quadrupeds that feed on grass. To such it would be useless; as the female gives suck to her young while she herself is feeding. Beasts of prey, such as lions, tigers, wolves, pair not. The female is left to shift for herself and for her young; which is a laborious task, and often so unsuccessful as to shorten the lives of many of them. Pairing is essential to birds of prey, because incubation leaves the female no sufficient time to hunt for food. Pairing is not necessary to beasts of prey, because their young can bear a long fast. Among animals that pair not, males fight desperately for a female. The beavers, with respect to pairing, resemble birds that place their nests on the ground. As soon as the young are produced, the males abandon their stock of food to their mates and live at large; but return frequently to visit them while they are suckling their young. Hedgehogs pair, as well as several of the monkey kind. We are not well acquainted with the natural history of these animals; but it would appear that the young require the nursing care of both parents. Seals have a singular economy. Polygamy seems to be a law of nature among them, as a male associates with several females. The sea turtles have no occasion to pair, as the female performs her task at once, by laying her eggs in the sand. The young are hatched by the sun, and immediately crawl to the sea.

PAISLEY, a town of Scotland in Renfrewshire, about six miles and a half west of Glasgow, on the river White Cart, over which there are two stone bridges of two arches each, and one of three. The town is very ancient; but was of much less consequence formerly than at present. The name Paisley is supposed to be derived from the Gaelic Pais-licht, i. e. the brow or face of a rock, which was the situation of its old church in 1160. It was erected into a burgh of barony by James IV. in 1488, when its importance seems to have been derived from its rich monastery. Even in the beginning of the eighteenth century it was but an inconsiderable place; consisting only of one street, about half a mile in length, with several lanes; whereas now it appears to be one of the largest and most populous towns in Scotland. Its buildings are elegant; its streets are well paved; and connected with one another, where the river intervenes, by three bridges. It is governed by three bailies, of whom the eldest is commonly in the commission of the peace, a treasurer, a town-clerk, and seventeen counsellors, who are annually elected about Michaelmas. It enjoys the powers of government and police, without the usual burdens of royal boroughs. The old part of the town runs from east to west upon the south slope of a ridge of hills, from which there is a fine prospect of Glasgow and the adjacent country; but on the south the view terminates in a ridge of green hills, about two miles distant. It is full a mile long, and nearly as broad. On the east side of the Cart stands the new town, which was feued off by the earl of Abercorn, and is now a large and populous place. The streets are laid off in a regular manner, but not in right angles. Many of them bear evidence of the industry of the people from their names, as Silk Street, Cotton Street, Lawn Street, &c. Here the earl of Abercorn built one of the largest and most elegant inns in Scotland, and several market-places. The town of Paisley continued a part of the abbey parish till 1738; when, the magistrates and council having purchased the patronage from the then earl of Dundonald, a new church was built, and the town was erected into a separate parish. This, called the Laigh Church, is built in the form of a Greek cross, very well laid out, and contains a great number of people. In 1756 another church was built, ornamented with a lofty spire, visible at a great distance. This is called the High Church, and is a very fine building; it is an oblong square of eighty-two feet by sixty-two, built of free-stone, with rustic corners and an elegant stone cornice. The roof is a pavilion covered with slate, having a platform covered with lead. In 1781 the Middle Church was built, and very elegantly finished; and in 1782 the town was divided into three parishes, named from their churches. There are six churches for the established religion, one each for the Episcopalians, Roman Catholics, Secession, Cameronians, and Methodists, two for the communion of relief, and two for the Independents. In addition to these, numerous other religious sects have their separate places of worship. The town-house is a very handsome

building of cut stone, with a tall spire and a clock. The flesh-market has an elegant front of cut stone, and is one of the most commodious in Britain. The poor's house is a large building, very well laid out, and stands opposite to the quay, in a fine free air. It is supported by a small tax. A philosophical society, the members of which are rather numerous, and hold weekly meetings in their hall during the winter season, has long existed. A taste for reading is also general among the manufacturing classes, in proof of which it may be mentioned, that besides what is called the trades' library, which forms indeed a third public one, many book societies have been formed; and numerous reading-rooms are supported by operatives only. Paisley is now one of the first manufacturing towns in Scotland, and is greatly celebrated on account of its manufactory of silk gauze. About the beginning of the last century the manufactures consisted principally of muslins, coarse linens, and handkerchiefs, which were afterwards succeeded by those of lawn and gauze, and a species of thread called ounce, or white thread, from Holland. In 1812 it was computed that 350,000 spindles of linen yarn, made into thread, were annually produced; this branch of trade has, however, greatly declined, and has been succeeded by the manufacture of wire or cotton thread. The lawn and linen gauze manufactures have also given way to other branches of industry. About the year 1760 the silk manufacture was introduced, and succeeded beyond expectation; but, in 1816, it had so much declined as not to employ more than a dozen looms. Since that period the silk trade, and also the fancy muslin branch, have rapidly increased, and, with the cotton manufactures, have been carried on to an extent before unknown, by the powerful aid of steam-engines, and other machinery. Shawls, both of silk and cotton, and also of silk mixed with Merino wool, are extensively manufactured here, under the names of scarfs, plaids, and shawls. It is difficult to give an exact account of the state of its manufactures at present. Besides the principal manufactures, there are four considerable tan-works, two soap and candle works, a manufacture of ribands, and another of inkle or tape. The Cart runs from south to north, and falls into the Clyde, after it has joined the conflux of the Gryfe and Black Cart at Inchinnan bridge, three miles below the town. At spring tides vessels of forty tons burden come up to the quay. The communication by water is of great importance to the inhabitants; for in this way they are served with fish of different kinds, and send their goods and manufactures to Port Glasgow, Greenock, and Glasgow; and by the great canal they have also a communication with the Frith of Forth. The trade of the town is considerably augmented by improving the navigation of the river Cart, by removing some rocks and shoals; and as the channel was but shallow under Inchinnan bridge, a navigable canal was constructed, which leaves the river a little above, and joins it a little below bridge. The Ardrossan canal also skirts the town, and is, in one place, formed into a basin, where there is an

excellent wharf. Paisley has fairs in August and November, and lies twenty-two miles north of Ayr.

In the adjoining parish there are five coal mines. Free-stone, granite, and lime-stone abound; and fossil marine shells are found in the lime quarries, as well as corals and shells in the coal mines. The ancient abbey church, which gives name to the parish, stands a short way south of the inn of Paisley, and was the only one which Paisley formerly required. This church was anciently a most noble building, and consisted of several distinct and separate places of worship; the relics of this magnificent Gothic structure are worthy the notice of the antiquarian. Only the chancel now remains, which is divided into a middle and two side aisles; all very lofty pillars, with Gothic arches; above these is another range of pillars much larger, being the segment of a circle, and above a row of arched niches from end to end, over which the roof ends in a sharp point. The outside of the building is decorated with a profusion of ornaments, especially the great west and north doors, than which scarcely any thing lighter or richer can be imagined. Close by the abbey church is the earl of Abercorn's burial-place. It is a vaulted Gothic chapel, without pulpit or pew, but has the finest echo perhaps in the world. In this chapel is the monument of Marjory Bruce, daughter of Robert Bruce, wife of Walter, great steward of Scotland, and mother of Robert II.; and in it were interred Elizabeth Muir and Euphemia Ross, consorts to Robert II. The abbey of Paisley was founded as a priory for monks of the order of Clugni, about 1160, by Walter, great steward of Scotland. It was afterwards raised to an abbacy; and its lands were by Robert II. erected into a regality, under an abbot. After the Reformation, the abbacy was secularised by the pope in favor of lord Claud Hamilton, son of the duke of Chatelherault: and, in 1588, it was erected into a temporal lordship, and lord Claud was created lord Paisley. Its revenues were very considerable; consisting of the tithes of twenty-eight parishes, with the property of several lordships. But in 1653 lord Claud's grandson, James earl of Abercorn, sold the lordship to the earl of Angus, who in 1654 sold it to William lord Cochran. Great part of it was since sold off by the family of Dundonald; and what remained was, in 1764, re-purchased by the late earl of Abercorn. The fabric of the abbey owed much of its magnificence to abbot George Schaw, who, about 1484, enlarged and beautified the building, gardens, &c. He built the refectory and other offices necessary for the monks, the church and the precinct of the convent; and enclosed the gardens and orchards by a wall of hewn stone, which measured about a mile in circuit. This wall, observes Mr. Pennant (Tour in Scotland), 'is a very noble and extensive one, and indicates the ancient grandeur of the place.' On a stone at the north-west corner is this very singular inscription:—

Thy call it the Abbot George of Shaw
About my Abbey gart mak this waw;

An hundred four hundredth zeir
Eighty-four the date, but weir
Pray for his salvtie
That laid this noble foundation.

The spinning of cotton was introduced into the abbey parish in 1783. The principal seat of that manufactory is at Johnstoun, a neat and regularly built village about three miles west from Paisley. There is also in the neighbourhood of Paisley a calico printing work and a copperas work. The bleaching business in the abbey parish is carried on to a very considerable extent. The distillery business is carried on to a great extent, and the spirit manufactured in great perfection. A considerable quantity of it is exported.

PAISLEY, BLACK BOOK OF, in literary history, an ancient chronicle, often quoted 'in Scottish history, containing a record of public affairs and remarkable events, kept by the monks, who resided in the monastery. It agreed in every material fact with the Scoti-chronicon of Fordun.

PAKFONG. The name given to the white copper of the Chinese, said to be an alloy of copper, nickel, and zinc; in sixteen parts of which there are seven of zinc, two and a half of copper, and six and a half of nickel. The combination of zinc and nickel simply does not succeed.

PALACE, *n. s.* } *Fr. palais*; *Lat. palatium.*

PALACIOUS, *adj.* } (From a residence of the Cæsars. See below.) A royal abode; the abode of any sovereign or superior person; a splendid or magnificent abode: the adjective we only find used by Graunt.

This Cambuscan, of which I have you told,
In regal vestiments sit on his deis,
With diademe ful high in his *palais*. *Chaucer.*
You forgot,

We with colours spread,
Marched through the city to the *palace* gates. *Shakspeare.*

Palaces and pyramids do slope
Their heads to their foundations. *Id.*
The *palace* yard is filled with floating tides,
And the last comers bear the former to the sides. *Dryden.*

London encreases daily, turning of great *palacious*
houses into small tenements. *Graunt.*

The sun's bright *palace* on high columns raised
With burning gold and flaming jewels blazed. *Addison.*

The old man early rose, walked forth and sate
On polished stone before his *palace* gate. *Pope.*

At once is lost the pride of awful state,
The golden canopy, the glittering plate,
The regal *palace*, the luxurious board,
The liveried army, and the menial lord. *Johnson.*
From scenes like these old Scotia's grandeur springs,
That makes her loved at home, revered abroad:
Princes and lords are but the breath of kings,
'An honest man's the noblest work of God.'
And certes, in fair virtue's heavenly road,
The cottage leaves the *palace* far behind. *Burns.*

In such a *palace* Aristeus found
Cyrene when he bore the plaintive tale
Of his lost bees to her maternal ear;
In such a *palace* poetry might place
The armory of winter. *Cowper.*

ARN. To the *palace*
Colonna, as I told you!
CÆS. Oh! I know
My way through Rome. *Beyron.*

PALACE, in architecture, the term generally applied to the dwelling-houses of kings and princes. There has been much difference of opinion as to the derivation of the Latin word *palatium*. Procopius derives it from a Grecian called *Pallos*, who gave his own name to a splendid house which he had built, adding, that after him the emperor Augustus applied the name *palatium* to the house of the Roman emperors on the hill called the *Palatine*. On the other hand, it has been contended that the house of *Romulus*, in which Augustus lived, was properly called *palatium*, because situated on the *Palatine hill*. However this be, *palatium*, at first doubtless a proper name, became at length, not 'like *homo*, common to all men,' but, in a similar way, common to all the habitations of sovereigns. Neither is it restricted to these: for, taking different additions according to the quality of the inhabitants, we speak of imperial palace, royal, pontifical, cardinal, ducal, episcopal, &c. Nay, it is customary in China to build palaces in honor of celebrated ancestors: and, in the year 1263, *Hu-pi-lay*, of the Mogul empire (the first who borrowed the Chinese customs), built one for his ancestors.

In the Ancient Universal History we have an account of a most magnificent palace in Upper Egypt, not far from *Aswan* (the ancient *Syene*), the ruins whereof are so extensive as to impress the mind of the spectator with amazement. It is as large as a little city, having four avenues of columns leading to as many porticoes. At each gate, between two pillars of porphyry, stand two gigantic figures of fine black marble armed with maces. The avenues consist of columns set three and three together, in a triangle, on one pedestal: on the chapter of each triangle is placed a sphinx and a tomb alternately. Each column is seventy feet high, all of one stone.

Homer gives us details with regard to the construction of the palaces of the kings in the heroic ages. These descriptions are to be taken with a great deal of reservation. They are, most likely, in part ideal, in part embellished, and possibly taken from edifices erected long after the reputed era of the siege of *Troy*. At all events they are curious, even as affording an evidence of the notions entertained by the illustrious old Grecian on the subject. In the sixth book of the *Iliad*, the palace of *Priam* is represented as a vast edifice, the lower part of which was composed of porticoes of stone and covered galleries, beneath which were fifty chambers richly decorated for the fifty sons of *Priam*. In front of this edifice, and in the middle of the court-yard, stood another of stone, in which were twelve beautiful rooms for the daughters of *Priam*. *Paris*, who is represented as a prince possessing himself some knowledge of architecture, brought to *Troy* several architects to build him a palace. This was situated between those of *Priam* and *Hector*, and like those included many apartments.

In the earliest periods of their history, the Romans applied the word *domus*, not only to ordinary houses, but also to the habitations of the great, and even to those of their sovereigns. Even in the time of the voluptuous madman,

Nero, the celebrated new palace built by him was denominated *domus aurea Neronis*, *Nero's golden house*. This sumptuous palace surpassed in profuse splendor, as well as in dimensions, all which either had preceded or have succeeded it. According to *Suetonius*, the court in which was the colossal statue of *Nero* was adorned with three ranges of porticoes, each a mile in length. The gardens attached to the palace were also of a prodigious size, and contained a sort of pond or lake, which *Suetonius* states might be said to resemble a sea, and on the banks of which stood clusters of elegant buildings, each like a little town. The imperial portion of the building was embellished with unheard-of magnificence. Gold, jewels, and other articles of value were lavished around with an unsparing hand, while the essences and perfumes fuming up on all sides bore testimony to the effeminate luxury of this rival of *Sardanapalus*. The whole of this surpassing structure has been demolished centuries since, and it would be well for the outraged feelings of humanity if the infamy of its wretched owner had passed away with the walls he constructed.

PALÆMON (*Quintus Rhemmius*), a celebrated grammarian of Rome, in the reign of *Tiberius*. He was the son of a slave at Vienna, and was first bred up a weaver: but, attending his master's son to school, he acquired so much learning, that he obtained his freedom and became a teacher at Rome. He gained great reputation as a rhetorician and a poet; but his morals were loose, and his income, though large, was not sufficient to support his continued debaucheries. His arrogance was so great, that he used to say 'that letters were born and would die with him.' We have only some fragments of his works.

PALÆOLOGUS (*Michael*). See *ROME*.

PALÆPHATUS, an ancient Greek philosopher, who flourished between the times of *Aristotle* and *Augustus*, but whose precise age is uncertain. He wrote five books *De Incredibilibus*, of which the first only is extant. In it he attempts to explain the fables of mythology by historical facts. The best edition is that of *J. Fred. Fischer*, 8vo. Leips. 1773.

PALÆPOLIS, an ancient town of Italy, in Campania, built by a Grecian colony, on the spot where *Naples* was afterwards erected.

PALÆSTRA, in Grecian antiquity, a public building where the youth exercised themselves in wrestling, running, playing at quoits, &c. To prevent the combatants from hurting themselves by falling, the bottom of the *palæstra* was thickly covered with sand.

Barthelemi's Anacharsis furnishes us with the following account:—The *palæstræ* are nearly of the same form with the *gymnasia*. We visited the apartments appropriated to all the species of baths; those where the wrestlers leave their clothes, when they rub their bodies with oil to render their limbs supple, and where they roll themselves in the sand in order to give their antagonists a hold.

'Wrestling, leaping, tennis, and all the exercises of the *Lyceum*, were here repeated before us with greater varieties, and with more strength

and skill on the part of the performers. Among the different groups before us we distinguished men of the most perfect beauty, and worthy of serving as models for artists: some with vigorous and boldly-marked outlines, as Hercules is represented; and others of a more slim and elegant shape, consistent with the description of Achilles.

PALAFIX (Juan de), a learned Spaniard, born in Arragon, in 1600. He studied at Salamanca; and was a member of council of the Indies; bishop of Angelopolis, and of Osma, and judge of the Indies. He wrote on various subjects and died in 1659.

PALAMBAM, or **PALEMBANG**, a river of Sumatra, rises near the west coast of the island, about a day's journey from Bencoolen, and empties itself by several branches into the strait of Banca; the land near its mouth is low and swampy, the breadth up to the Dutch factory, a distance of fourteen leagues, is nearly a mile, and it has depth for vessels of fourteen feet draft. The Dutch establishment in 1777 (and it does not appear to have been since increased) consisted of 115 Europeans, of whom about thirty were officers, civil and military. The Malay town of Palembang is the most considerable of Sumatra; it is sixty miles up the river, along both banks of which it extends for eight miles, besides a number of floating habitations on the river. The houses, are like those of the Malays in general, of wood and bamboo raised on posts. The sultan's palace is a large lofty building, surrounded by a high wall, and near it is the grand mosque, which appears to have been built by a European, having pilasters and a cupola, and glazed windows. Two forts mounting heavy cannon protect the town. Besides Malays, a great many strangers are settled at Palembang, principally Chinese, Cochinchinese, and Siamese. See **SUMATRA**.

In 1812 the kingdom of Palembang was conquered by a handful of British troops under the orders of colonel Gillespie. The sultan, who had made himself universally odious by his cruelties, and by his unprovoked massacre of the Europeans resident in his capital, was dethroned, and his brother raised to the throne. The expedition which achieved this conquest set sail from Batavia on the 20th of March. After they arrived in the river of Palembang, being retarded by various obstacles in their ascent to the capital, and learning that the sultan, on hearing of the approach of the British, had fled, and that his adherents were resolved on an indiscriminate massacre of all the wealthy Chinese and other merchants, which was to take place that night, colonel Gillespie, with a small party of about seventeen British grenadiers, and a determined band of officers, hastened to the capital, and forced their way into the palace, which was partly in flames, and of which the floors and pavements were covered with the blood of the wretched victims who had been lately massacred. Here they fortified themselves, and held possession of it until the remaining troops arrived; after which the sultan was formally dethroned.

PALAMEDEA, in ornithology, a genus

belonging to the order of grallæ. The character of this genus, according to Latham, is, the bill bends down at the point, with a horn, or with a tuft of feathers erect near the base of it; the nostrils are oval; the toes are divided almost to their origin, with a small membrane between the bottoms of each. There are two species:—

1. *P. cornuta*, the horned screamer. It is about the size of a turkey; in length about three feet four inches. The bill is two inches and a quarter long, and black; the upper mandible is a little gibbous at the base, the under shuts beneath it as in the gallinaceous tribe; the nostrils are oval and pervious, and placed near the middle of the bill. From the crown of the head springs a slender horn of more than three inches in length and pointed at the end; the irides are the color of gold; the plumage on the head, neck, and upper part of the body, is black, margined with gray on the first and downy; some of the feathers round the neck are likewise edged with the same; the under parts of the wings are pale rufous, appearing on the shoulders and edges of them when closed; at the bend of the wing are two strong, sharp, horny, yellow spurs, one above another, the uppermost an inch and a half in length; the belly, thighs, and vent, are white; the tail is eight inches and a half long; the legs are stout and dusky; the fore claws are moderately bent; the hind one is nearly straight, not unlike that of a lark, and is about an inch long. These birds are always met with in pairs. They frequent places near the water; make a large nest of mud, in the shape of an oven, upon the ground; and lay two eggs, the size of those of a goose. Bajon says they make nests in thickets and among rushes. Fermun says they build in high trees. The young are brought up in the nest till able to shift for themselves. They have but one nest in the year, which is in January or February, except the first eggs are taken away, when they make a second in April or May. The young birds are frequently eaten by the natives, though the color of the flesh is very dark; that of the old ones is tough and ill-tasted. This species is said to feed on crabs and birds, as pigeons and poultry, and even to attack sheep and goats; but others say its principal food is reptiles. This species is rare. It is found in Cayenne, Guiana, Surinam, and other parts of America, chiefly in the marshes and wet savannahs, and for the most part near the sea. These seem to be the birds mentioned by Ulloa, called by the inhabitants of Quito desperadores, or awakens, from their giving notice to others of the approach of danger; as on hearing the least noise, or seeing any one, though at a great distance, they rise from the ground and make a loud chattering like a magpie, continuing the noise, and hovering over the object which caused the alarm, whereby the rest of the birds, taking the hint, are able in time to escape the impending danger. This screaming noise, which some authors relate as being exceedingly loud and terrible, occasioned Pennant to give the genus the name annexed to it.

2. *P. cristata*, the crested screamer. This bird is about the size of a heron; the bill is short, bent like that of a bird of prey, and of a yellow-

ish brown; the irides are gold colored; on the forehead, just above the bill, is a tuft of black feathers, variegated with ash-color; the head, neck, and body are gray, mixed with rufous and brown, most inclining to the last on the wings and tail: the wings are not furnished with spurs; the legs pretty long, of a dull yellow; claws brown; the hind toe placed high up, so as not to touch the ground in walking. This species inhabits Brasil. Linné makes it to belong to the screamer genus, perhaps from its cry; for it is said to be heard at a great distance, and is not unlike that of a hen turkey. None of our later writers seem to have seen it. It is said to feed on the same food as the heron tribe; the flesh is good, and the bird by some kept tame.

PALAMEDES, a Greek chief, son of Nauplius, king of Eubœa, by Clymene. He was sent by the Grecian princes who were going to the Trojan war to bring Ulysses to the camp, and prevailed; but at the expense of the inveterate hatred of the latter, who forged a letter, which appeared to prove Palamedes a traitor, and he was accordingly stoned to death. Homer is silent about the fate of Palamedes; and Pausanias mentions, that it had been reported by some that Ulysses and Diomedes had drowned him in the sea as he was fishing on the coast. Philostratus adds, that Achilles and Ajax buried his body with great pomp on the sea-shore, and that they raised upon it a small chapel, where sacrifices were regularly offered by the inhabitants of Troas. Palamedes was a man of learning as well as a soldier; and according to some he completed the alphabet of Cadmus, by the addition of the four letters, θ , ξ , χ , ϕ , during the Trojan war. To him also is attributed the invention of dice and backgammon; and it is said that he was the first who regularly ranged an army in a line of battle, and who placed sentinels round the camp, and excited their vigilance and attention by giving them a watchword. He is also famed for his skill in physic.

PALAMOW, a jungly and mountainous district of the province of Bahar, Bengal, situated between 23° and 25° of N. lat. On the north it is bounded by Rhotas, on the south and west by different wild districts in the province of Gundwana; and on the east by Ramgur. This is one of the least cultivated and most thinly inhabited parts of the East India Company's dominions; but the soil in many parts is strongly impregnated with iron. The principal towns are Palamow and Jaynagar; there are no rivers of any considerable size.

PALANQUIN, *n. s.* Hindos. *palkee*. An eastern litter or covered carriage borne by slaves.

PALARIA, among the Romans, a kind of exercise performed at a stake by the soldiers. The stake being fixed in the ground, and six feet high above it, the young undisciplined soldiers advanced against it, armed with a hurdle and cudgel, instead of a sword and shield, and went through all the rules of attack and defence, as if actually engaged with an adversary. Sometimes they stood at a distance, and attacked with missile weapons; at the same time using all the

requisite motions for defending themselves, and warding off what might be thrown against them.

PALATE, *n. s.* } Lat. *palatum*. The seat
PAL'ATABLE, *adj.* } of the taste; the roof of
PALAT'IC. } the mouth: hence mental
 taste or relish: palatable is pleasing to the taste; grateful, and, in familiar language, admissible. bearable: palatic, an obsolete adjective, signifying belonging to the palate.

It may be the *palate* of the soul is indisposed by listlessness or sorrow.

The men of nice *palates* could not relish Aristotle, as drest up by the schoolmen. *Baker on Learning.*

Let their beds

Be made as soft as yours, and let their *palates*

Be seasoned with such viands. *Shakspeare.*

These ivory feet were carved into the shape of lions; without these their greatest dainties could not relish to their *palates*. *Hakewill on Providence.*

The three labials, P. B. M. are parallel to the three gingival T. D. N. and to the three *palatich* K. O. L.

Holder.

Light and colours come in only by the eyes; all kind of sounds only by the ears; the several tastes and smells by the nose and *palate*.

Locke.

There is nothing so difficult as the art of making advice agreeable. How many devices have been made use of to render this bitter potion *palatable*!

Addison.

By nerves about our *palate* placed,

She likewise judges of the taste:

Else, dismal thought! our warlike men

Might drink thick port for fine champagne. *Prior.*

The vulgar boil, the learned roast an egg;

Hard task to hit the *palate* of such guests. *Pope.*

They by the alluring odour drawn in baste,

Fly to the dulcet cates, and crowding sip

Their *palatable* bane. *Philips.*

The **PALATE**, in anatomy, is the flesh that composes the roof, or the upper and inner part of the mouth. It has much the same structure with the gums; but it has a great number of glands, discovered so early as the time of Fallopius; these are principally situated in the hinder part near the uvula, where it is pendulous, in the manner of a curtain, which part is called *velum*, or *claustrum palati*. The glands situated particularly in this part secrete a mucous fluid, serving to lubricate the mouth and throat, and to facilitate deglutition; they have a great number of apertures for the discharge of this humor into the mouth. The great uses of this membrane are to defend the bones of the palate, and to prevent, by its *claustrum* or *velum*, any thing attempted to be swallowed from getting up into the nostrils.

PALATI, a Latin historian of Venice, who flourished in the seventeenth century. His chief work is, *Monarchia Occidentalis, sive Aquila Interlilia, et Aquila Saxonica*.

PALATINATE, *n. s.* } Lat. *palatinatus*.

PAL'ATINE, *n. s. & adj.* } The seat of a count palatine, or chief officer in the court of a sovereign prince: a palatine is one invested with regal rights and prerogatives; and as an adjective signifies possessing royal privileges.

Many of those lords, to whom our kings had granted those petty kingdoms, did exercise *jura regalia*, inasmuch as there were no eight counties *palatine* in Ireland at one time. *Davies.*

These absolute *palatines*, made barons and knights, and exercised high justice in all points within their territories. *Id.*

PALATINATE, LOWER, or the PALATINATE OF THE RHINE, is a fertile province of Germany, situated chiefly on the west side of the Rhine, having Mentz on the north, Alsace on the south, and Lorraine on the south-west. It extends from 49° to 50° of N. lat. Its surface contains about 1600 square miles. It yields corn, flax, tobacco, vines, and all the fruits of the latitude. The pasturage likewise is good. The inhabitants are partly Catholics, partly Lutherans and Calvinists. Population about 305,000. Authors are divided about the origin of the name *Palatines* or *Psalzgraves*, as the Germans call them; but it seems most likely to be derived from the *palatia*, or palaces, which the old Frankish and German kings and Roman emperors were possessed of in different parts of the country, and over which they appointed supreme stewards or judges, who were called *Palatines* or *Psalzgraves*. The countries where these *Palatines* kept their courts, were, from them, called *Palatinates*; which name came at last to be appropriated, by way of eminence, to this country, as being the most considerable of them. In the thirteenth century the government of this country became vested in a branch of the ducal family of Bavaria. Various changes and interruptions in the succession ensued. In 1777, the branch of the family that governed Bavaria becoming extinct, the elector *Palatinate* succeeded to his states, removed to Munich, and governed them conjunctly with the *Rhenish* territory. This continued till 1794, when the French overran all the *Palatinate* to the left of the Rhine, and retained it until 1814. In that and the following year the congress of Vienna transferred the northern part to Hesse-Darmstadt, and the southern part to Austria, who ceded it the following year to Bavaria, as part of the indemnities for the Tyrol and Salzburg.

PALATINATE, UPPER, the former name of a German province, bordering on Bohemia, and now part of the circles of the *Regen* and the *Upper Maine*, in the kingdom of Bavaria. Its area is 2760 square miles; population 290,000. It is hilly and in general barren, its wealth consisting chiefly in its wood, pasturage, mines, and quarries. The produce of corn is insufficient for the consumption. This country formed for several centuries a part of the dominions of the elector *Palatine*; but in 1620 it was lost by the reigning elector, the son-in-law of James I. of England, and has ever since been in possession of Bavaria. Its sovereign was absolute until 1818, when the whole of the *Bavarian* dominions were allowed to send members to a representative body.

PALATINE, a township of Montgomery county, New York, on the north side of the Mohawk. Population 3111. Fifty-one miles W. N. W. of Albany.

PALATINE, or COUNT PALATINE, was a title anciently given to all persons who had any office or employment in the prince's palace; but afterwards conferred on those delegated by princes to hold courts of justice in the pro-

vinces; and on such among the lords as held a court of justice in their own houses.

PALATINE COUNTIES IN ENGLAND.—Chester, Durham, and Lancaster, are called counties *palatine*. The two former are such by prescription, or immemorial custom—at least as old as the Norman conquest; the latter was created by king Edward III. in favor of Henry Plantagenet, first earl, and then duke of Lancaster; whose heiress being married to John of Gaunt, the king's son, the franchise was greatly enlarged and confirmed in parliament, to honor John of Gaunt himself, whom, on the death of his father-in-law, the king had also created duke of Lancaster. Counties *palatine* are so called a *palatio*; because the owners thereof, the earl of Chester, the bishop of Durham, and the duke of Lancaster, had in those counties *jura regalia*, as fully as the king has in his palace; *regalem potestatem in omnibus*, as Bracton expresses it. They might pardon treasons, murders, and felonies; they appointed all judges and justices of the peace; all writs and indictments ran in their names, as in other counties in the king's; and all offences were said to be done against their peace, and not, as in other places, *contra pacem domini regis*. And indeed, by the ancient law, in all peculiar jurisdictions, offences were said to be done against his peace in whose court they were tried; in a court leet, *contra pacem domini*; in the court of a corporation, *contra pacem balivorum*; in the sheriff's court or tourn, *contra pacem vice comitis*. These *palatine* privileges (so similar to the regal independent jurisdictions usurped by the great barons on the continent, during the weak and infant state of the first feudal kingdoms in Europe) were in all probability originally granted to the counties of Chester and Durham, because they bordered upon enemies' countries, Wales and Scotland; in order that the owners, being encouraged by so large an authority, might be the more watchful in its defence; and that the inhabitants, having justice administered at home, might not be obliged to go out of the county, and leave it open to the enemy's incursions. And upon this account also, there were formerly two other counties *palatine*, *Pembrokeshire* and *Hexamshire*, the latter now united with *Northumberland*: but these were abolished by parliament, the former in 27 Hen. VIII. the latter in 14 Eliz. And in 27 Hen. VIII. likewise, the powers before mentioned of owners of counties *palatine* were abridged; the reason for their continuance in a manner ceasing; though still all writs are witnessed in their names, and all forfeitures for treason by the common law accrue to them. Of these three, the county of Durham is now the only one remaining in the hands of a subject. For the earldom of Chester, as Camden testifies, was united to the crown by Henry III. and the title has ever since been given to the king's eldest son. And the county *palatine* or duchy of Lancaster was the property of Henry of Bolingbroke, the son of John of Gaunt, at the time when he wrested the crown from king Richard II. and assumed the title of Henry IV. But he was too prudent to suffer this to be united to the crown; lest, if he lost one, he

should lose the other also. For, as Plowden and Sir Edward Cooke observe, 'he knew he had the duchy of Lancaster by sure and indefeasible title, but that his title to the crown was not so assured: for that, after the decease of Richard II., the right of the crown was in the heir of Lionel, duke of Clarence, second son of Edward III.; John of Gaunt, father to this Henry IV., being but the fourth son.' And therefore he procured an act of parliament, in the first year of his reign, ordaining that the duchy of Lancaster, and all other hereditary estates, with all their royalties and franchises, should remain to him and his heirs for ever; and should remain, descend, be administered, and governed, in like manner as if he never had attained the regal dignity; and thus they descended to his son and grandson, Henry V. and Henry VI.; many new territories and privileges being annexed to the duchy by the former. Henry VI. being attained in 1 Edward IV. this duchy was declared in parliament to have become forfeited to the crown, and at the same time an act was made to incorporate the duchy of Lancaster, to continue the county palatine (which might otherwise have determined by the attainder), and to make the same parcel of the duchy; and, farther, to vest the whole in king Edward IV. and his heirs, kings of England for ever; but under a separate guiding and governance from the other inheritances of the crown. And in 1 Hen. VII. another act was made, to resume such part of the duchy lands as had been dismembered from it in the reign of Edward IV., and to vest the inheritance of the whole in the king and his heirs for ever, as amply and largely, and in like manner, form and condition, separate from the crown of England and possession of the same, as the three Henrys and Edward IV., or any of them, had and held the same. The Isle of Ely is not a county palatine, though sometimes erroneously called so, but only a royal franchise. See COUNTY.

PALATINE GAMES, in Roman antiquities, games instituted in honor of Augustus, by his widow Livia, after he had been enrolled among the gods. They were celebrated in the palace, whence the name, and were confirmed by the succeeding emperors. Some authors say that these games were instituted in honor of Julius Cæsar, and others again confound them with the Ludi Augustales; but neither of these opinions seems to be well supported.

PALATINE MOUNT. See **PALATINUS**.

PALATINUS, a surname of Apollo, from his being worshipped on Mount Palatine.

PALATINUS MONS, or **PALATIUM**, the first mountain of Rome, occupied by Romulus, and where he fixed his residence and kept his court, as did Tullus Hostilius, Augustus, and all the succeeding emperors. The reason of the name is variously assigned; some say it is derived from the goddess Pales, or from the Palatini, who originally inhabited the place, or from balare, or palare, the bleatings of sheep, which were frequent there; or from the word palantes, wandering, because Evander, when he came to settle in Italy, gathered all the inhabitants, and made them all one society. On the east it has

Mount Cælius; on the south the Aventine; on the west the Capitoline; and on the north the Forum. Augustus built a temple to Apollo on this mount, adorned with porticoes and a library, valuable for the various collections of Greek and Latin MSS. which it contained.

PALATIUM, in ancient geography, a town of Italy, in the territory of Reate. Dionysius Halicarnassæus reckons it one of the first towns of the Aborigines; and from it Varro accounts for the name of the Mons Palatinus, viz. that a colony from Palatium settled there.

PALATIUM DIOCLETIANI, the villa of Diocletian, a town of Italy, near Salonæ, where he died (Eusebius); afterwards called Spalatum, which rose to a considerable city from the ruins of Salonæ, situated in Dalmatia on the Adriatic; now called Spalatto, or Spalatro.

PALAWAN, a large island of the Eastern Seas, between the northern extremity of Borneo and the Philippines. Its extreme length is 275 miles, and the average breadth about thirty-two miles. The country is flat to the bottom of the hills, and the productions are cowries, wax, tortoise-shell, and sea slug. There is much ebony and laka wood; and it is said there are hot springs and mines of gold here. The west side is inhabited by a savage people, who seldom frequent the coast; but the greater part of this island was formerly under the dominion of the Sooloos.

|--|--|
| PALE , <i>adj.</i> & <i>v. a.</i> | } Fr. <i>pale</i> ; Lat. <i>pallidus</i> . Wan; faded; light, or white of color; dim; not bright or shining; to make pale: the derivatives seem obvious in their meaning: paly 'is used poetically for pale. |
| PALE-EYED , <i>adj.</i> | |
| PALE-FACED , | |
| PALELY , <i>adv.</i> | |
| PALENESS , <i>n. s.</i> | |
| PALISH , <i>adj.</i> | |
| PALY . | |

Look I so pale, lord Dorset, as the rest!
—Ay, my good Lord; and no man in the presence,
But his red color hath forsook his cheeks.

Shakespeare.

The glow-worm shews the matin to be near,
And 'gins to pale his uneffectual fire. *Id.*

The night, methinks, is but the day-light sick,
It looks a little paler. *Id.*

Why have they dared to march
So many miles upon her peaceful bosom,
Friighting her palefaced villages with war? *Id.*

The paleness of this flower
Bewrayed the faintness of my master's heart. *Id.*

Fain would I go to chafe his paly lips
With twenty thousand kisses. *Id.*
Her blood durst not yet come to her face, to take
away the name of paleness from her most pure whiteness. *Sidney.*

No nightly trance, or breathed spell,
Inspires the pale-eyed priest from the prophetic cell. *Milton.*

To teach it good and ill, disgrace or fame,
Pale it with rage, or redden it with shame. *Prior.*

A dim gleam the paly lanthorn shows
O'er the mid pavement. *Gay.*
The blood the virgin's cheek forsook,
A livid paleness spreads o'er all her look. *Pope.*
Shrines, where their vigils pale-eyed virgins keep,
And pitying saints, whose statues learn to weep. *Ja.*

When the urine turns *pale*, the patient is in danger. *Arbuthnot.*

Spirit of nitre makes with copper a *palish* blue; spirit of urine a deep blue. *Id. on Air.*

With broken lyre and cheek serenely *pale*
So sad Alcæus wanders down the vale;
Tho' fair they rose and might have bloomed at last,
His hopes have perished by the northern blast. *Byron.*

And unobserved but by the traveller's eye,
Proud, vaulted domes in fretted fragments lie,
And the fallen column on the dusty ground,
Pale ivy throws its sluggish arms around. *Conning.*

PALE, *n. s. & v. a.* } Lat. *palus*, a stake or
PA'LING, *n. s.* } vine-prop. A narrow
rail used for enclosures; an enclosure; hence a
district or territory: to enclose with pales or
otherwise: paling is used for a collection or
series of pales.

A ceremony, which was then judged very convenient for the whole church even by the whole, those few excepted, which brake out of the common *pale*. *Hooker.*

There is no part but the bare English *pale*, in which the Irish have not the greatest footing. *Spenser.*

Will you *pale* your head in Henry's glory,
And rob his temples of the diadem,
Now in his life? *Shakspeare. Henry IV.*

The English beech
Pales in the flood with men, with wives and boys. *Shakspeare.*

Get up o' the rail; I'll peck you o'er the *pales* else. *Id.*

The lords justices put arms into the hands of divers noblemen of that religion within the *pale*. *Clarendon.*

Let my due feet never fail
To walk the studious cloister's *pale*,
And love the high embowed roof. *Milton.*

Having been born within the *pale* of the church, and so brought up in the Christian religion, by which we have been partakers of those precious advantages of the word and sacraments. *Duty of Man.*

As their example still prevails,
She tempts the stream, or leaps the *pales*. *Prior.*

The diameter of the hill of twenty foot, may be *paled* in with twenty deals of a foot broad. *Id.*

He hath proposed a standing revelation, so well confirmed by miracles, that it should be needless to recur to them for the conviction of any man born within the *pale* of christianity. *Atterbury.*

Confine the thoughts to exercise the breath;
And keep them in the *pale* of words till death. *Dunciad.*

Woe to the gardener's *pale*! the farmer's hedge,
Flash'd neatly, and secured with driven stakes
Deep in the loamy bank. *Cowper.*

The best inclosure for a park is a brick or stone wall; but, as the expence of this is very great, it may be done by *paling*; the *pales* must, in this case, be of sound heart of oak. *Dr. A. Ross.*

PALE, in heraldry, one of the ten honorable ordinaries, so called because it is like the palisades used about fortifications, and stands perpendicularly upright in an escutcheon, dividing it lengthways from the top to the bottom, as in the annexed figure. It should occupy a third part of the shield. See HERALDRY.

PALEARIIUS (Aonius), a man of great pro-

bity, and one of the best writers of the sixteenth century. He was professor of polite literature at Sienna, and afterwards settled at Lucca. Finally, he removed to Milan, where he was seized, carried to Rome, and burnt in 1566, for having written in favor of the Lutherans, and against the inquisition. He wrote several pieces in verse and prose, of which a poem on the Immortality of the Soul is most esteemed.

PAL'ENDAR, *n. s.* Lat. *palus*, a trunk or stump of a tree. A kind of coasting vessel. Obsolete.

Solyman sent over light-horsemen in great *pale-dars*, which running all along the sea coast, carried the people and the cattle. *Knolles's History.*

PALEOUS, *adj.* Lat. *palea*. Husky; chaffy. This attraction we tried in straws and *paleous* bodies. *Broune.*

PALERMO, a beautiful city of Sicily, the capital of that island, stands on the north coast, and possesses a fine harbour. This city is of great antiquity; but by whom it was founded is uncertain; nor have we any authentic accounts of its inhabitants till it became a colony of the Phœnicians; after which it passed into the hands of the various nations that became masters of this island. Its former name was Panormus.

Properly speaking, here are two harbours, situated in the gulf between Mount Pelegrino and Cape Saffarano. In the one, which is very large, and in which there is a mole 1300 paces in length, ships lie at anchor; in the other their cargoes are laden and unladen. Both the harbours open to the west. There is also a superb quay which extends a mile from west to east in a rectilinear direction, and is called La Marina. The bay of Palermo forms a large amphitheatre, with the city in the centre; it is surrounded for some miles by a most delightful country, enclosed by romantic rocks and mountains. The town was formerly surrounded by a strong wall; but the fortifications are now entirely neglected except towards the sea. The quay is the principal public walk. Palermo is environed with avenues of trees, and has four principal entrances, facing the four cardinal points which are at the extremities of the two spacious streets which cross each other. It is filled with public monuments, churches, monasteries, palaces, fountains, statues, and columns.

Seen from the Monte Pelegrino, to the north, the city presents a most enchanting prospect: the bay forms a graceful sweep along the shore; the domes, turrets, and spires, rise conspicuous above the other buildings; the surrounding plain is studded with convents, villas, and cottages, romantically interspersed among its luxuriant foliage; while in the distance to the east and south rises a majestic amphitheatre of mountain scenery. The houses have in general something striking in their architecture; and the fountains, statues, and busts, in front of them, seem appropriate decorations of a capital: but a more close inspection lessens our admiration, the architecture being too uniform and frequently heavy.

The principal streets are the Cassaro and the Strada Nuova: both about a mile in length, and well paved, with broad foot-paths. Their point

of intersection forms an open space, called, from its shape, the Ottangolo. Each of the eight sides is formed by a beautiful building, three stories high, composed of the Doric, Ionic, and Corinthian orders; and each has in its front an elegant fountain. From this spot is enjoyed a beautiful perspective view of the best part of the town, terminated by four gates. Of the other streets few are deserving attention. In several parts of the town they are almost covered with booths, or rather workshops and tables, where tradesmen of all descriptions carry on their work as in Naples in the open air. The ground floor of the palaces, as they are termed, of the nobility, is frequently occupied by shops. In almost every house in the town there is a common staircase; and each stage of apartments forms the separate residence of a family. Balconies with iron railings also abound here. In winter the streets are wretchedly lighted by a few solitary lamps, scattered over different parts of the town.

The Marina is a raised platform or terrace, extending above a mile along the bay, and eighty paces in breadth. At the eastern extremity is a public garden, called the Flora, laid out in walks, interspersed with statues, fountains, and summer houses; and here people of all ranks are admitted. Adjoining is the botanical garden, the entrance of which is through an imitation of an ancient temple. The garden contains a collection of valuable plants. The royal palace is situated at the top of the Via Cassaro, and commands a beautiful view of the town. The adjoining gardens are delightful. Its exterior wants symmetry, but its apartments are spacious and finely ornamented. The square in front contains a statue of Philip IV. of Sicily. Many of the mansions of the nobility have marble columns, either in front or in the large court which they generally enclose; but the effect of these is frequently destroyed by the meanness of the buildings adjoining. There are in this city three theatres; but in none is there any display of architectural or scenic taste. On the other hand, in the magnificence of its churches, Palermo is second only to Rome, and there are above forty monasteries, and fifty convents. The cathedral called the Madre Chiesa, and situated in the Via Cassaro, was erected in the twelfth century, and is a mixture of Grecian and Gothic styles of architecture. A considerable part of it has been lately restored in a more modern style. Its interior is supported by granite pillars. The church of St. Giuseppe is also profusely ornamented, and contains some fine columns of gray Sicilian marble, nearly sixty feet high. Of the other churches, the appearance is generally fine, but devoid of taste. Most of the convents have elegant chapels attached to them, and good collections of paintings. The great hospital of Palermo stands near the royal palace; that of St. Bartholomew close to the Marina. The poor-house, or Albergo de Poveri, is also an extensive edifice; and there are several pawnbanks (Monti di Pietà) for the poor. Here are also three public libraries, but the books are chiefly old and theological. The university, an extensive pile of building, has an observatory, and several cabinets of medals and curiosities: the number of pupils is not above a few hun-

dreds. There is, besides, a separate institution for boys of rank, and the charity school of St. Roch for orphans. The females are for the most part educated in the convents.

The trade here is not extensive, the exports of Palermo being confined to a few articles in silk and satin, with some manufactures for the supply of Malta; the wine, oil, and other surplus produce of the surrounding country, fish, particularly tunnies. The importations are more various, comprising almost every article, either of luxury or convenience. In the middle of the eleventh century silk manufactures were first established by government. They are still kept up, and the silk thread obtained from the fish called the Pinna Marina, and manufactured here, is of exquisite fineness.

The population amounts, according to the most accurate estimate, to about 130,000. It has been sometimes erroneously taken much higher. Poverty seems the common lot of the frequenters of its crowded streets; and there exists a serious obstacle to the improvement of their circumstances, in the number of persons dignified with titles, without the means of supporting their rank. Beggars of the most wretched appearance swarm every where, but in reality are not so miserable as they look, regular distributions of food being made at the different charitable and morastic institutions. The temperature in winter seldom falls below 50° of Fahrenheit: in summer it keeps for some months between 80° and 90°. In that season the inhabitants generally shut up their houses and shops a little before noon, and keep them shut for three or four hours. The Sirocco is at this season very oppressive, but not of frequent occurrence. Palermo is supplied with water, conveyed in pipes to the tops of the highest houses.

It is an opinion entertained by some of our countrymen who have been in Sicily, says a friend, that the people of Palermo and of the western shores of the Val di Mazzara, are not in general so attached to the English as in the other parts of the island: we know not the origin of this opinion. 'As to Palermo, perhaps it may have arisen from the dislike which the court and Neapolitans profess for the English. But we have never observed the least partiality entertained by the people for the French in any one corner of the whole island, and we have made the entire circuit of it, and crossed the interior in two different lines. We witnessed a fray at Palermo, the description of which may give our readers some idea of the materials from which we have deduced our opinions; it occurred in the summer of 1810. Several Neapolitan dragoons insisted on taking some cheese from a shop at a price considerably below that at which it was retailed;—an altercation ensued, which became rather violent, and one of the dragoons drew his sabre, and striking at the shopkeeper (a practice these fellows have) wounded him slightly. The latter instantly called to his men and to his neighbours, with the masonic epithet 'picciotti'; 'let us, my lads,' exclaimed he, 'serve these Neapolitans as they suspect we intend to do, and as they know they merit; let us do away with them.' In a very few seconds seven

or eight of the dragoons measured their length on the ground; the rest escaped; and, a great concourse of people being assembled by this time, the wounded shopkeeper began to harangue them; he was joined by the greater part of the mob in venting every imprecation against the Neapolitani—calling them Jacobini. Several times was it exclaimed, 'had it not been for the English long since you would have betrayed us to the French, who are now at this very moment solely kept out of the island by the English, without the least exertion on your part.' They called the soldiers cowards, and spoke of them with the greatest contempt—saying they were only capable of practising extortion upon quiet shopkeepers. Such was the language of a mob which might have proceeded to greater lengths, had not the captain of the city, prince Carini, a nobleman at that time rather a favorite of the people, come up, and by his exertions and persuasions dispersed the crowd and restored tranquillity. As the weapons these picciotti made use of were rather Herculean, being sticks of the ash tree from which they make the manna in Sicily, three or four of the dragoons died, and the rest were much injured.'

Palermo, soon after the beginning of the first Punic war, passed into the hands of the Romans, who conferred on it various privileges. In a subsequent age the Saracens made it the capital of their Sicilian territories; and since their time, with the exception of very short intervals, it has been considered the capital of the island. But it has hardly any remains of antiquity, owing, in some measure, to the depth of soil and frequency of inundations here. It was the residence of the court of Naples from 1806 to 1815: at present it is the seat of a viceroy and of the chief boards of the island administration. It is likewise the see of an archbishop, who has the title of primate of Sicily. This city has suffered greatly by earthquakes, particularly in 1693; and it was greatly damaged by a fire in 1730, when a magazine of powder was blown up, containing 400 tons. It is 130 miles west of Messina, and 200 south by west of Naples. Long. of the observatory 13° 20' 0" E., lat. 38° 6' 44" N.

PALES, in Pagan worship, the goddess of the shepherds; to whom they offered milk and honey, in order that she might deliver them and their flocks from wild beasts and infectious diseases. This goddess is represented as an old woman. She was worshipped with great solemnity at Rome; and her festivals, called *palilia*, were celebrated on the 21st of April, the day that Romulus began to lay the foundation of the city of Rome. The ceremony consisted in burning heaps of straw, and in leaping over them. No sacrifices were offered, but purifications were made with the smoke of horses' blood, and with the ashes of a calf that had been taken from the belly of its mother, after she had been sacrificed, and with the ashes of beans. The purification of the flocks was also made with the smoke of sulphur, of the olive, the pine, the laurel, and the rosemary. Offerings of mild cheese, boiled wine, and cakes of millet, were afterwards made to the goddess. Some call this festival *palilia*, from *pariendo*, bringing forth,

because the sacrifices were offered to the divinity for the fecundity of the flocks.

PALESTINE, a country highly celebrated in antiquity, now a part of Asiatic Turkey, is bounded by Mount Libanus, which divides it from Syria, on the north; by Mount Hermon, which separates it from Arabia Deserta, on the east; by the mountains of Seir and the deserts of Arabia Petraea on the south; and by the Mediterranean Sea on the west.

This once fertile and happy spot was first called the land of Canaan, or Chanaan, from Noah's grandson. In Scripture, however, it is frequently distinguished by other names; such as the Land of Promise, the Land of God, the Land of Israel, &c. It received the name of Palestine from the Palestinians or Philistines, who possessed a great part of it; and it had the name of Judæa, or Judæa Palestina, from Judah, the most considerable of the twelve sons of Jacob, or rather from the tribe, his descendants. Christian writers have denominated it the Holy Land; partly on account of the many singular blessings it received from the Divine Providence, and partly on account of its metropolis being made the centre of God's worship and his peculiar habitation; but much more for its being the place of our Saviour's birth, the scene of his preaching and manifold miracles; and especially the place in which he accomplished the great work of our redemption. As to the name of Judæa, it did not begin to receive that till after the return of the Jews from the Babylonish captivity, though it had been styled long before the kingdom of Judah, in opposition to that of Israel, which revolted from it under Jeroboam, in the reign of Rehoboam. By profane authors it was called by many different names; such as Syria, Palestina Syria, Cœlosyria, Iduma, Idumæa, and Phœnicia or Phœnice; many of them given in contempt of the Jewish nation, whom they looked upon as unworthy of any other name than what distinguished the most obscure parts of the neighbouring provinces. That part of the country which was properly called the Land of Promise was enclosed on the west by the Mediterranean; east by the lake Asphaltites, the Jordan, the sea of Tiberias or Galilee, and the Samachonite lake; north by the mountains of Libanus, or rather Antilibanus, or the province of Phœnicia; and on the south by that of Edom or Idumæa, from which it was parted by another ridge of high mountains. The boundaries of the other part, which belonged to the two tribes and a half beyond the Jordan, are not so easily defined, nor those of the conquests made by the more prosperous kings of the Jews. All that can be said with any probability is, that the river Arnon was the first northern boundary on that side.

Judea in its largest sense was divided into maritime and inland, as well as into mountainous and champaign; and again subdivided into Judea on this side, and Judea beyond Jordan. But the most considerable division is that which was made among the twelve tribes, by lot, under the Divine superintendence. Of these, two and a half were seated beyond Jordan, and the rest on this side. The next remarkable division was made by king Solomon, who divided his king-

dom into twelve provinces or districts, each under a peculiar officer; every one of whom was to supply the king with provisions for his household in his turn; that is, each for one month in the year. But the most fatal division of all was, that which obtained under his imprudent son Rehoboam; when ten of the twelve tribes revolted, under the conduct of Jeroboam, who became head of a new monarchy, styled the kingdom of Israel in opposition to that of Judah, the title which distinguished the maimed kingdom of Rehoboam from that time downwards. Under the second temple the distinction lasted a considerable time, and the same hostilities continued between these two kingdoms; that of Israel taking the name of Samaria from its capital. The inhabitants were a mixture of the old Israelites, and of new colonies sent thither by the kings of Assyria after their conquest of it, till they were subdued by the Maccabees, and their metropolis destroyed. Under the Romans it began to be divided into tetrarchies and toparchies: the larger were those of Judea, Samaria, and Galilee, Upper and Lower; the lesser, those of Geraritica, Sarona, and others of less note; all which lay on this side of the Jordan. The rest, on the other side, were those of Gilead, Peræa, Gaulonitis, Auranitis, Batanea, and Decapolis. Josephus mentions another division made in Gabinus's time into five districts, or, as he styles them, *synedria* or councils, agreeable to the Roman manner: these were Jerusalem, Jericho, and Sephoris on this side Jordan; and Gadaris and Amathus on the other. In the reigns of the Christian emperors, it was divided afresh into Palestina Prima, Secunda, and Tertia, or Salutaris; which last included the greater part, if not the whole country.

The extent of this country is variously stated by modern geographers; some giving it no more than 170 or 180 miles from north to south, and 140 in breadth where broadest, though not much above half the breadth where narrowest. But, from the latest and most accurate maps, it appears to be nearly 200 miles in length, about eighty in breadth about the middle, and about ten or fifteen, more or less, where it widens or shrinks.

As to its present administration it is included partly in the pachalic of Acre, and partly in that of Damascus. The former comprehends all the sea coast, while the latter extends over the interior; and they are separated by a line drawn from north to south, through the whole length of Palestine. The former pachalic long groaned under the fierce and gloomy tyranny of Djezzar, a chief whose energy of character was solely directed to military achievements, and whose avarice sought to gratify itself by rapine and extortion, without ever viewing his interest as connected with the permanent prosperity of the districts which he governed. Travellers have drawn the most gloomy picture of the state to which this territory was reduced during the latter years of his administration. Towns that had once been flourishing were reduced to a few cottages; and plains which might have borne the most luxuriant crops were abandoned as pasture to the wandering Arabs. On entering the territory of

the pacha of Damascus, the happiest change presented itself. The virtue, or at least the enlightened avarice, of this chief, induced him to employ with diligence every means of protecting property, and encouraging industry; so that the whole country subject to him was cultivated like a garden. Unluckily the pacha was not sufficiently liberal in imparting a share to his masters at Constantinople; and, having thus incurred their displeasure, he was driven from his post, which is now occupied by another, who is pacha at once of Damascus, Acre, and Aleppo. This new chief, however, though bred under the ferocious Djezzar, is represented by Burckhardt in a favorable light.

Palestine is distinguished by a great variety of surface. Some modern writers have represented it as barren; but this can apply only to some of the mountainous districts around, and east of Jerusalem. According to the best informed travellers, the greater part displays a luxuriant fertility, and corresponds to the ancient descriptions of the promised land.

Judea proper, the ancient kingdom of Judah, comprises the territory extending from the Lake Asphaltites to the sea, and is composed of a range of limestone hills, rising as it were by stages from the level of the Mediterranean. The plain extending along the coast, though neglected, appears to be excessively rich. Sandys, passing from Gaza to Jaffa, describes the caravan as almost buried under pastures 'unmowed and uneaten.' As the track ascends, it becomes rugged and rocky, so that from Jaffa to Jerusalem the road is very steep and difficult. The sides of the mountains, however, are here suitable for the vine, the olive, and the sycamore, and are crowned with natural groves of oak and cypress; while the earth is covered with aromatic plants. Here are interposed valleys, particularly that of Jeremiah and the Terebenthine vale; covered with plentiful crops of tobacco, wheat, barley, and millet. Delicious wine is also produced. The mountains themselves are tenanted by the wildest Arabs, who find lurking places in the numerous caves. On reaching the summit of these ranges, the traveller discovers the country round Jerusalem, which certainly wears a dry, rugged, and stony aspect. Under a protecting government, even these tracks, however, might be, as formerly, highly productive. Traces may be found of walls by which the earth was formerly supported, of cisterns where the rain water was collected, and of canals by which it was distributed. Wild bees still lodge, in the hollow of the rocks, honey, which is seen flowing from them. Dr. Clarke, indeed, in travelling towards Jerusalem from the north, saw the limestone rocks and stony valleys often covered with plantations of figs, vines, and olives. The hills, throughout their whole height, were overspread with gardens, in the highest state of cultivation. Even the sides of the most barren mountains had been rendered fertile, by being divided into terraces, upon which soil had been accumulated with great labor. Proceeding eastward to the Dead Sea, the scene is decidedly barren; and gloomy and naked rocks, sand, and ashes, become the only objects. Dr. Seetzen discovered,

near its southern extremity, a mountain of sal-gem, the continual dissolution of which seems to produce the saltness of this lake. The bitumen so copiously produced is found on its shores, and floating on its surface. Seetzen contradicts the report of no bird being able to fly over its waters, and of there being a peculiar unhealthiness in the air around this sea.

The ancient Samaria is now chiefly comprised in the district of Napolose; and Napolose, the ancient Sichem, is the capital. This district, though mountainous, is well cultivated, and carries on a considerable trade in corn, silk, and olives. The most prominent feature here is Mount Carmel, extending along the Gulf of Acre. During the middle ages this mountain was almost entirely filled with grottoes cut in the rock; the abode of thousands of monks, who took the name of Carmelites. Pococke saw one of these monasteries, in which two or three monks still resided, and a grand excavated saloon forty feet long, twenty wide, and fifteen high, the scene of their general conferences.

North of Samaria, and communicating with Judea by the Jordan, is Galilee, distinguished by its natural beauty and fertility. The plain of Esdraelon, two days' journey in length, and twenty miles in breadth, is described by Dr. Clarke as one vast meadow, covered with the richest pasture. He considers this as the finest part of all Palestine, though when he passed across it was entirely neglected. Above it rises Mount Tabor, in a conical form, with a plane at the top, commanding a most delightful prospect. The lake of Tiberias, or Gennesareth, is surrounded by lofty and picturesque hills, the sides of which were once covered with towns, now almost deserted.

The Jordan, one of the most important natural features of Palestine, with the lake of Tiberias through which it passes, and that of Asphaltites which it forms by its discharge, divides it completely into two portions. The region beyond this river, though less noticed in history, include many tracks once fertile and flourishing, which had escaped the notice of modern geography, till they were recently explored by Seetzen and Burckhardt. Here are the Hauran and Dechaulan, consisting of a vast plain, not watered by any great river; yet the inhabitants contrive, by collecting the torrents and rain water into ponds, to obtain a sufficient supply for the purposes of agriculture. The rocks are entirely composed of basalt; and the villages, being built on their sides of this material, present a gloomy appearance. The district of El Botthin, the ancient Batanea, is distinguished by thousands of caverns into which the rocks have been hollowed out. There are still a number of large caves, which receive whole families, with their cattle. Here, and in the Roman district of Decapolis, are found remains of splendid cities. Those of Decberrash, the ancient Gerasa, are compared by Seetzen to Balbec and Palmyra. They include several palaces, two superb amphitheatres, and three temples; 200 Corinthian pillars of white marble, still supporting their entablatures, and a much greater number overthrown. The ruins of Ammon, the ancient Philadelphia, one of the

principal cities of Decapolis, are also splendid. To the south, upon the eastern shore of the Dead Sea, is found the district of Karak, bleak, barren, and mountainous; the ruins of Rabbath Moab, the ancient capital, attest its former importance.

The Turks occupy all the civil and military posts; while the inhabitants of the eastern empire, under the name of Greeks, form a very numerous part of the population. The country districts, however, are filled to a great extent with nomadic Arabs. The dress of this people is very simple; it consists of a blue shirt, descending below the knees, the legs and feet being exposed, or covered with the ancient cothurnus or buskin. A cloak of very coarse and heavy camels' hair cloth, decorated with black and white stripes adorns the back: this is of one square piece, with holes for the arms; and a seam down the back. Upon their heads they wear a turban, or dirty rag, like a coarse handkerchief, bound across the temples, one corner of which generally hangs down; and this, by way of distinction, is generally fringed with strings in knots. The Arab women are not much concealed from view. Their bodies are covered with a long blue shift, but their breasts are exposed; and extend to an extraordinary length. Upon their heads they wear a hood, and a handkerchief bound over it across the temples. Just above the right nostril they place a small button, studded with pearl, a piece of glass, or any other glittering substance. Their faces, hands, and arms, are tattooed, and covered with scars; their eyelashes and eyes being painted, or rather dirtied, with some dingy black or blue powder; their lips are dyed of a deep and dusky blue; their teeth jet black; their nails and fingers bright red; their ears are loaded with ponderous rings. Their usual weapons consist of a lance, a poniard, an iron mace, a battle axe, and sometimes a matchlock gun, and the moveables of a whole family seldom exceed a camel's load. They reside always in tents made of goats' hair on the open plain, or on the mountains; men, women, children, and cattle, all lodging together. In their disposition, though grave and sedate, they are said to be amiable, and most hospitable.

After the conversion of the Roman empire to Christianity, Judea became an object of religious veneration, and the empress Helena repaired hither in pilgrimage, and built various splendid temples. A crowd of pilgrims resorted thither subsequently from every part of the world: the most numerous arriving from the west, over which the church of Rome had fully established its domination. In the commencement, however, of the sixth century, an entire change took place. Judea was among the countries first exposed to the invasion of the fanatical followers of Mahomet, and soon fell under their sway. The caliphs were at first induced to encourage pilgrimage, from the gain which it afforded. But, when the Turks poured in from the north, they no longer observed the same courtesy. They profaned the holy places, and, the intelligence of their outrages being conveyed to Europe, roused the religious spirit of the age into those expeditions called the Crusades. All Europe seemed

to pour itself upon Asia: the Saracen armies were routed, Jerusalem taken by storm, and its garrison put to the sword. A Latin kingdom of Jerusalem was now erected here under Godfrey of Bouillon, which endured for above eighty years, the Holy Land streaming continually with Christian and Saracen blood! The Mahometan states, whose resources were all at hand; gradually, however, regained the ascendancy. In 1187 Judea was conquered by Saladin, on the decline of whose kingdom it passed through various hands, till in 1517 it was swallowed up in the Turkish empire. In modern times it was drawn into notice by Buonaparte's invasion of Syria, and his siege of its port of Acre; see ACRE: and we apprehend the reader will gladly receive in this place the contribution of two or three of the most celebrated modern travellers to the further illustration of its present state.

We begin with M. Chateaubriand. This author is well known in the annals of modern French literature, and long had the merit of standing, amidst the moral desolation of his country, the faithful advocate of religious feelings and principles, to the extent of the light which he had received. His popular works, *Les Martyrs* and *Le Génie du Christianisme*, entitle him to praise; and, to enrich his mind with images appropriate to his romance on the Martyrs of Christianity, M. de Chateaubriand undertook his eastern journey. His description of Jerusalem and its environs will be satisfactory to those who wish to acquire general notions of its present state, without entering into deep researches and correct investigations. But here, as well as every where else, an allowance must be made for the prejudices of the author as a Romanist. He of course attaches an importance to certain objects which appear indifferent enough to a general reader. This, however, and the historical parts of his work, appear to us to be the best. As the ship, laden with Latin pilgrims for Jerusalem, approached the shore of Palestine near Jaffa during the night, M. de Chateaubriand observes:—
'Je n'ai guère vu de scènes plus agréables et plus pittoresques. Le vent étoit frais, la mer belle, la nuit sereine. La lune avoit l'air de se balancer entre les mâts et les cordages du vaisseau; tantôt elle paroissoit hors des voiles, et tout le navire étoit éclairé; tantôt elle se cachoit sous les voiles, et les groupes des pèlerins renfroient dans l'ombre. Qui n'auroit béni la religion, en songeant que ces deux cents hommes, si heureux dans ce moment, étoient pourtant des esclaves, courbés sous un joug odieux? Ils alloient au tombeau de Jésus Christ oublier la gloire passée de leur patrie et se consoler de leurs maux présents. Et que de douleurs secrètes ne déposeroient-ils pas bientôt à la crèche du Sauveur! Chaque flot qui poussoit le vaisseau vers le saint rivage, emportoit une de nos peines.'
 T. 2, p. 95.

The ship discharged its cargo at the port of Jaffa, and the affecting account of the Christian charity and hospitality of certain Italian monks at that place afforded a singular contrast to other scenes which are recorded in history to have passed on the same soil.

But we hasten to the neighbourhood of Jeru-

salem. The church built over our Lord's nativity at Bethlehem must of course be an interesting object of contemplation to every Christian. It is a subterranean place of worship, lighted by thirty-two lamps, presented by different Christian princes; and being fitted up with much splendor, and preserved with great care, affords a striking contrast to the miserable Arab ruins, and half naked savages which strike the eye on emerging from the sacred place. The circumstance of the place of our Saviour's nativity being under ground has given rise to a controversy whether this be the real stable or not. But natural excavations were often used as stables in ancient times, and many fathers of the church preserved a tradition that Christ was born in Bethlehem, in a stable not made by art, but by nature, i. e. in a grotto (vide Justin, M. Dialog, cum Tryph: Origen contra Cels., and many other fathers). We confess that our conviction that the knowledge of the real place of our Lord's nativity has been preserved is very much derived from the circumstance of the emperor Adrian's having consecrated a grove at Bethlehem to the worship of Adonis, and erected a statue of this god over the grotto in question. (Hieron. Epist. 19, &c.) This plainly shows that the particular spot was visited and revered by the primitive Christians, which the heathen emperor endeavoured to prevent by the repulsive effect of profane and dissolute rites. Providence, however, so ordained, that these very profanations should be the means of ascertaining and transmitting to future ages the knowledge of the precise spot where the glory of the Redeemer first burst upon the world. The number of pilgrims to this church has very much diminished of late years, particularly of those of opulence and high rank, whose presence and contributions were most conducive to the maintenance of the ancient splendor of the place.

In his excursion to the Dead Sea, the author met some tribes of the Bedouin Arabs, whose morals and manners we are disposed to think he libels, when he asserts that they prostitute their wives and daughters for money. We never heard of such a depraved custom among them, and it is so contrary to the ordinary habits of the Arab race that we cannot help suspecting that it is only a tale picked up by the author, without having understood the meaning of what he was told. In the Dead Sea he perceived by day, and heard by night, myriads of little fish playing about the shores, contrary to the common and received opinion that it produces and sustains no living creature. We have been informed by a person who has often conversed with the Arabs that frequent the shores of that sea, that where the Jordan disembogues itself there are many fish carried down with the stream, which live and thrive within the verge of the supply of fresh water at the mouth of the river; but they have no means of ascertaining whether fish exist in the more central depths. Daily experience has convinced them of the falsehood of the report that birds cannot fly over the Dead Sea without falling down dead. They constantly do so without any apparent inconvenience. Flames are occasionally emitted from the surface, accompanied with sulphureous and mephitic smells, and fogs are

common at certain seasons. But it does not appear that there is any thing peculiarly unwholesome in the climate of the neighbouring country. M. de Chateaubriand carried home a bottle of the water to Paris, with a view to ascertain whether the sea-fish of Europe would live in it. A large piece of the asphaltos, from the borders of the lake, is to be seen at the Latin convent. It resembles coal, but is more shining, burns when put on the fire, and emits a sulphureous and extremely offensive smell.

From Bethlehem and the Dead Sea the author proceeded to Jerusalem, the great object and end of his journey. We have no doubt that a man like M. de Chateaubriand, endued with Christian feelings, must have been highly gratified at visiting the spot where the mysteries of our holy religion were performed. But his account differs little from that of other travellers; and the city itself and its society have undergone but little change from the state in which it was two centuries ago, when our plain-spoken countryman, Fynes Moryson, visited it in 1596. 'All the citizens,' says he, 'are either tailors, shoe-makers, cooks, or smiths (which smiths make their keys and locks not of iron but of wood), and in general poore, rascall people, mingled of the scum of divers nations; partly Arabians, partly Moores, partly the basest inhabitants of neighbour countries; by which kind of people all the adjoining territorie is likewise inhabited, which should have no trafficke if the Christian monasteries were taken away. Finally the inhabitants of Jerusalem, at this day, are as wicked as they were when they crucified our Lord, and as they have been since. Hence it was that Robert duke of Normandy being sicke, and carried into Jerusalem upon the backs of like rascalls, when he met by the way a friend who was then returning into Europe, desiring to know what he would command him to his friends, he earnestly entreated him to tell them that he saw duke Robert carried into heaven upon the backs of divels.'—Moryson's *Itinerary*, folio, 1617, p. 219. We shall content ourselves with remarking such further passages of M. de Chateaubriand's description as have either a pretension to novelty, or may be otherwise interesting to our readers.

The great objects of curiosity are of course Mount Calvary, the church of the Holy Sepulchre, the convents of Romish monks, who serve as guides and hosts to the Christians visiting Jerusalem, and the great mosque erected on the site of the temple of Solomon. Mount Calvary and the Holy Sepulchre, although formerly at some little distance from Jerusalem, are now in the very heart of the city, a circumstance that can only be accounted for by the very singular form of the ancient Jerusalem. It was built on two elevations, at a short distance from each other, and covered nearly the whole of their surface, thus forming two separate towns, which were joined together by a comparatively narrow slip of buildings across the valley between, principally occupied in ancient times by the palace and temple of Solomon. These buildings, according to an accurate general view of the city, taken by Meyer, about thirty years ago, from the Mount of Olives, and which is now before us,

are in ruins, or their sites totally bare, as well as many other parts of the old town. It is obvious that the two masses of buildings thus connected would form a town somewhat in the form of a horseshoe; and Mount Calvary and the Holy Sepulchre are situated in the valley which was included between the two elevations. But, Jerusalem having for many years been the seat of Christian governments, it is natural to conclude that their veneration for the spots where their redemption had been fulfilled would lead them to fix their residence as near to them as possible. The church which they built over the tomb of their Saviour has also in all ages attracted crowds of pilgrims of every rank, and houses must of course have sprung up for their accommodation; so that upon the whole there are sufficient causes to account for the increase of the town in this particular part, or rather for its removal from the elevations into the valley; for the old town, as we have just observed, has now very large spaces within its circuit either quite bare or covered with ruins.

The church of the Holy Sepulchre is now in ruins, having been burned down the year after M. de Chateaubriand saw it in 1806. Large subscriptions have been raised among the pious Christians of the Levant for its re-erection; although the following account of the priestcraft practised there by the Greek clergy, which, though unknown to M. de Chateaubriand, we have received from an eyewitness of veracity, would certainly induce us to wish that the care of this interesting place were transferred to better hands. On the day of the renewal of the holy fire, as the Greeks call it, the church of the Holy Sepulchre is crowded with pilgrims, Greek, Armenian, Coptic, and Abyssinian. This holy fire is said to issue spontaneously from the Holy Sepulchre on Easter eve. At that period the Greek patriarch, with his clergy arrayed in their sacerdotal robes, and followed by the Armenian patriarch and his clergy, and the bishop of the Copts, march in grand and solemn procession, and singing hymns, three times round the Holy Sepulchre. The procession ended, the Greek patriarch puts off his robes and enters alone into the sepulchre, probably with some phosphorus in his pocket; the Armenian and Coptic prelates remain in the antichamber, where they state that the angel was sitting when he appeared to the pious women after the resurrection of our Lord. As soon as the holy fire is kindled, as the patriarch says by a miracle, he lights his wax taper and comes forth from the sepulchre, and offers it first by a previous agreement to such person as bids the highest price for the special privilege of first lighting his taper from that of the patriarch. A considerable sum is paid for this preference, and much competition prevails for it, as they believe that the more it is removed from its first source, the more its purity and efficacy are diminished. The scene of confusion which ensues when the patriarch enters the church with two lighted tapers is beyond description. The people press forward with such incredible eagerness to light their tapers, that Turkish guards, placed with whips and sticks, and liberally dealing out blows on every side,

can scarcely, with all their exertions, prevent many from being trodden to death. The eager motions of the populace, like waves agitated by the wind—the noise and clamor which resound within the dome of the church—the multitude of candles gradually lighted by which the blaze increases, and at length fills the whole building and illuminates its inmost recesses, can more easily be imagined than described. The Greeks assert that the continuation of this pretended miracle is an evident and convincing proof of the truth of their religion; and it is certain that, had the fraud been discontinued, the number of pilgrims would be considerably diminished. The pecuniary interests of the clergy would also have suffered; for in former times some thousand (even 30,000) sequins have been paid for the permission of first receiving the fire from the high priest's hands; but superstition, at least among the rich, has latterly so much declined, that a few hundred sequins are now sufficient to secure the privilege. The Roman Catholic monks of Jerusalem look upon this fraud of the Greeks with horror. They are not exposed to the same temptation, and living in the midst of trials and oppressions, and exercising all the hospitality of which their scanty means are capable, appear to be a simple and interesting race of men.

The great mosque on the site of the temple of Solomon is the last object we shall here notice at Jerusalem, concerning which Abulfeda has the following passage in his description of Syria. 'There is at Jerusalem a mosque, a greater there is none in all Islamism, and in it there is a rock (sakhra), which is a stone elevated as a bench, about as high as a man's chest, and its breadth is equal to its height. There is a descent underneath by steps. This sakhra served the prophets, and especially the great prophet, as a place of dismounting from al-borak (a beast larger than an ass and smaller than a camel), who had carried them to Paradise.' M. de Chateaubriand gives several extracts from ancient travellers upon the interior of the mosque; but, as all entrance is strictly forbidden to Christians, he had of course no opportunity of verifying the information.

The following account was given of this mosque, in the year 1796, by the mufti of Jerusalem to a European, who conversed with him in Arabic at the house of the governor of Jerusalem, called by the Christians Pilate's house. This European is now in England, and from him we had the following account:—'Hearing me speak in Arabic he entered into conversation with me, and I took the liberty of asking him why the Mahometans would not permit the Christians to see the celebrated mosque of the rock. Upon which he opened a window which overlooks the mosque and all the ground on which it is raised, and permitted me to look at it as much as I pleased. He then said, 'We cannot permit the Christians to tread upon that ground, of which every spot is marked by the step of some holy prophet; still less upon the sakhra, or upon the interior of the mosque. But there are thirty-two large columns which support

for the support of the smaller arches; there are many lamps that are lighted on our festivals. There is a mihrab of marble with architectural ornaments, and a staircase to it with steps of the same material. The walls are incrustured with marble like the great mosque at Damascus, and ornamented with painted tiles. The name of God (Allah!) is written in large characters in several parts of the mosque, as well as the names of Mahomet and his first successors. We believe that if an infidel should walk between the columns they would meet and crush him to death.'

'The mosque, on account of its peculiar sanctity, was once the place towards which the Mussulmans of north-western Asia were to turn their faces in their prayers; but this commandment was altered by God's special order, and the Bait Allah (house of God) at Mecca was appointed for the only Kiblah. On the sakhra or rock were fixed iron rings, at which to tie the prophet's horses when they came to worship in the mosque. The mosque is called by many names by the Mahometans to denote its superiority over other temples, as al akse, the whole world, al masgid al akse, or al giarmiâ al akse, templum extremum. The origin of its importance seems to have been this:—The kalif Abd-al-Malik al Merwan was jealous of Abdallah the son of Zobeir, the ruler of Arabia, and in order to prevent his subjects in Syria from going in pilgrimage to Mecca, and thus enriching his rival, and probably also with a view to attract the profitable concern of receiving pilgrims from other countries to his own capital, he set up this mosque in opposition to that of Mecca. He adorned and beautified it in the year 685 of the Christian era, employing the whole revenue of Egypt for nine years for the accomplishment of his design. It is believed, on the faith of tradition, that the sakhra or rock is the same from which God spake to the patriarch Jacob, and that the sanctum sanctorum was built where the mosque now stands. Upon the whole it is impossible to contemplate the holy city in its desolate condition without the deepest interest. Jews, Mahometans, and Christians of all sects and denominations unite in acknowledging the existence of something extraordinary and supernatural about her awful ruins. They raise their heads from the dust, and from among them is heard a voice to warn and instruct mankind, and to proclaim to all ages and nations of the world, *This hath God wrought*.

Dr. CLARKE assures us that he 'ventured to see this country with other eyes than those of monks, and to make the Scripture rather than Bede or Adamnanus his guide in visiting the holy places; to attend more to a single chapter, nay a single verse of the gospel, than to all the legends and traditions of the fathers of the church.' Now we certainly think that it was a very laudable precaution to refer constantly to the gospel in travelling over the scenes where the events of that sacred history were transacted. But surely it is reasonable to conclude that the 'fathers of the church,' and even that 'old lady of good intentions, the empress Helena,' were not unmindful of this obvious precaution.

On the second day's journey from Acre, Dr

Clarke and his companions passed over the plain of Zabalon, 'every where covered with spontaneous vegetation, flourishing with the wildest exuberance'; but entirely neglected and uncultivated through the tyranny and bad policy of the tyrant Djezzar. In the centre of this plain lies the ancient acropolis of Sapphura, or Zeph (Joshua xv. 55), once 'the chief city and bulwark of Galilee.' In the ruins of a stately Gothic edifice, called the house of St. Anne, some ancient pictures, part of the former decorations of the church had lately been discovered; but, from the account and engraving given by Dr. Clarke, they do not appear to be essentially different from the oldest of the sacred paintings, which are occasionally discovered in the ancient European cathedrals. From Sephoury, notwithstanding the rumors of plague, the party proceeded to Nazareth, a small town or village situated upon the side of a barren rocky elevation facing the east, and commanding a long valley. An engraving of this nursing place of our Saviour is given: it appears to stand in a desolate situation surmounted by romantic hills. The plague, the tyrannical government of Djezzar, and the natural barrenness of the soil, had conspired to reduce the few inhabitants that remained to the most wretched state of indigence; and to provoke a repetition of the taunting question, whether 'any good thing could come out of Nazareth?' The objects of curiosity he found at Nazareth were, 1. A cave, the supposed residence of Joseph and the Virgin Mary; for building a handsome church over this retreat the empress Helena, mother of Constantine, has incurred the violent anger of Dr. Clarke, who even goes the length of asserting, that this good old lady would have dedicated and paved the sea of Tiberias, had not nature opposed itself to her wishes. 2. The workshop of Joseph. 3. The synagogue, where Christ is said to have read the Scriptures to the Jews; and, lastly, a precipice without the town, which accords with the words of the Evangelist, and proves the present site of the village to be the same with that occupied by the ancient town. The following singular scenes presented themselves during the day, which the party spent at Nazareth:—As we passed through the streets, loud screams, as of a person frantic with rage and grief, drew our attention towards a miserable hovel, whence we perceived a woman issuing hastily, with a cradle, containing an infant. Having placed the child upon the area before her dwelling, she as quickly ran back again; we then perceived her beating something violently, all the while filling the air with the most piercing shrieks. Running to see what was the cause of her cries, we observed an enormous serpent, which she had found near her infant, and had completely despatched before our arrival. Never were maternal feelings more strikingly portrayed than in the countenance of this woman. Not satisfied with having killed the animal, she continued her blows until she had reduced it to atoms, unheeding any thing that was said to her, and only abstracting her attention from its mangled body to cast, occasionally, a wild and momentary glance towards her child. In the evening we visited the environs, and, walking to

the brow of the hill above the town, were gratified by an interesting prospect of the long valley of Nazareth, and some hills between which a road leads to the neighbouring plain of Esdraelon, and to Jerusalem. Some of the Arabs came to converse with us. We were surprised to hear them speaking Italian; they said they had been early instructed in this language, by the friars of the convent. Their conversation was full of complaints against the rapacious tyranny of their governors. One of them said, 'Beggars in England are happier and better than we poor Arabs.' 'Why better?' said one of our party. 'Happier,' replied the Arab who had made the observation, 'in a good government: better, because they will not endure a bad one.' (p. 439).

From Nazareth they proceeded to the sea of Tiberias, 'an immense lake, almost equal in the grandeur of its appearance to that of Geneva,' surrounded by magnificent mountains rising from the cultivated plains which deck its immediate borders. At the northern extremity of the lake is a mountainous territory, still called in Arabic 'the wilderness,' to which John the Baptist and Jesus himself retired in their early years. To the south-west, at the distance of twelve miles, lies Mount Thabôr, having a conical form, and perfectly insulated on the northern side of the wide plains of Esdraelon. In a romantic nook, on the borders of the lake, is seated the little fortified town of Tiberias, and near it the warm baths of Emmaus. And northward, upon a bold declivity, the travellers beheld 'the situation of Capernaum, upon the boundaries of the two tribes of Zabulon and Naphthali.' This exquisitely interesting scene is illustrated by a well executed engraving. From Tiberias they crossed the plain of Esdraelon, round the base of Mount Thabôr, to Napolose the ancient Sichem. On the plain were encamped parties of Djezzar's cavalry, and the Arabs, whose incursions they were sent to check, occupied the mount and the surrounding hills; a trifling conflict, for the possession of some cattle, had occurred between the hostile bands a few days before. To the historical celebrity of this vast plain, the following well-wrought passage bears an opposite testimony:—'Here, on this plain, the most fertile part of all the land of Canaan (which, though a solitude, we found like one vast meadow, covered with the richest pasture), the tribe of Issachar 'rejoiced in their tents.' In the first ages of Jewish history, as well as during the Roman empire, the Crusades, and even in later times, it has been the scene of many a memorable contest. Here it was that Barak, descending with his 10,000 from Mount Thabôr, discomfited Sisera and 'all his chariots, even 900 chariots of iron, and all the people that were with him,' gathered 'from Harosheth of the Gentiles, unto the river of Kishon'; when 'all the host of Sisera fell upon the edge of the sword; and there was not a man left'; when 'the kings came and fought, the kings of Canaan in Taanach, by the waters of Megiddo.' Here also it was that Josiah, king of Judah, fought in disguise against Necho, king of Egypt, and fell by the arrows of his antagonist. So great were the lamentations for his death that the mourning for Josiah became 'an

ordinance in Israel.' The 'great mourning in Jerusalem,' foretold by Zechariah, is said to be as the lamentations in the plain of Esdraelon, or, according to the language of the prophet, 'as the mourning of Hadadrimmon in the valley of Megiddon.' Josephus often mentions this very remarkable part of the Holy Land, and always under the appellation of 'The Great Plain.' The supplies that Vespasian sent to the people of Sepphoris are said to have been reviewed in the great plain, prior to their distribution into two divisions; the infantry being quartered within the city, and the cavalry encamped upon the plain. Under the same name it is also mentioned by Eusebius, and by St. Jerome. It has been a chosen place for encampment in every contest carried on in this country, from the days of Nabuchodonosor, king of the Assyrians (in the history of whose war with Arphaxad it is mentioned as the great plain of Esdraelon), until the disastrous march of Napoleon Buonaparte from Egypt into Syria. Jews, Gentiles, Saracens, Christian Crusaders, and Anti-Christian Frenchmen, Egyptians, Persians, Druses, Turks, and Arabs, warriors out of 'every nation which is under heaven,' have pitched their tents upon the plain of Esdraelon, and have beheld the various banners of their nations wet with the dews of Thabor and of Hermon.' (p. 496.)

'As the traveller descends towards Napolose, it appears luxuriantly embosomed in the most delightful and fragrant bowers, half concealed by rich gardens, and by stately trees collected into groves, all around the bold and beautiful valley in which it stands. Trade seems to flourish among its inhabitants;' and in the neighbouring country the cultivation was every where marvellous, affording a most striking picture of human industry; the rocks and stony valleys of Judea were covered with figs, vines, and olives; the hills laid out with gardens; the mountains divided into terraces in the highest state of agricultural perfection; on all sides were to be seen plentiful crops of millet, cotton, linseed, tobacco, and barley, exhibiting proofs of the incalculable produce which might be raised from the Holy Land under a wise and beneficent government. 'Its perennial harvest; the salubrity of its air; its limpid springs; its rivers, lakes, and matchless plains; its hills and vales; all these, added to the serenity of its climate, prove this land to be, indeed, 'a field which the Lord hath blessed: God hath given it of the dew of heaven; and the fatness of the earth, and plenty of corn and wine.'

On the ancient history of Sichem, connected with the stories of Joseph, Eleazar, Joshua, &c., Dr. Clarke has an animated passage, which we regret our inability to insert. A long and tedious ride, with the thermometer at 102° of Fahrenheit, brought them to the Holy City.

We have entered fully into the present state of JERUSALEM after this writer in our article of that name. Concerning the discoveries which Dr. Clarke thinks that he has made, and his removal of Calvary and the tomb of our Saviour from their reputed localities, which have been acquiesced in for 1800 years, to a spot at a considerable distance,—we shall content ourselves with observing that the whole hypothesis appears

to us to rest upon mere conjecture; and, although there be neither 'impiety nor temerity in venturing to surmise' that the hypothesis is founded in probability, we think 'the existing documents' produced altogether insufficient to establish it.

After a long philippic against the empress Helena and her architectural piety, to which every visitor to Jerusalem since the days of that pious lady is pronounced to be a dupe, Dr. Clarke describes his visit to the ordinary objects of curiosity in the city and neighbourhood; we are not aware that any thing very worthy of observation occurs in these remarks; we shall, therefore, accompany Dr. Clarke to Bethlehem, the place of our Saviour's nativity; a town covering the ridge of a hill on the southern side of a deep and extensive valley, the most conspicuous object being the monastery erected over the cave of the Nativity. An interesting engraving of this picturesque town illustrates the following account:—'The temptation to visit Bethlehem was so great, that, notwithstanding the increasing alarms concerning the ravages of the plague as we drew near the town, we resolved, at all events, to venture thither. For this purpose, calling all our troop together, we appointed certain members of our cavalcade to keep a look-out, and act as guards in the van, centre, and rear of the party, to see that no person loitered, and that none of the inhabitants might be permitted to touch us, or our horses and camels, on any account whatsoever. In this manner we passed entirely through the town, which we found almost deserted by the inhabitants, who, having fled the contagion, were seen stationed in tents over all the neighbouring hills. It appeared to be a larger place than we expected to find: the houses are all white, and have flat roofs, as at Jerusalem, and in other parts of the country. A nephew of the governor of Jerusalem, mounted upon a beautiful Arabian courser, magnificently accoutred, rode near the centre of our caravan. He had volunteered his company, as he said, to ensure us respect, and as a mark of the governor's condescension. To our very great embarrassment, we had no sooner arrived in the middle of Bethlehem, than some of the inhabitants, at the sight of this man, came towards him to salute him; and, in spite of all our precautions and remonstrances, a Bethlehemite of some consideration came and conversed with him, placing his arm upon the velvet saddle-cloth which covered his horse's haunches. This, we knew, would be sufficient to communicate the plague to every one of us; therefore there was no alternative, but to insist instantly upon the young grandee's immediate dismissal. However, when our resolutions were made known to him, he positively refused to leave the party: upon this, we were compelled to have recourse to measures which proved effectual; and he rode off, at full speed, muttering the curses usually bestowed on Christians, for our insolence and cowardice. We reached the great gate of the convent of the nativity without further accident; but did not choose to venture in, both on account of the danger, and the certainty of beholding over again much of the same sort of mummery which had so frequently put our patience to the proof in Jerusalem. Passing

close to its walls, we took our course down into the deep valley which lies upon its north-eastern side; visiting the place where tradition says the angel, with a multitude of the heavenly host, appeared to the shepherds of Judea, with the glad tidings of our Saviour's nativity; and finally halting in an olive plantation at the bottom of the valley below the convent and the town.' (p. 614.)

Under the walls of Bethiehem they stopped to refresh themselves with a draught of its 'pure and delicious water,' in reference to which Dr. Clarke gives the following ingenious illustration. 'David, being a native of Bethlehem, calls to mind during the sultry days of harvest, a well near the gate of the town, of whose delicious water he had often tasted, and expresses an earnest desire to assuage his thirst by drinking of that limpid spring. And David longed and said, Oh! that one would give me drink of the water of the well of Bethlehem, which is by the gate (2 Sam. chap. xxiii.). It will be recollected, that three loyal and mighty men fought their way through the Philistine garrison, procured the draught, and laid it at the feet of their sovereign. It will also be recollected with what noble self-denial he declined the proffered luxury, and how frequently the example has been followed by other celebrated commanders of ancient and modern times. From Bethlehem Dr. Clarke and his friends made their way, with some risk, through hordes of hostile Arabs, to Rama (see Jeremiah xxxi. 15), and thence to Joppa, or Jaffa. The road, and particularly the neighbourhood of the towns, were strewn with dead bodies, victims of the plague, which was raging with great fury in this part of Palestine. From this place they returned by sea to Acre, and the approach to Mount Carmel and the Bay of Acre concludes this part of Dr. Clarke's Travels.

Our next traveller is a French nobleman, M. le Comte de Forbin. He sailed from Toulon 21st of August 1817, on his Travels in Greece and Syria, and arrived in October in sight of the mountains of Syria.

Mount Carmel was the first land he saw; and soon after the vessel entered the small harbour of St. Jean D'Acre. 8000 or 10,000 Turks, Arabs, Jews, and Christians, carry about with them into the polluted streets and bazaars of this place, an air of dark and ferocious melancholy. Even human sense is disagreeably affected, we are told, by objects of deformity, filth, and wretchedness. Beings, that look as if they were risen from tombs, drag themselves along half naked, with a sort of covering of dirty white, streaked with black. At each step one sees by the side of the wretched victims of ophthalmia, the sufferers under the cruelty of the late Djezzar Pacha (the Butcher, as the name signifies) deprived of their eyes, noses, and ears. These miserable creatures rest always abroad, lying under the walls of the seraglio gardens. The present inhabitant of this palace, the successor of the Butcher, seldom stirs out,—'deaf to the cries of a starved population, he passes his life in groves of myrtles which are refreshed by limpid rivulets.' His minister, who relieves him entirely from the weight of public business, oc-

cupied the same honorable and elevated situation under the Butcher of blessed memory, and in one and the same day had his salary doubled, and his nose and ears cut off, by the commands of his gracious master! This tried servant of the public is described by M. de Forbin, as supple, clever, and incalculably rich. Our author was introduced to the present Pacha, Soliman; he found him squatting in the corner of a sofa, and surrounded by courtiers, who received his permission, when it was thought proper, that they should laugh at the sallies of a favorite buffoon who held a high reputation at court. He examined the traveller's uniform very particularly, and described at great length the excellence of his Arabian horses, smoking as he spoke, and ordering coffee to be brought in for his visitor.

Our author left St. Jean D'Acre with a numerous caravan. Barren hills lie along the coast, about a league from the sea, and the intervening space is a white sandy beach. The ruins of Athlit present themselves; it was the last possession held by the crusaders; its port is now filled with sand, its ramparts are fallen, and its fine gardens are stagnant marshes. The khan (inn) of Santoura was found entirely occupied by another caravan: our traveller and his companions lay down in some small cabins, from which toads and centipedes soon drove them. The town of Caesarea presents a very striking sight; it is entirely deserted, yet, strange to say, stands in a state of perfect preservation. The view of its ramparts, ports, and monuments, excites an undefinable surprise. The streets and the public squares are perfect; nothing would be wanting but gates to its high and frowning battlements to render it susceptible of defence. The walls of the churches are yet black with the smoke of incense; the pulpit, illustrated by learned and courageous bishops, still stands; the graves alone seem to have sustained violence; they are open; and the human bones scattered about give the sole proof that man has once dwelt in the midst of this frightful solitude. The silence that reigns around is only broken by the monotonous noise of the tide, that comes rolling on—dashing over upon the piers and quays of the port, where no step of mariner or merchant ever treads. The ceaseless beating of the waves has here shaken and shifted the stone-work: the wall of the light-house is split, and its staircase and chambers are seen within, mouldering away, though as yet they afford a sanctuary to the sea-birds, which have there found an undisturbed habitation. Superb columns are still standing in this town. Next evening the caravan bivouacked under some sycamores, near which there was an abundant well; and young and handsome women! 'y appartaient, d'un pas majestueux, la cruche de Rachel.' The 15th of November they arrived at Jaffa, where our author was received in a miserable convent of fathers of the Holy Land, who are obliged to perform their rites in a secret vault, and are a prey to constant persecution. From Jaffa he proceeded to Rama, where he found the superior of the religious fraternity, by whom he was received, to be 'a Spaniard with a thundering voice and an imposing stature. This good monk

did not seem to me at all to like the state of martyrdom to which he was devoted. He gave me a clean chamber, looking out on a terrace shaded by palm-trees.'

From Rama to Jerusalem the road passes for two or three miles over the well-cultivated plains of the ancient Arimathea: afterwards the traveller passes by the hills of Latroun into profound valleys, where vegetation becomes rare and feeble; complete barrenness succeeds; and up to Jerusalem one traverses a red and sterile soil. The eye discovers nothing in the distance but the signs of vast natural eruptions and catastrophes; dry beds of torrents; and winding roads covered with sharp flints. To these may be added, to complete the picture, ruined cisterns, at the bottom of which a little stagnant water lies fetid and green, with bare craggy mountains rising around. Such, says our author, is the scenery depicted by Jeremiah; such is the valley of Terebintha; such is the approach, preparing the mind for the awful impression about to be made upon it by the first appearance of Jerusalem.

Jerusalem, observes Chateaubriand, has been taken and sacked seventeen times; millions of men have been massacred within its bosom, and it may almost be said that these massacres still continue:—a person who would take lodgings in the town would be daily in danger of his life, observes the author whom we have just mentioned. Great cities, and even whole nations, have been cast down and destroyed:

Great Carthage self in ashes cold doth lie;
Her ruins poor the herbs in height scant pass;
So cities fall, so perish kingdoms high;
Their pride and pomp are hid in sand and grass.

FAIRFAX.

But Jerusalem still exists, still drags on a cadaverous life, to excite horror, while these utterly fallen abodes of past greatness inspire a fine melancholy. She presents the aspect of dreary, and gaunt, and painful disease: they offer the spectacle of calm death.

The sun was on the point of setting when M. de Forbin, from an elevated part of this rough and inconvenient road, caught the first view of this celebrated place. 'I perceived, in fine, long ramparts, towers, and vast edifices, surrounded by barren and black ground, and rocks that looked as if they had been smitten by thunder. Here and there ruined chapels were to be observed: Mount Sion rose in view; and more distant, the rugged mountains of the Arabian desert.' Our author, with a very just feeling, expresses his indignant contempt for the poor-minded creature, of whatever country or belief, who should regard this lost city in a temper of ironical sceptical malice. 'Quelles que soient les opinions religieuses, le seul engourdissement de l'esprit pourrait s'opposer à la sensation de surprise et de respect qu'inspire Jerusalem. Tout est silencieux autour de cette ville; tout est muet: le dernier cri de l'Homme-Dieu semble avoir été le dernier bruit répété par les échos de Siloé et de Gehennon.'

The very day of his arrival afforded him a most interesting spectacle, in a meeting of the

whole Jewish population of Jerusalem, which took place in the valley of Josaphat. The Turkish governor had sold to these poor creatures permission to celebrate the feast of tombs. 'At the view of these captives seated in silence on the sepulchral stones of their ancestors, it might have been almost thought that the awful trumpet had made itself heard, that the generations of mankind crowded the borders of Cedron, and that from the bosom of the cloud the words of joy and of sorrow were about to issue.' (p. 85). It is supposed that Jerusalem contains about 25,000 inhabitants. Not more than 200 Christian families reside there. Our author calculates the Jews still remaining in this ancient capital of their people at about 8000 or 9000. Scarcely ought one to call by the name of street, the narrow, filthy, and steep passage which divides the half-fallen houses in the quarter of the Hebrews. Squalid and diseased wretches, with features strongly marked, quarrel and tear each other to pieces for the pittance which charity throws to their misery. Descending by a ruined staircase into vaults that were falling in, where they were not partially sustained by a few pillars that indicated they had been formerly gilt and sculptured, our author found himself, to his astonishment, in the grand synagogue. Some children in rags were learning, from a blind old man, the ancient history of the city, and heard that their fathers adored the God of Israel, not in the wretched den where they then were, but under porticos of marble, and roofs built of the cedars of Lebanon! Such is now the condition of the remnant of the extraordinary people whose hands raised, and whose sweat and blood bathed the proudest monuments of Memphis and of Rome. The space within the walls would contain six times the number of inhabitants above specified; so that a great part of its unpaved and steep streets is uninhabited, and a large quantity of houses, churches, and monasteries, are entirely deserted. The inhabited houses generally receive the light only by means of the door, and one or two small holes for windows, with wooden bars. In a few poor shops they sell olives and fruits brought from Damas, rice, corn, and some dried vegetables: a group of starving Arabs may be seen devouring these luxuries with their eyes; while the Turkish shopkeeper smokes his pipe with indifference, utterly regardless, to all appearance, of his own interests.

M. de Forbin went from Jerusalem to Bethlehem, which received its name, it is said, from Abraham himself. David there guarded his flock, and Boaz and Ruth were Bethlehemites. The first Christians built a small chapel over the spot where the stable stood in which our Saviour was born: the emperor Adrian substituted the altar of Adonis, which was afterwards thrown down by St. Helen, who caused the church to be erected that stands there to this day. The Armenians are now in possession of this temple. The convent has all the appearance of a fortress; the principal gate is made very low, to hinder, as our author says, the Arabs from entering on horseback, or in too great number. The town had just been visited with an order for a contribution of 8000 piastres; and the population, which is

entirely Christian, was in a state of great agitation. The young women of Bethlehem are described as graceful, and finely featured: a veil envelopes, without hiding, their countenance; and their arms are naked. M. de Forbin visited many families of the place, and was kindly received. Going out of the town, you see the mountains of Hebron, where the pretended tomb of Abraham is still shown; in the valley of Mamre repose the ashes of Caleb: further distant they point out the rock in a cave of which David hid himself from the fury of Saul.

To go to Jericho, it is necessary to leave Jerusalem by the gate Setty-Mariam, and to cross the torrent Cedron. When M. de Forbin took this journey it was winter; but the temperature of the air scarcely permitted him to believe this. Throughout the whole of Judea, occasional rain is the only indication of winter: 'autumn brings no fruits, spring expands no flowers; yet the heats of summer dry the source of Siloa: it would appear that there are no longer seasons for this unhappy country.' (p. 92.) The road to Jericho passes through narrow valleys and deep ravines, almost impracticable, that seemed made by some recent convulsion. The mountains looked as if they were stained with sulphur, as at the Solfatara in the neighbourhood of Naples. The traveller, after having descended into dismal chasms, must climb sharp and steep rocks to discover the plain of Jericho. The Arabs call it Ryah: a crowd of huts, built of earth and reeds, and roofed with a sort of heath, is all that now remains bearing the name of this city, whose once celebrated walls are replaced by fagots of thorns and thistles, that hardly serve to defend the cattle against the frequent attacks of wild beasts. The age, as wretched as his subjects, inhabited a ruined tower, which our traveller climbed with much difficulty. The best abode in the place was assigned him for the night; but he could not support its bad smell: he joined his companions round a large fire in the open air, where they supped on a kid killed before them, and broiled on the wood ashes. 'Wrapped up in my cloak, and stretched on the ground, I slept in spite of my bad supper and the noise of my entertainers. The principal persons of Jericho (les notables) came to chat with the Turks of my escort,—and the conversation was long and loud. We were all on the alert again before break of day, and saw the sun rise behind the mountains of the Arabian desert.' (p. 94.)

The Dead Sea, or Asphaltic Lake of Sodom, is seen on the right of Jericho: the Jordan discovers itself far off in the distance on the left, between two small hills covered with thorny shrubs. The age added some fresh men to our traveller's escort, who proceeded towards the spot where the sinful towns were destroyed by the fire of heaven. The road lay over a sandy plain, thinly spotted with small shrubs, and some plants of an exquisite perfume. The party was on its guard against Arab robbers, and took prisoner a Bedouin whose companions fled at its approach. He was afterwards permitted to get off by throwing himself into the Jordan. The banks of this river are high, and covered

with trees; its water is yellow, troubled, and pretty deep. Its width here is trifling—about a quarter that of the Seine at Paris.

Our author's description of the Asphaltic Lake contains nothing new: he says, the Jews believe that, at the birth of Messiah, the fire-destroyed cities will re-appear. From a hill formed of ruins, supposed to be those of Gomorrah, M. de Forbin sketched a view, which included the Mount Nebo, where Moses died. 'Searching on the banks of the river for vestiges of the guilty town, I in fact discovered some remains of walls, of a tower, and of several columns.'

Nothing, according to our author's account, can equal the horrible melancholy of this country. Deep and dark valleys are suddenly shut up by a lofty mountain, perfectly white, which in the twilight might be taken for an enormous phantom defending the passage; the crevices and the caverns then put on the appearance of features, and the ravines down its sides mark the folds of its frightful robe. 'Mountains of cinders, in the shape of imperfect and reversed cones; fantastic rocks, riven, overturned, and standing; these were the objects we encountered for several leagues, till we gained a more elevated spot, whence the bitter waters of the Dead Sea were again visible: at this moment the sun was descending behind the mountains of Edom. The lake seemed an exquisite surface of lapis lazuli, of which the mountains that surrounded it formed the golden border. Further off the rocky crags, heaped one upon the other, now put on the appearance of a fortified city, and now of a vast amphitheatre that had no other spectators or actors but the kites and vultures. Immense eagles balanced themselves majestically in the mid-air above their ancient and undisturbed empire.' (p. 101.)

The monastery of St. Sabas, one of those dismal inaccessible Cenobite retreats, of which numbers are to be found in the deserts of Asia, is placed on the peak of a rock, and hangs at the height of 400 feet over the dried torrent of Cedron. Our author describes it as the most frightful solitude he had ever seen: the grots of the unhappy fanatics are excavated in nooks, and under projections that expose them to continual danger. Doves, and a multitude of anchorites, formerly inhabited together the whole of the awful valley below:—it is now, however, deserted by the human beings, yet blue pigeons, says the traveller, still float over the abyss. Not a shrub, not a plant, not a drop of water, can be found within the enormous enclosure of the monastery. Two low and narrow gates, covered with iron and nails, were closely shut against the party: they begged admission in vain; the hour seemed a suspicious one to the Greek hermits; and al that prayers the most earnest, and menaces the most severe, could procure, was a jar of water, long-time expected, and at last lowered to them from the top of a tower eighty feet high. The poor Caloyers are obliged to watch day and night against the Arabs, whole tribes of whom often come to attack them. Their watching, however, is of small avail: their enemies possess themselves of all the issues; and the inmates of

the place are thus compelled to conclude a treaty, the single article of which provides for the payment of a contribution.

On the 2d of December our traveller quitted Jerusalem, proceeding by the village of Jeremiah towards the sea. As he approached Jaffa, by the road of the ancient Arimathea, the weather became milder still, and he breathed the perfume of orange and citron gardens, which are planted without order or art. Pleasant rivulets go murmuring amongst the rows of trees which press thickly against each other: their branches are bent down, with the weight of flowers and fruits, into the running water at their feet, where they refresh themselves, and add to the gentle noise of the streams. Noble palm-trees rise, like minarets, above these embalmed groves. This is a very different scene from that of the Cenobite monastery, and of the rocks and valleys of the Dead Sea. 'It is not possible to conceive the pleasure,' he says, 'we felt in plunging into these delicious thickets, after our eyes had been so long accustomed to spread themselves over bare and burning flats, and our ears had been struck by no pleasanter sounds than those of the shrill and incessant cries of an Arabian populace, always apparently threatening and revolting.'—p. 132.

At Jaffa our author delivered his letters of introduction to the aga, a brave, able, cunning, cruel, and ambitious Circassian, who seems to aim at acquiring some day an independent power. The Christian convent here is on a tolerably good footing with the chief of the government, owing to the adroitness of 'le Pere Curé, Juan Solar, a sharp intriguing ecclesiastic, who has made a friend of Elias Basila, a Syrian Christian, and second writer to Mehemet Aga. Le Pere Curé intrigues that his protector Elias may become prime minister; and prompts, pushes, and whispers to advance this laudable end, without ceasing. The second writer, however, is too indolent and too honest, says our author: he smokes 200 pipes a day, while he is waiting quietly till his greatness shall be thrust upon him. M. de Forbin had determined to cross Palestine, for the purpose of arriving at Damietta. The journey is far from a safe one; but the aga furnished him with a good conductor. Near the ruins of Azoth, so flourishing under the Philistines, our author fell in with a Bedouin, wandering, as he stated, without any object, and mounted on a beautiful mare, with gazelle eyes, whose praises he loudly sounded, and was delighted to hear re-echoed. He stooped over the neck of the graceful animal, spoke to it as to a favorite child, and covered it with kisses.

Ascalon is totally deserted: not one inhabitant remains within its walls. It is placed, like Naples, on an amphitheatrical slope, forming a half circle, and the sea forms the chord of the arc. The gates and ramparts still stand: the streets conduct to the squares: the wild antelope mounts the staircases of the palaces: the vast churches ring with the cry of the jackal; and bands of these animals meet in the great marketplace. They are now the sole masters of Ascalon! The Arabs, who call it Djaurah, struck by its melancholy appearance, regard it as the abode

of evil spirits. They stoutly affirm that during the night the city is often seen illuminated: that the sound of innumerable voices is heard, also the neighing of horses, the clashing of arms, and all the tumult of combats. An exquisite temple of Venus, in the Greek style, stands not far from the Gothic Christian monuments. Lady Esther Stanhope has recently made excavations at Ascalon; but the expense was found by her ladyship to be too great, and her attempts have been discontinued. M. de Forbin adds a note respecting our countrywoman, who has taken up her abode in the East:—'Lady Esther Stanhope has inhabited Syria for some years past: at present she resides in the small town of Antoura, above Lebanon. Her good actions have conquered the affections of the Bedouin Arabs; and people say, that they are very well disposed to proclaim her their queen. A ceremony, which certainly would have resembled a coronation, was prepared for her at Tadmour, the ancient Palmyra, but her modesty induced her to decline this singular triumph.' (p. 143.)

But we have been better pleased, we confess, with Mr. Buckingham's Travels in Palestine, than with any other recent publication respecting this country. 'The itineraries of Catholic devotees,' he justly remarks, 'have furnished the most ample details regarding the sanctuaries and holy places; and the names of Phocas, Quaresmius, and Adrichomius, are associated with these early labors. The extended journeys of Protestant scholars have enlarged our acquaintance with objects of more general enquiry, and the names of Maundrell, Shaw, and Pococke, stand pre-eminent among these. The profound researches of both English and French critics have laid open all the stores of learning in illustration of the ancient geography of Judea; and the works of Reland and D'Anville, are monuments of erudition and sagacity that would do honor to any country, while the labors of very recent travellers would seem to close the circle of our enquiries, by the pictures which they have given of the general state of manners and the present aspect of the country, retaining still the freshness of their original coloring. Yet, among all those who have made the Holy Land the scene of their researches, there has not been one who did not conceive that he was able to correct and add to the labors of his predecessors, and, indeed, who did not really notice something of interest which had been disregarded before. It is thus that Dr. Clarke expresses his doubts and disbelief at every step, and attempts to refute, with indignation, authorities which travellers of every age had hitherto been accustomed to venerate. And it is thus, too, that Chateaubriand confesses, with all the frankness of disappointment, that, after he had read some hundreds of volumes on the country he came to visit, they had given him no accurate conceptions of what he subsequently beheld for himself.' (Pref. p. v. vi.)

Mr. Buckingham embarked at Alexandria on the 25th of December, 1815, on board a shuktoor, a three-masted vessel peculiar to the navigation of the Syrian coast, about thirty feet in length, by fifteen in its extreme breadth, and about forty tons burden. The captain and his

crew, all together ten in number, were Syrian Arabs, professing the Greek religion, unskilful in the management of their vessel, and utterly ignorant of navigation. After a tedious and perilous voyage of thirteen days, the circumstances of which it is not necessary to detail, the vessel entered in safety the harbour of Soor, the ancient Tyre, whence he determined to prosecute his journey by land.

Of the present state of this proud mart of antiquity, whose resources of wealth and power are enumerated with so much eloquence by the prophet when proclaiming its destined fall—'whose merchants were princes—whose traffickers were the honorable of the earth,' (Isaiah xxiii. 8)—we have the following interesting particulars:—'The town of Soor is situated at the extremity of a sandy peninsula, extending out to the north-west for about a mile from the line of the main coast. The breadth of the isthmus is about one-third of its length; and, at its outer point, the land on which the town itself stands becomes wider, stretching itself nearly in right angles to the narrow neck which joins it to the main, and extending to the north-east and south-west for about a third of a mile in each direction. The whole space which the town occupies may be, therefore, about a mile in length, and half a mile in breadth, measuring from the sea to its inland gate. It has all the appearance of having been once an island, and at some distant period was, perhaps, of greater extent in length than at present, as from its north-east end extends a range of fragments of former buildings, beaten down and now broken over by the waves of the sea. Its south-western extreme is of natural rock, as well as all its edge facing outward to the sea; and the soil of its central parts, where it is visible by being free of buildings, is of a sandy nature.

'While this small island preserved its original character, in being detached from the continent by a strait of nearly half a mile in breadth, no situation could be more favorable for maritime consequence; and, with so excellent a port as this strait must have afforded to the small trading vessels of ancient days, a city built on it might, in time, have attained the high degree of splendor and opulence attributed to Tyrus, of which it is thought to be the site. On approaching the modern Soor, whether from the sea, from the hills, from the north, or from the south, its appearance has nothing of magnificence. The island on which it stands is as low as the isthmus which connects it to the main land, and, like this, all its unoccupied parts present a sandy and barren soil. The monotony of its gray and flat-roofed buildings is relieved only by the minaret of one mosque with two low domes near it, the ruins of an old Christian church, the square tower without, the town to the southward or south-east of it, and a few date-trees scattered here and there among the houses. On entering the town, it is discovered to have been walled; the portion towards the isthmus still remaining, and being entered by a humble gate, while that on the north side is broken down, showing only detached fragments of circular towers greatly dilapidated. These walls, both from their con-

fined extent and style of building, would seem to be of less antiquity than those which encompassed Tyrus in the days of its highest splendor, as they do not enclose a space of more than two miles in extent, and are of ordinary workmanship. They do not reach beyond the precincts of the present town, thus shutting out all the range to the northward of the harbour, which appears to be composed of the ruins of former buildings. The tower to the south-east is not more than fifty feet square and about the same height. It is turretted on the top, and has small windows and loop-holes on each of its sides. A flight of steps leads up to it from without, and its whole appearance is much like that of the Saracenic buildings in the neighbourhood of Cairo. At the present time the town of Soor contains about 800 substantial stone-built dwellings, mostly having courts, wells, and various conveniences attached to them, besides other smaller habitations for the poor. There are, within the walls, one mosque, three Christian churches, a bath, and three bazaars. The inhabitants are at the lowest computation from 5000 to 8000, three-fourths of which are Arab Catholics, and the remainder Arab Moslems and Turks.' (p. 47, 48.)

During the fair season, that is, from April to November, the port is frequented by vessels from the Greek islands, the coasts of Asia Minor, and Egypt, and a considerable trade is carried on in all the productions of those parts; Soor being one of the marts of supply for Damascus, for which its local situation is now, as it formerly was, extremely eligible. The mercantile people are chiefly Christians, whose dress resembled that of the same class in Cairo: the women were habited partly after the Egyptian and partly after the Turkish fashion. In the court of the house where our traveller lodged, he observed a female divested of her outer robes. 'Her garments,' he says, 'then appeared to resemble those of the Jewish women in Turkey and Egypt: the face and bosom were exposed to view, and the waist was girt with a broad girdle fastened by massy silver clasps. This woman, who was a Christian, wore also on her head a hollow silver horn, rearing itself upwards obliquely from her forehead, being four or five inches in diameter at the root, and pointed at its extreme; and her ears, her neck, and her arms, were laden with rings, chains, and bracelets. The first peculiarity reminded me very forcibly of the expression of the Psalmist, 'Lift not up thine horn on high, speak not with a stiff neck.' 'All the horns of the wicked will I cut off, but the horns of the righteous shall be exalted;' similar illustrations of which Bruce had also found in Abyssinia, in the silver horns of warriors and distinguished men. The last recalled to my memory, with equal readiness, the species of wealth which the chosen Israelites were commanded to borrow from the Egyptians, at the time of their departure from among them; and of the spoils taken in their wars with the Canaanites whom they dispossessed, when it is stated that many shekels of silver and of gold were produced on melting down the bracelets, the ear-rings, and other ornaments of the women and children whom they

had made captive. Most of the women that we saw wore also silver bells, or other appendages of precious metals, suspended by silken cords to the hair of the head, and large high wooden pattens, which gave them altogether a very singular appearance.' (p. 49, 50.)

As the state of the country rendered it necessary to Mr. Buckingham's personal security that he should have a firman from the pacha of Acre, he went thither by the common route, which has so often been described by preceding travellers as to render any notice of it unnecessary. On his arrival at Acre, he found that Suliman Pasha, the second successor of the celebrated Djézzar, had departed thence early on the morning of the preceding day, with a large body of troops, to secure the possession of the districts of Galilee, Samaria, and all Judea to the southward; while one of his confidential officers had previously marched with another body towards Damascus (the pacha of which had lately died), in order to prepare the way for his master's entrance. As it was known that Suliman would make his first halt at Jerusalem, after securing possession of its neighbourhood, the English consul recommended that our author should proceed thither, and obtain from his hand the only protection under which he could now safely travel. While he was detained at Acre, Mr. Buckingham employed his unwilling leisure in embodying such observations on it as he had been able to make, together with the information which he had obtained respecting that place from those who had been long resident there.

Several curious anecdotes are recorded by our author of the late pacha, one of which we transcribe, as it justifies the appellation of Djézzar, or the Butcher, by which that ferocious and avaricious Moslem is generally known. 'Some short time before his decease, he was conscious of the approach of death; but so far was he from showing any remorse for his past actions, or discovering any indications of a wish to make atonement for them, that the last moments of this tyrant were employed in contriving fresh murders, as if to close with new horrors the bloody tragedy of his reign. Calling to him his father-in-law, Sheikh Taha, as he himself lay on the bed of death, 'I perceive,' said he, 'that I have but a short time to live. What must I do with these rascals in my prisons? Since I have stripped them of every thing, what good will it do them to be let loose again naked into the world? The greatest part of them are governors, who, if they return to their posts, will be forced to ruin a great many poor people, in order to replace wealth which I have taken from them; so that it is best both for their own sakes, and for that of others, that I should destroy them. They will be then soon in a place where proper care will be taken of them, a very good place, where they will neither be permitted to molest any one, nor be themselves exposed to molestation. Yes, yes! that's best! Despatch them!' In obedience to the charitable conclusion of this pathetic apostrophe, twenty-three wretches were immediately added to the long list of the victims of Djézzar Pasha's cruelty; and it is said they were all of them thrown into the sea together,

as the most expeditious mode of execution. (p. 80, 81.)

On his departure from Acre, or Acre, Mr. Buckingham passed through Nazareth (of whose present state we have a pleasing account); and, while his mules were feeding at the little village of Deborah, he ascended Mount Tabor, on the summit of which is an oval plain, of about a quarter of a mile in its greatest length, covered with a bed of fertile soil on the west, and having at its eastern end a mass of ruins, seemingly the vestiges of churches, grottoes, strong walls, and fortifications; all decidedly of some antiquity, and a few appearing to be the works of a very remote age. The panoramic view from the summit he found equally beautiful and extensive. Having with difficulty escaped being plundered by some of the marauding soldiers who, at this time, infested the country, our author, on regaining the village of Deborah, was obliged to retrace his steps to Nazareth; whence he resumed his journey towards Jerusalem on the 13th of January, 1816, taking his route over Mount Carmel, through Dora (in all probability the Dor of the Scriptures. See Joshua xvii. 11.—Judges i. 27), and Cesarea, by Joppa and Ramla, which town is supposed to be erected on the site of the ancient Ramah.

Of the ancient history of Jaffa, the Joppa of the sacred writings, we have a copious and well-written account. As it now appears, this place 'is seated on a promontory jutting out into the sea, and rising to the height of about 150 feet above its level, having a desert coast to the north and south, the Mediterranean on the west, and fertile plains and gardens behind it on the east. It is walled around on the south and east, towards the land, and partially so on the north and west towards the sea. There are not more than 1000. habitations in all the town; and the number of three mosques, one Latin convent, and one Greek church, will afford a guide to estimate the relative proportions of these religious bodies to each other. There is a small fort near the sea on the west, another on the north, and a third near the eastern gate of entrance, mounting in all from fifty to sixty pieces of cannon; which, with a force of 500 horse, and nearly the same number of infantry, would enable the town to be defended by a skilful commander. The port is formed by a ledge of rocks running north and south before the promontory, leaving a confined and shallow space between these rocks and the town. Here the small trading vessels of the country find shelter from south and west winds, and land their cargoes on narrow wharfs running along before the magazines. When the wind blows strong from the northward, they are obliged to warp out, and seek shelter in the small bay to the north-east of the town, as the sea breaks in here with great violence, and there is not more than three fathoms water in the deepest part of the harbour: so accurately do the local features of the place correspond with those given of it by Josephus.' (p. 157, 158.)

On his arrival at Jerusalem, Mr. Buckingham proceeded to the Latin convent of the Terra Santa, where he met with a hearty welcome from the

procure, to whose holy care and protection the president of Nazareth had recommended him as a 'Milord Inglese, richissimo, affabilissimo, ed anche dottissimo.' The monks residing in this convent (with the exception of two Italians) were Spaniards, and displayed all the bigotry and ignorance for which the ecclesiastics of that country have long been pre-eminently distinguished. Among the news of Europe, the re-establishment of the Inquisition was spoken of, and all exulted in the hope that under so wise and pious a king as Ferdinand the church would again resume its empire, and Christianity flourish! The brightest trait which they could find in his character was, that on any application to him for money to be applied to pious purposes, if the 'Convento della Terra Santa' was named, he usually gave double the sum demanded. 'Let the inquisition reign,' said they, 'and the church will be secure. Let the cross triumph, and the Holy Sepulchre shall soon be redeemed from the hands of infidels by another crusade, in which all our injuries will be avenged.' Instead of the comfort, apparent equality, and cheerfulness, which reigned at Nazareth, and even at Ramlah, all seemed here to stand in fear of each other; gloom and jealousy reigned throughout, and the names of the padre superiore, and of the procuratore generale, were as much dreaded as they were respected. When we talked of the nature of their duties here, every one complained of them as severe in the extreme. The tinkle of the bell for service was heard at almost every hour of the day; and, besides getting up two hours before sunrise to celebrate a mass, they were obliged to leave their beds every night at half-past eleven, for midnight prayers. Nothing was talked of but suffering, and the difficulty of obedience, ardent desire to return to Europe, and a wish to be sent any where, indeed, on the out-stations, rather than to continue at Jerusalem. Not even in a solitary instance did I hear a word of resignation, or of the joy of suffering for Christ's sake, or the love of persecution, or of the paradise found in a life of mortification, so often attributed to these men. One complained 'I came here for three years only, and have been kept seven; God grant that I may be able to return home at the coming spring.' Another said, 'what can we do? we are poor; the voyage is long; and unless we have permission, and some provision made for our way, how can we think of going?' A third added, 'in Christendom we can amuse ourselves by occasional visits to friends; and, during long fasts, good fish, excellent fruit, and exquisite wines are to be had.' While a fourth continued, 'and if one should be taken sick here, either of the plague or any other disease, we have no doctor but an old frate of the convent, no aid but from a few spurious medicines, and nothing, in short, to preserve one's life, dearer than all beside; so that we must end our days unpitied, and quit the world before our time.' (p. 179, 180.) This convent is called 'Il Convento della Terra Santa,' by way of distinction, and is at the head of all the religious establishments of the Romish faith throughout the Holy Land. The superior

is immediately dependent upon the pope, but the inferior members are sent from Naples, Sicily, and the South of Spain, indiscriminately. The funds of the institution are chiefly supplied from Rome; but these supplies being interrupted, during the late war, they were dependent on the charitable donations of their flock at Jerusalem. Legacies, however, are frequently bequeathed to them by the devout in Europe; and large sums are sent to them by the monarchs in that quarter of the globe. Among these, the donations of the present king of Spain are exceedingly liberal; so much so, that, when a secretary of the British ambassador at Constantinople was sent, in 1815, with a present of £1500 from the prince regent of England, the monks did not give him the most flattering reception, telling him that the king of Spain had just before sent them about £6000 sterling!

Upwards of 100 pages are devoted to a description and investigation of the Holy Places in Jerusalem (including an excursion to Bethlehem), the actual site of which places it is impossible to identify, at this distance of time. As our traveller has added very little to the previous descriptions of Dr. Clarke (on whom he introduces some rather severe animadversions), and of viscount Chateaubriand, we shall not detain our readers with his accounts of these reputedly sacred spots, and of the various legendary tales connected with them.

But the following particulars, relative to the actual population and trade of Jerusalem, are too interesting to be omitted. From the most accurate estimate which his means of information enabled him to form, it appears that 'the fixed residents, more than one half of whom are Mahometans, are about 8000; but the continual arrival and departure of strangers make the total number of those present in the city, from 10,000 to 15,000 generally, according to the season of the year. The proportion which the numbers of those of different sects bear to each other, in this estimate, was not so easily ascertained. The answers which I received to enquiries on this point were framed differently by the professors of every different faith. Each of these seemed anxious to magnify the number of those who believed his own dogmas, and to diminish that of the professors of other creeds. Their accounts were therefore so discordant that no reliance could be placed on the accuracy of any of them. The Mahometans are certainly the most numerous, and these consist of nearly equal proportions of Osmanli Turks, from Asia Minor; descendants of pure Turks by blood, but Arabians by birth; a mixture of Turkish and Arab blood, by intermarriages; and pure Syrian Arabs, of an unmixed race. Of Europeans, there are only the few monks of the Catholic convent, and the still fewer Latin pilgrims who occasionally visit them. The Greeks are the most numerous of all the Christians, and these are chiefly the clergy and devotees. The Armenians follow next in order, as to numbers, but their body is thought to exceed that of the Greeks in influence and in wealth. The inferior sects of Copts, Abyssinians, Syrians, Nestorians, Maronites, Chaldeans, &c., are scarcely

perceptible in the crowd. And even the Jews are more remarkable from the striking peculiarity of their features and dress, than from their numbers, as contrasted with the other bodies.' (p. 260—262.)

This account varies in some degree from the estimates made by other recent travellers in Palestine. Captain (now colonel) Light, who visited Jerusalem in 1814, computed its population at 12,000; but Mr. Joliffe, who was there in 1817, states that the highest estimate makes the total amount to 25,000; of these, there are supposed to be

| | |
|-----------------|-------------------|
| Mahometans | 13,000 |
| Jews | from 3000 to 4000 |
| Greeks | 2000 |
| Roman Catholics | 800 |
| Armenians | 400 |
| Copts | 50 |

These numbers vary from the amount specified by Mr. Buckingham, but it is probable that the increased number of pilgrims, whom mistaken piety might conduct to Jerusalem in 1817, will account for the difference. Whether, however, we take its population at 15,000, or even 25,000, it is a very slender aggregate, compared with the flourishing population which the city once supported: but the numerous sieges it has undergone, and their consequent spoliations, have left no vestige of its original power.

'Jerusalem, under the government of a Turkish aga, is still more unlike Jerusalem as it existed in the age of Solomon, than Athens during the administration of Pericles, and Athens under the dominion of the chief of the black eunuchs. We have it upon judgment's record, that, before 'a marching army a land has been as the garden of Eden, behind it a desolate wilderness.' Joel ii. 3. The present appearance of Judea has embodied the awful warnings of the prophet in all their terrible reality.' Joliffe's *Letters from Palestine*, page 102. From Christmas to Easter is the period in which Jerusalem is most populous, the principal feasts of the Christmas falling between these great holidays. At the latter festival, indeed, it is crowded, and the city exhibits a spectacle nowhere else to be seen in the world. Mecca and Medina offer, perhaps, a still greater variety of persons, dresses, and tongues; yet there the pilgrims visit but one temple, and are united in one faith; while here, Jews, Mahometans, and Christians, all perform their devotions within a few yards of each other, each proudly believing that this city of the living God is holy and noble to himself, and his peculiar sect alone.

In Jerusalem there is scarcely any trade, and but few manufactures. The only one that at all flourishes is that of crucifixes, chaplets, and relics, of which, incredible as it may seem, whole cargoes are shipped off from Jaffa, for Italy, Portugal, and Spain. Religion being almost the only business which brings men of opposite quarters together here, there is much less bustle than would be produced in a trading town by a smaller number of inhabitants. This city being included within the pachalic of Damascus, is governed by a Mutesellim, appointed from

thence; and the nature of his duties, and the extent of his responsibility, are similar to those in other Turkish towns. No difference is created by the peculiar sanctity of this place, as is done by that of the Arabian cities of Mecca and Medina; for, while a governor of either of these is honored by peculiar privileges, the Mutesellim of Jerusalem ranks only as the magistrate of a provincial town. The force usually kept up here consists of about 1000 soldiers, including horse and foot. These are armed and equipped in the common Turkish fashion, and are composed of Turks, Arabs, and Albanians. The walls of the city, added to the strength of its natural position, form a sufficient defence against any attack from the armies of the country; and some few cannon, mounted at distant intervals on the towers, would enable them to repel a besieging force of Arabs, but it could offer no effectual resistance to an attack conducted on the European system of war. From the general sterility of the surrounding country, even when the early and the latter rains favor the husbandman's labours, and from the frightful barrenness that extends all around Jerusalem during the parching droughts of summer, every article of food is much dearer here than it is in any other part of Syria. The wages of the laborer are advanced in the same proportion; as the lowest rate given here to those who perform the meanest offices is about the third of a Spanish dollar per day; while, on the sea-coast of this country, it seldom exceeds a sixth, and in Egypt is never more than an eighth of the same coin. (p. 262, 263.)

The preparations for the prosecution of his journey being completed, our author bade adieu to Jerusalem on the 28th of January, 1816, in company with Mr. Bankes, whom he had met there. The route, which they had marked out to themselves, was, to cross the Jordan and pass through Jerash (the ancient Geraza) and Gamala, two cities of whose ruins they had heard much. In this excursion they traversed the countries of Bashan and Gilead, on the east of the Jordan: and this portion of Mr. Buckingham's travels is not only the most interesting part of his volume, but may also be termed entirely new. For that stream has hitherto been the boundary of all our knowledge relative to the ancient Judea, no traveller having explored the countries beyond it, except the late Dr. Seetzen and Mr. Burkhart.

The first place that received the travellers was Jericho; the road thither is rocky and wild, amidst grand and awful scenery; and it is still infested by robbers. 'The whole of this road,' says Mr. Buckingham, 'from Jerusalem to the Jordan, is held to be the most dangerous about Palestine, and, indeed, in this portion of it, the very aspect of the scenery is sufficient, on the one hand to tempt to robbery and murder, and on the other to occasion a dread of it in those who pass that way. It was partly to prevent any accident happening to us in this early stage of our journey, and partly, perhaps, to calm our fears on that score, that a messenger had been despatched by our guides to an encampment of their tribe near, desiring them to send an escort to meet us at this place. We were met here, ac

cordingly, by a band of about twenty persons on foot, all armed with matchlocks, and presenting the most ferocious and robber-like appearance that could be imagined. The effect of this was heightened by the shouts which they sent forth from hill to hill, and which were re-echoed through all the valleys, while the bold projecting crags of rock, the dark shadows in which every thing lay buried below, the towering height of the cliffs above, and the forbidding desolation which every where reigned around, presented a picture that was quite in harmony throughout all its parts.

'It made us feel most forcibly the propriety of its being chosen as the scene of the delightful tale of compassion which we had before so often admired for its doctrine, independently of its local beauty. See Luke x. 30—34.

'One must be amid these wild and gloomy solitudes, surrounded by an armed band, and feel the impatience of the traveller who rushes on to catch a new view at every pass and turn; one must be alarmed at the very tramp of the horses' hoofs rebounding through the caverned rocks, and at the savage shouts of the footmen, scarcely less loud than the echoing thunder produced by the discharge of their pieces in the valleys; one must witness all this upon the spot, before the full force and beauty of the admirable story of the Good Samaritan can be perceived. Here pillage, wounds, and death, would be accompanied with double terror, from the frightful aspect of every thing around. Here the unfeeling act of passing by a fellow creature in distress, as the Priest and Levite are said to have done, strikes one with horror, as an act almost more than inhuman. And here, too, the compassion of the Good Samaritan is doubly virtuous, from the purity of the motive which must have led to it, in a spot where no eyes were fixed on him to draw forth the performance of any duty, and from the bravery which was necessary to admit of a man's exposing himself, by such delay, to the risk of a similar fate to that from which he was endeavouring to rescue his fellow-creature.' (p. 292, 293.)

On quitting Jericho, the travellers crossed the Jordan (it appears) pretty nearly at the same ford as that which was passed by the Israelites when the river had overflowed its banks. Now, however, the stream appeared to be little more than twenty-five yards in breadth; it was extremely rapid, and its otherwise turbid waters were here tolerably clear, as well as pure and sweet to the taste, in consequence of its flowing over a bed of pebbles. From the valley of the Jordan they proceeded through the mountains of Gilead, among which they found numerous lofty plains bearing the marks of high fertility. They now entered the country of Decapolis, as it was called in the Roman division of Palestine (which is so often mentioned in the New Testament), or the province of Gaulonitis from Gaulon or Golan, its early capital. From Mr. Buckingham's description of this interesting region, we select one or two paragraphs, illustrative of the geography of the sacred volume. 'We continued our way over this elevated tract, continuing to behold, with surprise and admiration, a

beautiful country on all sides of us; its plains covered with a fertile soil, its hills clothed with forests, at every new turn presenting the most magnificent landscapes that could be imagined. Among the trees, the oak was frequently seen, and we know that this territory produced them of old. In enumerating the sources from which the supplies of Tyre were drawn in the time of her great wealth and naval splendor, the prophet says, 'of the oaks of Bashan have they made thine oars.' Some learned commentators, indeed, believing that no oaks grew in these supposed desert regions, have translated this word by alders, to prevent the appearance of inaccuracy in the inspired writer. The expression of the fat bulls of Bashan, which occurs more than once in the Scriptures, seemed to us equally inconsistent, as applied to the beasts of a country generally thought to be a desert, in common with the whole tract which is laid down in our modern maps as such, between the Jordan and the Euphrates; but we could now fully comprehend, not only that the bulls of this luxuriant country might be proverbially fat, but that its possessors too might be a race renowned for strength and comeliness of person.

'In our way, just as we came out of a thick wood and opened on an extensive view, we were surprised by a party of peasants on foot, to the number of thirty at least, all armed with muskets slung across their shoulder. These were Arabs, though they possessed scarcely any thing but the language in common with the Arabs whom we had been accustomed to see. The great features of difference observable in them were, that they were generally taller, more robust, and of finer forms, and fairer complexions. Some of them had even light eyes, and many of them brown and auburn hair, which they wore in tresses hanging over their shoulders. The dress of these men differed also both from that of the desert Arabs, and of the Syrian peasants. They wore long white shirts girded round the loins, but neither turbans nor other coverings for their heads. From retaining the beard, while the hair was suffered to hang in long and curling locks over the neck, they resembled the figures which appear in the Scriptural pieces of the great masters, and many of them reminded us of the representation of Christ himself in the principal scenes of his life. These men were cultivators of the earth, and had been occupied in the tillage of their lands, from which labor they were now returning. As they live in a state of complete independence of pachas or other governors, there are no boundaries that mark any peculiar portion of the earth as private property. Rich land is so abundant in every direction near them, that the only claim to the possession of any particular spot is that of having ploughed and sown it, which entitles the person so doing to the harvest of his toils for the present season. In all their occupations they continue to be armed, partly because their country is sometimes scoured by horse Arabs from the eastern deserts, against whom they are then called to defend themselves; and partly because it is the fashion of the country to be armed, inasmuch, that the being without weapons, of some kind or other, is always

imputed to great poverty or to cowardice.' (p. 337, 329.)

At length they reached the ruins of Jerash (or, as Dr. Seetzen terms it, *Dscherrasch*), the ancient *Geraza*: of these interesting remains we have a long description accompanied by several plates and vignettes, without the aid of which it is impossible to give any account of the beautiful reliques of ancient art that have escaped the united ravages of time, and of the Arabs. The discovery of a noble triumphal arch, though not of the chastest kind, a *naumachia* for the exhibition of sea-fights, a palace, baths, two theatres, four temples, and several Greek inscriptions, repaid the travellers for the trouble and risk which they had incurred in penetrating to this remote region. Mr. Buckingham is of opinion that Jerash is the *Gergashi* of the Hebrews.

On the 2nd of February, 1816, nearly six weeks after their departure from Jerusalem, Messrs. Buckingham and Banks reached the modern Arab settlement of *Oom-Kais* on the site of the ancient *Gamala*, whose ruins they alighted to examine. In their ascent to the hill, on the summit of which the remains of the Roman city stand, they explored numerous sepulchres, excavated in the side of the gray limestone rock, which appear to have formed its *neropolis*. Although these repositories of the dead had been violated, and innumerable sarcophagi broken, yet they discovered not fewer than 200 which were perfect; some of them were highly ornamented with garlands and wreaths; others with heads of *Apollo* and little *Cupids*, or *genii* with wings, joining hands together beneath those heads; and some with shields similar to those which the travellers had seen at *Geraza*. The city of *Gamala* appears to have been nearly square, about half a mile in its greatest length; and its breadth, perhaps, one-fourth less: it stands in a very commanding situation, and from its height enjoys a grand and extensive view. The ruins are those of two theatres and an *Ionian* temple: the prevalent orders of architecture are *Ionian* and *Corinthian*, though there are some few capitals of the *Doric* order. The stone was sometimes the gray rock of the mountain, and sometimes the black volcanic stone used in the tombs and sarcophagi. One of these ancient Roman tombs was used as a carpenter's shop; and another, into which the travellers entered, was cleansed out and used as a private dwelling; a perfect sarcophagus still remained within, which was used by the family as a chest for corn and other provisions. An affair of blood between our author's guides and the inhabitants of the vicinity of *Tiberias*, together with other circumstances, compelled him, instead of proceeding thither directly, to recross the *Jordan* and return to *Nazareth*, whence he proceeded to *Tiberias*, now called *Tabareeah*.

The fine piece of water usually called the lake or sea of *Tiberias* abounds with a great variety of excellent fish, but, from the poverty and indolence of the people who live on its borders, there is not a single boat or raft throughout its whole extent: so that the few fish that are occasionally taken are caught by lines from the shore, nets never being used. Mr. Buckingham

made an excursion along the borders of this lake, in the course of which he visited *Tal-hheun* or *Tal-hheum* (as it is variously pronounced), an Arab station standing on the site of the ancient *Capernaum*, around which he discovered various remains of what must have formerly been a very considerable settlement. The waters of the lake of *Tiberias* lie in a deep basin, surrounded on all sides with lofty hills, excepting only the narrow entrance and outlets of the *Jordan* at each extreme; for which reason long continued tempests from any one quarter are unknown here; and this like the *Dead Sea*, with which it communicates, is, for the same reason, never violently agitated for any length of time. The same local features, however, render it occasionally subject to whirlwinds, squalls, and sudden gusts from the hollow of the mountains, which, as in every other similar basin, are of momentary duration, and the most furious gust is instantly succeeded by a calm.' Luke viii. 23, 24. (p. 468.)

Mr. Buckingham bears testimony to the fidelity of *Josephus's* description of this lake, *De Bell. Jud. lib. iii. c. 13. § 7*, the features of which, he says, are drawn by the Jewish historian with an accuracy that could only have been attained by one who had resided in the country. 'The size is still nearly the same, the borders of the lake still end at the beach, or the sands, at the feet of the mountains which environ it. Its waters are still as sweet and temperate as ever, and the lake abounds with great numbers of fish of various sizes and kinds.'

'In more early times, the sea of *Galilee*, or lake of *Gennesareth*, was called the sea of *Chinnereth*, from a city of that name seated on it, belonging to the children of *Naphtali*, and the edge of this sea on the other side *Jordan*, eastward, was made the western boundary of the portion of *Gad*, who occupied all the cities of *Gilead*, and half the land of the children of *Ammon*. *Gennesareth* is most probably the original name of this sea of *Chinnereth*, gradually corrupted; *Galilee* was the name given to the lake from its situation, on the eastern borders of that division of *Palestine*; and *Tiberias*, which is its most modern name, must have been bestowed on it after the building of that city by *Herod*. This last both the town and the lake still retain, under the Arabic form of *Tabareeah*; and the present inhabitants, like the earliest ones, call their water a sea, and reckon it, and the *Dead Sea*, to the south of them, to be the two largest known, except the great ocean. The appearance of the lake, as seen from this point of view at *Capernaum*, is still grand; its greatest length runs nearly north and south, from twelve to fifteen miles, and its breadth seems to be, in general, from six to nine miles. The barren aspect of the mountains on each side, and the total absence of wood, give, however, a cast of dulness to the picture; and this is increased to melancholy by the dead calm of its waters, and the silence which reigns throughout its whole extent, where not a boat or vessel of any kind is to be found.' (p. 470, 471.)

The town of *Tabareeah* or *Tiberias* presents but few objects worthy of note, excepting the hot baths and some other remains of antiquity in its neighbourhood. Its total population does not

exceed 2,000 souls, one half of whom are Jews, principally from Europe, and the remainder are Mahometans, with the exception of about twenty Christian families of the Romish communion. The military force here rarely exceeds twenty or thirty soldiers, under the command of an aga, and there are four old cannon mounted on different parts of the walls. Provisions are by no means abundant, and therefore are generally dear : and fish, when occasionally taken by a line from the shore, are sold either to the aga, or to some rich Jews, at an exorbitant price.

In retracing his way to Nazareth, Mr. Buckingham deviated from the road, in order to visit Subassta, a humble village, on a strong hill, in a commanding and pleasant situation, being surrounded by fruitful valleys and abundance of olive trees. In its centre stood the city of Samaria, by Herod called Sebaste (of which its present name is a corruption). Here are some remains of ancient edifices, particularly of a large cathedral church attributed to the piety of the empress Helena. Nablous, or Napolose (the Sicheim of the Scriptures), is, as we have stated, a populous town, containing nearly 10,000 inhabitants, all of whom, with the exception of about fifty Greek Christians, are Mahometans : and the grounds around it bear the marks of opulence and industry. It fully occupies the valley between the two hills of Gerizim on the south, and Ebal on the north. Though a place of considerable trade with Damascus and the towns on the sea-coast, yet there were no Jews here, who remained as permanent residents. The Samaritans, of whom a remnant remained in Maundrell's time (the close of the seventeenth century), are now reduced to scarcely half a dozen, or a dozen families, who perform their sacred rites in studied seclusion and obscurity, and are, if possible, more despised here than the Jews are in other Mahometan cities.

PALETTE, *n.s.* Fr. *palette* ; Ital. *paletta*, of Lat. *pala*. A painter's color board.

Let the ground of the picture be of such a mixture, as there may be something in it of every color that composes your work, as it were the contents of your *palette*. Dryden.

Er'e yet thy pencil tries her nicer toils,
Or on thy *palette* lie the blended oils,
Thy careless chalk has half atchiev'd thy art,
And her just image makes Cleora start. Tickle.

When sage Minerva rose,

From her sweet lips smooth elocution flows,
Her skilful hand an ivory *palette* graced,
Where shining colours were in order placed. Gay.

PALEY (Dr.), sub-dean of Lincoln, and rector of Bishop Wearmouth, was born at Peterborough in 1743. His father, who held a small living in that place, soon afterwards removed to Giggleswick in Yorkshire, where he was appointed to be master of a grammar-school, and continued to act in that capacity till his death, which happened in the year 1799. Dr. Paley was educated under his father's care until he became a student of Christ College, Cambridge, in 1759. In 1763 he took the degree of bachelor of arts, and in the previous examination had the honor of appearing the first man of his year. His studies now being completed, and no other engagement offering, he went to be assistant at

Greenwich school. In that situation he remained nearly three years, and then, upon being elected a fellow of Christ College, returned to a residence in the university. His election into a fellowship of the college was very soon followed by an appointment to be one of the tutors of it. His lectures on moral and political philosophy, and on the Greek Testament, contained the outlines of the works by which he has so much benefited the world, and his old pupils preserve in their note-books some of the arguments and illustrations which have rendered them so celebrated and so useful. After his return to the university, he continued to live in it about ten years. During this time he was rather a hard worker than a hard student. To his engagement as a public tutor he added others still more numerous as a private one, and, by these united labors, was in the receipt of a very considerable income. In 1770 Dr. Paley left college, and married. He had at first a small benefice in Cumberland; then the living of Appleby in Westmoreland, worth about £300 a-year; and in a short time was promoted to a prebendal stall in the cathedral of Carlisle, together with the living of Dalston, a pleasant village situated in the neighbourhood of that city, and between it and Rose-castle, the seat of the bishop. In 1782, on the resignation of Dr. John Law, who was created an Irish bishop, he was made archdeacon of the diocese, and not long afterwards succeeded Dr. Burn, the author of the *Justice of the Peace*, &c., in the chancellorship. All these preferments were bestowed on him, either by the bishop of Carlisle, or by the dean and chapter of the cathedral church, in which Dr. Law, who was a prebendary, had the leading influence. It was while his residence was divided between Carlisle and Dalston, that Dr. Paley undertook his *Elements of Moral and Political Philosophy*. The public did not hesitate long about the reception of it. It was read with universal admiration, and editions were multiplied with a rapidity entirely unexpected by the author. It is dedicated to the bishop of Carlisle; on whose death, in 1767, archdeacon Paley drew up a short memoir of him. He soon after published his *Horæ Paulinæ*, a work which ranks him very high among the argumentative advocates of Scripture authority. The chief object of this work is to bring together, from the Acts of the Apostles, and from the different epistles, such passages as furnish examples of undesigned coincidence, and thus to infer the authenticity of the Scriptural writings, independently of inspiration. Not long after this work had made its appearance (in 1789) Dr. James Yorke, bishop of Ely, offered him the mastership of Jesus College, Cambridge, of which he has the disposal in right of his see. This was a singular instance of honorable and disinterested patronage. His lordship had never seen Dr. Paley, he had no knowledge of his friends, he was influenced solely and entirely by his well-earned reputation, and by a wish to render them serviceable in a high academical situation. His preferments in the north of England, and the engagements they imposed upon him, induced him to decline the offer, after a very long hesi-

tation, which, he has been heard to say, would probably have terminated otherwise, if he had not accidentally overlooked a small field belonging to the master of Jesus; and he expressed his gratitude to the bishop in a dedication of the Evidences of Christianity. This is one of Dr. Paley's most elaborate and successful performances. Containing a general view of the evidences of our religion, it is better adapted to the wants of the common reader than an argument, however masterly, which is confined to a single subject. It is distinguished, in an eminent degree, by that happy combination of sagacity, force, and perspicuity, which appears in all his writings. After Dr. Paley had become sub-dean of Lincoln, and rector of Bishop Wearmouth, his residence was divided between those two places, his summers being spent at the latter, and his winters at the former. He now undertook and proceeded slowly with his last work, the *Natural Theology*, which was not published till the end of the year 1804. He professes to have chosen this subject, because, with those he had already treated of, it formed a system which was complete, though its parts had been produced in an inverted order. As a writer, Dr. Paley is not remarkable for elegant periods or splendid sentiment. He seems to have been less ambitious of pleasing the ear than of informing the understanding; for if we except the dedication of the *Moral and Political Philosophy*, some chapters in the same work (particularly that on reverencing the Deity), and the conclusion of the *Natural Theology*, which contain some of the most elegant and dignified passages to be found in our language, the general character of his writings is plainness and simplicity. In private life he had nothing of the philosopher. He entered into little amusements with a degree of ardor which, when contrasted with the superiority of his mind, had a pleasing effect, and constituted a very amiable trait of his character. He was fond of company; nor was he at any time more happy than when exercising his unrivalled talents of wit and humor. He died at Bishop Wearmouth 25th May, 1805.

PALFIN (John), an eminent surgeon, anatomist, and lecturer on surgery in Ghent, the place of his birth; acquired great reputation by his learning and works. The principal of these are, 1. *A Treatise on Osteology*, in 12mo. Paris, 1731; 2. *Anatomy of the Human Body*, in 2 vols. 8vo. Paris, 1734. He died at Ghent at a great age, in 1730.

PALFREY, *n. s.* } *Fr. palefray*; *Ital. pala-*
PALFREYED, *adj.* } *freno*; *Spanish palafren.*
A small riding horse: palfreyed is using or possessed of a palfrey.

Her wanton palfrey all was overspread
With tinsel trappings, woven like a wave. *Spenser.*

The smiths and armorers on palfreys ride.

Dryden.

Such dire achievements sings the bard that tells
Of palfreyed dames, bold knights, and magic spells.

Tickel.

The damsel is mounted on a white palfrey, as an emblem of her innocence. *Addison's Spectator.*

PALICAUDCHERRY, or **PALIGHAUT**, a town in the province of Malabar, 110 miles

south from Seringapatam. Lat. 10° 50' N., long. 76° 50' E. The fort was built by Hyder Ali, on his conquest of Malabar; in the country called Paligatsberry, which then belonged to the Shekury Rajah, one of the Malabar chiefs. Around the fort are scattered many villages and bazaars, all together containing a considerable population: but there is very little appearance of a town. This small district, in the year 1800, contained, according to Mr. Hamilton, the following number of houses:—

| | |
|---------------------------------------|------|
| Occupied by the families of rajahs | 42 |
| By Christians | 13 |
| By Mahometans | 1469 |
| By Namburies (Brahmins of high caste) | 137 |
| By Puntar Brahmins | 3309 |
| By Nairs | 4294 |
| By artificers and tradesmen | 2329 |
| By Shanars or Tiars (cultivators) | 4287 |
| By fishermen | 539 |
| By people of Karnata, or Chera | 5054 |

Total houses 21,473

| | |
|-----------------------------|---------|
| Containing free inhabitants | 106,500 |
| Add Chumar, or slaves | 16,574 |

Total population 123,074

exclusive of military, camp followers, travellers, vagrants, &c. The part occupied by thick forests, and uninhabited, is very extensive, and is intersected by several branches of the Paniani River, by which, in the rainy season, the timber may be floated to the sea. About 45,000 cubical feet of teak may be procured annually, with the assistance of a large body of trained elephants. The Palighaut district was ceded to the British by Tippoo, at the peace of 1792, when its revenues were valued at 88,000 pagodas.

PALICI, or **PALISCI**, in mythology, two deities, sons of Jupiter by Thalia, whom Æschylus, according to Macrobius, calls Ætna, in a tragedy, which is lost. The nymph Ætna, when pregnant, begged Jupiter to remove her from the pursuit of Juno. Upon which he concealed her in the bowels of the earth; and, when the time of her delivery arrived, the earth opened and brought into the world two children, who were named Palici, *απο του παλιν κρηθαι*, because they came again into the world from the bowels of the earth. These deities were worshipped with many ceremonies by the Sicilians: and near their temple were two small lakes, which were supposed to have sprung out of the earth when they were born. Near these pools it was usual to take the most solemn oaths, when any wished to decide controversies and quarrels. If any of the persons who took the oaths were perjured, they were expected to be immediately punished supernaturally; and those whose oath, by the deities of the place, was sincere, departed unhurt. The Palici had also an oracle, which was consulted upon some great emergencies, and which rendered the truest and most unequivocal answers. In a superstitious age, the altars of the Palici were stained with the blood of human sacrifices; but this barbarous custom did not last long.

PALIFICATION, *n. s.* Lat. *palius*. The act or art of making ground firm with piles..

I have said nothing of *paliification* or piling of the groundplot commanded by Vitruvius, when we build upon a moist soil. *Wotton.*

PALINDROME. Gr. *παλινδρομα*, *παλιν*, and *δρομα*. A word or sentence which is the same read backward or forward: as, madam; or this sentence, Subi dura a rudibus. Some have refined upon the Palindromus, and composed verses, each word of which is the same backwards as forwards; for instance, that of Camden:—

Odo tenet mulum, madidam mappam tenet Anna.
Anna tenet mappam madidam, mulum tenet Odo.

PALINODE, *n. s.* } Gr. *παλινωδια*, *παλιν*,
PALINODY. } and *ωδη*, a song or recitation; a recitation.

I of thy excellences have oft been told;
But now my ravisht eyes thy face behold:
Who therefore in this weeping *painod*
Abhor myself, that have displeased my God,
In dust and ashes mourn.

Sandys's Parable on Job.

PALINURI PROMONTORIUM, a town of Italy, mentioned by Virgil and Velleius, with a cognominal port, at the south extremity of the Sinus Pæstanus, on the coast of Lucania, so called from Palinurus.

PALINURUS, in fabulous history, the pilot of Æneas, who fell into the sea when asleep, and was three days exposed to the tempests, and at last came safe ashore, where the cruel inhabitants of the place murdered him. His body was left unburied on the sea shore. See Virg. Æneid, lib. VI. v. 337.

PALISADE, *n. s.* & *v. a.* } Fr. *palisade*;
PALISADO. } Span. *palisado*, of
Lat. *palius*. Pales, taken collectively; paling; a single series or set of pales.

The Trojans round the place a rampire cast,
And *palisades* about the trenches placed. *Dryden.*

The wood is useful for *palisadoes* for fortifications, being very hard and durable. *Mortimer.*

The city is surrounded with a strong wall, and that wall guarded with *palisades*. *Broome.*

PALISADOES, or **PALISADES**, in fortification, are stakes made of strong split wood, about nine feet long, six or seven inches square, three feet deep in the ground, in rows about two and a half or three inches asunder, placed in the covert way, at three feet from, and parallel to, the parapet or side of the glacis, to secure it from surprise. They are also used to fortify the avenues of the open forts, gorges, half-moons, the bottoms of ditches, &c. They are usually fixed perpendicularly, though some make an angle inclining towards the ground next the enemy, that the ropes cast over them to tear them up may slip off.

PALISSE, in heraldry, a bearing resembling a range of palisades before a fortification, represented on a fosse, raising up a considerable height, and pointed, with the field appearing between them.

PALISSY (Bernard de), a Parisian artist, was born at Agen in France about 1524. He discovered the method of applying enamel to stoneware, and his manufacture excelled the finest of

the Italian. He is said next to have pursued the study of chemistry; his knowledge of which enabled him to make improvements in agriculture. He also formed the first cabinet of natural history in France, on which science he delivered lectures. He was a Protestant, and so firmly attached to his religion that during the fury of the league under Henry III., in 1584, he was committed to the bastille. The king, who had patronised him as an artist, having told him that if he did not comply with the prevailing religion he should be constrained to leave him in the hands of his enemies, Palissy replied, 'your majesty has often said that you pity me; for my part I pity you for pronouncing the words, 'I shall be constrained;' this is not speaking like a king; but let me inform you in royal language, that neither the Giusarts, your whole people, nor yourself, shall constrain a potter to bend his knee before images.' He used to say that he had no other property than heaven and earth. His works are, *Moyen de devenir riche*, &c.; *Discours admirable de la Nature des Eaux et Fontaines, des Metaux, des Sols, des Salines, des Pierres, des Terres*, &c. He died in 1590. His works and life were published at Paris in 1777 by St. Fond.

PALIURUS, in ancient geography, a river of Africa, with a town of the same name, at the western extremity of Egypt, on the Mediterranean.—*Strabo.*

PALL, *n. s.* & *v. a.* Span. *pallio*; Lat. *pallium*. (There is also a Hind. *pal*.) See **PALLIUM**. A cloak or mantle of state, civil or ecclesiastical; a covering thrown over the dead: to cloak or invest with a pall.

With princely pace,
As fair Aurora in her purple *pall*,
Out of the east her dawning day doth call;
So forth she comes. *Spenser.*

Come, thick night,
And *pall* thee in the dunest smock of hell,
That may keen knife see not the wound it makes. *Shakespeare.*

Let gorgeous tragedy
In scepter'd *pall* come sweeping by. *Milton.*
The right side of the *pall* old Egeus kept,
And on the left the royal Theseus wept. *Dryden.*

An archbishop ought to be consecrated and anointed, and after consecration he shall have the *pall* sent him. *Ayliffe.*

PALL, *v. n.* & *v. a.* (Probably from **PALE**.) To grow vapid or insipid: to make insipid or vapid; to cloy; dispirit, or weaken.

For this,
I'll never follow thy *palled* fortunes more.

Empty one bottle into another swiftly, lest the drink *pall*. *Bacon.*

Ungrateful man,
Base, barbarous man, the more we raise our love,
The more we *pall*, and cool, and kill his ardour. *Dryden.*

Beauty soon grows familiar to the lover,
Fades in the eye, and *palls* upon the sense. *Addison.*

Palled appetite is humorous, and must be gratified with sauces rather than food. *Tatler.*

Reason and reflection, representing perpetually to the mind the meanness of all sensual gratifications,

blunt the edge of his keenest desires, and *pall* all his enjoyments. *Atterbury.*

Wit, like wine, from happier climates brought,
Dashed by these rogues, turns English common draught,

They *pall* Moliere's and Lopez' sprightly strain.

Swift.

Now *pall* the tasteless meats and joyless wines
And luxury with a sigh her slave resigns. *Johnson.*

PALL, in heraldry, a figure like a Greek Y, about the breadth of a pallet; being the archiepiscopal ornament sent from Rome to the metropolitans.

PALLA, in Roman antiquity, a mantle which women wore over the gown called stola. It was borne on the left shoulder, whence passing to the other side, under the right arm, the two ends were bound under the left arm, leaving the breast and arm quite bare. It had many folds, and derived its name from *παλλω*, to shake. From this term springs the word *pall*, which denotes the rich pontifical garment worn by the popes, patriarchs, primates, and metropolitans of the Romish church over their other vestments; and which is in the shape of a band or fillet three inches broad, encompassing the shoulder, whence it has been denominated by certain writers *superhumerales*. Both behind and before are pendants, or strings, about a palm in length, with small laminae of lead rounded at the extremities, and covered with black silk with four red crosses.

PALLADINI (Archangela), a celebrated Italian paintress, born at Pisa in 1599. Her father was a painter, and she attained great excellence in portrait painting; but died young, in 1622.

PALLADINO (James), an Italian author, born at Teramo, in Naples, in 1349. He became successively bishop of Monopoli, Tarentum, Florence, and Spoleto, and legate in Poland. Among his works, the most celebrated is the *Processus Luciferi contra Jesum*. He died in Poland in 1417.

PALLADIO (Andrew), the celebrated architect, was born in 1518, at Vicenza, in Lombardy. He learned the principles of his art from Trissino, after which he studied at Rome, and on his return constructed a number of noble edifices. He was employed in various parts of Italy, particularly at Venice, where he built the palace Foscari. He died at his native place in 1580. His *Treatise on Architecture* was printed at Venice in 1570, folio; and again at London in 1715, in 3 vols. folio. In 1730 lord Burlington published some of Palladio's designs, in 1 vol. folio. This artist was likewise the author of a work entitled *Le Antichità di Roma*; and an illustration of *Cæsar's Commentaries*.

PALLADIUM, in fabulous history, a statue of the goddess Pallas. It was about three cubits high, and represented the goddess sitting and holding a pike in her right hand, and in her left a distaff and a spindle. It was said to have fallen down from heaven near the tent of Ilius, as he was building the citadel of Ilium. Others assert

that it fell at Pessinus in Phrygia. Some maintain that the palladium was made with the bones of Pelops by Abaris; but, according to Apollodorus, that it was only a piece of clock-work which moved of itself. However various the opinions of ancient authors be about this celebrated statue, it was universally allowed, that on its preservation depended the safety of Troy. This fatality the Greeks, during the Trojan war, were well aware of; and therefore Ulysses and Diomedes were commissioned to steal it. This they effected, and they were directed how to carry it away by Helenus, a son of Priam, who in this betrayed his country, because his brother Deiphobus, at the death of Paris, had married Helen, of whom he was enamoured. Minerva was enraged at the violence offered to her statue; and, according to Virgil, the palladium itself seemed to have received life and motion; and by the flashes which started from its eyes, and sudden springs from the earth, it seemed to show the resentment of the goddess. The true palladium, however, according to some, was not carried away from Troy by the Greeks, but only a statue of similar size and shape, which was placed near it, to deceive whatever sacrilegious persons attempted to steal it. The palladium, therefore, they pretend Æneas conveyed safe from Troy to Italy, and it was afterwards preserved by the Romans with the greatest secrecy and veneration, in the temple of Vesta, unknown to all but the vestal virgins. The destiny of Rome was believed to depend upon it; and there were several others made perfectly like it, to secure it from being stolen, as was that at Troy. A palladium was also placed in the citadel of Athens.

PALLADIUM, in chemistry, a new metal, first found by Dr. Wollaston, associated with platina, among the grains of which he supposes its ore to exist, or an alloy of it iridium and osmium, scarcely distinguishable from the crude platina, though it is harder and heavier.

If crude platina be dissolved in nitro-muriatic acid, and precipitated with a solution of muriate of ammonia in hot water; the precipitate washed, and the water added to the remaining solution, and a piece of clean zinc be immersed in this liquid, till no farther action on it take place; the precipitate now thrown down will be a black powder, commonly consisting of platina, palladium, iridium, rhodium, copper, and lead. The lead and copper may be separated by dilute nitric acid. The remainder being then digested in nitro-muriatic acid, and common salt about half the weight of the precipitate added on the solution, on evaporating this to dryness, by a gentle heat, the result will be, triple salts of muriate of soda, with platina, palladium, and rhodium. Alcohol will dissolve the first and second of these, and the small portion of platina may be precipitated by sal ammoniac. The solution being diluted, and prussiate of potash added, a precipitate will be thrown down, at first of a deep orange, and afterwards changing green. This, being heated with a little sulphur and borax in a crucible, will afford a metallic button of pure palladium.

This metal is of a white color, more of the appearance of platina than any other metal. It

is something harder than the above metal, being about the stiffness of jewellers' gold. It is less malleable than silver or platina, owing probably to its greater hardness. Its specific gravity, according to Dr. Wollaston, varies from 11.3 to 11.8. When heated to about 30° of Wedgewood, it assumes a blue color, owing to its combination with oxygen, in which property it has some resemblance to iron. If, however, the heat be increased, the oxygen flies off, and it re-assumes its original lustre. It does not fuse at the ordinary temperature of furnaces. Although its oxide seems to be formed at a certain temperature of the open air, it has not been procured by these means. An orange oxide is procured by precipitation from the acids, but not sufficiently pure to get the proportion of oxygen; hence we are at present unacquainted with the oxides of palladium. It does not combine with carbon, nor is it known to combine with hydrogen, nitrogen, or phosphorus.

It combines with sulphur, forming a compound fusible at a low red heat. The sulphur gradually escapes, leaving the metal in a state of purity.

Its specific gravity is from 10.9 to 11.8. It is a less perfect conductor of caloric than most metals, and less expansible, though in this it exceeds platina. On exposure to a strong heat its surface tarnishes a little, and becomes blue; but an increased heat brightens it again. It is reducible per se. Its fusion requires a much higher heat than that of gold; but, if touched while hot with a small bit of sulphur, it runs like zinc. The sulphuret is whiter than the metal itself, and extremely brittle.

Nitric acid acquires a fine red color from the palladium, but the quantity it dissolves is small. Nitrous acid acts on it more quickly and powerfully. Sulphuric acid, by boiling, acquires a similar color, dissolving a small portion. Muriatic acid acts much in the same manner. Nitro-muriatic acid dissolves it rapidly, and assumes a deep red.

Alkalis and earths throw down a precipitate from its solutions, generally of a fine orange color; but it is partly re-dissolved in an excess of alkali. Some of the neutral salts, particularly those of potash, form with it triple compounds, much more soluble in water than those of platina, but insoluble in alcohol.

Alkalis act on palladium even in the metallic state; the contact of air, however, promotes their action.

A neutralised solution of palladium is precipitated of a dark orange or brown by recent muriate of tin; but, if it be in such proportions as to remain transparent, it is changed to a beautiful emerald-green. Green sulphate of iron precipitates the palladium in a metallic state. Sulphureted hydrogen produces a dark brown precipitate; prussiate of potash, an olive-colored; and prussiate of mercury a yellowish-white. As the last does not precipitate platina, it is an excellent test of palladium. This precipitate is from a neutral solution in nitric acid, and detonates at about 500° of Fahr. in a manner similar to gunpowder. Fluoric, arsenic, phosphoric, oxalic, tartaric, citric, and some

other acids, with their salts, precipitate some of the solutions of palladium.

All the metals, except gold, silver, and platina, precipitate it in the metallic state. If this metal were more common (its price is about six times that of gold), it might be employed for medals and chemical vessels, and it might be used in place of silver in some articles of jewellery.

PALLADIUS, bishop of Helenopolis in Bithynia, and afterwards of Aspona. He was a Galatian, and born at Cappadocia. He became an anchorite in the mountain of Nebria in 388, and was consecrated a bishop in 401. He was an intimate friend of St. John Chrysostom, whom he never forsook during the time of his persecution, nor even in his exile. He went to Rome some time after Chrysostom's death, and, at the request of Lausus, governor of Cappadocia, composed the history of the Anchorites or hermits, and entitled it *Lausiaca*, after that lord, to whom he dedicated it in 420, when it was written, being then in the twentieth year of his episcopacy, and fifty-third of his age. His history was published in Greek by Meursius at Amsterdam, in 1619, and in Latin in the *Bibliotheca Patrum*.

PALLADIUS (R. T. Emilianus), an author who flourished after the decline of literature at Rome, but the precise period is not known. A treatise written by him, *De Re Rustica*, was published at Paris, in *L'Economie Rurale*, vol. 5, in 1775.

PALLANTIDES, the fifty sons of Pallas, the son of Pandion, and brother of Ægeus; who were all killed by Theseus, the son of Ægeus, whose succession they opposed.—*Plut. in Theseus*.

PALLAS, in mythology, a giant, the son of Cælus and Terra, who was killed by Minerva.

PALLAS, a common name of Minerva, from *παλλᾶς*, to brandish, in allusion to her spear.

PALLAS, a freed man of Claudius, celebrated for the power and the riches which he obtained. He advised the emperor to marry Agrippina, and to adopt her son Nero for his successor. It was through him and Agrippina that the death of Claudius was hastened, and that Nero was raised to the throne. Nero, however, discarded Pallas, and some time after caused him to be put to death, that he might obtain his wealth.

PALLAS (Peter Simon), a celebrated German modern naturalist, was born at Berlin, in 1741. After having studied medicine at Halle and Göttingen, he removed to Leyden, where he graduated M.D. in 1760. He then came to London, to improve his professional knowledge, and about 1762 returned to Berlin. At length he settled at the Hague, where he published some valuable zoological works. In 1767 he went to Russia, and was employed by the government of that country on an expedition of discovery in the Asiatic provinces. In the course of this undertaking he procured the materials for several important works on the various branches of natural history, which he afterwards published. In 1793 and 1794 he travelled in the southern provinces of Russia, and subsequently settled in the Crimea, on an estate bestowed on him by the empress. His death took place at Berlin in 1811. Among his principal works are, *Elenchus Zoophytorum*, Hag. Com., 1765; *Miscellanea Zoologica*, Hag. Com., 1766, 4to; *Spicilegia quibus novæ Ani-*

malium species Iconibus illustr., Berolin, 1767—80, 4to.; *Novæ Species Quadrupedum*, e Gli-rium Ordine, Erlang. 1778, 4to.; *Icones Insec-torum præsertim Rossie, Sibirique peculiarium*, Erlang. 1791, 4to.; *Flora Russica*, seu stirpium Imp. Rossici per Europam et Asiam indigena-rum Descriptiones et Icones, Petrop., 1784—1815, 2 vols. folio; *Illustrationes Plantarum imperfectæ vel nondum cognitarum*, Petrop., 1804—6, folio; *Linguarum totius Orbis Vocabularia comparativa*, Petrop., 1786—89, 2 vols. 4to.; *Reise durch verschiedene Provinzen des Russis-chen Reichs*, Petersb. 1771, &c. 5 vols. 4to.; *Sammlungen Historischer Nachrichten über die Mongolischen Völkerschaften*, Leips. 1779, 8vo.; *Bemerkungen auf einer Reise in die Südlichen Staathalterschaften der Russischen Reichs in den Jahren, 1793—4*, Leips. 1799—1801, 2 vols. 4to. The travels of M. Pallas have been trans-ated into French, under the title of *Voyages dans Plusieurs Provinces de l'Empire de Russie, et dans l'Asie Septentrionale*, trad. par Gautier de la Peyronie, Paris, 1788, 5 vols. 4to., and 1794, 8 vols. 8vo.; and, *Second Voyage en Rus-sie, pendant les années, 1793—4*, Paris, 1811, 4 vols. 8vo. There is also an English translation of the latter work, 1812, 2 vols. 4to.

PALLAVICINI (Ferrante), an Italian wit of considerable note, descended from a noble fami-ly in Placentia, where he was born about the close of the sixteenth century. He gave early proofs of an extraordinary genius, and quickly acquired a masterly knowledge in the elements of classical erudition. He was afterwards sent to complete his education in the monastery of Augustin friars at Milan, where he took the habit, lived much esteemed for piety as well as learn-ing, and raised great expectations of future fame; but at length he engaged in an intrigue with a young courtesan of Venice, to enjoy whose company without restraint, he obtained leave from his general to make the tour of France. Accordingly, he pretended to set out for that country; but never left Venice, but lived there privately with his mistress; and imposed upon his friends, by sending them, in letters, feigned accounts of his travels through France; also informing them of several things respecting that court, which he learned from the information of many considerable persons with whom he cor-responded. But such a series of imposition could not last. Being in want of money, he wrote for the booksellers; and, among other pieces, published a collection of Satirical Letters, the wit of which was chiefly levelled against the Spaniards, entitled *The Courier* robbed of his Mail. Though licensed by the inquisitors, the secretary of the republic of Venice refused it his imprimatur; which irritated the author so much that he published an enlarged edition of it, filled with severe invectives against, not only the Venetian secretary, but pope Urban VIII., his ne-phews, and the whole family of the Barbarini. This raised him a number of powerful enemies; who, by the treachery of one Morfu, a French-man, who pretended to be his friend, got him at last into their power; and, after a year's impris-onment at Avignon, brought him for form's sake to a trial; and, notwithstanding an excel-

lent defence, condemned him to be beheaded and he was accordingly executed, in the flower of his age. The latter part of his life had been one continued series of dissipation, debauchery, folly, and extravagance. Yet he was not without some virtues. Sincere and faithful in his friend-ships, no man was ever a more easy prey to the treachery of others. His works were published in 2 vols., with his life prefixed, at Amsterdam, in 1696.

PALLAVICINI (Sforza), a learned cardinal, born at Rome in 1607. He became a Jesuit in 1638. He was much employed by popes Inno-cent X. and Alexander VII. He wrote several works, the chief of which was a History of the Council of Trent, wherein he opposes that of F. Paul.

PALLENE, a small peninsula of Thrace or Macedonia, formerly called Phlegra. It is si-tuated near the bay of Thermæ, and contains five cities, the principal of which is also called Pallene. It was famous in the mythology for an engagement between the gods and the giants.

PALLET, *n. s.* Fr. *paillette*; Lat. *palestrus*. Written 'paillet' by Chaucer, from Fr. *paille*, straw, as Dr. Johnson conjectures. A small mean bed: also a small measure.

Why, rather, Sleep, liest thou in smoky cribs,
Upon uneasy pallets stretching thee,
And hush't with buzzing night-flies to thy slumber;
Than in the perfumed chambers of the great,
Under the canopies of costly state,
And lulled with sounds of sweetest melody?

Shakespeare.

His secretary was laid in a pallet near him for ven-tilation of his thoughts. *Wotton's Buckingham.*

If your stray attendants be yet lodged,
Or shroud within these limits, I shall know,
Ere morrow wake, or the low-roosted lark
From her thatcht pallet rouse.

Milton.

A surgeon drew from a patient in four days, twenty-seven pallets, every pallet containing three ounces.

Hakewill.

PALLET, among painters, is a little oval table, or piece of wood, or ivory, very thin and smooth; on and round which the painters place the sever-ral colors they have occasion for, to be ready for the pencil. The middle serves to mix the colors on, and to make the tints required in the work. It has no handle, but, instead thereof, a hole at one end to put the left thumb through to hold it.

PALLET, among potters, crucible-makers, &c., a wooden instrument, almost the only one they use for forming, heating, and rounding their works. They have several kinds, the largest are oval, with a handle; others are round, or hollowed triangularly; others, like large knives, serving to cut off whatever is superfluous on the moulds of their work.

PALLET, in gilding, an instrument made of a squirrel's tail, to take up the gold leaves from the pillow, and to apply and extend them on the matter to be gilt.

PALLET, in heraldry, the di-minutive of the pale, being one-half of its breadth. Several pallets may be borne in one es-cutcheon, as in the annexed ex-ample. 'Argent three pallets, wavy gules, name Downes.'

PALLIAMENT, *n. s.* Lat. *pallium*. A dress or robe.

The people of Rome
Send thee by me their tribute,
This *palliament* of white and spotless hue.

Shakespeare.

PALLIATE, a name which the Romans gave to such plays as the plot, being laid in Greece, required the performers to appear in Grecian habits. It is used in contradistinction to *togate*, in which the scene was laid at Rome, and the dresses were Roman. The word is derived from *pallium*, which was a part of dress peculiar to the Greeks; whereas the *toga* belonged to the Romans only.

PALLIATE, *v. a.*

PALLIATION, *n. s.*

PALLIATIVE, *adj. & n. s.*

French, *pallier*,
from Lat. *pallium*.
To cover; disguise; excuse; extenuate: hence to ease or qualify pain: palliation is extenuation; alleviation; excuse; apology: imperfect cure: palliative, mitigatory; extenuating: and, as a noun substantive, synonymous with palliation, but of more frequent use as applied to medicines.

If the just cure of a disease be full of peril, let the physician resort to *palliation*.

Bacon's Natural History.

I saw clearly through all the pious disguises and soft palliations of some men.

King Charles.

The fault is to extenuate, palliate, and indulge.

Dryden.

Such bitter invectives against other men's faults, and indulgence or palliation of their own, shews their *seal* lies in their spleen. *Government of the Tongue.*

Consumption pulmonary seldom admits of other than a palliative cure, and is generally incurable when hereditary.

Arbutnot.

They never hide or palliate their vices, but expose them freely to view.

Swift.

It were more safe to trust to the general aversion of our people against this coin, than apply those palliatives which weak, perfidious, or abject politicians administer.

Id.

PALLID, *adj.* Lat. *pallidus*. Pale; light of color; dim.

Of every sort, which in that meadow grew,

They gathered some; the violet *pallid* blue.

Spenser.

When from the *pallid* sky the sun descends.

Thomson.

Whilst, on the margin of the beaten road,

Its *pallid* bloom sick-smelling hen-bane showed.

Harte.

And, like a withered lily, on the land

His slender frame and *pallid* aspect lay,

As fair a thing as e'er was formed of clay.

Byron.

PALLIO CO-OPERIE. It was an ancient custom, where children were born out of lawful wedlock, and their parents were afterwards married, that those children, together with the father and mother, should stand *pallio co-operti*, under a cloth, while the marriage was solemnising; which was a kind of adoption, and had the effect of a legitimization.

PALLIOT (Peter), a French engraver, printer, bookseller, and author, born at Dijon, in Normandy. His works are highly valued by literary antiquaries; particularly two tracts on Blazoning and Genealogy. His folio edition contains above 6000 escutcheons of his own engraving.

PALLIUM, in antiquity, an upper garment or mantle worn by the Greeks, as the toga was by the Romans. Each of these were so peculiar to the respective nations, that *Palliatius* is used to signify a Greek, and *Togatus* a Roman.

PALLIUM, a word often mentioned in our old historians. Durandus tells us that it was a garment made of white wool, after the following manner, viz. The nuns of St. Agnes, every year, on the feast-day of their saint, offer two white lambs on the altar of their church, during the time they sing *Agnus Dei*, in a solemn mass; which lambs are afterwards taken by two of the canons of the Lateran church, and by them given to the pope's subdeacons, who send them to pasture till shearing time, and then they are shorn, and the pall is made of their wool mixed with other white wool. The pall, being thus made, is carried to the Lateran church, and there placed on the high altar, by the deacons, on the bodies of St. Peter and St. Paul; and, after an usual watching, it is carried away in the night, and delivered to the subdeacons, who lay it up safely. And, because it was taken from the body of St. Peter, it signifies the plenitude of ecclesiastical power; and therefore it was the prerogative of popes, who pretend to be the immediate successors of that saint, to invest other prelates with it; which at first was done nowhere but at Rome, though afterwards at other places.

PALLMALL, *n. s.* Fr. *pale maille*; Lat. *pila* and *malleus*. A play in which the ball is struck with a mallet through an iron ring: and which seems to have given name to the celebrated street in Westminster of this name.

PALM, *n. s. & v. a.*

PALMIST,

PALMISTRY, *n. s.*

Fr. *palme*; Ital.,
Span., Port., and Lat.,
palma; Gr. *παλαμη*. The inner surface of the hand: hence a measure of three inches: to conceal in the hand or palm; hence to impose by juggling or fraud; to handle or stroke with the hand: palmist is one who attempts to foretell the events of a person's life by inspecting the palm of the hand: palmistry, his pretended art: Addison uses it of another kind of cheating by the hand. See below.

By this virgin *palm* now kissing thine,
I will in thine.

Shakespeare.

Drinks of extrema thin parts fretting, put upon the back of your hand, will, with a little stay, pass through to the *palm*, and yet taste mild to the mouth.

Bacon.

Henry VIII. of England, Francis I. of France, and Charles V. emperor, were so provident, as scarce a *palm* of ground could be gotten by either, but that the other two would set the balance of Europe upright again.

Id.

The same hand into a fish may close,
Which instantly a *palm* expanded shows.

Denham.

The length of a foot is a sixth part of the stature; a span one eighth of it; a *palm* or hand's breadth one twenty-fourth; a thumb's breadth or inch one seventy-second; a forefinger's breadth one ninety-sixth.

Holder on Time.

We shall not query what truth is in *palmistry*, or divination from lines of our hands of high denomination.

Brown's Vulgar Errors.

Seeking my success in love to know,

I tried the infallible prophetic way,

A poppy-leaf upon my *palm* to lay.

Dryden.

If not by scriptures, how can we be sure,
Reply'd the panther, what tradition's pure?
For you may *palm* upon us new for old. *Id.*
Palming is held foul play amongst gamesters. *Id.*

Moll White has made the country ring with several imaginary exploits *palmed* upon her.

Addison's Spectator.
Going to relieve a common beggar, he found his pocket was picked; that being a kind of *palmy* at which this vermin are very dextrous. *Id.*

Frank carves very ill, yet will *palm* all the meat. *Prior.*

With the fond maids in *palmy* he deals;
They tell the secret first which he reveals. *Id.*

Here while his canting drone pipe scann'd
The mystic figures of her hand,
He tipples *palmy*, and dines
On all her fortune-telling lines. *Cleveland.*

PALM, n. s. } *Fr. palmier*; *Ital. Span.*
PALMER, } *Port. and Lat. palma*, as
PALMERWORM, } some have conjectured
PALMETTO, n. s. } from its leaves resembling
PALMIFEROUS, adj. } the open hand. A tree of
PALMY, } great variety in its species.
PALMIFEDE. } See below. Its branches

were borne and worn as tokens of victory; hence it intends victory; triumph; superiority: a palmer is a kind of pilgrim, so called from those who formerly returned from Palestine bearing palm-branches: palmerworm, a worm covered with hair, so called, says Johnson, because he wanders over many plants: palmiferous, is bearing or abundant in palms: palmipede, web-footed; having the toes connected by a membrane (as the palmleaves): palmy is literally synonymous with palmiferous, and used for high; triumphant; magnificent, as in the extract from Shakspeare.

Get the start of the majestic world,
And bear the *palm* alone.

Shakspeare. Julius Cæsar.
In the most high and *palmy* state of Rome,
A little ere the mightiest Julius fell,
The graves stood tenantless. *Id. Hamlet.*
My sceptre, for a *palmer's* walking staff.

Shakspeare.
Nothing better proveth the excellency of this soil,
than the abundant growing of the *palm*-trees without
labour of man. This tree alone giveth unto man
whatsoever his life beggeth at nature's hand.

Raleigh.
Above others who carry away the *palm* for excellence, is Maurice Langrave of Hesse. *Peucham.*

Fruits of *palm*-tree, pleasantest to thirst
And hunger both. *Milton.*
It is described like fissipedes, whereas it is a *palmipede* or finfooted like swans. *Brown.*

A flesh fly, and one of those hairy worms that resemble caterpillars and are called *palmerworms*, being conveyed into one of our small receivers, the bee and the fly lay with their bellies upward, and the worm seemed suddenly struck dead. *Boyle.*

Thou youngest virgin, daughter of the skies,
Whose *palms* new plucked from Paradise,
With spreading branches more sublimely rise. *Dryden.*

Namur subdued is England's *palm* alone;
The rest besieged, but we constrained the town. *Id.*

She passed the region which Panchea joined,
And, flying, left the *palmy* plains behind. *Id.*

Water-fowl which are *palmipeds* are whole footed, have very long *necks*, and yet but short legs, as swans.

Ray.
There are twenty-one species of this tree, of which the most remarkable are, the greater *palm* or date-tree. The dwarf *palm* grows in Spain, Portugal, and Italy, from whence the leaves are sent hither and made into flag-brooms. The oily *palm* is a native of Guinea and Cape Verd Island, but has been transplanted to Jamaica and Barbadoes. It grows as high as the main mast of a ship. *Miller.*

Behold yon isle, by *palmer*s, pilgrims trod,
Men bearded, bald, cowed, uncowed, shod, unshod. *Pope.*

Broad o'er my head the verdant cedars wave,
And high *palm*ettes lift their graceful shade. *Thomson.*

PALM, in botany. See *PALME* and *PHENIX*. The palm has among almost all nations been regarded as an emblem of victory, and assigned as the reward of it. The reason why this tree was adopted, and made use of to represent victory, is said to be, because it is so elastic that, if pressed by the greatest weight, it will rise superior to the pressure, and be able to restore itself to its former state, appearing almost invincible.

PALM, CABBAGE. See *ARECA*.

PALM, COCOA NUT. See *COCOS*.

PALM SUNDAY, the Sunday before Easter; being so called in memory of our Saviour's triumphal entry into Jerusalem, when the multitude that attended him strewed branches of palm trees in his way. The ancients had other names for this day: for, 1. They called it *Dominica Competentium*, i. e. Sunday of the Competents; because on that day the catechumens came to ask the bishop leave to be admitted to baptism, which was conferred the Sunday following. They had also then given them the symbol or creed, to get off by heart, to be repeated to the bishop in the ceremony of baptism. 2. They called it *Capitulivium*, the Sunday of washing the head; because those who were to be baptised the following Sunday were prepared by washing their heads on this day.

PALMA, a north-west island of the Canaries, is eight leagues long, and six leagues broad, very mountainous and woody: the interior having many extensive volcanoes. It is only cultivated near the coast, and produces the best wine of the islands, a great quantity of almonds, some sugar and silk, and corn to serve its inhabitants half the year. It has a trade in silk which is considerable, and a good fishery on the African coast. Humboldt states it to contain 36,000 inhabitants.

PALMA, the capital of Majorca, is situated at the bottom of a large bay, formed by Cape Blanco and Cala Figuera. It stands on the slope of a hill; and, when viewed from the bay, presents a picturesque appearance. It is still surrounded with walls, and has on the land side a dry ditch and outworks, but is not capable of sustaining a siege. Part of the streets are narrow and ill paved, but those in the lower part of the town, and the squares, are spacious and regular. The cathedral is a large and handsome Gothic building, with beautiful windows of painted glass, and has a tower remarkable for the bold-

ness and delicacy of its architecture. The parish church of St. Michael is yet more ancient, and served for a mosque under the Moors. The government house is an irregular but large building, containing a chapel royal, an arsenal, barracks, and state prison. It has several elegant apartments. The house called de la Contratacion is a large Gothic edifice, with a beautiful hall, and is used for the meetings of merchants, as well as for balls, and other public entertainments. The town-house attracts attention by the sculpture and public ornaments on its entablature. In the inside are portraits of all the great men of Majorca, from Hannibal to Don Jayme. The clock is said to be regulated, both in marking and striking the hours, by the course of the sun and by the solstices, being perhaps the only one of the kind in the world. The private houses are on the plan of the ancient Moorish residences, which is probably the most suitable to the climate: they have on the ground floor a portico and lobby, with pillars, and some small apartments. On the first floor are large rooms without glass windows; and above all the family apartments, such as bed-rooms, kitchen, &c. In the latter there are seldom chimneys or stoves, the cooking being carried on with charcoal. The poor reside in cellars, which seldom receive air or light but by the door. See MAJORCA.

PALMA, a town of Sicily, noted for its sulphur cargoes shipped annually to England. It has a small harbour. Population 6000. Twelve miles S.S.E. of Girgenti.

PALMA, a small town in the south of Spain, in Andalusia, on the Xenil. Population 4200. Thirty-eight miles W.S.W. of Cordova.

PALMA, a town of Austrian Illyria, in Friuli, on the Natissone, near Aquileja, with 2000 inhabitants, and a fort.

PALMA, a small inland town of Portuguese Estremadura, on the right side of the river Cadon, twenty-eight miles east of Setubal.

PALMA, a river of Brasil, which runs nearly west, and enters the Paratinga, a tributary of the Tocantines.—It is also the name of an island close to the mouth of the river Plata.

PALMA, NUESTRA SENORA DE LA, a city of New Granada, in Tunja, on the east shore of the river Magdalena. The inhabitants carry on a considerable trade in sugar, sweets, and linen and cotton manufactures. Population 600 house-keepers. Fifty-four miles north-west of Santa Fe, and sixty-eight west by south of Tunja. Long. 74° 52' 30" W., lat. 5° 8' N. This is the name of several other settlements in South America.

PALME, in botany, palms. Under this name Linnæus has arranged several genera, which, although capable of a place in separate classes of his system, he chooses rather, on account of their singular structure, to place apart in an appendix to the work. See BOTANY. They are defined to be plants with simple stems, which at their summit bear leaves resembling those of the ferns, being a composition of a leaf and a branch; and whose flowers and fruit are produced on that particular receptacle or seat called a spadix, protruded from a common calyx in form of a sheath or scabbard, termed by Linnæus *spatha*.

PALMAS, CIVIDAD DE LAS, the capital of the Grand Canary Island, and the centre of all its commerce. It is the residence of a bishop, whose living is said to be worth about £10,000. The convents are numerous; and the town, watered by a rivulet, has a handsome appearance. Inhabitants 9437. Being less frequented by navigators, however, it does not equal in importance the ports of Tenerife.

PALMAS, a small town, the capital of Gomera, one of the Canaries.

PALMAS, CAPE, a promontory of West Africa, forming the entrance from the north into the Gulf of Guinea, and the western termination of the Ivory coast. Here is a road affording good shelter against south winds.

PALMER (John), an eminent actor, born in London in 1742, made his debut, under Foote, at the Haymarket theatre, and, after having performed with reputation in the country, was engaged by Garrick at Drury Lane. He gradually appeared in a great variety of parts, both in tragedy and comedy, in some of which perhaps he was never excelled. He remained at Drury Lane, sometimes visiting Liverpool in the summer, till he engaged in the scheme for erecting a new theatre in the East of London. Having been appointed manager, he laid the first stone of the new building, December 26th, 1785, and in June 1787 it was opened, but without legal authority. Mr. Palmer persevered for some time in a fruitless attempt to obtain a patent; and was obliged at last to return to Drury Lane. His unlucky project was the cause of great pecuniary embarrassments, and he was committed to the King's Bench, from which he was only liberated by a compromise with his creditors. His difficulties continuing, he purposed to emigrate to America; and went with that view to Edinburgh, but afterwards relinquished his scheme. Towards the close of his life he passed the summer season in the country, and his last engagement was at Liverpool. At the theatre there, on the 2d of August 1798, while performing *The Stranger*, he fell on the stage exclaiming, in the words of the drama, 'There is another and a better world' and almost immediately expired. His distressed circumstances, the recent loss of a son by death, and other misfortunes, had preyed greatly on his spirits.

PALMER (John), the projector of the mail coaches, was a native of Bath, where he at first was employed in a common brewery. After this, he solicited and obtained a patent for a theatre, which concern proved eminently successful. To elicit theatric talent he travelled much on horseback; and the necessity of despatch, but, above all, the insecurity of the ordinary mode of conveying the mails, inspired Mr. Palmer with the idea of transmitting letters by coaches. He succeeded in his object, though not without great opposition; but the utility of the plan soon became manifest, and he was made comptroller general of the post-office, with a salary of £1500 a year. But in 1792 he was suspended, and lost the benefit to which he was entitled for the advantage he had rendered to the public. At length, on application to parliament, he received a compensation; though a very in-

adequate one, for the per centage which he was to have received in case his plan succeeded. He died in 1818.

PALMERSTON ISLAND, an island of the South Pacific Ocean, discovered by captain Cook, and visited by captain Wilson in the missionary ship *Duff*, who states it to consist of a group of small islets, eight or nine in number, connected together by a reef of coral rocks, and lying in a direction nearly circular. 'The islet we landed upon,' he says, 'is not a mile in circuit, and at high water is not more than four or five feet above the level of the sea. The soil is coral sand, with an upper stratum of blackish mould produced from rotten vegetables. All the inner area of the islet is covered with cocoa-nut trees, which, decaying and falling successively, form a thick underwood: without these, near to the beach, are the wharra-tree, and others of various sorts. We saw a vast number of men of war birds, tropic birds, and boobies. Among the trees there was plenty of red crabs, dragging after them a shell in form of a periwinkle, but longer, being in diameter about two or three inches. We also saw the beautiful submarine grotto described in Cook's third voyage. At one part of the reef which bounds the lake within, almost even with the surface, there is a large bed of coral, which affords a most enchanting prospect; its base, which is fixed to the shore, extends so far that it cannot be seen, so that it appears to be suspended in the water. The sea was then unruffled, and the refulgence of the sun exposed the various sorts of coral in the most beautiful order; some parts luxuriantly branching into the water, others appearing in a vast variety of figures, and the whole heightened by spangles of the richest colors, glowing from a number of large clams interspersed in every part. Even this delightful scene was greatly improved by the multitude of fishes that gently glided along, seemingly with the most perfect security; their colors were the most beautiful that can be imagined, blue, yellow, black, red, &c., far excelling any thing that can be produced by art.' There are no inhabitants on the island; but plenty of rats, which the missionaries suppose must have been drifted here on some hollow tree or root. Long. 163° 10' W., lat. 18° 4' S.

PALMETTO, in botany. See *CHAMEROPS*.
PALMIPEDES, in ornithology, the third order in Mr. Latham's system; comprehending web-footed birds; which that ingenious ornithologist found it necessary to introduce between Linnaeus's orders of *picæ* and *grallæ*, answering to the *anseræ* of Linnaeus. Latham subdivided this order into two divisions; viz. *semipalmati* and *palmati*, in which he is followed by Kerr. The former have long legs, and their feet only half-webbed; the body is conical and somewhat flattened; the thighs are naked on their lower halves; the legs are very long; the feet are fitted for wading; and the toes are only connected together at their posterior parts by a membrane. They mostly pair in breeding time, and build their nests on the ground. They feed on fish and insects. This division contains three genera. The latter have short legs, a smooth bill, covered with a membranous skin, and increasing

in size towards the point. The feet are fitted for swimming, having short legs, thin, or compressed laterally; and the toes are all compressed to their ends by an interposed membrane. They are mostly polygamous; they build their nests on the ground; they live much in the water, and the young are soon able to provide for themselves.

PALMUS, a long measure used both by the Greeks and Romans. The Grecian palmus, called also *yopov*, was of two sorts; the greater, which contained nine finger-breadths, and the less which contained four. The Roman palmus was also of two kinds; the greater, which contained twelve finger-breadths, or eight and a half inches English; and the less, which contained four finger-breadths, or nearly three inches English. The great palmus was taken from the length of the hand or span; the less from the breadth of it.

PALMYRA, a noble city of ancient Syria, now in ruins, supposed to have been the 'Tadmor in the wilderness' built by Solomon (1 Kings, ix. 18, 2 Chron. viii. 4, and Josephus, Ant. Jud. lib. 1), though this is much controverted by many learned men. For the world has been long and justly astonished to find in the Desert of Syria, at a distance from the sea, with only a very precarious and scanty supply of water, and without a particular connexion with any great monarchy, ruins of a city more extensive and splendid than Rome itself, the deposit of all the arts which Greece in its most flourishing periods could afford.

Tadmor was situated where two hills converged, and beyond the point where they approached. These hills afforded water, and the aqueducts through which it was brought from them were discovered and described by Mr. Wood. Though the other towns now in ruins afford some remains of luxury and opulence, yet in these respects they are much inferior to Palmyra. 'The two springs of fresh water it possesses,' says Volney, 'were a powerful inducement in a desert every where else so parched and barren. These, doubtless, were the principal motives which drew the attention of Solomon, and induced that commercial prince to carry his arms so remote from the limits of Judea.' 'He built strong walls there,' says the historian Josephus, 'to secure himself in the possession, and named it Tadmor, which signifies the place of palm trees.' Hence it has been inferred that Solomon was its first founder; but we should, from this passage, rather conclude that it was already a place of known importance. The invasion of Tadmor by that prince throws a great light on the history of this city. The king of Jerusalem would never have carried his attention to so distant and detached a spot without some powerful motive of interest; and this interest could be no other than that of an extensive commerce, of which this place was already the emporium. This commerce extended itself to India, and the Persian Gulf was the principal point of union. From the nature of the commodities, from the requisite assistance of the Tyrians, and other forcible arguments, M. Volney infers that the Persian Gulf was the centre

of the most ancient commerce of the eastern world; and that it was with a view of obtaining a shorter route, by the Euphrates, that Solomon turned his attention to Tadmor, distant but three days' journey from it.

'An ancient historian,' says Volney, 'who has informed us that Nabuchodonosor, before he laid siege to Jerusalem, took possession of Tadmor, clearly indicates that the latter city acted in concert with the two neighbouring capitals, Tyre and Jerusalem. Their gradual decline became, under the Persian empire and the successors of Alexander, the efficient cause of the sudden greatness of Palmyra in the time of the Parthians and Romans; she had then enjoyed a long peace for many centuries, which allowed her inhabitants to erect those monuments of opulence whose ruins we still admire.' The verdant part of the ground was, perhaps, in remote times far more extensive than it is at present, the sands having without doubt encroached in a considerable degree on the tract calculated for bearing the fruits of the earth. A place possessed of the advantages we have mentioned was soon made a point of resort for the caravans by which the various rich commodities of India were transported to European countries. Palmyra thus grew to be an independent and wealthy city; and appears to have been permitted by the Romans, during their Parthian wars, to maintain a strict neutrality. Trajan, however, incorporated it with the imperial Roman state, and it should seem that during the period in which it held the subordinate rank of a Roman colony (namely, for a century and a half subsequently), those temples and palaces of Grecian architecture, whose widely extended ruins have occasioned so much speculation, were erected.

In old times Palmyra was doubtless encompassed by palms and fig trees, and it might probably have been reduced to its present forlorn and miserable appearance by the oceans of sand drifted over it by whirlwinds. The walls of the city are flanked with square towers; and are of the extent of three miles in circumference. But there is no authentic history of Palmyra till after the captivity of the emperor Valerian by the Persians. It is first mentioned by the Roman historians, as a place which Marc Antony attempted to plunder, upon pretence that it had not observed a just neutrality between the Romans and Parthians. Pliny takes notice of it, as situated in a rich soil, among pleasant streams, and separated from the rest of the world by a vast sandy desert, which had preserved its independence between Parthia and Rome. After the captivity of Valerian, it was become an opulent city, to which its situation in the vicinity of the Roman and Parthian empires greatly contributed; as the caravans, going to or returning from the east, frequented the place, and thus rendered it a considerable seat of merchandise. But, when the defeat and captivity of Valerian had so much weakened the empire that the Persians seemed to be in a fair way of becoming masters of all the eastern provinces, the Palmyrenians began to attempt recovering their liberty. Odenatus, prince of Palmyra, sent a polite letter to Sapor on his return, accompanied with con-

siderable presents; but by that haughty conqueror his letter and embassy were treated with the most provoking contempt. The presents were thrown into the Euphrates; and to his letter Sapor replied, That his insolence in presuming to write to his lord was inexcusable; but, if he could atone for it in any way, it would be by presenting himself before the throne bound hand and foot. Upon this Odenatus was so provoked that he swore either to bring down the pride of the haughty conqueror, or die in the attempt. Accordingly, having assembled what forces he could, he fell upon the Persians, destroyed a great number of them, took a great part of their baggage, with Sapor's queen, and some of his concubines. But though the Persians were often vanquished, and the independency of Palmyra often established, Valerian was never released from his captivity, though Odenatus earnestly endeavoured to rescue him from his enemies. Odenatus enjoyed his sovereignty but a short time; being murdered by his nephew, who was soon after put to death by Zenobia, the widow of Odenatus.

Zenobia was possessed of very extraordinary endowments both of body and mind. Immediately on the murder of her husband, she assumed the government, avenged his death, and soon strengthened herself so much that she resolved to submit neither to the Roman nor Persian power. Arabia, Armenia, and Persia, dreaded her enmity and solicited her alliance. To the dominions of Odenatus, which extended from the Euphrates to the frontiers of Bithynia, she added the inheritance of her ancestors, the populous and fertile kingdom of Egypt. The emperor Claudius II. acknowledged her merit, and was content that, while he pursued the Gothic war, she should enjoy the dignity of the empire in the east. The conduct, however, of Zenobia, was attended with some ambiguity. She blended with the popular manners of Roman princes the stately pomp of the courts of Asia, and exacted from her subjects the same adoration that was paid to the successors of Cyrus. She bestowed on her three sons a Roman education, and often showed them to the troops adorned with the imperial purple. For herself she reserved the diadem and title of queen of the east. When Aurelian passed over into Asia, his presence restored obedience to Bithynia, already shaken by the arms of Zenobia. Advancing at the head of his legions, Ancyra submitted, and he was admitted into Tyana, after an obstinate siege, by the treachery of a perfidious citizen. The generous though fierce Aurelian abandoned the traitor to the rage of the soldiers: a superstitious reverence induced him to treat with lenity the countrymen of Apollonius the philosopher. Antioch was deserted on his approach; till he recalled the fugitives, and granted a general pardon to all who, from necessity, had fought for the Palmyrenian queen. The unexpected mildness of such conduct reconciled the Syrians, and, as far as the gates of Emesa, the people submitted to his arms. Zenobia, however, opposed the emperor's approach. The fate of the east was decided in two great battles; the first fought near Antioch, the second near

Emesa. In both, the queen of Palmyra animated the armies by her presence, and devolved the execution of her orders on Zabdas, who had already signalised his military talents by the conquest of Egypt. The numerous forces of Zenobia consisted for the most part of light archers, and of heavy cavalry clothed in complete steel. The Moorish and Illyrian horse of Aurelian were unable to sustain the ponderous charge of their antagonists. They fled in real or affected disorder, engaged the Palmyrenians in a laborious pursuit, harassed them by a desultory combat, and at length discomfited this impetuous body of cavalry. The infantry, when they had exhausted their quivers, remained exposed to the swords of the legions. After the defeat of Emesa, Zenobia found it impossible to collect a third army. As far as the frontier of Egypt, the nations subject to her empire had joined the standard of the conqueror. Palmyra was her last resource. She retired within its walls; made every preparation for a vigorous resistance; and declared, with the intrepidity of a heroine, that the last moment of her reign and of her life should be the same. In his march over the sandy desert, between Emesa and Palmyra, Aurelian was perpetually harassed by the Arabs; nor could he always defend his army, and especially his baggage, from those flying troops of daring robbers. The siege of Palmyra was an object far more difficult and important; and the emperor, who, with incessant vigor pressed the attacks in person, was himself wounded with a dart. 'The Roman people,' says Aurelian, in an original letter, 'speak with contempt of the war which I am waging against a woman. They are ignorant both of the character and of the power of Zenobia. It is impossible to enumerate her warlike preparations, of stones, of arrows, and of every species of missile weapons. Every part of the walls is provided with two or three balista, and artificial fires are thrown from her military engines,' &c. Aurelian at last judged it prudent to offer terms of an advantageous capitulation: to the queen, a splendid retreat; to the citizens, their ancient privileges. His proposals were obstinately rejected. Zenobia hoped, that in a short time famine would compel the Roman army to repossess the desert; and that the kings of the east, particularly the Persian monarch, would arm in the defence of their natural ally. But the death of Sapor distracted the councils of Persia; and the inconsiderable succors that attempted to relieve Palmyra were easily intercepted. The Roman camp was increased by the return of Probus with his victorious troops from the conquest of Egypt. It was then that Zenobia resolved to fly. She mounted the fleetest of her dromedaries; and had reached the banks of the Euphrates, about sixty miles from Palmyra, when she was overtaken by Aurelian's light horse, seized, and brought back a captive. Her capital soon after surrendered, and was treated with unexpected lenity. When the Syrian queen was brought into the presence of Aurelian, he sternly asked her, How she had presumed to rise in arms against the emperors of Rome? The answer of Zenobia was a prudent mixture of respect and

firmness: 'Because I disdained to consider as Roman emperors an Aureolus or a Gallienus. You alone I acknowledge as my conqueror and my sovereign.' But the courage of Zenobia deserted her in the hour of trial; she trembled at the clamors of the soldiers, who called aloud for her immediate execution; forgot the bold despair of Cleopatra, which she had proposed as her model, and ignominiously purchased life by the sacrifice of her fame and her friends. It was to their councils, which governed the weakness of her sex that she imputed the guilt of her obstinate resistance; it was on their heads that she directed the vengeance of the cruel Aurelian. The fame of Longinus, who was included among the numerous and perhaps innocent victims of her fear, will survive that of the queen who betrayed, or the tyrant who condemned him. Genius and learning were incapable of moving a fierce unlettered soldier, but they had served to elevate and harmonise the soul of Longinus. Without uttering a complaint, he calmly followed the executioner, pitying his unhappy mistress, and comforting his afflicted friends.

Returning from the conquest of the east, Aurelian had already crossed the straits which divide Europe from Asia, when he was provoked by the intelligence that the Palmyrenians had massacred the governor and garrison which he had left among them, and erected the standard of revolt. Without delay, he once more turned towards Syria. Antioch was alarmed by his rapid approach, and the helpless city of Palmyra felt the irresistible weight of his resentment. We have a letter of Aurelian himself, in which he acknowledges, that old men, women, children, and peasants, had been involved in that dreadful execution which should have been confined to armed rebellion: and, although his principal concern seems directed to the re-establishment of a temple of the sun, he discovers some pity for the remnant of the Palmyrenians, to whom he grants the permission of rebuilding and inhabiting their city. But it is easier to destroy than to restore. The seat of commerce, of arts, and of Zenobia, gradually sunk into an obscure town, a trifling fortress, and at length a miserable village. Little is known concerning the fortunes of Palmyra since the time of Mahomet, except that it was considered as a place of strength; and that in the twelfth century there were 2000 Jews in it.

The company with whom Mr. Wood, the publisher of *The Ruins of Palmyra*, travelled, arrived at the end of the plain, where a ridge of barren hills, by which it was divided on the right and left, seemed to meet; between them there was a vale, through which an aqueduct formerly conveyed water to Palmyra. On each side of this vale they remarked several sepulchres of the ancient Palmyrenes, which they had scarcely passed, when the hills opening on a sudden, they discovered such piles of ruins as they had never seen. They were all of white marble; and, beyond them, towards the Euphrates, was a wide level, stretching farther than the eye could reach, totally desolate, and without bounds. After having gazed some time upon this prospect, which rather exceeded than fell short of their expecta-

tions, they were conducted to one of the huts of the Arabs, of which there were about thirty in the court of the great temple. The inhabitants of both sexes were well shaped, and the women, though very swarthy, had good features. They were veiled, but did not so scrupulously conceal their faces as the eastern women generally do. They painted the ends of their fingers red, their lips blue, and their eye-brows and eye-lashes black. They had large rings of gold or brass in their ears and nostrils.

These celebrated ruins consist of temples, palaces, and porticoes of Grecian architecture; and lie scattered over an extent of several miles. They were accidentally discovered by some English travellers from Aleppo above a century ago. The most remarkable of them is the temple of the Sun, of which the ruins are spread over a square of 220 yards. It was encompassed with a stately wall, built of large square stones, and adorned with pilasters within and without, to the number of sixty-two on a side. Within the court are the remains of two rows of noble marble pillars thirty-seven feet high, with their capitals of most exquisite workmanship. Of these only fifty-eight remain entire, but they appear to have gone round the whole court, and to have supported a double piazza. The walks opposite the castle appear to have been spacious. At each end of this line are two niches for statues, with their pedestals, borders, supporters, and canopies, carved with the utmost propriety and elegance. The space within this enclosure seems to have been an open court, in the middle of which stood the temple encompassed with another row of pillars of a different order, and much taller, being fifty feet high; but of these sixteen only remain. The whole space contained within these pillars is fifty-nine yards in length, and nearly twenty-eight in breadth. The temple is thirty-three yards long, and thirteen or fourteen broad. It points north and south; and exactly in the middle of the building, on the west side, is a most magnificent entry, on the remains of which are some vines and clusters of grapes, carved in the most masterly imitation of nature that can be conceived. Just over the door are discerned a pair of wings, which extend its whole breadth; but the body, whether of an eagle, or an angel, is destroyed. The north end of this temple is adorned with the most curious fret-work and bas-relief; and in the middle there is a dome or cupola about ten feet diameter. North of this place is an obelisk, consisting of seven large stones, besides its capital. It is about fifty feet high; and, just above the pedestal, is twelve feet in circumference. About a quarter of a mile from this pillar, to the east and west, are two others, besides the fragment of a third. About 100 paces from the middle obelisk is a magnificent entry to a piazza, which is forty feet broad, and more than half a mile long, enclosed with two rows of marble pillars twenty-six feet high, and eight or nine in compass. Of these there still remain 129, but there must originally have been no less than 560. The upper end of the piazza was closed by a row of pillars. To the left are the ruins of a stately banquetting-house, built of better marble, and finished with yet

greater elegance, than the piazza. The pillars which supported it were of one entire stone. It measures twenty-two feet in length, and in compass eight feet nine inches. In the west side of the piazza are several apertures for gates into the court of the palace. Each of these was adorned with four porphyry pillars, placed by couples in the front of the gate facing the palace, two on each side. Two of these only remain entire. They are thirty feet long, and nine in circumference. On the east side of the piazza stand a great number of marble pillars, some perfect, but the greater part mutilated. At a little distance are the remains of a small temple, without a roof. Before the entry, which looks to the south, is a piazza supported by six pillars, two on each side of the door, and one at each end. The pedestals of those in front have been filled with inscriptions, both in the Greek and Palmyrene languages, which are become totally illegible. Among these ruins are many sepulchres. They are all square towers, four or five stories high. There is a walk across the whole building, the space on each hand is subdivided into six partitions by thick walls. The space between the partitions is wide enough to receive the largest corpse; and in these niches there are six or seven piled upon one another. Many inscriptions have been found at Palmyra, which have occupied much of the attention of the learned. See Barthelemy's *Reflections on the Palmyrene Alphabet*, published at Paris in 1754; *An Explication of the Inscriptions at Palmyra* hitherto published by John Swinton, of Christ Church, Oxford; *Philosophical Transactions*, No. 217 and 218; *Ancient Universal History*, Vol. 1; and, above all, the *Ruins of Palmyra, or Tadmor in the Desert*, published by Mr. R. Wood, who, with M. Bouverie and Mr. Dawkins, travelled thither in 1751. The result of their observations was published in 1753, in the form of an atlas. The ruins of this once mighty and celebrated city are represented in fifty-seven copper plates, sixteen by twelve inches, printed on imperial paper. They are admirably executed; Palmyra was visited by Mr. Bruce, before his journey into Abyssinia. Before he came in sight of the ruins, he ascended a hill of white gritty stone, in a very narrow winding road; but, on getting up to the top, he was struck with the most stupendous sight which, he believes, ever mortal saw. The whole plain below, which is very extensive, was so covered with magnificent buildings that they seemed to touch one another. All of them are finely proportioned, and composed of white stones, which at that distance appeared like marble.

In the neighbourhood of Palmyra are some salt-marshes; and to the adjacent country a trade is carried on in kelp from Tripoli in Syria. Respecting the latitude and longitude there are various opinions. Before Mr. Bruce left Palmyra, he observed its latitude with a reflecting quadrant of Hadley, but, as the instrument was out of order, he could not determine it exactly. In his opinion, however, $33^{\circ} 58'$ is the latitude. From such observations as he could make on the longitude, he concluded it to be $37^{\circ} 9' E.$ of Greenwich. Mr. R. Wood makes the lat. 34°

N. That which appears to be nearest the truth is long. 38° 50' E., lat. 33° 20' N. It stands about fifty leagues south-east of Aleppo, as much from Damascus, and twenty leagues west of the Euphrates.

PALMYRAS POINT, the south point of Balasore Bay, Bengal, is a low point, covered with palm-trees, and on each side of it a river, that on the south being navigable for small vessels. The bay of Balasore has but little depth, and the great danger here is of mistaking Cape False for the Point. No ship should enter Balasore roads between Lady-day and Midsummer, and at all seasons a pilot should be taken on board. The East India Company have lately erected a light-house here. Long. 87° 5' E., lat. 20° 44' N.

PALNAUD, a district of the Carnatic, Hindostan, situated principally between 16° and 17° of N. lat., and on the south side of the Kistnah. This district was ceded by the nabob of the Carnatic to the British, in 1801, and is now comprehended in the collectorship of Guntoor. The chief towns are Macheria, Timerycotta, and Curumconda.

PALO, a town of Diarbekir, Asiatic Turkey, is situated on the edge of a mountain, upon the banks of the Euphrates. The top of the mountain is covered with ruins, supposed to be those of Balisbiga; and quantities of old coins and medals are continually dug up here. The present population of Palo is about 8000 Turks, Armenians, and Koords; but the town is ill built, and subject to earthquakes. The Euphrates is here extremely rapid. Sixty miles north of Diarbekir.

PAL'PABLE, *adj.* } Fr. *palpable*; Latin
PALPABILITY, *n. s.* } *palpor*. Perceptible to
PAL'PABLENESS, } the touch; hence easily
PAL'FABLY, *adv.* } detected; gross; coarse;
PALPA'TION, *n. s.* } plain: palpability and palpableness are synonymous, expressing the state or quality of being perceived by the touch; plainness; obviousness: palpably is the corresponding adverb: palpation (of which we find no instance) the act of feeling.

That grosser kind of heathenish idolatry, whereby they worshipped the very works of their own hands, was an absurdity to reason so *palpable*, that the prophet David, comparing idols and idolaters together, maketh almost no odds between them.

Hooker.

Art thou but
A dagger of the mind, a false creation?
I see thee yet in form as *palpable*,
As this which now I draw.

Shakspeare. Macbeth.

Clodius was acquitted by a corrupt jury, that had *palpably* taken shares of money. Before they gave up their verdict, they prayed of the senate a guard, that they might do their consciences justice.

Bacon.

Darkness must overshadow all his bounds,
Palpable darkness! and blot out three days.

Milton.

Since there is no such dissimilitude between cause and effect in the more *palpable* phenomena, we can expect no less between them and their invisible effects.

Glanville.

They would no longer be content with the invisible monarchy of God, and God dismissed them to the *palpable* dominion of Saul.

Holyday.

He must not think to shelter himself from so *palpable* an absurdity, by this impertinent distinction.

Tillotson.

Having no surer guide, it was no wonder that they fell into gross and *palpable* mistakes.

Woodward's Natural History.

He first found out *palpability* of colors; and, by the delicacy of his touch, could distinguish the different vibrations of the heterogeneous rays of light.

Mart. Scribblers.

MYR. And felt you not this a mere vision!

SAR.

No:

It was so *palpable*, I could have touched them.

I turned from one face to another, in

The hope to find at last one which I knew

Ere I saw theirs: but no—all turned upon me.

Byron.

PALPAH, a mountainous and barren district of Northern Hindostan, situated between 28° and 29° of N. lat. It forms one of the principalities subject to the rajah of Nepaul, called the territories of the twenty-four rajahs. It is intersected by the Gunduck.

PALPAH, the capital of the above-mentioned district, the residence of a Hindoo chief named Mehadut Sein, who is tributary to Nepaul. It is situated among the mountains on the banks of the Gunduck River. Long. 82° 55' E., lat. 28° 11' N.

PALPITATE, *v. a.* } French *palpiter*; Lat.

PALPITATION, *n. s.* } *palpito* (à Gr. *παλλω*).

To pant; throb; beat as the heart; flutter: the substantive corresponding.

The heart strikes five hundred sort of pulses in an hour; and hunted into such continual *palpitations*, through anxiety and distraction, that fain would it break.

Harvey.

I knew the good company too well to feel any *palpitations* at their approach.

Taiter.

Anxiety and *palpitations* of the heart are a sign of weak fibres.

Arbuthnot on Aliments.

Her bosom heaves

With *palpitations* wild.

Thomson's Spring.

While, as beautiful as May,

A female child of ten years tried to stoop

And hide her little *palpitating* breast

Amidst the bodies killed in bloody rest. *Byron.*

PALPITATION OF THE HEART. See **MEDICINE**, Index.

PALSGRAVE (John), a learned writer, who flourished in the reigns of Henry VII. and Henry VIII. He received his grammatical learning at London, his native place. He studied logic and philosophy at Cambridge, where he became A. B., after which he went to Paris, where he spent several years in study, took the degree of A. M., and acquired such excellence in the French tongue that, in 1514, when a treaty of marriage was negotiated between Louis XII. of France, and the princess Mary, sister of Henry VIII. of England, Mr. Palsgrave was appointed to be tutor in that language. But Louis XII. dying soon after his marriage, Palsgrave attended his fair pupil back to England, where he taught French to the young nobility, obtained preferment in the church, and was appointed one of the king's chaplains in ordinary. In 1531 he settled at Oxford, and in 1582 was made A. M. and B. D. He was much esteemed for his learning; and, though an Englishman,

was the first who reduced the French tongue to grammatical rules, or fixed it to any kind of standard. This he executed with great ingenuity, in a large work which he published in that language at London, entitled *L'Eclaircissement de la Language Françoise*, in three books, thick folio, 1530, with a large English introduction; so that the French nation stand originally indebted to England for that universality which their language at present possesses. He translated into English a Latin comedy called *Acolastus*, written by one William Fullonius, an author then living at Hagen in Holland. He died in 1540.

PALSY, *n. s.* Lat. *paralysis*, of which it seems a corruption. A privation of animal motion or feeling.

The *palsy*, and not fear, provokes me.
Shakespeare.

Palled, thy blazed youth
Becomes assuaged, and doth beg the alms
Of *palsied* old. *Id. Measure for Measure.*

A *palsy* may as well shake an oak, as shake the delight of conscience. *South.*

Though she breathes in a few pious peaceful souls, like a *palsied* person, she scarce moves a limb.
Decay of Piety.

Let not old age long stretch his *palsied* hand;
Those who give late are importuned each day. *Gay.*

There is a threefold division of a *palsy*; a privation of motion, sensation remaining; a privation of sensation, motion remaining; and, lastly, a privation of both together. *Quincy.*

Eneas! Jesus, the true Messiah, in whose name I preach and act immediately healeth thee!—And upon this the *palsy* left him, and the disabled man was all at once so strengthened that he arose immediately and did it. *Doddridge on Acts ix.*

PALSY. See **MEDICINE**, Index.

PALTER, *v. n. & v. a.* As Skinner and
PALTERER, } Minshew think,
PALTRINESS, } from Fr. *poltron*.
PALTRY, *adj.* } Mr. Thomson more

probably from Span. *falter*, or *baldar* (barb. Lat. *palitare*), *fallo*. To shuffle; shift; deal insincerely; deceive: according to Ainsworth it has also been used for to squander, as 'he falters his fortune': a palterer is a shuffler; insincere dealer or negotiator: paltry, low; tricky; sordid; mean.

Be these juggling fiends no more believed,
That *patter* with us in a double sense;
That keep the word of promise to our ear,
And break it to our hope. *Shakespeare. Macbeth.*
Then turn your forces from this *paltry* siege,
And stir them up against a mightier task.

Shakespeare.
Whose compost is *paltry* and carried too late,
Such husbandry useth that many do hate. *Tusser.*

For knights are bound to feel no blows
From *paltry* and unequal foes. *Hudibras.*
It is an ill habit to squander away our wishes
upon *paltry* fooleries. *L'Estrange.*

When such *paltry* slaves presume
To mix in treason, if the plot succeeds,
They're thrown neglected by; but, if it fails,
They're sure to die like dogs. *Addison's Cato.*

PALUDAMENTUM, in Roman antiquity, a habit that differed but little from the chlamys, except that this last belonged chiefly to the lower class of people. It was worn by the officers and principal men among the Romans in time of war,

who are therefore called *Paludati*; distinguished from the common soldiers, who, because they wore the sagum, were called *sagati*. The *paludamentum* came down only to the navel, was open on the sides, had short sleeves resembling angels' wings, and was generally white or red. It is also used to signify the common soldier's coat.

PALY, or **PALE**, in heraldry, is when the shield is divided into four or more equal parts, by perpendicular lines falling from the top to the bottom.

PALY BENDE is when the escutcheon is divided by perpendicular lines, which is *paly*; and also by diagonals, which is called *bendy*.

PAM, *n. s.* Probably, as Johnson says, from palm, victory, as trump from triumph. The knave of clubs.

Ev'n mighty *pam* that kings and queens o'erthrew,
And mowed down armies in the fights of lu. *Pope.*

PAMELIUS (James), a Flemish divine, the son of Adolphus, counsellor of state to Charles V., born at Bruges, in 1536. He was canon of Bruges; and Philip II. appointed him bishop of St. Omer; but, in going to take possession of his episcopate, he died at Mons. He wrote several works; of which the chief is his *Notes upon Tertullian and Cyprian*.

PAMIGER, or **PAMINGER** (Leonard), or the elder, was a scholar, musician, and the intimate friend of Martin Luther. He composed a great variety of church music, printed in four volumes, which appeared at different periods after his decease in 1568, under the superintendence of his son Sophonias.

The latter was born in 1526, studied under Luther and Melancthon, at Wittenberg, and afterwards suffered much persecution on account of his religious opinions. He became in 1568 rector of the choir at Oettingen; but, his principles forcing him to quit that place, he returned to Nuremberg, where he supported himself principally by the sale of his father's works, and by teaching at the Carthusian convent. His death took place in 1603.

PAMPAS DEL SACRAMENTO, vast plains of South America, to the eastward of the Andes, running in a direction nearly north and south through the province of Peru, to the extent of nearly 8000 square leagues. They are so level that they have been compared to the ocean, and are shaded with forests of eternal verdure. They are between the Ucayale and the limits of the Portuguese territories, which bound them to the east and west, while to the north they are bounded by the river Amazons. They contain abundance of lakes and rivers, whose isles and havens are inhabited by tribes greatly diversified. Rain and thunder are frequent, and for some hours of the day thick fogs always rest on the trees. The thickness of the woods often prevents the rain from penetrating to the earth, and the warmth and moisture give birth to innumerable insects and reptiles, and render these regions very unhealthy. Here some of the rarest vegetable products are found: balsams, oils, gums, resins, incense, cinnamon superior to that of Ceylon in strength, but not so valuable, on account of a juice which it transudes; cocoa, cascarilla, and

excellent spiceries. This vast region was discovered about the year 1726; and several missions were established, which were afterwards abandoned. In 1790 father Sobriela was instructed by the Spanish government to set out on an expedition, for the purpose of exploring the course of the Guallaga; and father Girval afterwards, in 1794, surveyed the Ucayale. The Spaniards have endeavoured to train the natives here to agriculture, and to the arts of civilised life; and various missionary settlements have so far succeeded that the missionaries have completely gained the good-will of the natives, and new communications are constantly opened with Peru.

PAMPELUNA, or **PAMPLONA**, a strong town in the north of Spain, the capital of the province of Navarre. It stands partly on an eminence on the banks of the Agra, partly on a plain, and is surrounded by mountains. It derives its chief defence from two castles, one in the inside, the other on the outside of the walls. The latter is the citadel and stands on a rock, of which the only accessible part is covered by a morass. It has a deep ditch, five bastions faced with stone, and in its centre an open space, of a circular form, communicating by five short streets, with five bastions. Pampeluna is said to have been the first town in Spain that embraced Christianity. Its bishopric is certainly one of the oldest; for it was abolished during the Moorish invasion. The public edifices are a cathedral, four churches, and thirteen monasteries. In this, as in most towns of Spain, the education of the youth of both sexes is very imperfect, being confided to the monks and nuns, and the society of the place is very monotonous. The manufactures are insignificant, but the surrounding country is fertile and well cultivated. Population 14,000.

This town is said to have been built by Pompey, after the defeat of Sertorius. In June 1813, on the flight of the French army from Vittoria, Pampeluna was hastily garrisoned and provisioned. It was forthwith invested by the British; but the approach of marshal Soult, with an army, towards the close of July, promised it an early deliverance. In the vicinity the obstinate conflicts of 27th and 29th July took place; and the French being compelled to repass the Pyrenees, with great loss, Pampeluna surrendered on the 31st of October. Sixty-two miles E. S. E. of Bilbao, and about 200 north-east of Madrid.

PAMPER, *v. a.* Ital. *pambere*; of Lat. *panes* and *bibere*. To fill, or rather to glut; feed luxuriously.

It was even as two physicians should take one sick body in hand, of which the former would minister all things meet to purge and keep under the body, the other to *pamper* and strengthen it suddenly again; whereof what is to be looked for but a most dangerous relapse?

Spenser.

You are more intemperate in your blood

Than Venus, or those *pampered* animals

That rage in savage sensuality. *Shakespeare.*

They are contented as well with mean food, as those that with the rarities of the earth do *pamper* their voracities. *Sandys.*

Praise swelled thee to a proportion ready to burst; it brought thee to feed upon the air, and to starve thy soul, only to *pamper* thy imagination. *South.*

His lordship lolls within at ease,
Pampering his paunch with foreign rarities.

Dryden.

To *pampered* insolence devoted fall,
Prime of the flock and choicest of the stall. *Pope.*

Hard is the fate of the infirm and poor;
Here, as I craved a morsel of their bread,
A *pampered* menial drove me from the door.

Moss.

PAMPHLET, *n. s.* & *v. a.* } Fr. *par un*
PAMPHLETEER. } *fillet* Whence

this word is written by Caxton, *paunflet*. A small book; properly a book sold unbound, or only stitched.

Can'st thou with deep premeditated lines,
With written *pamphlets* studiously devised.

Shakespeare.

I put pen to paper, and something I have done,
though in a poor *pamphletting* way. *Howell.*

I put forth a slight *pamphlet* about the elements
of architecture. *Wotton.*

Since I have been reading many English *pamphlets* and tractates of the Sabbath, I can hardly find any treatise wherein the use of the common service by the minister, and the due frequenting thereof by the people, is once named among the duties or offices of sanctifying the Lord's day. *White.*

He could not, without some tax upon himself and his ministers for the not executing the laws, look upon the bold licence of some in printing *pamphlets*.

Clarendon.

The squibs are those who in the common phrase are called libellers, lampooners, and *pamphleteers*.

Taylor.

As when some writer, in a public cause,

His pen, to save a sinking nation, draws;

While all is calm his arguments prevail,

Till power, discharging all her stormy bags,

Flutters the feeble *pamphlet* into rags. *Swift.*

With great injustice I have been pelted by *pamphleteers*. *Id.*

See Louvet, patriot, *pamphleteer*, and sage,

Tempering with amorous fire his virtuous rage.

Formed for all tasks, his various talents see,—

The luscious novel, the severe decree. *Canning.*

PAMPLONA, a city of Tunga, New Granada, situated on a plain, surrounded on all sides by mountains. It has a handsome parish church, with other public edifices and squares. 185 miles north-east of Santa Fe, and 156 W. S. W. of Truxillo.

PAMPHILUS, a celebrated painter of Macedonia, in the age of Philip II. He was founder of the school for painting at Sicyon; and he made a law which was observed not only in Sicyon, but all over Greece, that none but the children of noble and dignified persons should be permitted to learn painting. Apelles was one of his pupils.

PAMPHYLA, an ancient Grecian authoress, who flourished in Nero's reign, and wrote a general history, in thirty-three books, much commended by the ancients, but not extant.

PAMPHYLLIA, the ancient name of a country of Natolia, in Asia, now called Caramania and Cay Bay, between Lycia and Cilicia, on the south coast, north of the Mediterranean. Its first name was Mopsopia.

PAN, *n. s.* } Sax. *ponne*, *panna*; Belg.

PANCAKE. { *panne*; Swed. *panna*. A broad shallow vessel used in kitchens: hence, perhaps, the remarkable cavity of the knee; the part of a

gunlock which contains the priming, &c. : a pancake is an excellent preface or addition to dinners, cooked in the frying-pan.

This were but to leap out of the *pan* into the fire.

Spenser.

A certain knight swore by his honour they were good *pancakes*, and swore by his honour the mustard was naught.

Shakespeare.

Our attempts to fire the gunpowder in the *pan* of the pistol succeeded not.

Boyle.

The pliant brass is laid

On anvils, and of heads and limbs are made,

Pans, cans.

Dryden.

The flour makes a very good *pancake*, mixed with a little wheat flour.

Mortimer's Husbandry.

PAN, in mythology, the god of shepherds, hunters, and all country exercises. In Egypt he was named Mendes, which, according to Jablonski, signifies fecundity. Hence his symbol was a he-goat, the most salacious of all animals. His principal temple was a magnificent building in a city of Lower Egypt, called after his name, where was kept a he-goat, to whom sacrifices of a very monstrous kind were offered. Homer makes him the son of Mercury, and says he was called Pan from *παν*, omne, all, because he charmed all the gods with his flute; others say that he was the son of Demogorgon, and first invented the organ, of seven unequal reeds, joined together in a particular manner. Having on a time fought with Cupid, that god in spite made him fall in love with the coy nymph Syrinx, who, flying from him to the banks of Faddon, a river of Arcadia, at the instant prayers of the nymphs, was turned into a reed, as her name in Greek signifies, which the god grasping, instead of her, made a pipe of it, and, for his music, was adored by the Arcadians. The most common opinion was, that he was the son of Mercury and Penelope. He was by no means displeasing to the nymphs, who are generally drawn dancing round about him to hear his pipe. The goddess Luna, and the nymphs, cut the most distinguished figure in the history of his amours. The usual offerings made him, were milk and honey, in shepherds' wooden bowls; also they sacrificed to him a dog, the wolf's enemy; whence his usual epithet is *λυκαυος*; and whence also his priests were called Luperi. His festival brought into Italy by Evander the Arcadian, and revived afterwards by Romulus, in memory of his pre-server, was celebrated by the Romans on the 15th February. He was also called by them Inuus, ab innuendo. See Liv. l. 5, Macrob. Sat. I. 22, and Serv. in Virg. *Æn.* VI. 775. The ancients, by giving so many adjuncts and attributes to this idol, seem to have designed him for the symbol of the universe: his upper parts being human, because the upper part of the world is fair, beautiful, smiling like his face; his horns symbolise the rays of the sun and of the moon; his red face the splendor of the sky; the spotted skin wherewith he is clothed, the stars which bespangle the firmament; the roughness of his lower parts, beasts and vegetables; his goat's feet the solidity of the earth; his pipe, compact of seven reeds, the seven planets, which they say make the harmony of the spheres: his crook, bending round at the top, the years circling in one another.—Serv. Interpr. Such is the Pan

VOL. XVI.

of the poets; but among the Egyptians, as Mendes, and by the earlier Greeks, he was worshipped in a much higher character, as the soul of the universe, the whole system of things, animated and eternal.

PANACEA, *n. s.* Fr. *panacée*; Gr. *πανακεια*. A universal medicine. An herb.—Ainsworth.

PANA'DA, *n. s.* } From Lat. *panis*, bread.

PANA'DO. } Food made by boiling bread in water.

Their diet ought to be very sparing; gruels, *panados*, and chicken broth.

Wiseman's Surgery.

PANÆTIUS, a stoic philosopher of Rhodes, who flourished about A. A. C. 140. He studied at Athens, and was offered citizenship, but declined. He came to Rome, where he had the Scipios and the Læliuses among his disciples. Scipio Africanus, the younger, was so attached to him, that he took him along with him in all his expeditions. His countrymen, the Rhodians, were highly indebted to him for various privileges and immunities. He wrote a treatise on the Duties of Man, which Cicero praises greatly in his work on the same subject. He lived about thirty years after this.

PANAGIOTI, a Greek nobleman of the seventeenth century, who was chief interpreter to the Grand Signior; and had so great interest with him that he procured many favors to his countrymen. He wrote a book in modern Greek, entitled The Orthodox Confession of the Catholic and Apostolic Eastern Churches. He died in 1673.

PANAMA, a province of Colombia, in the late viceroyalty of New Granada, bounded on the north by the Spanish Main, on the east by the province of Darien, on the south by the Pacific Ocean, and on the west by Veragua. The name of Panama is said to have been given to this country by Tello de Guzman, in 1513, from his having observed the natives engaged in fishing; the word denoting a place abounding in fish. It is bounded on the north by the Caribbean Sea or Spanish Main, on the west by the province of Veragua, on the east by Darien, and on the south by the Pacific Ocean. Great part of the country is still covered with thick forests; and the land between the two seas consists generally of abrupt and broken chains of mountains, one of which, the Sierra de Canatague, on the borders of Panama and Veragua, divides North from South America. On the tops of these craggy mountains the land is sterile and uninhabited, the cities, settlements, plantations, and Indian villages, being mostly along the shores of the two oceans.

The river Chagre is the principal stream in this province, and may be called the high-road of Panama, being used as the means of communication between the eastern shore and the capital. It takes its rise in the mountains near Cruces, which place is about five leagues from Panama. The Chagre has a considerable descent, but is nevertheless navigable for boats up to Cruces; its velocity is about three miles an hour; therefore the ascent from the coast is rather fatiguing. The breadth of this river is about a quarter of a mile at the mouth, and 150 feet at Cruces. The distance from the estuary

2 M

to Cruces, the last navigable point in a straight line, is not above thirty-six miles; but the river winding frequently increases this length. It requires four or five days to ascend it when the waters are not very high. If the water passage is counted, the sinuosities make it forty-three miles, reckoning from Fort San Lorenzo, which defends the entrance. It is by means of this river that one of the communications between the two oceans has been proposed. The ascent from Cruces, where the river is first navigable, towards the summit of the mountains, is rapid for a short space, after which there is a gentle descent the whole way to the South Sea.

In the river Chagre are seen numberless caymans or alligators; they are observed either in the water or on the banks; but, on account of the thorny shrubs and thick underwood, cannot be pursued on shore.

The climate of Panama is hot, as may be well supposed from its situation. The greatest heat is felt in the months of August, September, and October, when it is almost insupportable: the brisas, or trade-winds, and the continual rains, ameliorate the excessive heats during the other months; but at the same time render the climate very unpleasant. The mines produce so little gold or silver, that they are supposed not to answer the expense of working.

The pearl fishery here is also at present of little importance. It was anciently carried on amongst the small islands in the bay of Panama, and was very lucrative. An endeavour has lately been made to re-establish it.

The soil of Panama is prolific, abundantly producing the tropical fruits and plants. On the borders of the Chagre the luxuriance is such, that it is very difficult to penetrate the forests. The barks which navigate the stream are formed of those trees which grow nearest the waters, some of which are very large. These forests are plentifully stocked with all sorts of wild animals peculiar to the torrid regions, among which are innumerable tribes of monkeys. The peacock, the turtle-dove, the heron, and various other sorts of beautiful birds, frequent the forests of the Chagre and of Panama. The country is also infested with reptiles, insects, &c.

The trade of Panama consists in its relations with Veragua, and the ports of Peru and New Granada. From these it is supplied with cattle, maize, wheat, and poultry. Its exports are of no great importance or value. From Cartagena, European goods are received, for which mahogany, cedar, and other woods, with gums and balsams, are exchanged.—Part of the European trade of the western shore of South America is carried on by way of Panama and Porto Bello; but, since the galleons were disallowed, the trade of these two cities has been comparatively trifling. The province contains three cities, twelve villages, and numerous settlements of converted Indians.

PANAMA, the capital of the above province, a city and sea-port, built near the bottom of a large bay of the Pacific which bears the same name. From this city the Isthmus of Darien has frequently taken its appellation; at present it is indifferently styled the Isthmus of Panama or of Darien. It stands in 9° 0' 30" N. lat., and

79° 19' W. long. The streets are broad and paved, both in the city and suburbs; but the houses of the latter are mostly of wood, intermixed with thatched huts. The cathedral is a handsome edifice of stone, as are the churches, convents, monasteries, and an excellent hospital. The people of Panama have a disagreeable drawling method of speaking, and appear as if they were overcome by the great heat of the climate: they nevertheless are really healthy, and live in general to a good age.

Such is the spirit of trade in this place that every person is engaged in bartering. A treasury, custom-house, &c., are established here, and, when the galleons came from Lima, Panama and Porto Bello might be said to be the Acapulco and Vera Cruz of South America. The former is remarkable for its fine bay studded with islands, and in the road before those of Perico, Naos, and Flamingos, ships from the south anchor in safety two leagues and a half from the town.

PANAPA ISLAND, an island at the mouth of the Orinoco, separated from the shore by a shallow channel, moderately wide. At the east and west points there are flats with very little water on them. That of the west point ascends more than a league, and inclines always to the south. Between this island, which is a league and a half long, and the north coast, is the principal channel of the Orinoco.

PANAROOCAN, a town of Java, formerly the capital of a principality, situated on a river which enters the sea by several mouths, about twenty miles west of Cape Sandana, the north-east entrance of the island. It is now subject to the Dutch, and has a square fort, which stands about three quarters of a mile from the sea.

PANATHENÆA, *παναθηναία*, in Grecian antiquity, an ancient Athenian festival, in honor of Athena, or Minerva, the protectress of Athens. Harpocration and Suidas refer the institution of this festival to Erichthonius, the fourth king of Athens, who lived before Theseus. Theodoret alone says the feast was established by Orpheus. Be this as it will, till Theseus, it was never a particular feast of the city of Athens, and was called simply Athenæa; but, that prince uniting all the people of Attica into one republic, they afterwards assisted at the feast; whence the name Panathenæa, i. e. the feast of all Attica. In effect all Attica was present; and each people sent a bullock for the sacrifices, and for the entertainment of the vast multitudes of people assembled. There were two festivals under this denomination, the greater and the less. The greater panathenæa were exhibited every five years; the less every three, or, according to some writers, annually. Though the celebration of neither, at first, employed more than one day, yet, in after times, they were protracted for many days, and solemnised with greater preparations and magnificence than at their first institution. The ceremonies were the same in the great and the little panathenæa; excepting a banner whereon the actions of the goddess were represented in embroidery, performed by maids, with the names of those who had distinguished themselves in the service of the republic which

was only borne at the greater. Prizes were established for three different kinds of combat; the first consisted of foot and horse races; the second of athletic exercises; and the third of poetical and musical contests. These last are said to have been instituted by Pericles. Singers of the first class, accompanied by performers on the flute and cithara, exercised their talents here, upon subjects prescribed by the directors of these exhibitions. A particular account of the order observed in this festival, with the various contests, races, prizes, &c., may be found in Barthelemi's Travels of Anacharsis, vol. ii. p. 434.

PANAX, ginseng, a genus of the diœcia order, belonging to the polygamia class of plants. There are five species.

1. *P. arborea*.
2. *P. fruticosum*. Of these two species and the *spinosa*, there is nothing that merits particular notice.
3. *P. quinquefolium*, the five-leaved ginseng, is a native of North America, and is generally believed to be the same with the Tartarian ginseng; the figures and descriptions of that plant which have been sent to Europe by the missionaries agreeing perfectly with the American plant. This has a jointed, fleshy, and taper root, as large as a man's finger, frequently divided into two smaller fibres downwards. The stalk rises nearly a foot and a half high, and is naked at the top, where it generally divides into three smaller foot-stalks, each sustaining a leaf composed of five spear-shaped lobes, sawed on their edges; they are of a pale green, and a little hairy. The flowers grow on a slender foot-stalk just at the division of the foot-stalks which sustain the leaves, and are formed into a small umbel at the top; they are of an herbaceous yellow color, composed of small yellow petals, which are recurved. Woodville says they are white, that they are produced in a roundish terminal umbel, and are hermaphrodite and male on separate plants. The former stand in close simple umbels; the involucre consists of several small, tapering, pointed, permanent leaves; the proper calyx is tubular, and divided at the rim into five small teeth; the corolla consists of five petals, which are small, oval, equal, and reflexed; the filaments are five, short, and furnished with simple antheræ; the germen is roundish, placed below the corolla, and supports two short erect styles, crowned by simple stigmata; the fruit is an umbilicated two-celled berry, each containing a single irregularly heart-shaped seed. The flowers appear in the beginning of June; and are succeeded by compressed, heart-shaped berries, which are first green, but afterwards turn red; enclosing two hard, compressed, heart-shaped seeds, which ripen in the beginning of August. Ginseng was formerly supposed to grow only in Chinese Tartary, affecting mountainous situations, shaded by close woods; but it has now been long known that this plant is also a native of North America, whence M. Sarrasin transmitted specimens of it to Paris in the year 1704; and the ginseng since discovered in Canada, Pennsylvania, and Virginia, by Lasiteau, Kalm, Bartram, and others, has been found to correspond exactly with the

Tartarian species; and its roots are now regularly purchased by the Chinese, who consider them to be the same as those of eastern growth, which are known to undergo a certain preparation, whereby they assume an appearance somewhat different. For it is said that in China the roots are washed and soaked in a decoction of rice or millet-seed, and afterwards exposed to the steam of the liquor, by which they acquire a greater firmness and clearness than in their natural state. The plant was first introduced into England in 1740, by that industrious naturalist, Peter Collinson. They thrive in those places where it has a light soil and shady situation, and will produce flowers and seeds; but the latter, though in appearance ripe and perfect, will not produce any new plants, as Mr. Miller says he has repeatedly made the experiment, and waited for them three years without disturbing the ground. There are many good specimens in the royal botanic garden at Kew. The dried root of ginseng, as imported here, is scarcely the thickness of the little finger, about three or four inches long, frequently forked, transversely wrinkled, of a horny texture, and both internally and externally of a yellowish white color. On the top are commonly one or more little knots, which are the remains of the stalks of the preceding years, and from the number of which the age of the root is judged of. 'To the taste it discovers a mucilaginous sweetness, approaching to that of liquorice, accompanied with some degree of bitterness, and a slight aromatic warmth, with little or no smell. It is far sweeter and of a more grateful smell than the roots of fennel, to which it has by some been supposed similar; and differs likewise remarkably from those roots in the nature and pharmaceutical properties of its active principles, the sweet matter of the ginseng being preserved entire in the watery as well as the spirituous extract, whereas that of fennel roots is destroyed or dissipated in the inspissation of a watery tincture. The slight aromatic impregnation of the ginseng is likewise in good measure retained in the watery extract, and perfectly in the spirituous.' Lewis, Mat. Med. p. 325. The Chinese ascribe extraordinary virtues to the root of ginseng; and have long considered it as a sovereign remedy in almost all diseases to which they are liable, having no confidence in any medicine unless in combination with it. Jartoux, when in China, boasted of its effects upon himself. But we know of no proofs of the efficacy of ginseng in Europe; and from its sensible qualities we judge it to possess very little power as a medicine. A drachm of the ginseng root may be sliced and boiled in a quarter of a pint of water to about two ounces; then, a little sugar being added, it may be drank as soon as it is cool enough. The dose must be repeated morning and evening; but the second dose may be prepared from the same portion of root which was used at first; for it may always be twice boiled.

4. *P. spinosa*. See No. 1.

5. *P. trifolium*, the three-leaved ginseng, grows naturally in North America; but Mr. Miller never saw more than one plant, which

was sent to him from Maryland, and did not live beyond the first year; being planted in a dry soil, in a very dry season. The stalk was single, and did not rise more than five inches in height, dividing into three foot-stalks, each sustaining a trifoliate leaf, whose lobes were longer, narrower, and deeper indented on their edges than the former. The flower-stalk rose from the divisions of the foot-stalk of the leaves; but, before the flowers opened, the plant decayed.

PANCHBERARAH, a town and small district of Hindostan, in the province of Cashmere. It was formerly esteemed one of the holy places of the Hindoos; but, since the province came into possession of the Mahometans, it has been neglected. Long. 75° E., lat. 34° 32' N.

PANCARPUS, Gr. from *παν*, all, and *καρπος*, fruit, in Roman antiquity, a kind of show, which the Roman emperors frequently exhibited to the people. The name was also given by the Athenians to a sacrifice wherein all kinds of fruits were offered. In this spectacle, the circus, being all set over with large trees, represented a forest, into which the beasts being let from the dens under ground, the people, at a sign given by the emperor, pursued, shot, and killed all they could lay hold of, which they afterwards carried away, to regale upon at home. The beasts usually given on these occasions were boars, deers, oxen, and sheep. Casaubon, Cujas, Pithou, &c., make the pancarpus and sylvia the same thing; Salmasius will have them different. The sylvia, according to him, was such a diversion as that above described; but the pancarpus, a combat, wherein robust people, hired for that purpose, fought with wild beasts; which opinion he confirms from Cassian, Justinian, Claudian, Firmicius, Manilius, and Cassiodorus.

PANCHES, a province of New Granada, fifteen leagues in length from east to west, and twelve wide from north to south, of a hot temperature, and rough and craggy territory, full of mountains and ravines. It is well watered by several large rivers, and is fertile in maize and vines. Here are also many sugar engines for the manufactory of sugar. The capital is Tocaima.

PANCIROLLUS (Guy), a famous lawyer of Rhegium, was educated at the principal universities of Italy; and became professor of law at Padua. Philibert Emmanuel, duke of Savoy, invited him to his university in 1571, where he composed his ingenious treatise *De rebus inventis et deperditis*. But, the air of Turin not agreeing with him, he there lost an eye, and, for fear of losing the other, returned to Padua, where he died in 1591.

PANCO, POINT, a remarkable cape of the north-eastern extremity of the island of Java, at the mouth of the western entrance of the straits of Madura. Here Java and European pilots are stationed, who, as soon as vessels are discovered standing for the channel, pilot them to Gressee and Sourabaya. Long. 112° 44' E., lat. 6° 48' S.

PANCRAST WICK, a hamlet of England, in Devonshire, four miles W. N. W. from Holsworthy. Population 403.

PANCRATIUM, from *παν*, all, and *παρρω*, I overcome, among the ancients, a kind of intermixed exercise, consisting of the lucta or wrestling, and the pugilate or boxing; but it differs in this, that, as the athletes were not to seize the body, their hands were not armed with gauntlets, and gave less dangerous blows. It was the third gymnastic exercise, and not introduced till long after the others. Those who engaged in these exercises were called *pancratiastæ*, as well as those who did not confine themselves to one exercise, but succeeded in several different ones.

PANCRACTICAL, *adj.* Gr. *παν* all, and *παρρω*, strength. Excelling in all the gymnastic exercises.

He was the most *pancratical* man of Greece, and, as Galen reporteth, able to persist erect upon an oily plank, and not be removed by the force of three men.

PANCREAS, *n. s.* } Gr. *πανκρεας*. The **PANCREATIC**, *adj.* } sweet-bread, a gland of the conglomerate sort, situated between the bottom of the stomach and the vertebrae of the loins: pancreatic is, contained in the pancreas.

In man and viviparous quadrupeds, the food moistened with the saliva is first chewed, then swallowed into the stomach, and so evacuated into the intestines, where, being mixed with the choler and *pancreatic* juice, it is further subtilised, and easily finds its way in at the straight orifices of the lacteous veins.

Ray on the Creation.
The bile is so acrid, that nature has furnished the *pancreatic* juice to temper its bitterness. *Arbutnot.*

PANCREAS. See **ANATOMY**, Index.

PANCSOVA, a town of Hungary, pleasantly situated at the confluence of the Temes and the Danube. It has a good trade with Turkey; and having been burned down so lately as 1789, to prevent its falling into the hands of the Turks, has recovered very rapidly. Inhabitants 7000. They are a mixed race of Walachians, Rascians, Germans, and Greeks. Eight miles north-east of Belgrade.

PAN'CY, or } Fr. *pensée*; Lat. *panax*. A **PAN'SY**, *n. s.* } kind of violet.

The daughters of the flood have searched the mead
For violets pale, and cropped the poppy's head;
Pancies to please the sight, and cassia sweet to smell.

Dryden.

The real essence of gold is as impossible for us to know, as for a blind man to tell in what flower the color of a *pansy* is, or is not to be found, whilst he has no idea of the color of a *pansy*. *Locke.*

From the brute beasts humanity I learned,
And in the *pansy's* life God's providence discerned.

Harte.

PANSY. See **VIOLA**.

PANDA, in mythology, a goddess who was invoked as the protectress of travellers and navigators. The goddess of peace was also called Panda, because she opened the gates which were shut in time of war. According to Varro, Panda is also a surname of Ceres, derived a pane dando, because she gave bread to mankind.

PANDANUS, in botany, a genus of the monandria order, belonging to the diœcia class of plants.

PANDARUS, in fabulous history, a son of Lycaon, who assisted the Trojans in their war with the Greeks. He wounded Menelaus and

Diomedes, but was at last killed by the latter. Hom. II. ii. and v. Virg. *Æn.* v. 495.

PANDECT, *n. s.* Lat. *pandecta*. A treatise that comprehends the whole of a science: particularly a digest of the whole civil law.

It were to be wished that the commons would form a *pandect* of their power and privileges to be confirmed by the entire legislative authority. *Swift*.

PANDECTÆ, **PANDECTS**, from *παν*, all, and *δεχομαι*, to take, *q. d.* a book containing all things or all laws, the digest or collection, made by Justinian's order, of 534 decisions or judgments of the ancient lawyers, on so many questions occurring in the civil law; to which that emperor gave the force of law, by the epistle prefixed to them. They consist of fifty books, and make the first part of the body of the civil law. They were denoted by *ππ*; but the copyists taking those *ππ* for *ff*, the custom arose of quoting them by *ff*. In 1137 the pandects of Justinian, which had been brought by an Amalfitan merchant from the east, fell into the hands of the Pisans, and for nearly three centuries they were called Pandectæ Pisanae. But about 1416, Pisa being taken by the Florentines, they were transported to Florence, where they are now preserved in the library of the Medici, and named Pandectæ Florentinae. Papias extends the name of Pandects to the Old and New Testament. There are also Pandectæ Medicinæ by Mat. Sylvaticus of Mantua; Pandects of Turkey, by Leunclavius; and Pandectæ Canonum, by bishop Beveridge.

PANDEMIC, *adj.* Gr. *παν* and *δημος*, a people. Incident to a whole people.

Those instances bring a consumption, under the notion of a *pandemic*, or endemick, or rather vernacular disease to England. *Harvey*.

PANDER, *n. s. & v. a.* } From Pandarus,
PANDERLY, *adj.* } the pimp in the story of Troilus and Cressida; it was therefore originally written pandar, till its etymology was forgotten.—Johnson. A pimp; a male bawd; a procurer; an agent for the ill designs of another: to pander, to be basely subservient to another's vices: panderly follows these senses.

If ever you prove false to one another, since I have taken such pains to bring you together, let all pitiful goers between be called *panders* after my name. *Shakespeare. Troilus and Cressida*.

Proclaim no shame,

When the compulsive ardour gives the charge,
Since first itself as actively doth burn,
And reason *panders* will. *Id. Hamlet*.

Oh you *panderly* rascals! there's a conspiracy against me. *Shakespeare*.

Thou hast confessed thyself the conscious *pander* of that pretended passion:

A single witness infamously known,
Against two persons of unquestioned fame. *Dryden*.

My obedient honesty was made
The *pander* to thy lust and black ambition. *Rowe*.

PANDIA, an ancient festival held at Athens, instituted by Pandion, from whom some derive its name; though others insist that, as it was observed in honor of Jupiter, the name is derived from his omnipotence, because he *παντα διεινεν*, can move and turn all things as he pleases.

PANDICULATION, *n. s.* Lat. *pandiculans*. The restlessness and uneasiness that accompany the cold fits of an intermitting fever.

Windy spirits, for want of a due volatilization, produce in the nerves a *pandiculation*, or oscitation, or stupor, or cramp in the muscles. *Floyer*.

PANDORA, in mythology, a woman formed by Prometheus, to whom each of the gods gave some perfection. Venus bestowed upon her beauty; Pallas wisdom; Juno riches; Apollo music; and Mercury eloquence; but Jupiter, being displeased at Prometheus for having stolen fire from heaven to animate the mass he had formed, gave Pandora a box, which she was ordered not to open; and then sent her to the earth with this box, in which were enclosed age, diseases, pestilence, war, famine, envy, discord, and all the evils and vices that could afflict mankind. This fatal box was opened by Epimetheus, Prometheus's brother, when instantly all the diseases and mischiefs with which it was filled spread over the earth, and Hope alone remained at the bottom. Hesiod says that she was the first woman.

PANDORON. See **PANDURA**.

PANDOSIA, a strong inland town of the Brutii, on the Acheron, where Alexander of Epirus, deceived by the oracle of Dodona, met his fate and perished. (Livy, Justin, Strabo.) Now called Mendicino.—*Holstein*.

PANDOSIA, a town of Epirus, on the Acheron, which Alexander of Epirus was advised to avoid as fatal, but which he met with in Italy. (Livy.) This last is said to have been the residence of the Enotrian kings.—*Strabo*.

PANDOURS are Hungarian infantry; they wear a loose garment fixed tight to their bodies by a girdle, with great sleeves, and large breeches hanging down to their ancles. They use fire-arms, and are excellent marksmen; they have also a kind of sabre nearly four feet long, which they use with great dexterity.

PANDURA, or **PANDORON**, a musical instrument, used among the ancients, resembling the lute; so called from *παν* and *δωρον*, i. e. all gifts. Isidore derives the name from its inventor Pandorus; others from Pan, to whom they attribute its invention, as well as that of the flute. It has the same number of strings with the lute; but they are of brass, and of consequence give a more agreeable sound than those of the lute. Its frets are of copper, like those of the cistre; its back is flat like those of the guitar; and the rims of its table, as well as its ribs, are cut in semicircles. Du Cange observes, that Varro, Isidore, and others of the ancients, mention it as having only three strings; whence it is sometimes also spoken of under the denomination *τρίχορδον*, trichordum.

PANE, *n. s.* Fr. *paneau*; Ital. and Lat. *pagina*. A square of glass: hence a variegated piece of work in one frame.

Him all repute

For his device in handsomg a suit,
To judge of lace, pink, *panes*, print, and plait,
Of all the court to have the best conceit. *Donna*.

The letters appeared reverse through the *pane*.
But in Stella's bright eyes they were placed right again. *Swift*.

The face of Eleanor owes more to that single *pane* than to all the glasses she ever consulted.

Pope's Letters.

PANEGRYIC, *n. s.* } Fr. *panegyrique*; Gr. PANEGYRIST, *n. s.* } πανηγυριστής. An eulogy; encomiastic piece; praise.

Add these few lines out of a far more ancient *panegyrist* in the time of Constantine the Great.

Camden.

The Athenians met at the sepulchres of those slain at Marathon, and there made *panegyrics* upon them.

Stillington.

That which is a satyr to other men must be a *panegyric* to your lordship.

Dryden.

To chase our spleen, when themes like these increase,

Shall *panegyric* reign and censure cease?

This gentleman's name requires no *panegyric*.

Byron.

PANEGRYIC is derived from παν all, and αἵνω, to assemble; because anciently held in public assemblies of the Greeks, at their games, feasts, fairs, or religious meetings. To make their *panegyrics* the more solemn, the Greeks used to begin with the praises of the deity in whose honor the games, &c., were celebrated; then they descended to the praise of the people or country where they were celebrated; then to the princes or magistrates who presided at them; and at length to the champions, especially the conquerors who had gained the prizes in them.

PANEGRYICUM, in church history, an ecclesiastical book, used by the Greek church, containing the *panegyric*al orations of various authors, on the solemnities of Jesus Christ and the saints. It is found in MS. in most churches, but is not the same in all; each church having its particular saints, and the compilers of this kind of books usually suited their collections to the taste of their own devotion. They are disposed according to the order of months, and frequently consist of twelve volumes, answering to the twelve months. Among the principal authors of these works are Athanasius, Cyril, Basil, Chrysostom, &c.

PANEKA, or PAFCA POINT, a remarkable point of the Island of Java, situated at the north-eastern extremity, at the mouth of the western entrance of the straits of Madura. Here the Dutch maintain a small military guard; and Java and European pilots are stationed, who, as soon as vessels are discovered standing for the channel, go before to pilot them to Gresse and Sourabhaya. Refreshments of every kind may be procured from the masters and crews of the pilot boats at moderate prices.

PANEL, *n. s.* From PANE. A square of wood, paper, or parchment: hence a schedule or roll, containing the names of such jurors as the sheriff provides to pass upon a trial.

This fellow will join you together as they join wainscot; then one of you will prove a shrunk *panel*, and, like green timber, warp.

Shakespeare.

The chariot was all of cedar, save that the fore end had *panels* of sapphires, set in borders of gold.

Bacon.

Then twelve of such as are indifferent, and are returned upon the principal *panel*, or the tales, are sworn to try the same, according to evidence.

Hale's History of England.

Maximilian, his whole history is digested into twenty-four square *panels* of sculpture in bas relief.

Addison on Italy.

A bungler thus, who scarce the nail can hit, With driving wrong will make the *panel* split.

Swift.

PANG, *n. s. & v. a.* Sax. pang, venom? Extreme pain; or throe of pain; torment: to torment extremely or cruelly.

I grieve myself

To think, when thou shalt be disedged by her,

Whom now thou tirest on, how thy memory

Will then be *panged* by me.

Shakespeare.

Say, that some lady

Hath for your love as great a *pang* of heart,

As you have for Olivia.

Id. Twelfth Night.

Sufferance made

Almost each *pang* a death.

Id. Henry VIII.

Earth trembled from her entrails, as again

In *pangs*; and nature gave a second groan.

Milton.

Juno, pitying her disastrous fate,

Sends Iris down, her *pangs* to mitigate.

Denham.

My son advance

Still in new impudence, new ignorance,

Success let others teach, learn thou from me,

Pangs without birth, and fruitless industry.

Dryden.

I saw the hoary traitor

Grin in the *pangs* of death, and bite the ground.

Addison.

Ah! come not, write not, think not once of me, Nor share one *pang* of all I felt for thee.

Pope

Heaven and earth are pulling different ways: and, which ever succeeds in drawing him, there will be a parting *pang*, when the ties give way that bind him to the other. If the will of God be, that he should suffer either way, it is better that he should suffer the *pang* of breaking with the world, than the *pang* of breaking with his God, and making shipwreck of eternity. He would fain keep on terms with both. But that cannot be. He cannot serve God and mammon.

British Review.

PANGATARRAN, a long flat island of the Sooloo archipelago, about ten miles long by four in average breadth. It consists of a bed of coral rock, and a very thin soil. The island, however, abounds in cocoa nut trees. There is no fresh water, nor is there any good anchoring ground near, except in a few places. The island has abundance of cattle, goats, and poultry, and is tolerably well inhabited. It was formerly settled by the Spaniards. Some of the chief houses are built on trees, lopped off for posts, which have vegetated afterwards. Long. 120° 30' E, lat. 6° 9' N.

PANGESANA, PANGESANI, or PANGANSANE, an island to the south of Celebes, in the Eastern Seas, and separated from Bouton on the east by a strait which is not more than a cable's length across. It is about fifty-two miles in length, and sixteen in average breadth. The northern part is low, marshy, and unhealthy, but it is in general well peopled. Long. 122° 50' E, lat. 5° 5' S.

PANGOLIN, a species of the manis peculiar to Hindostan. It is certainly a remarkable variety, if not a different species, of the pangolin of Buffon. According to a paper in the Asiatic Researches, 'it has hardly any neck; and, though some filaments are discernible between the scales, they can scarcely be called bristles. But the principal difference is in the tail; that of Buffon's

animal being long, and tapering almost to a point; while that of ours is much shorter, ends obtusely, and resembles in form and flexibility the tail of a lobster. In other respects it seems to have all the characters of Buffon's pangolin; a name derived from that by which the animal is distinguished in Java, and consequently preferable to manis or philidotus, or any other appellation deduced from any European language. A female pangolin, described in the Asiatic Researches, 'had a long tongue shaped like that of the camelion; and if it was nearly adult, as we may reasonably conclude from a young one found in it, the dimensions of it were much less than those which Buffon assigns generally to his pangolin; for he describes its length as six, seven, or eight feet, including the tail, which is almost, he says, as long as the body when it has attained its full growth; whereas ours is but thirty-four inches long from the extremity of the tail to the point of the snout, and the length of the tail is fourteen inches; but, exclusively of the head, which is five inches long, the tail and body are indeed nearly of the same length; and the small difference between them may show, if Buffon be correct in this point, that the animal was young. The circumference of its body in the thickest part is twenty inches, and that of the tail only twelve. There are on each foot five claws, of which the outer and inner are small when compared with the other three. There are no distinct toes; but each nail is moveable by a joint at its root. This creature is extremely inoffensive. It has no teeth, and its feet are unable to grasp. The nails are well adapted for digging in the ground; and the animal is so dextrous in eluding its enemies by concealing itself in holes and among rocks, that it is extremely difficult to procure one. The upper jaw is covered with a cross cartilaginous ridge, which, though apparently not at all suited to any purposes of mastication, may, by increasing the surface of the palate, extend the sense of taste. The oesophagus will admit a man's fore finger with ease. The tongue at the bottom of the mouth is nearly about the size of the little finger, whence it tapers to a point. The animal can protrude this member a great way from the mouth. The tongue arises from the ensiform cartilage and the contiguous muscles of the belly, and passes in form of a round distinct muscle over the stomach, through the thorax, immediately under the sternum, and interior to the windpipe. When dissected out, the tongue could be easily elongated so as to reach more than the length of the animal exclusive of its tail. There is a cluster of salivary glands seated around the tongue, as it enters the mouth. These will necessarily be compressed by the action of the tongue; so as occasionally to supply a plentiful flow of their secretion. The stomach is cartilaginous, and analogous to that of the gallinaceous tribe of birds. When dissected it is generally found full of small stones and gravel, which in India are almost universally calcareous. The inner surface of the stomach is rough to the feel, and formed into folds, the interstices of which are filled with a frothy secretion. The guts are filled with a sandy pulp, in which, however, are

interspersed a few distinct small stones. No vestiges of any animal or vegetable food have been traced in the whole *primæ viæ*. The gall-bladder is commonly distended with a fluid resembling in color and consistence the dregs of beer. It is a viviparous animal. From the contents of its stomach and *primæ viæ*, the pangolin has been supposed by Mr. Burt, an eminent surgeon in Bengal, to derive its nourishment from mineral substances. This novel conjecture is not a little confirmed by the experiments of M. Bruquatelli of Pavia, on the authority of M. Creil, by which we learn that some birds have so great a dissolvent power in the gastric juice as to dissolve in their stomachs flints, rock crystal, calcareous stones, and shells. See MANIS.

PANGONIA, in the old system of mineralogy, from *πας*, numerous, and *γωνος*, an angle, a genus of crystals, consisting of such as are composed of many angles. The bodies of this genus are single-pointed, or imperfect crystals, composed of dodecangular or twelve-planed columns, terminated by twelve-planed pyramids, and the whole body therefore made up of twenty-four planes. There are three species.

PANIANY, a sea-port town of Malabar, forty miles south by east from Calicut. Lat. 10° 44' N., long. 76° E. It is called by the natives Punang Wacul, and contains above 500 houses, belonging to traders, forty mosques, and at least 1000 huts. The town is scattered over a sandy plain, on the south side of a river, which descends from Animalaya, and enters the sea by a very wide channel: the mouth, however, is shut by a bar, which only admits boats to enter. It is very irregularly built, but many of the houses are of stone, two stories high, and thatched with cocoa nut leaves. The huts are inhabited by boatmen and fishermen, who were formerly Mucuas, a low caste of Hindoos, but have now all embraced the faith of Mahomet. The trading boats here are called pattamars, and on an average carry 50,000 cocoa nuts, or 1000 muddies of rice, equal to 500 Bengal bags. About sixty years ago the Moplays of this port were very rich, and possessed vessels that sailed to Surat, Mocha, Madras, and Bengal; but the oppressions of Tippoo Sultan reduced them to poverty. The exports hence are teak wood, cocoa nuts, iron, and rice; the chief imports wheat, pulses, sugar, jagory, salt, cut (terra japonica), and spices.

This is the residence of the tangul, or chief priest, of the Moplays, who says he is descended from Ali and Fatima, the daughter of Mahomet. Although of the Mahometan religion, the tangul's sister's son, according to the custom of Malabar, is considered as the heir to this hereditary dignity. These people are called Moplayar in Malabar, and Lubbaymar at Madras; but, among themselves, they acknowledge no other name than that of Mussulmans.

Of Arabic extraction, they consider themselves, according to Mr. Hamilton, of more honorable birth than the Tartar Mahometans. They use a written character peculiar to themselves, and totally different from the present Arabic, which is known to very few of them except their priests. The Moplays of Malabar are both traders and

farmers; the Lubbymers of Madras confine themselves to the former profession. As traders, they are a remarkably quiet, industrious people; but some of them in the interior, having been encouraged by Tippoo in a most licentious attack on the lives, persons, and property of the Hindoos, became a set of fierce, blood-thirsty, bigoted ruffians; which disposition the British government had considerable difficulty in reforming. In religious matters the tangul is the head of the sect, and the office is hereditary in the female branch. The mosques are very numerous, in each of which presides an imaum, or moullah, appointed by the tangul, who usually bestows the office on his sister's son, the heir of the person who last held the office. (F. Buchanan, &c.)

PANIC, *n. s. & adj.* Fr. *panique*; Gr. *πᾶν-σοφ*. From the god *Pav*, groundless fear being supposed to be sent by him. A sudden and extreme fright: violent (as applied to fear), beyond the cause.

The sudden stir and *panical* fear, when chanticleer was carried away by reynard. *Cambden's Remains*.

Which many respect to be but a *panic* terror, and men do fear they justly know not what.

Browne's Vulgar Errors.

I left the city in a *panic* fright;
Lions they are in council, lambs in fight. *Dryden*.

PANIC, Polyenus says, originates from Pan, one of the captains of Bacchus, who with a few men put a numerous enemy to rout, by a noise which his soldiers raised in a rocky valley, favored with a great number of echoes. This stratagem making their number appear far greater than it was, the enemy quitted a very commodious encampment, and fled. Hence all ill-grounded fears have been called *panics*, or *panic* fears; and this gave occasion to the fable of the nymph Echo being beloved by the god Pan. Others derive the origin of it hence; that in the wars of the Titans against the gods, Pan was the first who struck terror into the hearts of the giants. Theon on Aratus says, he did it by the means of a sea-shell, which served him for a trumpet, whereof he was the inventor.

PANICLE, in botany, denotes a soft woolly beard, on which the seeds of some plants hang pendulous; as in millet, reeds, and hay. See *BOTANY*, Index.

PANICOLA, a town of Naples, in Lavoura.

PANICUM, in botany, a genus of the digynia order, belonging to the triandria class of plants; and in the natural method ranking in the fourth order, gramina. The calyx is trivalved; the third valve being very small. There are thirty-five species:

The species of Guinea-grass by some authors is classed as a panicum; but by expert botanists, who have lately examined the plant, it is called the hollyus polygamum. See *POLYGAMUM*.

PANINI (Paul), a painter of perspective and architecture. He was born at Placentia in 1691, and studied at Rome, where he designed every vestige of ancient magnificence. In his earlier pictures his composition is rich; the truth of his perspective exact; and his paintings are esteemed for the grandeur of the architecture, the clearness of his coloring, the beautiful figures he introduced, and the elegant taste with which he disposed them; but his later paintings have many faults. He died in 1758.

PANIONIA, in antiquity, a festival celebrated in honor of Neptune by people from all the cities of Ionia. In this festival, if the bull offered in sacrifice happened to bellow, it was accounted an omen of divine favor; because that sound was thought acceptable to Neptune.

PANIONIUM, a place in Asia Minor, at the foot of Mount Mycale, near Ephesus, where the deputies of the twelve cities of Ionia assembled to celebrate the above festivals, or to deliberate upon any other public business.

PANLANG, a town of Pegu, in the Birman empire, situated on the Rangoon branch of the Irrawaddy River, and formerly a place of great opulence and extent. It was taken by the celebrated Alompra, from the Peguers, in 1755, and is still a place of consequence. It is situated sixteen miles north-west of Rangoon.

PANNADE, *n. s.* In the manege, the curve of a horse.

PANNAH, a town of Hindostan, in the province of Allahabad, and district of Bundelcund. In the neighbourhood are the celebrated Panassa diamond mines of Ptolemy. They are situated in a range of hills of about twenty-four miles in length, and five in breadth, belonging to different chiefs. The richest of them is called Guddaseah, and produced the largest diamond now in Hindostan. The mines were formerly let out to contractors; but all stones exceeding a certain weight were the property of the chief; so that frequently the contractors were losers. During the reign of Akbar, in the sixteenth century, the revenue received by him on this account amounted to nearly £100,000 per annum; but after the decline of the Mogul empire, and the district came into the possession of rajah Chuttersal (about the year 1750), the profits did not exceed £50,000. Since that period we have no accurate estimate of them. Long. 80° 17' E., lat. 24° 43' N.

PANNALL, a parish of England, West Riding of Yorkshire, seven miles W.N.W. from Wetherby. Population 914.

PANNANACH, or **PANNANICK**, a village of Scotland, in Aberdeenshire, noted for its mineral waters. These waters issue from the north side of the hill of Pannanich, and are said to resem-

ble the Seltzer water in Germany, being strongly impregnated with aerial acid. The spring has been cleared and covered, and several houses have been erected for the accommodation of the visitors, who in summer are numerous, being attracted by the surrounding scenery, which is in the highest degree romantic and sublime. There is an inn for the visitors on the banks of the Dee, about a mile from the wells.

PAN'NEL, *n. s.* Fr. *paneau*; Belg. *pannul*; Ital. *panello*, of Lat. *pannus*. A rustic saddle.

A *pannel* and wanty, pack-saddle and ped, With line to fetch litter, and halters for head.

Tusser.

His strutting ribs on both sides showed

Like furrows he himself had plowed ;

For underneath the skirt of *pannel*,

'Twixt every two there was a channel. *Hudibras.*

PANNELA, or PANNELLA, a town and fortress of Bejapore, Hindostan. It was formerly deemed one of the strongest fortresses in India, and was only taken by the celebrated Mahratta chief Sevajee, by stratagem, in the year 1660. It was subsequently besieged in vain by the army of the king of Bejapore, but yielded to the arms of Aurungzebe, after his capture of Sambajee, about the year 1670. Near this place the British ambassador, Sir William Norris, had his audience of Aurungzebe, in the month of April 1701; and, after being kept nearly six months in the camp, was dismissed. It was recently in possession of the Mahrattas. Long. 74° 57' E., lat. 16° 50' N.

PANNICLE, or } A plant. See below.

PANNICK, *n. s.* }

The *pannicle* is a plant of the millet kind, differing from that, by the disposition of the flowers and seeds, which, of this, grow in a close thick spike: it is sowed in several parts of Europe, in the fields, as corn, for the sustenance of the inhabitants; it is frequently used in particular places of Germany to make bread.

Miller.

September is drawn with a cheerful countenance; and in his left hand a handful of millet, oats, and *pannicle*.

Peasam.

Pannick affords a soft demulcent nourishment.

Arbuthnot.

PANNICLE. See PANNICUM.

PANNICULUS CARNOSUS, in zootomy, a robust, fleshy tunic, situated in beasts between the skin and the fat; by means of which they can move their skin in whole or in part. It is altogether wanting in mankind.

PANN'IER, *n. s.* Fr. *panier*. A basket; particularly a basket in which fruit, or other things, are carried on a beast of burden.

The worthless brute

Now turns a mill, or drags a loaded life,

Beneath two *panniers* and a baker's wife. *Dryden.*

We have resolved to take away their whole club in a pair of *panniers*, and imprison them in a cupboard.

Addison.

PANNIPUT, PANIPATI. A town in the province of Delhi, fifty miles north by west from the city of Delhi. Lat. 29° 23' N., long. 76° 50' E. Famous for having been the scene of the two greatest battles ever fought in India. The first was in the year A. D. 1525, between the army of sultan Baber and that of the Delhi Patan emperor Ibrahim Lodi, in which the latter was slain, and his army totally discomfited. The

second took place in 1761, between the combined Mahomedan army, commanded by Ahmed Shah Abdalli, the sovereign of Cabul, and that of the Mahrattas, commanded by the Bhow Sedasiva. This place is about four miles in circumference, and was formerly surrounded by a brick wall, which partly remains. In the centre is the shrine of a Mahomedan devotee, named Shah Shereef ud Deen Abu Ali Cullinder, whose death happened in the 724th year of the Hegira. The imports are salt, grain, and cotton cloth; the surrounding country produces and exports coarse sugar.

PANNONIA, an extensive country of Europe, bounded on the east by Upper Mesia, south by Dalmatia, west by Noricum, and north by the Danube. It was divided by the ancients into Upper and Lower, or Superior and Inferior Pannonia. The boundary between these was the Arabo and Mount Cetina; the Upper Pannonia lying on the west, and the Lower on the east side. This division was made about the times of the Antonines. The inhabitants were of Celtic origin. Sirmium was the ancient capital of all Pannonia. Philip II. of Macedon, and his son Alexander, successively conquered the country. It was again invaded by Julius Cæsar, and conquered in the reign of Tiberius. It is now divided into the modern provinces of Bosnia, Carniola, Croatia, March, Sclavonia, and Windisch; and part of it is contained in Austria, Hungary, and Servia.—*Lucan.* iii. 95, vi. 220. *Plin.* iii. *Dion. Cass.* 49. *Strabo* iv. vii. *Ptol.* *Tibul.* iv. el. 1. 109. *Suet.* *Aug.* 20. *Jornand.* *Lempriere.*

PANOMPHEUS, from παν all, and ομφη voice, in antiquity, a designation given to Jupiter, because he was said to be the original author of all sorts of divination, having the books of fate, and out of them revealing either more or less, as he pleased, to inferior demons.

PANOPEUS, a son of Phocus and Asterodia, who accompanied Amphitryon in his war against the Teleboans. He was father of Epeus, who made the famous wooden horse by which Troy was taken.

PAN'OPLY, *n. s.* Gr. πανοπλια. Complete armour.

In arms they stood

Of golden *panoply*, refulgent host!

Soon banded.

Milton's Paradise Lost.

We had need to take the Christian *panoply*, to put on the whole armour of God. *Ray on the Creation.*

PANOPOLIS, Gr. Παν, and πολις, i. e. the city of Pan, an ancient town of Egypt, called also Chemmis and Achmim. See ACHMIM. Pan had a temple in it, where he was worshipped, and represented in a statue, fascino longissimo erecto.—*Diod.* v. *Strabo*, 17.

PANORAMA, from Gr. παν all, and οραμα view, a word recently introduced, to express a painting in oil or water colors, which represents an entire view of any country, city, or other natural objects, as they appear to a person standing in any situation, and turning quite round. To produce this effect, the painter or drawer must fix his station, and delineate correctly and connectedly, every object which appears as he turns

round, concluding his drawing by a connexion with where he began.

PANORMITA (Anthony), a native of Palermo in Sicily, one of the most learned men of the fifteenth century. He was secretary to Alphonso, king of Naples, and was esteemed the best poet of his age. He sold an estate to purchase a copy of Livy. He died in 1471.

PANORMUS, an ancient city of Sicily, built by the Phenicians, on the north-west coast between Lilythæus and Pelorus, with a capacious harbour. It was afterwards a principal town of the Carthaginians, and their strongest hold in the island. It was at last taken with difficulty by the Romans.—Thucyd. Polyb. Mela, ii. 7. Ital. xiv. 262. It is now called Palermo.

PANORPA, the scorpion fly, in zoology, a genus of insects belonging to the order of neuroptera. The rostrum is horny and cylindrical; there are two pappi, and three stemmata; the feelers are longer than the thorax. The body is of a black brown color, yellow on the sides, with a few spots of the same on the top. Its tail, formed by the three last segments of the abdomen, is of a maroon color; of these three segments, the last is the largest, almost round, and terminates in two hooks, which constitutes a tail like that of the scorpion. The wings, as long as the body, are diaphanous, reticulated with fibres and stripes of spots of a brown color. There are different varieties of this insect, consisting in the color of the wings. Some, instead of several stripes of spots upon their wings, have only a single black stripe, transverse and irregular, on the middle of the wing, the extremity whereof is also black; others have their wings entirely white, excepting the extremity, which is black. The forceps that is seen at the hinder part of this insect is used by the males to lay hold of their females in their amorous embraces: the threatening tail of the male does no mischief. This insect is found in meadows, by the sides of the ditches. There are four species, distinguished by the color and shape of their wings. See plate CCLXVI.

PANSA (C. Vibius), a Roman consul, who, with his colleague, A. Hirtius, pursued Cæsar's murderers, and was killed in a battle near Mutina. Hirtius and Pansa were the two last consuls of the Roman republic, who enjoyed the dignity of chief magistrates with full power. The consular authority after this dwindled into a mere title.

PANT, *v. n.* & *n. s.*

PANT'ESS, *n. s.*

PANT'ING,

PANTINGLY, *adv.*

Old Fr. *panteler*; barb. Lat. *panthelo*. To palpitate; beat with quick pulsations, as the heart in sudden terror, or after hard labor; heave the breast as for want of breath: hence to agitate, with intermission; to desire earnestly, taking *after* or *for* before the object: as a noun substantive, a palpitation or motion of the heart: pantess, in falconry, is the hawks; difficulty of breathing: panting and pantingly follow the senses of pant.

They *pant after* the dust of the earth on the head of the poor. *Amos* ii. 7.

Yet might her piteous heart be seen to *pant* and quake. *Spenser*.

Leap thou, attire and all,
Through proof of harness, to my heart, and there
Ride on the *pants* triumphing. *Shakespeare*.

She heaved the name of father
Pantingly forth, as if it prest her heart. *Id.*

Below the bottom of the great abyss,
There where one centre reconciles all things
The world's profound heart *pants*. *Crashaw*.

Pluto *pants* for breath from out his cell,
And opens wide the grinning jaws of hell. *Dryden*.
If I am to lose by sight the soft *pantings*, which
I have always felt when I heard your voice, pull
out these eyes before they lead me to be ungrateful.

Tatler.
Miranda will never see her eyes swell with fatness, or *pant* under a heavy load of flesh, till she has changed her religion. *Law*.

The whispering breeze
Pants on the leaves and dies upon the trees. *Pope*.

Who *pants* for glory, finds but short repose,
A breath revives him, and a breath o'erthrows. *Id.*

PANTÆNUS, a stoic philosopher, born in Sicily, in the reign of Commodus. He presided over the celebrated school of Alexandria, and was sent by Demetrius, bishop of Alexandria, to instruct the Indians. He was succeeded in his catechetical school by the famous Clemens, usually called CLEMENS ALEXANDRINUS (see that article), who, not long after his entering upon the office of catechist, wrote that celebrated work entitled, An Exhortation to the Gentiles, in which he exhibited the impiety and absurdity of heathenism, and the arguments in support of Christianity. Pantænus published some commentaries upon the Bible, which are lost.

PANTALARIA, or the ancient Cosyra, is a small island in the Mediterranean, belonging to Sicily, and situated between that island and the African coast. It has a circumference of thirty-four miles, and has a considerable elevation in some parts. The principal products are corn, olives, and cotton. The high grounds are covered with a species of bastard oak and caper trees; and in one of them the remains of a volcanic crater are apparent. The island is exposed to the incursions of the Barbary corsairs, who frequently land and carry off whole families. It belongs, under the title of a principality, to the house of Requisino, in Sicily. Inhabitants 6000. Sixty miles from Marsala, in Sicily, and about the same distance from Cape Bon, near Tunis. Long. 12° 26' 25" E., lat. 36° 45' 40" N.

PANTALOON, *n. s.* Fr. and Span. *pantalón*; Ital. *pantalone*. Dr. Merrick says from the Ital. of *plant the lion*, an old Venetian war-cry. A species of long breeches, 'anciently worn,' says Dr. Johnson; but modern times have converted them into a common garment.

The sixth age shifts
Into the lean and slippered *pantaloon*,
With spectacles on nose, and pouch on side. *Shakespeare*.

The French we conquered once,
Now give us laws for *pantaloons*,
The length of breeches and the garters. *Hudibras*.

PANTALOON, on the theatre, is a buffoon or masked person, who performs high and grotesque dances, and shows violent and extravagant

postures and airs. The word is likewise used for the habit or dress these buffoons usually wear ; which is made precisely to the form of their body, and all of a piece from head to foot. Hence those who wear a habit of this kind under their other clothes are called pantaloons of Venice.

PANTARE, an island in the Eastern seas, about thirty miles in length by twelve in average breadth, separated from the coast of the island of Lomaben by the strait of Alvo, and from the west coast of Ombay by a channel called the strait of Panter. Long. $124^{\circ} 30' E.$, lat. $8^{\circ} 10' S.$

PANTARBE, in natural history, a name given to an imaginary stone, the effects of which upon gold were similar to those of the loadstone upon iron. The ancients, as well as some moderns, had an opinion that there was such a stone ; and the amphitane of Pliny is described as possessing this remarkable quality ; but there is no reason, from any experiment well ascertained, to believe that there ever was such a stone.

PANTHEA, the beautiful and virtuous wife of Abradates, king of Susa. She was taken prisoner by Cyrus the Great, who treated her well, but would not visit her, lest he should be ensnared by her charms. Abradates, hearing of this, laid down his arms, joined Cyrus with all his forces, and fought for him. Being afterwards killed in battle, Panthea killed herself on his body, and Cyrus raised a monument to their memory.—*Xenoph. Cyrop.*

PANTHEA, in antiquity, single statues composed of the figures or symbols of several different divinities together. F. Joubert, who calls them panthea, and who has remarked them sometimes on medals, says, their heads are most commonly adorned with the symbols or attributes belonging to several gods. An instance of this appears in a medal of Antoninus Pius ; which represents Serapis by the bushel it bears ; the sun, by the crown of rays ; Jupiter Ammon, by the ram's horns ; Pluto, by the large beard ; and Esculapius, by the serpent twisted in his hand. M. Boudelot, in a dissertation on the Lares, observes, that the panthea had their origin from the superstition of those who, taking several gods for the protectors of their houses, united them all in the same statue, by adorning it with the several symbols proper to each of these deities.

PANTHEISM, a philosophical species of idolatry leading to atheism, in which the universe was considered as the supreme God. Who was the inventor of this absurd system is not known ; but it was of early origin, and differently modified by different philosophers. Some held the universe to be one immense animal, of which the incorporeal soul was properly their god, and the heavens and earth the body of that god ; whilst others held but one substance, partly active and partly passive : and therefore looked upon the visible universe as the only Numen. The earliest Grecian pantheist of whom we read was Orpheus, who called the world the body of God, and its several parts his members, making the whole universe one divine animal. According to Cudworth, Orpheus and his followers believed in the immaterial soul of the world ; therein agreeing with Aristotle, who certainly held that

God and matter are co-eternal ; and that there is some such union between them as subsists between the souls and bodies of men. With respect to the universe being God, and all things divine and human being modifications of mere matter, the stoics undoubtedly agreed with Anaximander and his followers ; for the school of Zeno held but one substance. This impious doctrine, that all things are God, and that there is but one substance, was revived in modern times by Spinoza, an apostate Jew. See **PAN** and **SPINOZA**.

PANTHEON, a beautiful edifice at Rome, anciently a temple dedicated to all the gods ; but now converted into a church, and dedicated to the Virgin and all the martyrs. It is generally thought to have been built by Agrippa, son-in-law to Augustus, because it has the following inscription on the frieze of the portico :—' M. Agrippa L. F. cos tertium fecit.' Several antiquarians and artists, however, have supposed that the pantheon existed in the time of the commonwealth ; and that it was only embellished by Agrippa, who added the portico. Be this as it may, however, the pantheon, when perfected by Agrippa, was an exceedingly magnificent building, the form of whose body is round or cylindrical, and its roof or dome is spherical ; it is 144 feet diameter within ; and the height of it, from the pavement to the grand aperture on its top, through which it receives the light, is just as much. It is of the Corinthian order. The inner circumference is divided into seven grand niches, wrought in the thickness of the wall ; six of which are flat at the top ; but the seventh, opposite to the entrance, is arched. Before each nich are two columns of antique yellow marble fluted, and of one entire block, making in all fourteen, the finest in Rome. The whole wall of the temple, as high as the grand cornice, inclusive, is cased with divers sorts of precious marble in compartments. The frieze is entirely of porphyry. Above the grand cornice arises an attic, in which were wrought, at equal distances, fourteen oblong square niches : between each nich were four marble pilasters, and between the pilasters marble tables of various kinds. This attic had a complete entablature ; but the cornice projected less than that of the grand order below. Immediately from the cornice springs the spherical roof, divided by bands, which cross each other like the meridians and parallels of an artificial terrestrial globe. The spaces between the bands decrease in size as they approach the top of the roof ; to which, however, they do not reach, there being a considerable plain space between them and the great opening. That so bold a roof might be as light as possible, the architect formed the substance of the spaces between the bands of nothing but lime and pumice stones. The walls below were decorated with lead and brass, and works of carved silver over them ; and the roof was covered on the outside with plates of gilded bronze. There was an ascent from the springing of the roof to the very summit by a flight of seven stairs. The portico is composed of sixteen columns of granite, four feet in diameter, eight of which stand in front with an equal intercolumniation all along. The ascent to the

portico is by eight or nine steps. Such was the pantheon, the richness of which induced Pliny to rank it among the wonders of the world. The eruption of Vesuvius, in the reign of Tiberius, damaged the pantheon very considerably: it was repaired by Domitian and Adrian. But the pantheon is more indebted to Septimius Severus, than to any one since its erection. Septimius bestowed essential reparations upon it, as appears from an inscription upon the architrave. The temple subsisted in all its grandeur till the incursion of Alaric. Zozymus relates, that the Romans having engaged to furnish this barbarian prince with 3000 lbs. of gold, and 5000 lbs. of silver, upon condition that he should depart from their walls, and it being impossible to raise those sums, they stripped the temples of their statues and ornaments of gold and silver. Genserick, king of the Vandals, thirty-nine years after, took away part of their marbles; and loaded one of his ships with statues. On this occasion the inestimable works of Diogenes became the prey of this barbarian. The Christian emperors had issued edicts for demolishing the pagan temples. But the Romans spared the pantheon, which suffered no damage from the zeal of the pontiffs, and other enemies of idolatry, before the first siege of Rome by Alaric. It remained so rich, till about A. D. 655, as to excite the avarice of Constantine II., who came from Constantinople and pillaged the pantheon of its brazen coverings, which he transported to Syracuse, where they soon after fell into the hands of the Saracens. About fifty years before this, pope Boniface IV. had obtained the pantheon of the emperor Phocas, to make a church of it. The artists of these days spoiled every thing they laid their hands upon. After the devastations committed by the barbarians, Rome was contracted within a narrow compass. The pantheon, standing at the entrance of the Campus Martius, was surrounded with houses, which spoiled the fine prospect of it; and some of them were built close to its walls. Pedlars' sheds were built within its portico, and the intercolumniations were bricked up to the irreparable damage of the matchless pillars, of which some lost part of their capitals, and others were chiseled out six or seven inches deep, and as many feet high, to let in posts. This disorder continued till the pontificate of Eugene IV., who had all the houses cleared away, and so the miserable barracks in the portico were knocked down. Benedict II. covered it with lead, which Nicholas V. renewed in a better style. Raphael Urban, who had no equal as a painter, and as an architect no superior, left a considerable sum by his will for the reparation of the pantheon, where his tomb is placed. La Vagua, Udino, Hannibal Carracci, Flamingo Vacca, and Archangelo Corelli, did the same. Pope Urban VIII. was a protector or practiser of the arts. He repaired it; but while he built up with one hand, he pulled down with the other. He caused two belfries of a wretched taste to be erected on the ancient front work, and he divested the portico of all the remains of its ancient grandeur, viz. the brazen coverture of the cross beams, which amounted to a prodigious quantity. This pope, who was of the fa-

mily of Barbarini, presented as much of this metal to his nephew as was sufficient for the decoration of his new palace; on which occasion this pasquinade was stuck up:—

Quod non fecerunt Barbari fecere Barbarini.

Alexander VII. did what Urban had neglected to do. He ordered search to be made for pillars to match those of the portico of the pantheon; and some were found of the very same model. He also caused all the old houses before the portico to be pulled down, and the rubbish to be cleared away which covered the steps, and the bases of the pillars. Clement IX. enclosed the portico with iron rails. Several later popes have added to its decorations, which were all in the taste of the times they were done in; and the body of the edifice and its architecture gained nothing from them.

PANTHEON, the name of another temple at Rome, dedicated to Minerva, as the goddess of medicine. It was in the form of a decagon, and the distance from one angle to another measured twenty-two feet and a half. Between the angles there were nine round chapels, each of which was designed for a deity; and over the gate there was a statue of Minerva.

PANTHEON. In the Escorial is a magnificent chapel, called pantheon, thirty-five feet in diameter, and thirty-eight feet high from the pavement, which is composed of marble and jasper inlaid. The whole inside of the chapel is of black marble, except the luthern, and some ornaments of jasper and red marble. In this chapel are deposited the bodies of the kings and queens; there are only places for twenty-six, and eight of them are already filled.

The PANTHEON OF ATHENS was in many respects little inferior to the Roman one built by Agrippa. The Greek Christians also converted it into a church, dedicated to the Virgin, under the name of Panagia; and the Turks changed it into a mosque.

The PANTHEON OF NISMES was a temple in that city, wherein were twelve niches or statues, supposed to have been destined for the twelve great gods.

PANTHEON, in literary history, a name assumed by a speculative society, established at Edinburgh for public debate upon various subjects, and carried on for above twenty years. It was first instituted in December 1770, or 1771, by a number of young gentlemen, mostly engaged in the studies of law, physic, or divinity, under the name of the Debating Society, and held for upwards of two years in St. John's Lodge, Canongate. But, some differences having arisen among the members respecting its management, a schism took place, and the principal speakers erected a new society under the name of Pantheon, in the end of 1773, which met weekly, first in St. Giles's Lodge, and afterwards in Mary's Chapel, for above eighteen years. The objects of the institution were to mingle the utile with the dulce; public improvement with public amusement, by accustoming the members and all visitors, who inclined to take part in the debates, to a facility in public speaking. Such an institution, it was sometimes remarked; had it been established in

London, in the early years of the celebrated M. Addison, would, in all probability, have accustomed him to deliver himself with ease, and have prevented his failure in the only public oration he ever attempted to make. The subjects were extremely various;—literary, speculative, philosophical, moral, historical, biographical, political, and sometimes religious. A subject, in the form of an alternative question, was announced from the chair at the one meeting, discussed at the next, and at the conclusion of the debate decided by a vote of the company. The society was for many years extremely popular, and often very much crowded by ladies and gentlemen of the first rank. Divines, physicians, writers to the signet, advocates, baronets, members of parliament, and even peers, honored it with their attendance, and occasionally took part in the debates; on which occasions they were admitted honorary members. On questions of public importance, very capital orations were delivered in it. Its popularity was not a little increased by that part of its constitution which devoted its funds, after paying the necessary charges, to charity; particularly to the relief of literary people. These funds arose chiefly from the weekly contribution of sixpence paid by each visitor for admission. The chief cause of its being given up, and the debates suspended, was the political ferment that took place in the public mind, in 1791-2, in consequence of the French Revolution. Accordingly, it was thought improper to continue a society, the laws of which authorising full freedom of debate, seditious or treasonable persons might have made an unjustifiable use of this privilege; and no meeting has been held since 1791.

PANTHER, *n. s.* Fr. *panthere*; Lat. *panthera*; Gr. *παρθύρ*. A spotted wild beast: a pard.

An' it please your majesty,

To hunt the *panther* and the hart with me,

With horn and hound.

Shakespeare.

Pan, or the universal, is painted with a goat's face, about his shoulders a *panther's* skin.

Peachment.

The *panther's* speckled hide

Flowed o'er his armour with an easy pride. *Pope.*

PANTHER, in zoology. See **FELIS**.

PANTHOIDES, a patronymic of Euphorbus, the son of Panthous; applied also to Pythagoras, who pretended that the soul of that hero had transmigrated into his body. See **EUPHORBUS**.

PANTICAPEUM, an ancient town of Taurica Chersonesus, built by the Milesians, and governed by its own laws, till it was conquered by the kings of Bosphorus, and became their capital. Mithridates the Great died in it. (Pliny. *Strabo*.) It is now called Kerche.

PANTLER, *n. s.* Fr. *panetier*. An officer in a great family who keeps the bread.

When my old wife lived,

She was both *panter*, butler, cook.

Shakespeare.

He would have made a good *panter*, he would have chipped bread well.

Id. Henry IV.

PANTOFLE, *n. s.* Fr. *pantoufle*; Ital. *pantofola*. A slipper.

Melpomene has on her feet, her high cothurn or tragick *pantofles* of red velvet and gold, beset with pearls.

Peachment.

PANTOGRAPH, in the arts, the name given to an instrument for copying drawings, so contrived that the copy may either be of the same, a greater, or a smaller size than the original. It consists of four moveable bars fixed together by four pivots, and forming a parallelogram. At the extremity of one of these bars is a point, which is drawn over the lines of the original plan, whilst a pencil fixed at the end of the opposite bar, traces on paper the lines of the copy. The pencil is placed in a hollow cylinder, with a weight on the top, by means of which, the point of the pencil is made to press on the paper. The improvements in the construction of different parts of the pantograph described in the *Mémoires de l'Académie des Sciences*, 1743, have been generally adopted, but the instrument is now scarcely ever used, artists in general preferring the method of squaring the drawings to this tedious and inaccurate instrument.

PANTOMIME, *n. s.* Fr. *pantomime*; Gr. *παρ* and *μυμος*, a mimic; one who has the power of universal mimicry; a buffoon; a scene; a tale exhibited in gesture or dumb show.

Not that I think those *pantomimes*

Who vary action with the times,

Are less ingenious in their art,

Than those who duly act one part. *Heaistras.*

He put off the representation of *pantomimes* till late hours, on market-days.

Arbutnot.

PANTOMIMES made a part in the theatrical entertainments of the ancients: their chief employment was to express, in gestures and action, whatever the chorus sung, changing their countenance and behaviour as the subject of the song varied. They were very ancient in Greece, being derived from the heroic times according to some; but, however this may be, they were certainly known in Plato's time. In Rome it was as late as the time of Augustus before they made their appearance. As to their dress it was various, being always suited as nearly as possible to that of the person they were to imitate. The crocata was much used among the Roman pantomimes, in which and other female dresses they personated women.

PANTRY, *n. s.* Fr. *paneterie*; Ital. *panateria*; barb. Lat. *panarium*. A room or closet in which bread and other provisions are kept.

The Italian artisans distribute the kitchen, *pantry*, bakehouse under ground.

Watson's Architect.

What work they make in the *pantry* and the larder.

L'Estrange.

He shuts himself up in the *pantry* with an old gipsy, once in a twelvemonth.

Addison's Spectator.

PANUCO, a town and district of Mexico, in the intendency of Vera Cruz, on the shore of the river Panuco. It consists of some very neat houses of stone, with roofs of palm leaves. 143 miles north, with a slight inclination east of Mexico. Long. 98° 52' W., lat. 22° 48' N.—A river of this name falls into the gulf of Mexico.

PANWELL, a large town of the province of Aurungabad, Hindostan, twenty-seven miles east of Bombay. It is situated on the banks of the Pan, about seven miles from its mouth. About the year 1680 the Mahratta chief Sevajee built here a fort, part of which still remains, to protect the inhabitants against the incursions of the Siddees

or Ethiopians. Panwell now belongs to the British, and carries on a considerable trade. It is situated in long. 73° 13' E., lat. 19° N'.

PANY ISLE, one of the Philippines, 110 miles in length, by thirty-eight in average breadth. Numerous villages are very regularly built on the declivity of the higher grounds, but the climate is generally considered unhealthy, on account of the morasses. Deer, hogs, buffaloes, and wild animals, are found in the interior, and the coast abounds with cocoa trees. Cattle and horses range at pleasure in the uncultivated parts.

The island is said to contain mines of gold and silver, and the inhabitants manufacture cotton handkerchiefs and cloths. The establishment of the Spaniards on this island are at Iloilo and Antigua, on which coast there is good anchorage; but their government here is on a most wretched footing, and cannot defend its unfortunate subjects from the incursions of pirates, who plunder vessels in the harbours, and carry off their crews into slavery. Long. 122° 33' E., lat. 11° 15' N.

PANZACCHIA (Maria Helena), an Italian paintress, born at Bologna, in 1668, of a noble family. She learned design under Emilio Taruffi, and in a short time acquired great readiness in composition, correctness of outline, and a lovely tint of coloring. She also excelled in painting landscapes; and her works were exceedingly prized.

PAO, SAN JUAN BAPTISTA DEL, is a city of Venezuela, Colombia, situate at fifty leagues south-west of Caracas, in 9° 20' N. lat.

The river Pao, which runs south of the town, formerly discharged itself into the Lake Tacarigua; but an earthquake and inundation have altered its course: it now flows into the Apura.

San Juan consists of a church and several handsome streets on the Pao: and this city is remarkable in having only the proprietors of cattle for its inhabitants. 5400 persons form its population.

The heat would be intolerable here, if it were not tempered by the violence and frequency of the north-east wind: but the place is now very healthy; and the pasturage of the neighbourhood excellent; the settlements numerous, and stocked with mares, horses, mules, and horned beasts. Besides the emoluments arising from their sale, still further are derived from that of a quantity of cheese made here. If a canal were to be cut from the Tacarigua to the Pao, it would be easy to establish a communication from Caracas to Guiana, and even as far as the Brasils. Art might, with so much the more ease, establish this navigation, as it would have only to deepen the bed of the Pao, for the first ten or twelve leagues from its source. The advantages which commerce would derive from it, are incalculable; because, in time of war especially, the province of Venezuela would preserve an intercourse with Guiana, in spite of the cruisers of the enemy. It does not require a very penetrating genius to perceive that by this way, which the enemy could not impede, the most prompt assistance could be sent to Guiana, in case she should be threatened with an invasion.

PAOLI (Hyacinth), a Corsican of a good family. Having acquired reputation, he was elected one of the chief magistrates of the island in 1735. But the various revolutions Corsica underwent, and the oppressions of the Genoese, obliged him to retire to Naples with his family; whence, in 1755, he sent his celebrated son, Pascal Paoli, then in his twenty-ninth year, to assist his countrymen in regaining their liberty, who was appointed by them commandant-general on his arrival.

PAOLI (Pascal de), was born in the island of Corsica in 1726. His father Hyacinth Paoli, after laboring in vain to establish the freedom of his country, went to Naples, where Pascal was educated in the Jesuits' college. In his twenty-ninth year he was chosen generalissimo of Corsica, where he exerted himself in promoting the independence of the republic. The Genoese, however, having made a transfer of the island to France, that power sent such an overwhelming force into it as compelled Paoli to seek an asylum in England, where he obtained a pension of £1500 per annum. On the breaking out of the French revolution, he returned to Corsica, and prevailed upon his countrymen to submit to the English government; after which, disagreeing with the viceroy, he returned to London, and died in 1807.

PAO-TING, a city of China, of the first rank, in the province of Pe-che-lee. Among the cities of this province, it ranks next to Peking, and is the residence of a viceroy. It is very agreeably situated in a fertile and beautiful district, seventy-seven miles S. S. W. of Peking.

PAP, *n. s.* } Bleg. *pappa*; Ital. *papa*;
PAPESCENT, *adj.* } Lat. *papa*, *papilla*. The nipple or teat, particularly of the human female; any light food made for infants; the pulp of fruit: papescent is containing pap.

Some were so from their source endued
By great dame Nature, from whose fruitful pap
Their well-heads spring. *Spenser.*

Out, sword, and wound

The *pap* of Pyramus.

—Ay, that left *pap*, where heart doth hop.

Shakespeare.

Sleep then a little, *pap* content is making. *Sidney.*

The noble soul by age grows lustier;
We must not starve, nor hope to pamper her
With women's milk and *pap* unto the end.

Donne.

Let the powder, after it has done boiling, be well beaten up with fair water to the consistence of thin *pap*. *Boyle.*

An infant making to the *paps* would press
And emets, instead of milk, a falling tear.

Dryden.

In weaning young creatures, the best way is never to let them suck the *paps*.

Ray on the Creation.

That Timothy Trim and Jack were the same person, was proved, particularly by a mole under the left *pap*. *Arbutnot.*

PAPA', *n. s.* Lat. *papa*; Gr. *παππας*; Pers. *baba*; Arab. *baaba*. A fond name for father in many languages.

Where there are little masters and misses in a house, bribe them, that they may not tell tales to *paps* and mamma. *Swift.*

PAPA, in geography, a small but strong town of Lower Hungary, in the county of Vespri. In 1596 the garrison revolted to the Turks, but it was soon retaken by Matthias. It again revolted, and was again retaken from the Turks in 1683, and is subject to the house of Austria. It is seated on a mountain, near the Marchaez; forty-five miles west of Buda. Long. 18° 20' E., lat. 47° 26' N.

PAPA, or **PAPA STOUR**, i. e. Great Papa, an island of Scotland, in Shetland, a mile west of Main-land, in the parish of Walls and Sandness, about two miles long, and above one broad. The surface is level, the soil sandy; but in a good season, when well manured with sea-ware, yields rich crops of barley, oats, and potatoes, as well as excellent grass. It has several small harbours, which afford safe shelter for the fishing boats, and the beaches are convenient for drying the fish. These advantages have induced a great fishing company from Northumberland to erect drying houses upon it, and send vessels to the fishing. In 1792 it had 285 inhabitants. It has a singular cave through which the sea flows far under the rocks.

PAPA, or **PAPA STRONSAY**, an island of Orkney, half a mile north-east of Stronsay, and three miles in circumference. The surface is level, and the soil so fertile that with little improvement it might be rendered one continued corn-field. There are ruins of two chapels on it, dedicated to St. Nicholas and St. Bridget. Mid-way between these is an eminence, called Earl's Know, which has many graves, containing uncommonly large human bodies.

PAPA, or **PAPA WESTRAY**, an island of Orkney, three miles north-east of Westray, and twenty-five from Kirkwall; four miles long, and one broad. Its form is oval; and the soil is so very fertile that it is reckoned the best arable and pasture-land in the Orkneys. It is divided into twenty-four plough-gates, and contained 240 inhabitants in 1792. About seventy tons of kelp are manufactured annually.

PAPACY, *n. s.* } Ital. *papa*, the pope. Po-
PAPAL, *adj.* } pedom; the office, state, or
 dignity, of the pope, or bishop of Rome; papal is relating to or taught by the pope or popery: agreeing with the doctrine of the Romish church; terms like papist, papistical, &c. are often used in unmeaning and unjustifiable reproach. See **ROMAN CATHOLICISM**.

The pope released Philip from the oath, by which he was bound to maintain the privileges of the Netherlands; this *papal* indulgence hath been the cause of so many hundred thousands slain. *Raleigh*.

Now there is ascended to the *papacy* a personage, that though he loves the chair of the *papacy* well, yet he loveth the carpet above the chair. *Bacon*.

The **PAPAL STATE**, or **STATES**, State of the Church, or Ecclesiastical State, so called as forming the temporal dominion of the pope, comprises a country of Italy 240 miles in length from north to south, but of very unequal breadth, being in the central part above 100 miles, and in other parts only twenty or thirty broad. Its superficial extent exceeds 17,000 square miles; but, for so fine a country, it is thinly peopled, containing less than 2,500,000 inhabitants. On

the north it is bounded by the Po, which separates it from the Austrian dominions; on the west by the grand duchy of Tuscany; the Adriatic on the east, and the kingdom of Naples on the south. The congress of Vienna transferred to Austria the Ferrarese territory to the north of the Po, and the French revolution deprived the pope of the districts of Avignon and the Venaisin; but these are the only territorial losses sustained for many years by the papal state.

By the following return, made in 1817, Rome, the capital, and its circuit, contain 241,500

I. The Legations and Delegations of the first class.

| | |
|--------------------------|---------|
| Bologna, legation | 286,426 |
| Ferrara, legation | 174,155 |
| Forli, district | 164,651 |
| Ravenna, legation | 143,199 |
| Urbino and Pesaro, duchy | 196,424 |

II. Delegations of the second class.

| | |
|--|---------|
| Ancona, Mark | 159,047 |
| Fermo, Mark | 88,471 |
| Frosinone and Pontecorvo, principality | 163,372 |
| Macerata, province | 181,003 |
| Perugia, district | 182,673 |
| Spoletto, duchy | 104,380 |
| Viterbo, district | 116,369 |

III. Delegations of the third class.

| | |
|--------------------------|--------|
| Ascoli, district | 69,507 |
| Benevento, duchy | 20,184 |
| Camerino, Mark | 41,672 |
| Civita Vecchia, district | 23,845 |
| Rieti, district | 68,345 |

Total 2,425,223

This territory is traversed from north-west to south-east by the Appennines, which moderate the violent heats of summer, and give rise to the Tiber and a number of minor streams. In the valleys, among the lower ranges of the Appennines, are several large lakes. The principal are those of Perugia, Bolsena, and Bracciano. On the south-west are the Pontine marshes, which corrupt the atmosphere for many miles round; though for the last thirty years canals for draining off these waters have been dug and slowly carried forward: if carefully kept up and extended they would soon, it is thought, add a valuable agricultural tract to the state.

The upper part of the country, comprehending the Marca d'Ancona, the duchy of Spoleto, and part of the legations, enjoys a fine climate, and is well cultivated, producing all kinds of corn and pulse, with excellent wine, fruit, oil, silk, flax, and hemp. Various spots are also favorable to pasturage; so that the rearing of cattle and sheep is prosecuted with success, and great quantities of wool produced. But the Maremma, or lower provinces, towards the Mediterranean, present a very different picture. Although the soil is rich, not a twentieth part is in any tolerable cultivation; and the country is almost deserted from the unwholesomeness of its air. The worst season begins about the middle of July, and continues till the rainy season in October.

Various reasons have been assigned for this, such as the scorching winds of the south, the large quantity of sea-weed thrown upon the coast, the collections of stagnated water, the sulphurous exhalations of the neighbourhood, &c. But a grand cause of evil is the troubles of former ages, and the recent course of weak and inefficient government. Lands are held by short and precarious leases; the time of labor is abridged by endless holidays; numbers of idlers subsist under the characters of monks and pilgrims; and the government has the right of pre-emption in regard to corn and cattle. In consequence, the farm houses are thinly scattered and meanly built; while the laboring people are wholly neglected as a class. However, the present pontiff, by the abolition of the remaining feudal usages, has made a considerable step in favor of this portion of the state.

The manufactures carried on here are generally undertaken by public institutions, under the direction of some ecclesiastic, and are often supported by an annual allowance from government. On this plan are several woollen manufactories of coarse goods; some silk manufactories, particularly at Bologna, the crapes and gauzes of which place are known throughout Europe. At Rome there is a considerable fabric of tapestry. Foreign leather being prohibited, several extensive tanneries have been established, and this manufacture is perhaps the most thriving of any. In 1770 there was established, at the expense of the apostolic chamber, a manufactory of calicoes, and it has been prosecuted with success; but the workmen are chiefly foreigners. Hats, coarse linens, and hardware, are likewise made in the papal dominions. The chief mineral products are marble, rock-salt, sulphur, and alum.

The little trade carried on in the papal harbours is almost entirely in foreign hands. The chief article of export is wool, which is sent to France and Switzerland, and often returned in a manufactured state. Another large article of export is alum. The imports consist of foreign manufactures, fish, such as tunny from Sicily, cod from Newfoundland, and, above all, pilchards from England. The chief sea-ports are Ancona on the east coast, and Civita Vecchia on the west. Accounts are here kept in scudi, or Roman crowns of 4s. 3d. sterling value, each containing ten paoli or 100 bajocchi.

The pope is invested here with absolute power, both spiritual and temporal, the government being considered a theocracy. The candidates for the tiara are necessarily members of the college of cardinals, and for some time back they must be Italians by birth. The election, which rested for several centuries with the nobility, clergy, and citizens of Rome, was transferred in the year 1059 to the college of cardinals, the number of the latter being nominally seventy, but seldom complete. The chief ministers of state are the cardinal camerlingo, at the head of the apostolic chamber, and minister of finance; the cardinal secretary of state for foreign affairs; and the cardinal datary, who has the patronage of vacant livings, the dispensations for marriages, and the charge of whatever relates to an-

nates or first fruits. To these are added the cardinal vicar, who acts for his holiness as bishop of Rome; the cardinal chancellor, whose functions correspond to those of keeper of the great seal in England; the cardinal auditor, or minister of justice; and, finally, the cardinal secretary of briefs.

The consistory is an assembly of cardinals held under the personal presidency of the pope, and may be either private or public. The former is commonly held once a fortnight. A public consistory is a meeting of all the cardinals, held once a month, when his holiness gives audience to foreign ambassadors. The name of 'congregation' is given to a board or commission held under a cardinal or other prelate. The principal are the Congregation of Ecclesiastical Immunities; one for drawing bulls and dispensations; another for superintending the different communities or corporations; the office of the inquisition (whose powers have been greatly moderated of late); the Congregation of the Index, for aiding the inquisition in regard to prohibited books; the Congregation of Rites, for the regulation of ceremonies throughout the Catholic church; and that for the direction of foreign missions. In the different provinces magistrates hear cases in their first stage, and pass sentence in all except capital charges. Bologna, Ferrara, and Romagna, are the three legations, so called because they are governed by a cardinal, deputed by the pope for three years at a time. In the other provinces, every place with the name of a city has a prelate sent from Rome as a governor. In small places the chief magistrates are sometimes laymen. Generally speaking, the administration throughout the country is mild; but the absurd idea of sacrificing the interests of the provinces to those of the capital obtains every where.

The laws in force are the edicts and ordinances of the different pontiffs, the code of Justinian, and the Pandects; but the reigning pope may alter or annul the existing laws: and each minister acting as a judge, and having a court apart, increases greatly the number of law suits. The principal criminal tribunal for laymen is the *sagra consulta*, whose authority extends over the whole of the state except the city of Rome. The procedure of this, as of almost all other courts, is characterised by great tardiness and secrecy. Although of course the inhabitants of this state are almost all Catholics, in the large towns there are Protestants of foreign extraction, and many Jews. The number of bishops is about thirty. Literature cannot be called in a flourishing state, though there are numerous learned institutions in Rome, and all the principal towns.

Before the late revolutions the papal revenue was about £600,000 a year, chiefly derived from local taxes; the produce of the annates and dispensations having done little more, in later times, than discharge the expenses of the boards appointed to manage them. The concourse of pilgrims to Rome is said to be by no means productive of revenue. The taxes consist in duties on wine and brandy; dues on bread and butchers' meat consumed in Rome; customs on imports; and, finally, in a lottery.

The papal troops, including the militia, do not exceed 6000 or 7000. Rome is protected by the castle of St. Angelo. The other fortifications are Civita Vecchia, Urbino, and Perugia. The navy consists of a few galleys and armed vessels stationed at Civita Vecchia, and capable of repelling the inroad of a corsair, but of no use against men of war, and incapable in rough weather of keeping the sea.

The history of the papal see will more properly occupy a portion of our article *ROME*. It may suffice in this place to notice that in the middle of the eighth century the popes first began to acquire lands and temporal possessions. In 1073 the imperious Gregory VII. arrogated supreme dominion both in church and state: from 1307 to 1377 the residence of the pope was at Avignon; and, from 1379 to 1429, there existed a violent schism, during which there were two, and at one time three, dignitaries assuming the title of pope, and acknowledged by different states of Europe. This considerably weakened the papal influence, and paved the way for the Reformation in 1517. Next came the wars of religion, which continued at repeated intervals until the peace of Westphalia in 1648. After this the business of the papal see was in a great measure confined to arrangements relative to particular orders, and to the formation of concordats with Catholic countries. Matters went on thus until the interests of the church were attacked by the measures of the emperor Joseph II., and the French revolution. The French convention proceeded to a total rejection of the papal authority in France; the territory of the Holy See was invaded in 1796 and 1797, and the French were on the eve of entering Rome; but peace was obtained by the payment, it is said, of £1,500,000 sterling, and a great cession of territory. Still more serious oppression was exercised by the French directory in 1798; but Buonaparte, on attaining supreme power, affected to respect the pope, while he made him instrumental to his own views. He concluded a concordat for France in 1802; and two years after the pope repaired to Paris to crown him emperor. But this cordiality was of short duration. The pope had too strong feelings of independence for the new king of Italy: Rome was occupied in 1808 by the French troops, and the pope conveyed a prisoner, first to Savona, and afterwards into France, where he remained until 1814, when the success of the allies restored him to most of his former possessions and prerogatives. See *ROME*.

PAPAYER, the poppy. See *BOTANY*, Index. A genus of the monogynia order, and polyandria class, natural order twenty-seventh, *rhœadæ*: *cor.* is tetrapetalous: *cal.* diphyllous: *caps.* bilocular, opening at the pores below a persisting stigma.

1. *P. album*, or *somniferum*, the white, or *somniferous* garden poppy, rises with an upright smooth stalk, dividing or branching a yard or more high; garnished with large, deeply jagged, amplexicaule, smooth leaves; and terminated by large, spreading, dark purple, and other colored flowers, in the varieties, having smooth cups and capsules. There are many varieties, some of

them extremely beautiful. The white officinal poppy is one of the varieties of this sort. It grows often to five or six feet, having large flowers, both singles and doubles, succeeded by capsules or heads as large as oranges, each containing about 8000 seeds. In the province of Bahar, in the East Indies, the poppy seeds are sown in October and November, at about eight inches distance, and well watered till the plants are about half a foot high, when a compost of dung, nitrous earth, and ashes, is spread over the areas; and a little before the flowers appear they are again watered profusely till the capsules are half grown, at which time the opium is collected; for when fully ripe they yield but little juice; two longitudinal incisions from below upwards, without penetrating the cavity, are made at sunset for three or four successive evenings; in the morning the juice is scraped off with an iron scoop, and worked in an iron pot in the sun's heat till it is of a consistence to be formed into thick cakes of about four pounds weight; these are covered over with the leaves of poppy, tobacco, or some other vegetable, to prevent their sticking together, and in this situation they are dried. The *somniferous* quality of the poppy resides in the milky juice of the capsule. See *OPIMUM*. It grows in England, generally in neglected gardens, or uncultivated rich grounds, and flowers in July and August. This species is said to have been named white poppy from the whiteness of its seeds; a variety of it, however, is well known to produce black seeds; the double-flowered white poppy is also another variety; but, for medicinal purposes, any of these may be employed indiscriminately, as there is no difference in their sensible qualities or effects. The seeds, according to some authors, possess a narcotic power, but there is no foundation for this opinion; they consist of a simple farinaceous matter, united with a bland oil, and in many countries are eaten as food. As a medicine, they have been usually given in the form of emulsion, in catarrhs, stranguries, &c. The heads or capsules of the poppy, which are directed for use in the pharmacopœias, like the stalks and leaves, have an unpleasant smell, somewhat like that of opium, and an acrid bitterish taste. Both the smell and taste reside in a milky juice, which more especially abounds in the cortical part of the capsules, and in its concrete state constitutes the officinal opium. These capsules are powerfully narcotic or anodyne; boiled in water, they impart to the menstruum their narcotic juice, together with the other juices which they have in common with vegetable matters in general. The liquor, strongly pressed out, suffered to settle, clarified with whites of eggs, and evaporated to a due consistence, yields an extract which is about one-fifth or one-sixth of the weight of the heads. This possesses the virtues of opium, but requires to be given in double its dose to answer the same intention, which it is said to perform without occasioning a nausea and giddiness, the usual effects of opium. This extract was first recommended by Mr. Arnot; and a similar one is now received in the Edinburgh Pharmacopœia. It is found very convenient to prepare the syrup from this extract, by dissolving one drachm in

two pounds and a half of simple syrup. The *syrupus papaveris albi*, as directed by both colleges, is a useful anodyne, and often succeeds in procuring sleep, where opium fails; it is more especially adapted to children. White poppy heads are also used externally in fomentations, either alone, or more frequently added to the decoction pro fomento.

2. *P. Cambricum*, the Welch poppy, has a perennial root, pinnated cut leaves, smooth, upright, multiflorous stalks, a foot and a half high; garnished with small pinnated leaves, and terminated by many large yellow flowers, succeeded by smooth capsules. It flowers in June.

3. *P. orientale*, the oriental poppy, has a large, thick, perennial root; long, pinnated, sawed leaves; upright, rough, uniflorous stalks, terminated by one deep red flower, succeeded by oval, smooth capsules. The flowers appear in May.

4. *P. rhoeas*, the wild globular-headed poppy, rises with an upright, hairy, multiflorous stalk, branching a foot and a half high; garnished with long, pinnatifid, deeply cut, hairy leaves; the stalk terminated by many red and other colored flowers in the varieties, succeeded by globular smooth capsules. This plant is common in corn fields, and flowers in June and July. It may be distinguished from the *papaver dubium*, to which it bears a general resemblance, by its urn-shaped capsules, and by the hairs upon the peduncles standing in a horizontal direction. The capsules of this species, like those of the *somniferum*, contain a milky juice, of a narcotic quality, but the quantity is very inconsiderable, and has not been applied to any medical purpose; but an extract prepared from them has been successfully employed as a sedative. The flowers have somewhat of the smell of opium, and a mucilaginous taste, accompanied with a slight degree of bitterness. A syrup of these flowers is directed in the London Pharmacopœia, which has been thought useful as an anodyne and pectoral, and is therefore prescribed in coughs and catarrhal affections; but it seems valued rather for the beauty of its color than for its virtues as a medicine. All the kinds are hardy, and will prosper any where. The first and last species, being annual, are to be propagated only by seeds; but the others by parting the roots as well as by seeds.

PAPAV'EROUS, *adj.* Lat. *papavereus*, from *papaver*, a poppy. Resembling poppies.

Mandrakes afford a *papavereous* and unpleasant odour, whether in the leaf or apple. *Broune.*

PAPAW', *n. s.* Fr. *papayer*; Hind. *pupuey*, low Lat. *papaya*. A plant.

The fair *papaw*,

Now but a seed, preventing Nature's law,

In half the circle of the hasty year,

Projects a shade, and lovely fruit does wear.

Waller.

PAPAW, in botany. See **CARICA**.

PAP-CASTLE, an ancient castle of England, in Bridekirk parish, Cumberland, which stood two miles from Cockermouth, on the other side of the Darwent, whose Roman antiquity is proved by several monuments; and a large green stone vessel found here, with little images upon it, is supposed to have been formerly a Danish font

for dipping of infants; and has been since used at Bridekirk in the neighbourhood for sprinkling. The name of Pap-castle seems to be contracted from Pippard its owner; it is said to have been demolished, and the materials employed to build Cockermouth Castle. Mr. Routh, in a letter to Mr. Gale, thus describes the ruins discovered at Pap-castle, January 16th, 1743. 'The close in which they lay is a little to the south of the fort, on the declivity of the hill to the river, and bounded on the west by a narrow lane, probably the *via militaris* continued; and is usually shown to strangers as the most remarkable here for finding Roman coins. They are the largest ruins ever known to be discovered in these parts; for they met with three walls, besides the pavement.' Mr. Routh, in another letter to Mr. Gale, April 13th, 1743, describes a fibula, a coin of Trajan found it. Dr. Stukely says, the Roman castrum lies on the top of the hill above the village, and he traced its whole circumference, a bit of the Roman wall by the river side going to Wigton, and there the ditch is plainly visible, though half filled up with the rubbish of the wall. Coins of Claudius, Adrian, and a silver Geta, *PONT. REV. PRINCEPS IVVENTVTIS*, were also found in it. He supposes its ancient name, *Derventio*, derived from the *Dervent*.

PAPER, *n. s., adj. & v. a.* } Fr. *papier*;
PAPER-MAKER, } Lat. *papyrus*. A
PAPER-MAKING, } well known sub-
PAPER-MILL. } stance used for
 writing and printing upon; a portion of paper;
 single sheet; deed; essay; account, or state-
 ment; used variously for what is contained on
 paper or on a sheet of paper: as an adjective,
 made of paper; hence slight or thin: to paper is,
 to register; commit to, line, or adorn with paper:
 for paper-maker, paper-making, and paper-mill,
 see below.

He makes up the file
 Of all the gentry: and his own letters
 Must fetch in him he papers.

Shakspeare. Henry VIII.

What see you in those papers, that you lose
 So much complexion? look ye how they change!
 Their cheeks are paper. *Id. Henry V.*

Thou hast caused printing to be used: and contrary to the king, and his dignity, thou hast built a paper-mill. *Shakspeare.*

Nothing is of more credit or request than a petulant paper, or scoffing verses. *Ben Jonson.*

He was so careless after bargains that he never received script of paper of any to whom he sent, nor bond of any for performance of covenants. *Fell.*

'Tis as impossible to draw regular characters on a trembling mind, as on a shaking paper. *Locke.*

There is but a thin paper wall between great discoveries and a perfect ignorance of them. *Barnet.*
 They brought a paper to me to be signed. *Dryden.*

Do the prints and papers lie?

Swift.

I was in hopes that in coming to Leicester you would have had intelligence of your papers. As this is not the case you ought immediately to advertise them, &c. *Warburton.*

Sir,—In a literary performance, by a juvenile author, I feared to find intermixed much of the common trash of periodical papers; stories of love adventures. *Canning.*

PAPER, INCOMBUSTIBLE. An incombustible paper is made of the lapis asbestos, or linum vivum, which will bear burning without being injured. Dr. Bruckman, professor at Brunswick, published a natural history of the asbestine, or incombustible paper; and printed four copies of his book thereon. Vide Bibl. Germ. tom. xiv. p. 190.

The manner of making this paper is described by Mr. Lloyd (Phil. Trans. No. 166, p. 824), from an essay made by himself. He pounded a quantity of the asbestos in a stone mortar, till it became a downy substance; then sifted it in a fine searce, and by this means purged it indifferently well of its terrene parts; because the earth or stones he could not pick out of it before, or at the pounding, being reduced to a powder, came through a searce, the linum remaining. This done, he brought it to the paper-mill: and, putting it in water, in a vessel just big enough to make a sheet with such a quantity, he stirred it pretty much, and desired the workmen to proceed with it in the usual method, with their writing-paper mould; only to stir it about always before they put their mould in; considering it as a far more ponderous substance than what they used; and that consequently, if not immediately taken up after it was agitated, it would subside. The paper made of it proved but coarse, and was very apt to tear; but this was the first trial, and the workmen did not doubt, but in case it were pounded in one of their mortars for twenty hours, it would make good writing-paper. See ASBESTOS.

PAPER-HANGINGS, in the arts, are of various kinds, and are used for the covering of ceilings, walls, stair-cases, &c., and represent stucco-work, velvet, damask, brocades, chintzes, or such silks and stuffs as are employed for hanging rooms: hence their name. The principal difference in the manufacture lies in the grounds. The common grounds are laid in water, and made by mixing whitening with the common glovers' size, and laying it on the paper with a proper brush in the most even manner. This is all that is required where the ground is to be left white; and the paper being then hung on a proper frame till it be dry is fit to be painted. When colored grounds are required, the same method must be pursued, and the ground of whitening first laid, except in pale colors, such as straw-colors or pink, where a second coating may sometimes be spared, by mixing some strong color with the whitening.

There are three methods by which paper-hangings are painted; the first, by printing on the colors; the second, by using the stencil; and the third, by laying them on with a pencil, as in other kinds of painting.

1. When the colors are laid on by *printing*, the impression is made by wooden prints, cut in such a manner that the figure to be expressed is made to project from the surface; and this being charged with the colors tempered with their proper vehicle, by letting it gently down on a block on which the color is previously spread, conveys it from thence to the ground of the paper on which it is made to fall by means of its weight, and the effort of the arm of the person

who uses the print. It is easy to conclude that there must be as many separate prints as there are colors to be printed. But, where there are more than one, great care must be taken after the first to let the print fall exactly in the same part of the paper as that which went before, otherwise the figure of the design would be brought into irregularity and confusion. In common paper of low price it is usual, therefore, to print only the outlines, and lay on the rest of the colors by stencilling, which both saves the expense of cutting more prints, and can be practised by common workmen, not requiring the great care and dexterity necessary to the using several prints.

In the finer paper, where several colors are laid on with the prints, the principal color is begun with: and the rest taken successively; the print for the outline being laid on last. In cases where the pencil is to be used, the outline is nevertheless to be made before the colors are laid on by the pencil, if such outline is to be made at all; because that is the guide to the persons who lay on the color; and confines them to a correctness. In paper printed with designs in chiaro-scuro, such as the imitation of stucco-work, and bas relievos, the order of printing must be, to lay on the ground color first; afterwards the shades; and lastly the lights; and the same rule of succession must be observed where the colors are pencilled.—*Handmaid to the Arts*, vol. ii. p. 445, &c.

2. The manner of *stencilling* the colors is this. The figure, which all the parts of any particular color make in the design to be painted, is to be cut out in a piece of thin leather or oil-cloth, which pieces of leather or oil-cloth are called stencils; and being flat on the sheets of paper to be printed, spread on a table or floor, are to be rubbed over with the color properly tempered by means of a large brush. The color passing over the whole is consequently spread on those parts of the paper where the cloth or leather is cut away, and gives the same effect as if laid on by a print. This nevertheless is only practicable in parts where there are only detached masses or spots of colors; for where there are small continued lines, or parts that run one into another, it is difficult to preserve the connexion or continuity of the parts of the cloth, or to keep the smaller corners close down to the paper; and, therefore, in such cases, prints are preferable. Stencilling is indeed a cheaper method of accomplishing the work than printing; but, without such extraordinary attention and trouble as render it equally difficult, it is far less beautiful and exact in the effect. For the outlines of the spots of color want that sharpness and regularity that are given by prints, besides the frequent extralinations or deviations from the just figure, which happen by the original misplacing of the stencils, or the shifting of the place of them during the operation.

3. *Pencilling* is only used in the case of nicer work, such as the better imitations of the Indian paper. It is performed in the same manner as other painting in water or yarnish. It is sometimes used only to fill the outlines already formed by printing, where the price of the color, or the exactness of the manner in which it is required to be laid on, render the stencilling or printing it

less proper; at other times it is used for forming or delineating some parts of the design, where a spirit of freedom and variety, not to be had in printed outlines, is desired to be had in the work.

The paper designed for receiving *flock* is first prepared with a varnish-ground with some proper color, or by that of the paper itself. It is frequently practised to print some mosaic or other small running figure in colors on the ground, before the flock be laid on; and it may be done with any pigment of the color desired, tempered with varnish, and laid on by a print cut correspondently to that end.

The method of laying on the flock is this. A wooden print being cut, as is above described, for laying on the color in such manner that the part of the design which is intended for the flock may project beyond the rest of the surface, the varnish is put on a block covered with the leather or oil-cloth, and the print is to be used also in the same manner, to lay the varnish on all the parts where the flock is to be fixed. The sheet thus prepared by the varnished impression is then to be removed to another block or table, and to be strewed over with flock, which is afterwards to be gently compressed by a board or some other flat body, to make the varnish take the better hold of it, and then the sheet is to be hung on a frame till the varnish be perfectly dry; at which time the superfluous flock is to be brushed

off by a soft camel's-hair brush; and the proper flock will be found to adhere in a very strong manner. The method of preparing the flock is by cutting woollen rags or pieces of cloth with the hand, by means of a large bill or chopping-knife, or by means of a machine worked by a horse-mill.

There is a kind of counterfeit flock-paper, which when well managed has very much the same effect to the eye as the real, though done with less expense. The manner of making this sort is, by laying a ground of varnish on the paper; and, having afterwards printed the design of the flock in varnish, in the same manner as for the true, instead of the flock some pigment or dry color of the same hue with the flock required by the design, but somewhat of a darker shade, being well powdered, is strewed on the printed varnish, and produces nearly the same appearance.

Paper-hangings are sometimes spangled with that kind of talc called isinglass, which, being reduced to a gross flaky powder, has a great resemblance to thin silver scales or powder. It is laid on by strewing over the varnish, which forms the ground, before it begins to dry. When it is laid on in a figure, for the representation of embroidery, the figure must be printed in varnish, and the talc strewed upon it, and treated like flock. Smalt may also be used in the same manner as flock or spangles.

PAPER-MAKING.

PAPER-MAKING. The origin of this most useful art, like that of printing, to which it has proved so important an auxiliary, is involved in obscurity. The *ancients*, we are perhaps too ready to suppose, had comparatively little occasion for paper; important MSS. have always been committed to more durable substances; civilisation must become permanent in a country before the frequent interchange of mind by writing is extensively practised, particularly on subjects of temporary importance; and it is in the temporary writings, and the books of the *existing* generation, rather than those which are handed down to posterity, that the great consumption of paper takes place. Yet, in the annals of that country in which we find the earliest traces of the arts, we read much of paper; which, according to Varro, was first made at Alexandria, in Egypt, from the rush papyrus. Pliny describes its root as of the thickness of a man's arm, and ten cubits long; from this arise a great number of triangular stalks, six or seven cubits high, each thick enough to be easily spanned; its leaves are long like those of the bull-rush; its flowers staminate, ranged in clusters at the extremities of the stalks; its roots woody and knotty like those of rushes; and its taste and smell akin to those of the cyperus, under which genus Linnæus has classed the papyrus. See **PAPYRUS**. Various other useful articles were made of this rush, as blankets, mats, garments, and shoes; sails, ropes, and other naval rigging. Moses, according to the Septuagint, was exposed on the Nile, ἐν θυβίᾳ πapyrus, in a basket of this material.

• In the Roman writers we find various kinds of Egyptian paper described, as, i. Those denominated from the purposes to which they were applied. Such were (1.) The *hieratica*, the most ancient kind, and appropriated to religious services: this was afterwards called *Augusta*, after the emperor of that name, and sometimes *Lavinia*, in compliment to his wife, who is said to have suggested improvements in bleaching it. This paper seems to have been made of about eleven inches in breadth. (2.) The *emporica*, or *emporetica*, a small and coarse paper used by shopkeepers: we perhaps should rank here (3.) The *amphitheatrica*, from its being used or made in the amphitheatre; but it appears, according to Guilandinus, to have been known long before any building of this kind was erected; and he names it *Arthribitica*, from Arthribus a city of the Delta.—ii. Various papers were called after the place in which they were manufactured, as, (1.) The *Saitica*, from the city Sais; (2.) The *Teniotica*, or *Taitica*, from a place now unknown. Most of the inland towns and cities of Egypt are said to have had manufactories of this kind: and Vopiscus states that the tyrant Firmus, who rebelled in Egypt, declared he would maintain an army only with paper and glue, 'papyro et glutine,' which Casaubon understands as spoken of the produce and revenue of paper. iii. Other papers were called, as in modern times, after the names of celebrated makers: as, (1.) The *Fanniana*, from Rhem. Fannius Palamon, the grammarian, who owned a paper manufactory. This kind was small, but finer than the amphitheatrical paper; and at one time was first

wrought at Alexandria, and finished at Rome. (2.) *Claudia*, first made by order of the emperor Claudius, and reputed the best of all the kinds made in his time.

The general mode of manufacturing the papyrus was to begin by lopping off the head and root of the plant; the remaining stem was then slit lengthwise into two equal parts, and from each of these they stripped the thin scaly coats or pellicles, of which it was composed, with a needle or the point of a knife. The innermost of those pellicles were looked on as the best, and those nearest the rind or bark the worst; they were kept apart accordingly, for different and inferior sorts of paper. Pliny calls these pellicles by the twelve different names of *philura*, *ramentum*, *scheda*, *cutis*, *plagula*, *corium*, *tænia*, *subtegmen*, *flatumen*, *pagina*, *tabula*, and *papyrus*.

The pellicles being thus detached, and, according to the count de Caylus, dried in the sun, were stretched on a table, and two or more laid over each other transversely, so as that their fibres crossed in right angles. The Claudian paper, named above, consisted of three of these pellicles or layers. They were then glued together with the slime of the Nile, or a flour paste; afterwards pressed to get rid of the water; and flatted and smoothed by being beaten with mallets. Sometimes a polish was added by means of a hemisphere of glass, ivory, or bone. The Romans seem to have used a size or gum, whereby they could enlarge or diminish the final volume of the paper, and they excelled in the bleaching and polishing of it.

Varro, who in common with many writers assigns the origin of the manufacture of papyrus to Alexandria, seems to have overlooked several important facts which prove it to have been known to the Greeks before the conquest of Egypt by Alexander. Thus Anacreon Alcæus, Plato the comedian, Aristomenus, Plato the philosopher, Aristotle, and Æschylus, used the terms *βαβλος* and *βαβλιον*: and Herodotus, Homer, and Hesiod, expressly mention the papyrus. Pliny cites a passage from an ancient Roman annalist which speaks of paper books found in king Numa's tomb, who was buried above three centuries before Alexander. At the period of Alexander's conquests it seems, however, to have become far more generally known; and, so late as two centuries after, we find stems and barks of trees frequently used for writing upon through the scarcity of paper. In the reign of Tiberius there was such a scarcity of this article that its use in contracts was dispensed with by public authority. In about the twelfth century its manufacture seems to have been entirely discontinued.

Montfaucon and others speak of an ancient Egyptian bark paper, which they distinguish from that made of the papyrus as thicker and more brittle, as well as more apt to part asunder, so that in some instances the bottom layer has been found to remain, and that on which the writing was made has peeled off. Matthei, however, thinks little of this distinction, and contends that the only use of the *tilia* or linden was for making the boards or tablets used for diptycha or pocket-books; and sometimes to be

written on, on both sides, which the ordinary Egyptian paper would not bear.

A paper made of cotton seems to have been working its way into Europe from the east as early as the tenth century. There are MSS. written on it in fact of this date in the French king's library: and in the twelfth century cotton MSS. became more frequent than those on skins. This paper is that called *charta bombyca*.

Some anomalous kinds of ancient paper may be here alluded to, and close this part of our sketch. According to the *Memoirs de Trev.* (Sept. 1711), there are two papal bulls of the dates 891 and 895 (issued by the Anti-popes, Romanus, and Formosus), which are written on an unknown material of this description, two ells long and one broad: they consist of two leaves or pellicles glued together transversely, and are still legible in most places. The conjectures of the French literati in regard to them are very various. Some consider them to be made of the leaves of the alga, or sea-wreck; others of the leaves of a rush, called la boga, found in the marshes of Rousillon; others of papyrus; others of bark; and others of cotton. There is also a MS. of this description in the abbey of St. Germain.

The oriental and other papers made direct from vegetable substances, seem next to require our attention: though all the published details of the mode of manufacturing them are vague and unsatisfactory. There are many palm trees of India and America to which botanists have given the name papyraceous, because the natives have written with bodkins either on the leaves or the bark. Such is the American palm, called tal by the Indians; and the guajaraba of New Spain. Every palm the bark of which is smooth, and the leaves large and thick, may be used for this purpose.

But the art of making paper from vegetables reduced to stuff was known in China long before it was practised in Europe; and the Chinese have carried it to a degree of perfection hitherto unparalleled in the western world.

Every province of their empire has its peculiar paper. That of Se-tchuen is made of hemp or of linen rags, as in Europe; that of Fo-kien of the bamboo; that of the northern provinces, of the interior bark of the mulberry; that of the province of Kiang-nan of the skin found in the webs of the silk-worm; other provinces use the cotton plant extensively, others the bark of the elm, and wheat or rice straw; finally, in the province of Hu-quang, the tre-chiu, or ko-chu, furnishes the materials with which they make paper.

The method of fabricating paper with the bark of different trees is nearly the same with that which is followed in the bamboo, of which alone we shall speak. The second skin of the bamboo generally, but sometimes the whole substance, is reduced to pulp by steeping, boiling, and the mortar, and then beat together with the glutinous juice of a plant named ko-teng, till it becomes a thick and viscous liquor. The workmen plunge their forms into this liquor; take out what is sufficient for a sheet of paper, which immediately becomes firm and shining, and is detached from

the form by turning down the sheet on the heap of paper already made, without the interposition of pieces of woollen cloth, as in Europe. The Chinese paper must be dipped in a solution of alum before it can take either ink or colors.

In Japan they manufacture paper from the bark of trees of a prodigious strength. There is a kind of it fit for bed-hangings and wearing apparel; resembling so much stuffs of wool and silk, that it is often taken for them. The following is Kempfer's catalogue of trees used in Japan for the manufactory of paper:—1. The true paper-tree, called in the Japanese language *kaadsi*, Kempfer characterises thus: *papyrus fructu mori celsæ, sive morus sativa foliis urticæ mortuæ cortice papifero*. 2. The false paper-tree, called by the Japanese *katsi kadsire*; by Kempfer *papyrus procumbens lactescens, folio longo, lanceata cortice chartaceo*. 3. The plant which the Japanese call *oreni* is named by Kempfer *alva radice viscosa, flore ephemero magno puniceo*. 4. The fourth tree used for paper is the *futo-kadsura*, named by Kempfer *frutex viscosus procumbens folio telephii vulgaris æmulo fructu racemoso*.

When the bark they use has been cleansed and sorted, they boil it in clear lie; keeping it from the time it begins to boil perpetually stirred with a strong reed, and pouring from time to time so much fresh lie in as is necessary to condense the evaporation, and to supply what has been lost by it; this boiling is continued till the matter is so tender that being but slightly touched with the finger it will dissolve and separate into fibres. The lie is made of wood ashes, in the following manner: two pieces of wood are laid across over a tub and covered with straw, on which they lay wet ashes, and then pour boiling water upon it, which, as it runs through the straw into the tub underneath, is imbued with the saline particles of the ashes.

After boiling follows the washing of the bark, which is generally performed in a river, and requires great judgment and attention. The bark is put into a sort of sieve, which will let the water run through, and stirred continually till it comes to be diluted into a delicate pulp. For the finer sort of paper the washing is repeated, and the bark put into a piece of linen, instead of a sieve, as the particles become very fine; and the harder pieces or knots are now picked out. Now the bark is put upon a thick, smooth, wooden table, in order to its being beaten with sticks of the *kusnoki* wood, which is commonly done by two or three people, until it is so thin as to resemble a pulp of soaked paper; and, being thus prepared, it is put into a narrow tub, with the fat slimy infusion of rice, and the infusion of the *oreni* root, which likewise is very slimy and mucilaginous. These ingredients being put together are stirred with a thin clean reed, till they are thoroughly mixed and wrought into a uniform liquid substance, of good consistence, and out of this tub the leaves are taken off one by one, on proper patterns made of bulrushes. These to dry them are laid up in heaps, upon a table covered with a double mat, and a small piece of reed is put between every leaf,

which serves, in time, to lift them up and take them off singly.

At the beginning of the summer, when the *oreni* root is scarce, the paper-makers make use of a creeping shrub called *sane kadsura*, the leaves of which yield a mucilage in great plenty, though not altogether so good for this purpose. They also use the *juncus sativus*, which is cultivated in Japan with great care.

The Siamese make a paper of the bark of the *pleok-kloi* tree, of which they have a black and a white kind: it is folded up in books, in the manner of fans, and will bear to be written on on both sides with a stylus which they make of clay.

The Cingalese also, according to Dr. Davy, write very neatly and expeditiously with a sharp-pointed style on the immense leaf of the *talipot*-palm: coloring 'their characters, when scratched by an ink made of lamp-black and gum.' Their numerous books are all formed of these leaves, cut into suitable pieces, and confined by boards: 'occasionally, but rarely,' he adds, 'these books are made of thin copper-plates.' All the nations on the other side of the Ganges seem to make use of the bark of trees and shrubs for these purposes; the other Asiatic nations on this side the Ganges, the black inhabitants of the most southern parts of India excepted, make their paper of old cotton rags and stuff, and their method differs little from ours in Europe, except that it is more simple, and the instruments less refined. Yet it is very remarkable that what is called *India* paper (used in taking off our finest copper-plate impressions) cannot be manufactured in England.

We come now to the *modern art of paper-making* in Europe; or the important and admirable process by which our worn-out clothes and linen are converted into an economical but most efficient, convenient, and often elegant substance, to receive the labors of the pen and the operations of the press. Who first suggested this appropriation of linen rags it seems at this period hopeless to attempt to discover; certainly he bestowed on mankind a service barely exceeded by that of the invention of printing. Various dates have been assigned for its origin. Ray and Milnes (in his *Hortus Philosophicus*) date it about the year 1470, when it first appeared in this part of the world, says the former, at Guernsey; two persons, named Anthony and Michael, having brought it to Basil, from Galicia in Spain. It would seem most probable indeed that, like much of our other knowledge, this travelled from the east, soon after the taking of Constantinople. Rabelais, who died in 1553, mentions hempen cloth as having been known about 100 years before his time: yet Mabellon and others find paper MSS. dated, they say, so far back as the middle of the fourteenth century; and Dr. Priedeaux affirms that he has seen a registration of some acts of John Cranden, prior of Ely, made on paper, which bears date in the fourteenth year of Edward II., i. e. Anno Domini 1320. He however considers that this manufacture was brought to us from the east, through the Saracenic conquests in Spain.

PAPER MAKING.

Revised, 1846.

In our own times we have seen, in the invention of the new machinery applied to paper-making, the most important addition that has been made to the art; and such an one as nearly equals in importance the original suggestion of making it from rags. At such a period we must indulge a smile at the standing definition of 'linen, or European paper' in the most extensive of our modern Encyclopedias, as 'chiefly made of linen rags beaten to a pulp with *great hammers*, and the soil carried off by a continual supply of fresh water, conveyed among the pulp in little troughs, till it be rendered perfectly white.' The fact is hammers have been entirely discontinued in this country for these forty years, and long before the invention of the machine.

The modern process may be considered as divided into paper-making as conducted by the hand—and by the machine: the greater part of the best writing and printing papers taken together being, perhaps, at length made by the latter; for so strong is the attachment to particular names, with regard to writing papers, that though an article every way as perfect and beautiful can be manufactured by the machine, an equal quantity at least of that paper separately considered is made by the old method.

I. OF PAPER-MAKING BY THE HAND.—Even this, as conducted in the more respectable establishments, will not fail to strike an intelligent stranger to the process as a surprisingly simple and beautiful art. He may be first led into the *rag-house*, where a number of women and children will be found employed in cutting and sorting the washed rags.

Rags are sold to the paper-makers sorted into four or five different kinds: No. 1, sometimes called London superfine, being all linen, and reserved for the finest paper. No. 5 is generally the coarsest sort, and includes canvas; a sixth sort called 'rag-bagging' is, however, sometimes kept separate. 'Colored rags' include cotton of all colors except blue, which is kept apart for making blue paper.

Some mills use a duster, made of wire net, in the form of a cylinder, four feet in diameter and five feet long. It is put in motion on pivots in connexion with some part of the general machinery, and enclosed in a tight box, into which it casts off the dust. In different establishments very different degrees of care are exercised in the sorting: some separate cloth of hemp from cloth of flax; others keep hems and seams apart; and think that the coarseness of the cloth should be considered, and the degree of wear it has had attended to; for, if rags which are almost new be mixed with those that are much worn, the one will not be reduced to a pulp in the mill, whilst the other will be so attenuated as to be carried away by the water, to the real loss of the manufacturer, and the deterioration of the article made; or the particles carried off will be those which would give it a smooth and velvet-like softness. Nor is this all: a pulp of uneven tenuity produces those cloudy papers in which are seen at intervals parts more or less clear, and more or less weak, occasioned by the flakes assembled on the mould not being sufficiently tempered and diluted together.

The general furniture of the rag-house is a number of chests or boxes divided into five or more separate cases for the different sorts of rags; and in some cases having a large knife fixed on the top: each woman has a piece of paste-board hung from her girdle and extended on her knees, upon which, with the assistance of the knife, she unrips seams and stitches, and scrapes off all filth. Whatever can be used, after being well shaken, is distributed according to the degree of fineness, and the women throw the rest at their feet. The more exact manufacturers have six cases, i. e. for the superfine, the fine, the seams and stitches of the fine; the middling, the seams and stitches of the middling; and the coarse; without including the very coarse parts, reserved for brown and other coarse papers.

Sometimes the rags are bleached in the first stage of the process, or immediately after they are sorted, and Mr. Campbell took out a patent for a method of performing this in 1792. It is similar to the process of bleaching cotton thread. He directs that the rags should, before they are put into the receiver to be bleached, contain not more than their own weight of fair water. They should first be opened by a machine, called by the cotton manufacturers a devil, or some machine of that nature, and they are to be distributed in the receivers, in layers spread on frames, so that they will not come in contact with each other, or they may be placed in the body of the receiver, and have stirrers or agitators, provided to expose every part of them to the action of the bleaching gas. After the process, which must be concluded as soon as ever the rags are sufficiently bleached, lest the gas should act upon and injure their quality, they are to be washed in water, and will be ready for the mill.

Many manufacturers and printers consider that this mode of bleaching the rags makes them rotten; that it injures the quality of the paper, which it doubtless does if carried too far; and that it enables makers to pass off an article of inferior staple. This is no doubt the case in some instances; but, with all the just suspicion of bleached papers that obtains in many quarters, bleaching may clearly be delicately and judiciously applied; though whether in this stage or in the state of *half-stuff* we will not here decide; and it is certainly capable of making the same good materials into a better paper, when well managed. In many mills printing papers are bleached by muriate of lime inserted in the washing engine.

We may now describe the *paper-mill* in its principal parts. This is represented in the plates, PAPER-MAKING I. and II., through which, for the convenience of arrangement, the figures run on. Fig. 1 is a front, and fig. 2 a side elevation of the mill; the same letter expressing the same part in both. A B is the great water-wheel, giving motion to the whole on its shaft or axis C; a crown, or face wheel, D D is framed, and gives motion to the pinion G; this is fixed on the lower part of a vertical axis E E, which goes up into the upper room of the mill, and has two face wheels I and K fixed upon it; these actuate two pinions L M, upon

the end of the spindles of the two engines N and O, where the rags are ground.

W, fig. 1, is a wheel turned by the teeth of the great wheel DD; the axis of this wheel is formed into a triple crank *v, w, x*, which gives motion to two or three pumps, by means of levers or beams *y, z, y*, which cannot be fully seen in the figures, but may be easily imagined. These pumps raise up a constant stream of clean water, which is necessary to be kept running through the rags in the engine to wash away the dirt separated from them in the process. By the arrangement of the cog wheels, the pinions LM and cylinders of the engines are caused to revolve at the rate of 150 times per minute, when the water wheel moves with its proper velocity.

The internal construction of the engine is explained by the remaining figures. Fig. 3 is a longitudinal section, showing the cylinder in action; Fig. 4, a plan looking down upon it; fig. 6, the cylinder separate; N and O, in fig. 1. represent a large cistern or vat of an oblong figure, with the angles removed, as shown by fig. 4; it is lined with lead inside, and divided in the middle by a partition *ef*, figs. 3 and 4. On the front and back of the engine two short beams TT, figs. 2, 4, and 5, are bolted; they have long mortises through them to receive tenons at the ends of two horizontal levers SS, which rise and fall in bolts in one of the beams T as centres; the front one of these beams, or that nearest to the cylinder R, is capable of being elevated or depressed by turning the nut of the screw *r*, which, as shown in fig. 5, is fixed to the tenon of S, and comes up through the top of the beam T, upon which the nut takes its bearing. Two brasses are let into the middle of the levers S, S, and form the bearing for the spindle of the engine to turn upon. R is the cylinder made of wood and fixed fast upon the spindle; it has a number of knives or cutters fixed upon it, parallel to its axis, and projecting from its circumference about an inch; *e*, fig. 3 and 4, is a circular breasting, made of boards and covered with sheet lead, which fits the cylinder very truly, and leaves but very little space between the teeth and breasting. An inclined plane leads regularly from the bottom of the engine trough to the top of the breasting, at the bottom of the breasting beneath. The axis of the cylinder, a block *a*, fig. 3, is fixed, and has cutters of the same size and exactly similar to those in the cylinder, which at all times of the process pass very close to the teeth in the block, but do not touch. This block is fastened by a dove-tail fixed in the wooden bottom of the breasting; it comes through the woodwork of the chest, and projects a small distance on the outside of it, and is kept up to its place by a wedge, so that by withdrawing this wedge the block becomes loose, and can be removed to sharpen the cutters as occasion requires. The great velocity of the cylinder draws the rags, with which the engine trough is filled between the cylinder and the cutters in the block *a*, and by this they are cut in pieces; then by the rapid motion of the cylinder the rags are thrown over the top of the breasting, and they run down the

inclined plane, and passing round the partition *ef* come to the cylinder again, so as to be repeatedly cut till they are reduced to a pulp. This circulation or turning the rags over in the engine, causes them to present themselves to the cutters in a different direction every time; for as the cylinder cuts or clips in straight lines, in the same manner as a pair of shears, it is requisite to cut the rags across in different directions, to reduce them to a pulp. The screw *r* is used to raise or lower the cylinder, and cause it to cut finer or coarser by enlarging or diminishing the space between the cutters in the block and those of the cylinder. These cutters act in the same manner as a pair of scissors cut, the teeth of the cylinder being as before-mentioned parallel to the axis of the cylinder, and those of the block are placed rather inclined to them, so that the teeth of the cylinder come first in contact with the cutters of the block at one end, and then successively the contact proceeds along to the other end, so that any rags interposed between them are cut in the same manner as they would be between the blades of a pair of shears. Sometimes the plates or cutters in the block are bent to an angle in the middle instead of being straight and inclined to the cylinder; in this case they are called elbow plates, and of course the two ends are both inclined to the axis of the cylinder in an opposite direction; in either case the edges of the plates of the block cannot be straight lines, but must be curved to adapt themselves to the curve which an inclined line traced on the cylinder will of course have. The plates of the block are united by screwing them altogether, and their edges are bevelled away on one side only.

The cutters of the cylinder are fixed in, as shown in fig. 7; here R is the cylinder, formed of a solid piece of wood, and having grooves cut on its circumference parallel to its axis; each of these grooves has two cutters put into it, and a fillet of wood is driven fast in between them to hold them in; the fillets are kept in by spikes driven into the solid wood of the cylinder. A cover is put over the cylinder to prevent the water or rags being thrown out of the engine by its great velocity; it is a square box, *ghki*, fig. 3, and marked P, figs. 1 and 2; it has two small troughs, *k* and *i*, coming through the sides of the box; at *mm* are two hair or wire sieves sliding in grooves made in each side of the box. The cylinder as it turns throws a great quantity of water and rags up against these sieves; the water goes through them and runs down into the troughs at *k* and *i*, and thence into the ends of the leaden pipes *pp*, fig. 2, by which it is conveyed away; *n, n*, fig. 3, are grooves for two boards, which when down in their places cover the hair sieves and stop the water from going through them. A considerable part of the rags thus thrown up by the cylinder passes quite through it, and goes down under it again. The water is brought to the engine by a pipe from the pump; this pipe delivers it into a small cistern adjoining and communicating with the engine; the pipe has a cock to stop the entrance of the water when required; the exit of the foul water is, as before-mentioned, made by the cylinder throw-

ing it up into the troughs *i* and *k*. The two engines *N* and *O* are placed at different levels as shown by fig. 1, the bottom of *N* being higher than the top of *O*; the latter is called the washer, where the rags are first worked coarsely with water running through them, to wash and open the fibres of them, which after washing are called *half-stuff*; and are then let down into the beaten engine *O*; here they are ground and reduced to a finished pump, or *prepared stuff*, as it is called.

For making superfine paper, the following has been given as the established system of manufacture for the London market: 1 cwt. of the best white rags, called No. 1, is put into the washing engine, and the cock opened to let a considerable stream of water run through it. The screw of the cylinder is adjusted to raise it up, so that its teeth do not actually touch the teeth of the block: the rags are not therefore cut, but rather rubbed in a violent manner, so as to open and expose every fibre to the action of the water, that it may carry off all dirt; this gentle washing continues for a quarter of an hour or twenty minutes, when the cylinder is laid down, that is, the screw is turned back till the cylinder is let down upon the cutters of the block, and rests its weight upon them; in this state they begin with a tremendous noise and vibration to cut the rags into pieces; this is continued for about four hours, by which time the engine will come to work very steadily and with less noise, because the rags are cut into pieces and chopped up very much, though not yet reduced to a pulp.

The bleaching now commences, if it has not been done in the first stage upon the rags. To bleach the stuff in the engine they stop the water from running in, and throw in a quantity of bleaching salt, or muriate of lime; for fine rags, one or two pounds, more or less, are used according to circumstances; the two sliders, *n*, *n*, fig. 3, are put down in the cover of the cylinder to prevent the water getting away, and in this state the engine is worked about an hour for the bleaching. During this time the rags lose their color, but this does not color the water, though it is rendered rather white and milky by the salt. The very best rags, when first put into the engine, are of a yellow and dirty color, but they become by the bleaching a very perfect snow white. The cylinder is usually raised up a very little during the bleaching; which being concluded, the water-cock is opened again, the boards *n*, *n*, removed, and the washing continued about an hour to wash the salt away. This concludes the operation, and the *half-stuff*, as the rags are now called, is let off into a basket which suffers the water to drain through it: or if the manufacture is proceeding with despatch, and every thing is ready, it is let off into the beating engine at once; here the stuff is worked for about five hours with a sufficient quantity of water to make a pulp; in this affair great judgment is required, as it materially influences the quality of the paper; the water is not suffered to run through the beater, as in the other engine. The only difference between the two engines is the firmness of their teeth. The cylinder of the washer has twenty grooves in it, each containing two

bars or teeth, as shown in fig. 7, but the beater has three in each, so as to have sixty teeth in all. The beater is made to turn with a greater velocity than the other; the pinion *L*, fig. 1, which turns the beater, having only twenty teeth, while the other, *M*, has twenty-two. This greater velocity and number of teeth in the beater cause the strokes of the several knives passing by each other to be so rapid that they produce a coarse musical note or humming, which may be heard to a great distance from the mill; but the washer, being coarser and less rapid, produces the most horrible growling that can be conceived, and is so violent as to shake the whole building. In small mills, and where perhaps there is a deficiency of water, they only use one engine both for washing and beating, as it will do for either purpose; but the mills near London, chiefly at Maidstone, in Kent, have two, three, or even five engines. These require an immense body of water to turn them, and the steam engine has been, of course, very successfully applied in some mills. The stuff when finished is conveyed to a general receptacle called the stuff-chest, where it is kept till wanted to be made into paper; for the engines work day and night, though the making the paper, as it requires many workmen, is of course only carried on in the daytime.

The implements employed in this department of the manufacture are as follows: the vat with its stirrer, sometimes called a *hog*, the moulds and deckles, the felts, the vat press, another similar press to it for giving the paper a second pressure, &c.

The *vat* is made of wood in the form of a tub, and generally about five feet in diameter and two and a half in depth. It is kept at a proper temperature by means of a grate introduced at a hole in the side, and surrounded on the inside of the vat with a case of copper. For fuel to this grate charcoal or wood is used, and frequently to prevent smoke the wall of the building comes in contact with one part of the vat, so that the fire has no communication with the place where the paper is made. Every vat is furnished on the upper part with planks, enclosed inwards, and even railed in with wood to prevent any of the stuff from running over in the operation. Across the vat is a plank pierced with holes at one of the extremities, and resting on the planks which surround the vats. This is used to rest the mould upon when a sheet of paper has been made. In different mills two methods are made use of to mix up the stuff and water with which the vat is filled, and keep it in such an agitation as will prevent any coagulation or subsidence of the pulp, which would render the paper flaky and the different sheets of unequal thickness; in one, two instruments are employed to mix them, one of which is a simple pole, and the other a pole armed with a piece of board, rounded and full of holes. The operation of stirring is repeated as often as the stuff falls to the bottom. In the principal paper mills for making writing paper, they use for this purpose what is called a *hog*; which is a machine within the vat, that by means of a small wheel on the outside is made to turn constantly round, and keep the stuff in

perpetual motion. When the stuff and water are properly mixed it is easy to perceive whether the previous operations have been complete; for, if the stuff floats close and in regular flakes, it is a proof that it has been well worked in the engine.

The *mould* is a square frame or box made of well seasoned mahogany, and covered at the top with wire. In the old way the wires were disposed in parallel rows, with others across to strengthen them; this may be readily understood from the examination of a sheet of paper. But the modern paper is chiefly made on wool wire, which is exactly like cloth. The wire cloth is made larger than the intended sheet of paper, and turned down over the sides of the frame; the size of the sheet is determined by a square frame of mahogany bound with brass; this, which is called the *deckle*, when placed upon the wire of the mould, forms a shallow dish or mould, in which a quantity of the pulp is taken up, and by the draining through of the water the pulp is left in a sheet upon the wire, therefore this frame is necessary to retain the stuff of which the paper is made on the cloth; it must be exactly adapted to the wire cloth of the mould, otherwise the edges of the paper will be ragged and badly finished. The wire cloth of the form is varied in proportion to the fineness of the paper and the nature of the stuff. The deckle is moveable, and only held upon the mould by the workmen grasping the mould and deckle together in both hands at the opposite sides, so that the deckle being removed the sheet of paper may be taken up from the wire by applying the mould upon a piece of felt; it is then pressed with a felt between each sheet.

The *felts* are pieces of woollen cloth spread over every sheet of paper, and upon which the sheets are laid to detach them from the wire of the mould; they prevent them from adhering together and imbibe part of the water with which the stuff is charged, and transmit the whole of it when placed under the action of the press. The two sides of the felt are differently raised, that to which the hair is longest is applied to the sheets which are laid down, and any alteration of this disposition would produce a change in the texture of the paper. The stuff of which felts are made should be sufficiently strong, in order that it may be stretched exactly on the sheets without falling into folds, and at the same time sufficiently pliant to yield in any direction without injury to the wet paper. As the felts have to resist the reiterated efforts of the press, it appears necessary that the warp be made strong of combed wool and well twisted. On the other hand, as they have to imbibe a certain quantity of water and to retain it, it is necessary that the wool be of carded wool, and drawn out into a slack thread. These are the utensils together with the presses which are used in the apartments where the sheets of paper are formed.

Three principal workmen are employed in the operation of making the paper, which they manage thus: the first, called the *dipper*, stands in a nitch or hollow part of that kind of ledge or table which goes round the circumference of the vat; he holds a mould in both hands by the two

extremities with the deckle, applied exactly over the mould as if only one piece; then inclining it a little towards him he dips it into the vat and brings it up again in a horizontal position. The superfluous part of the pulp flows over on all sides, and the quantity thought sufficient is shaken gently from the right to the left, and up and down horizontally until it is equally extended over the whole surface of the mould. These two motions are also accompanied by a slight shake, that serves to fix and stop the sheet as the water drains through the wire; and then, the parts of the pulp uniting, the mould is immediately laid on the edge of the vat, the deckle taken off, and the mould made to slide along the board which is laid across the vat to the part where the sheet is to be laid or taken off. This board, which is but two inches in breadth where the sheet is laid, is nothing more than a deal board, which runs along the length of the vat, and is pierced with several holes at the broad extremity for letting the mould drain into the vat. The dipper, now taking the deckle off the first mould, places it immediately on the second which is given him for dipping it immediately in its turn, and the second workman, called the *coucher*, taking the mould on the board that runs across the vat, with the left hand raises it gently and lays it in an inclined position against one or two small pins which are driven into the board on the edge of the vat. In this condition the mould remains two or three seconds of time for draining into the vat, whilst the coucher extends a felt on which he applies the mould to take off the sheet, which being done he returns the mould to the dipper. These operations are performed in so short a time, that seven or eight sheets of a middling size can be made in a minute; but it is advisable to proceed more slowly, as the paper is thus better made, and of a stronger consistence.

The dipper is attentive in distributing the matter on the mould to reinforce the corner he is to take hold of, in raising and extending the sheets; for without this precaution he would break a great many. If he also take up too much matter with his mould, if he do not equally extend it, or if he strike his mould against the drainer, in all these cases, the matter is accumulated in certain parts of the mould, which produces something like ridges in the paper; or if he let the matter rest on the mould, and do not distribute it immediately, there will be parts of unequal thickness. When the vat is too hot, the stretching out of the sheet will be ill performed, because the water evaporates too soon over the mould. Add to this, that, in letting the matter run towards one of the edges, by not giving his arm a regular motion, he may form a feather-edged paper, which may likewise happen if he do not extend his stuff sufficiently; if the vat be too hot; if the fecula of the pulp be too crude, and do not run well; if his arms be too stiff, and if he give an irregular shake, or if the mould be ill made. An indented sheet is made by not taking off the deckle properly, or by the felts having stitches, seams, and selvages in them. In examining a sheet of paper, before the light, a greater opacity

is sometimes seen on both sides of each brass wire than towards the midst of the space. This is occasioned by the pulp, which the motion of the mould could not distribute, being stopped by the wires, or the manicoord, that serves to string them; a defect, however, almost wholly remedied by the improvement of weaving the wire of the mould like cloth. In order to avoid drops of water, which, if they fall upon the paper will make disagreeable spots, the mould is to be laid gently, and raised readily; and, as often as the coucher returns his mould to the drainer, he ought to be careful to shake his hands behind him, for, without this precaution, his fingers, which are wet, would drip upon the sheet already laid, whilst he is covering it with the felt. If he is also too quick in laying, the air, detained and compressed under the sheet, occasions a blemish.

The *coucher*, having taken off the several sheets from the mould as fast as they are made, lays them one by one in a pile under the press, with the felt between each individual sheet, until they have in this manner made six quires of paper, called a *post*, and containing 144 sheets. When the last sheet of the post is covered with the last felt, the workmen about the vat assist each other to submit the whole heap to the action of the press. They begin, at first, to press it with a middling lever, and afterwards with a lever fifteen feet in length; this operation expresses the water, and thus gives the paper a strength which it did not possess before. The vestiges of the protuberances made by the wires of the mould are altogether flattened, and, of consequence, the hollows opposite to them disappear also; but the traces formed by the interstices of the wire, in consequence of their thickness, appear on both sides, and are rounded by the press.

The business of the third workman, called the *lifter*, begins after the operation of the press, and consists in taking the sheets off the felts (for they are caused to adhere to them by the action of the press), and making them up in a second neat and compact pile; for this is very necessary to make the paper of a regular and equal thickness. It is now put under a second press, with all the sheets in contact with each other: this expresses a great quantity of water from the paper, and gives the sheets a very considerable strength; it also tends to take out those freckles in the surface which were occasioned by the impression of the felt; though it is necessary to have felts in the first pressure, because the paper is then so wet that it would be pressed into a solid mass if the sheets touched each other. The paper remains in the second press until another pile is made ready by the lifter, when it is taken out and sometimes separated sheet from sheet, which is called parting the packs: at other times it is taken in small masses of six or seven sheets into the drying-house.

For when the sheets are very thin, and it is found after the second pressure that they are formed by a fecula which is still saturated with a great deal of water, so that they have little consistence, it is probable that the second press has so joined them to one another that it is dif-

ficult to separate them; and, indeed, they cannot well be taken off, one by one, without tearing a great number: this, however, generally shows improper management in the second pressing. But, happily, this separation, sheet by sheet, is not necessary for drying, so that seven or eight may be taken together, which is called forming the pages; sometimes, also, a less number may do when the paper is of a large size, but never less than three sheets are *hung up* together. It is of more importance than we are at first aware of, that the sheets should remain, as it were, pasted several of them together; if they were single, and one by one, they could not resist the moisture of the size, yet this moisture is sufficient to facilitate their operation; and to hinder their separating, when they are hung up to dry, they should be so placed that the pages may receive the wind in the surface and not in the sides and edges.

The drying-locks are extensive apartments, usually the upper parts of all the buildings of the mill; the sides are formed by loffer boards, which are a kind of lattice, or boarding, which can be opened and shut to admit more or less air at pleasure. The sheets are taken up upon a piece of wood like a T, and hung upon hair lines, stretched across large horizontal wooden frames, called *tribbles*; and then, as they are filled, are lifted up between upright posts, to the top of the room, and retained by pegs put in the posts; then another frame, being filled, is put up in its turn, and so on, till the loft is filled from top to bottom.

Mr. Bramah has suggested an improvement in this method, which enables women or children to perform the business of the drying-house instead of men, and adds considerable facility to the process of hanging and re-hanging the sheets. Instead of using *tribbles*, he has a proper number of frames, made of wood, mounted with leaves, to represent so many frames or clothes' horses, similar to those used by any common laundress, but of a length proportioned to the dimensions of the drying-house, which may be divided into two or more rows, so as to leave room and proper aisles or passages for the convenience of the operators to hang and re-hang the sheets; and the height of the frames may be equal, or nearly equal, to one half the story in which they are fixed. They are stationed at proper distances from each other by means of upright posts with grooves fitted to the frames so that each may slide vertically up and down, by means of lines and pulleys affixed to each, just like sash windows that are double hung; so that, while one of the frames is sliding up to touch the ceiling of the building with its upper edges, the alternate one may be depressed till its lower edge, or the paper which hangs upon it, may come nearly in contact with the floor. By this means children can reach to hang the paper, and can afterwards elevate the frames to their proper height in the loft.

Writing paper, when dry, is carried to an apartment where it is sized by dipping each page, that is, each bundle of thirty-four or thirty-five sheets, which have been dried together, into a vat, containing a weak size. Printing-papers

are more generally sized in the beating-engine. The best size is made from shreds and parings got from tanners, curriers, and parchment-makers; all the putrefied parts and the lime are carefully separated from them, and they are enclosed in a kind of basket, and let down by a rope and pulley into the cauldron. This is a late invention, and serves two valuable purposes. It makes it easy to draw out the pieces of leather when the size is extracted from them by boiling, or easy to return them into the boiler if the operation is not complete. When the glutinous substance is sufficiently extracted it is allowed to settle for some time, and it is twice filtered before it is put into the vat where they dip the paper. Immediately before the operation, a certain quantity of alum is added to the size. The workman takes a handful of the sheets, smoothed and rendered as supple as possible, in his left hand, dips them into the vat, and holds them separate with his right, that they equally imbibe the size. After holding them above the vessel for a space of time, he sizes on the other side with his right hand, and again dips them into the vessel. When he has finished ten or a dozen of these handfuls, they are submitted to the action of the press, from which the superfluous size is carried back into the vat by means of a small pipe. The vessel in which the paper is sized is sometimes made of copper, and finished with a grate, to give the size, when necessary, a due temperature, and a piece of thin board or felt is placed between every handful as they are laid on the table of the press. This is technically called 'tub-sizing.'

After the sheets are sized and pressed, they must be quickly separated from each other, to prevent their adhering together; but it is to be remembered that the size is an extremely weak solution, so that the sheets will be in no danger of adhering until they are dry. In some of the most improved mills the sizing is performed in a machine, consisting of a large square vat, or wooden cistern, containing the size; in this a strong screw press is situated horizontally, the side beams of the press forming the outsides of the vat, and the screw works through a tight collar of leather. The press being open, the sheets of paper are suspended on lines, stretched in a frame, similar to those on which they are dried, and this is let down to immerse them in the size; and, after remaining a proper time, the screw of the press is worked, and the sheets thus gathered up into a close parcel; then, the lines being withdrawn, a strong pressure is given, and the paper, when taken out, is finished ready to be hung up again to dry. By this means the paper is sized very equally, whereas, in the old method of tub-sizing, some sheets drained off more size than others, and rendered them unequal as well as making marks in them.

The sizing of most printing-papers is however accomplished by throwing a small quantity of oil mixed with alum, pounded very fine, into the beating-engine towards the end of the process. About a pint and a half, or less, is sufficient to give the paper a proper quality for printing; powder-blue is also put into the engine to give a bloom to the paper.

When the paper is sufficiently dry, it is carried to the finishing room, called the *Saul*, where it is pressed, selected, and examined, by women, who remove all damaged and imperfect sheets; it is then put into the dry press, and squeezed with an immense force, to render the paper flat, and give it a good surface. The lever of this press is fifteen or eighteen feet long, and ten or twenty people are employed at the last to work it, though they sometimes use the *Sampson*, as it is called; that is, a windlass like a crane, with which they move the lever of the screw. The dry press is generally large enough to hold two packs of ordinary paper side by side. The *Saul* is surrounded by these dry presses. The paper remains under pressure as long as the demand of the mill will admit; but while it is in this operation it is parted, once, twice, or even three times: to do this, the heaps are carried back to the table, and the whole turned sheet by sheet, in such a manner that the surface of every sheet is exposed to a new one, and in this situation they are again brought under the press. It is in conducting these operations of parting and pressing sometimes four or five times, or as often as the nature of the paper requires, that much of the perfection and finish of the finest writing and drawing-paper consist. If the stuff is fine, or the paper slender, the parting is less frequently repeated. In this operation, it is necessary to alter the situation of the heaps, with regard to one another, every time they are put under the press; and, as the heaps are highest in the middle, to place small pieces of felt, which will bring all parts of the pile to an equal pressure.

Bramah's hydrostatic-press has been found most admirably adapted for dry-pressing paper. This press has no screw, but, in lieu of it, a piston or plunger, fitted accurately into a chamber, or barrel of cast iron, by collars of leather; a small force-pump is situated near to the press, and water is injected by it into the great chamber, and the piston is thus expelled from it; and presses up the board, or follower of the press, with a power in proportion to the relative diameters of the pump and the piston. The bottom of the cylinder must be made sufficiently strong, with the other parts of the surface, to resist the greatest strain which can ever be applied to it: the pipe from the forcing-pump communicates with the cylinder at the bottom, and the pump has, of course, valves to prevent the return of the water.

In a screw-press, of a fine thread, it requires nearly as much labor to unscrew as to screw it down, an evidence of the enormous friction of a screw when acting against a great pressure; but the hydrostatic-press only requires a cock to be opened to let out the water from beneath the piston, which then descends quickly by its own gravity, or the elasticity of the substance under the pressure. The greatest convenience of the hydrostatic-press is, that the power can so easily be transmitted to it from any distance, and in any direction, by means of pipes conducted along in situations where all other means of conveying the motion would be complicated and expensive in the extreme. Thus, in a large paper-mill, an injecting pump may be kept in

constant action by the water-mill, and inject water into an air vessel, from which pipes are conducted to presses in all parts of the mill, and, by simply opening a cock at any press, the required pressure will be instantly given by the elasticity of the confined air operating on the enlarged surface of the piston of any press. The air vessel has, of course, a safety-valve to allow the escape of the water, when the pressure becomes so great as to endanger the rupture of any of the vessels; for it is to be observed that the power of this principle is irresistible when the pump is worked by a mill, and will burst any vessels without the least appearances of strain on the moving parts of the pump.

After dry-pressing, the paper is finished, and only requires to be assorted into different lots, according to its quality and faults; after which it is made up into quires.

II. OF PAPER-MAKING BY THE MACHINE.

The machine now generally used was originally suggested by a Frenchman, Louis Robert, who sold his model to M. Didot. This gentleman brought it to England, and prevailing on the Messrs. Fourdrinier's to join in perfecting it, a patent was taken out for the benefit of these parties by Mr. Gamble, the brother-in-law of M. Didot. Figs. 1 and 2, plate III. PAPER-MAKING, exhibit a side view or elevation of the machine, with a plan annexed; and the same letters of reference are employed in both figures. The pulp being prepared in the usual way is placed in the vat, and by the addition of water brought to the required consistency; it is then suffered to run through certain apertures in the side or front of the vat at A, and conducted thence by an inclined plane B B, in a uniform stream upon the surface of the revolving web *a a a*, &c., which is so placed that its surface shall be as nearly level as possible, and shall have its revolving motion in the direction in which the stream of pulp runs from the vat. This web is kept extended longitudinally by two principal or extreme rollers, C and E, upon which it revolves; and the upper part thereof, upon which the paper is formed, is supported and kept level by a number of small rollers *b, b, b, b*, and other smaller ones afterwards described, placed parallel with the other two C and E, and at such distances from each other as to prevent the web from being pressed or weighed down by the pulp into the spaces between them, and also to cause the pulp to spread itself uniformly upon the surface of the web or sheet, thereby producing a sheet of paper of a uniform thickness. The width of the sheet of paper is determined by two pieces of wood set edgeways upon the web, exactly parallel with each other, and with the line of motion of the web. These pieces require no particular precision as to their dimensions. Between, and in contact as well with the under edges of these pieces as with the upper surface of the web, the patentees place two endless straps of leather of a width corresponding to the thickness of the pieces; and cause them to revolve upon pulleys with a velocity exactly equal to the velocity of the revolving web. They likewise place similar

pieces of the web, and exactly opposite to those upon the upper surface; so that the web is pressed between the upper and under straps and pieces, and the liquid pulp is then prevented from running off towards the sides. These pieces and their straps are called *dickeys* (F and G are the pieces, and H and I are the straps). Near that part of the web upon which the pulp falls from the inclined plane at C, and between it and the vat, is placed a flap of oiled silk or other flexible material; one edge on the web, the other being fastened to a piece of wood laid across the surface of the web, but not touching it, the length of the said piece corresponding to the width between, and being supported at each end by the *dickeys*. The flap of oiled silk is to prevent the pulp from running back towards the vat. Between the two principal or extreme rollers C and E, upon which the web revolves, and about two feet and a half from E, and between that and the vat, are placed two other rollers or cylinders J and K, one above the other, which cause the upper part of the web with the paper forming thereon to pass between them for the purpose of pressing out the water; and, from this use of them, they are distinguished by the denomination of the first or wet press cylinders or rollers. In order to guard the pulp, which before passing between the cylinders is yet in a soft state, from being dislodged or otherwise injured by the upper roller or cylinder J coming immediately in contact with it, the patentees use another revolving web of wove wire or other fit material, which in this case may be of felting, as at *d d d d*, of the same width as the one above-mentioned, but not so long, the first is called the under, and the second the upper web: the bottom part of the upper web is caused to pass between the two cylinders J and K, so that its under surface falls upon the surface of the pulp or paper, and defends it from the action of the upper cylinder J. This upper web is kept extended by, and made to revolve upon, two rollers L and M, placed one on each side of the wet press cylinders J and K, and at a convenient height above them. The wet press cylinders are provided with a compressing apparatus at each end, to give the necessary pressure to the paper.

It is evident then, that, if motion is given in the proper direction to the wet press cylinders J and K, having both the webs thus compressed between them, such webs will be drawn along by them, and caused to revolve upon their respective rollers; and that as long as these webs continue so to revolve, and the pulp continues supplied and running upon the surface of the under web, so long will the machine continue making a sheet of paper of continually increasing length.

But as the paper, after having passed between the first press cylinders, has not obtained such a degree of consistency and strength as to allow of its being removed from the machine, and cut into sheets and laid in packs; the patentees cause it to pass through a second pair of pressing cylinders N and O, which they denominate the second or dry press, where it receives such a further degree of pressure and consequent strength;

as to fit it for all the subsequent operations necessary to finishing it for market. The second or dry press consists of a pair of cylinders adapted to strong pressure, and which is therefore made of hard metal (preferring brass as not liable to rust), which cylinders, N and O, are turned perfectly true and smooth, and placed one above the other at a convenient distance from and exactly parallel with the first press cylinders. Between the second press cylinders, N and O, is placed the upper part of a revolving web of flannel or felting, or other fit material (represented by the lines at *c, e, e, e*; and this is made to revolve upon and to be kept extended by two rollers P and Q, one on each side of the cylinders N and O; and, by giving motion to those cylinders N and O, we cause the felting to revolve upon its rollers P and Q, in the same direction and with the same velocity as the under web. And the paper after it has passed the first press, and arrived at the extreme roller E, upon which the web revolves, is detached from the surface of the web, and deposited upon the revolving felting, and with it made to pass between the second press cylinders. The paper is then collected and wound upon reels or rollers as at R, which are successively removed and others applied as they become charged or filled with paper. The long sheets of paper thus obtained are, by a subsequent process, cut into others of the required dimensions.

Another machine for the manufacture of paper has been invented by Mr. Dickinson. He makes use of a hollow brass cylinder or barrel closed at the ends, but having a large hollow tube for the axis. This cylinder is so contrived that the periphery of it is uniformly pervious to water, and covered with fine woven wire. It is made to revolve in a vat of very diluted pulp, in which it is about two-thirds immersed: during the revolution of the cylinder the water of the pulp passes through the pervious surface into the interior, and flows out through the hollow tube before mentioned, each end of which passes through the sides of the vat in which the cylinder revolves. As the water of the pulp flows through the surface of the cylinder the fibres of rag floating in the vat are deposited on the wire, and thereby gradually form the paper on every part of the cylinder during its immersion in the fluid pulp. An endless felt takes the paper off the highest point of the cylinder, with which it is brought in contact by the pressure of a roller, called technically the couching roll. The hollow axis before mentioned does not revolve with the cylinder, but is firmly fixed to the sides of the vat of pulp, through which it conveys the water from the interior of the cylinder, and it has attached to it troughs and other apparatus in the interior of the cylinder from which it is the channel of communication to two double acting air pumps, by the working of which two distinct effects are produced, both of which are essential to the operation of the machine. In the first place by drawing air from the inside of the cylinder a partial exhaustion of the interior is produced, and the influx of the water and the adhesion of the rag to the surface are promoted; in the next place the air so drawn away is forced into a receiver, where it is condensed, and from which

it returns by a separate pipe to a long narrow trough in the inside of the cylinder parallel with the hollow axis, and under the place where the paper quits the cylinder and becomes attached to the endless felt which carries it away in a continued stream, the adhesion to this felt being produced by a continued blast of compressed air issuing from this trough, and which detaches the paper from the surface of the hollow cylinder on which it is made. The formation of the cylinder is very selaborate, and the apparatus essential to the process so complicated that the machine has not been adopted by any manufacturer except the original inventor Mr. Dickinson; but in his management it works with great precision and effect, and produces paper of very good quality.

The mode of pressing the paper on the endless felt and reeling it is the same in this machine as in those already described.

STEAM DRYING.—It was some years after the invention and perfecting of these machines before any other advance was made in the manufacture; but recently it has been carried another stage by drying the paper immediately as it comes from the pressing rolls of the machine. This is done by leading the paper over cylinders heated by steam, which are kept in motion in the same direction that the paper travels, and at the same rate.

The annexed diagram is a sketch of the apparatus most commonly in use for this purpose. A,

A, A, are three cylinders or steam rollers as they are technically called, about three feet diameter, which are made to revolve by wheel work in the direction shown, and to carry round an endless felt in close contact with a large portion of the surface of each, and the rate of movement is adjustable so that it may be made to correspond with the rate of the machine which makes the paper. The axis of each roll is a tube, at one end of which steam is introduced through a cock, by which the attendant adjusts the supply so as to regulate the temperature of the cylinders; at the other end the water formed by the condensation of the steam is discharged through a pipe, which is made to descend nearly to the bottom of the inside of the cylinder, and the force of the steam drives the water up through it. The end of the paper, as it comes in a wet state from the press rolls of the making machine, is led by the attendant over the top of the endless felt belonging to the steam rolls, and conducted between the felt and each of the rolls in succession; and the water which the press rolls have left in it, by the heat of the cylinders, converted into steam, and driven off, so that by the time it arrives at the roll B it is dry and fit for cutting into sheets, and sending out of the mill, after the usual pressure, in the dry state; and this process gives the paper a smoothness and gloss which is considered as an improvement of the article.

PAPER OFFICE, an office in the palace of Whitehall, in which all the public writings, matters of state and council, proclamations, letters, intelligences, negotiations abroad, and generally all despatches that pass through the offices of the secretaries of state, are lodged, by way of library.

PAPHIA, a surname of Venus, from Paphos.

PAPHLAGONES, or **PAPHLAGONIANS**, the inhabitants of Paphlagonia, who are mentioned by Homer as a brave people, but by Lucian as 'superstitious and silly.' Bochart derives their name and descent from Phaleg or Peleg, the son of Heber.

PAPHLAGONIA, in ancient geography, a country of the Hither Asia, beginning at Parthenius, a river of Bithynia, on the west, and extending in length to the Halys east, with the Euxine on the north, Galatia on the south. Pliny enlarges the limits on the west side to the river Billis, on this side the Parthenius. It is called *Pylæmenia* by Pliny.

PAPHOS, in ancient geography, two adjoining islands on the west side of the island of Cyprus; the one called *Halæ Paphos* (Strabo, Ptolemy, Pliny); the other *Nea Paphos*. When mentioned without an adjunct, this latter is always understood. Both were dedicated to Venus, hence surnamed *Paphia*, and left undistinguished by the poets (Virgil, Horace). The town of Paphos was restored by Augustus, after a shock of an earthquake, and called *Augusta* (Dio). It is situated on the south side: it contained the celebrated temple of Venus; which, together with the city, was destroyed by a second earthquake, so that the least vestige of it is not now to be seen. A lake in the neighbourhood, which in summer overflows with stagnant and corrupted water, renders the air unwholesome.

PAPHUS, in mythology, the son of Pygmalion, by the ivory statue of a woman, which he made, and to which Venus gave life. Ovid. Met. X. 297. See **PYGMALION**.

PAPIAS, bishop of Hieropolis, in Phrygia, a disciple of St. John the Evangelist, and the companion of Polycarp, as St. Jerome observes. He composed a work in five books, entitled *Expositions of the Discourses of our Lord*, of which there are only some fragments remaining.

PAPIER MACHE', a substance made of white or brown paper, boiled in water, and beaten in a mortar, till reduced into a kind of paste, and then boiled with a solution of gum arabic or of size, to give tenacity to the paste, which is afterwards formed into different toys, &c., by pressing it into oiled moulds. When dry, it is done over with a mixture of size and lamp-black, and afterwards varnished. The black varnish for these toys, according to Dr. Lewis, is prepared as follows:—Some colophony, or turpentine, boiled down till it becomes black and friable, is melted in a glazed earthen vessel, and thrice as much amber in fine powder sprinkled in by degrees, with the addition of a little spirit or oil of turpentine now and then; when the amber is melted, sprinkle in the same quantity of *sarocollo*, continuing to stir them, and to add more spirit of turpentine, till the whole becomes

fluid; then strain out the clear through a coarse hair-bag, pressing it gently between hot boards. This varnish, mixed with ivory-black in fine powder, is applied, in a hot room, on the dried paper paste; which is then set in a gently heated oven, next day in a hotter oven, and the third day in a very hot one, and let stand each time till the oven grows cold. The paste thus varnished, is hard, durable, glossy, and bears liquors hot or cold.

PAPILIO, *n. s.* } Fr. *papillon*; Lat. *PAPILIONACEOUS*, *adj.* } *papilio*. The butterfly. See below. *Papilionaceous* is resembling the butterfly in shape.

Conjecture cannot estimate all the kinds of *papilio*, natives of this island, to fall short of three hundred.

Ray.

The flowers of some plants are called *papilionaceous* by botanists, which represent something of the figure of a butterfly with its wings displayed; and here the petala, or flower leaves, are always of a difform figure: they are four in number, but joined together at the extremities; one of these is usually larger than the rest, and is erected in the middle of the flower, and by some called *vexillum*; the plants that have this flower are of the leguminous kind; as pease, vetches, &c.

Quincy.

All leguminous plants are, as the learned say, *papilionaceous*, or bear butterflyed flowers.

Haris.

And, though a worm, when he was lost,

Or caterpillar, at the most,

When next we see him, wings he wears,

And in *papilio*-pomp appears;

Becomes oviparous.

Cowper.

PAPILIO, the butterfly, in zoology; a genus of insects belonging to the order of lepidoptera. It has four wings, imbricated with a kind of downy scales; the tongue is convoluted in a spiral form, and the body is hairy. The antennæ grow thicker towards their extremity, and are in most subjects terminated by a kind of capitulum or head. The wings, when sitting, are erect, insomuch that their extremities meet or touch one another above the body. They fly in the day-time. The beauties of this elegant part of the creation are well known. The chrysalis is at once the tomb of the caterpillar and the cradle of the butterfly. It is within a silken cocoon, or under a transparent veil, that this great miracle of nature is daily wrought. Take one of their cods, make an aperture in it with a pair of scissors, fix it against a glass; observe the insect, you will perceive the organs gradually displaying themselves; follow his operations with your eye; he struggles to break loose from his confinement. Observe the frothy liquor which it disgorges; that liquor serves to soften the end of the cocoon, which at length yields to the butting insect's head. By degrees the bar is removed, and the butterfly springs forth; the impression of the air acts upon its wings, slightly apparent at first, but which afterwards expand with remarkable rapidity. The display of them is sometimes checked by drought, in which case the insect is deprived of the faculty of flying. The rostrum, extended under the covering of the chrysalis, is in this last state rolled up into a spiral, and lodged in a recess prepared for it. The fly is now perfectly formed; it gently flutters; then takes its flight, plunging its rostrum

into the cups of flowers. The species are principally distinguished by the color of their wings.

PAPILLARY, or ? Of Lat. *papilla*. Having **PAP'ILLOUS**, *adj.* } ing emulgent vessels, or the resemblance of paps.

Nutritious materials that slip through the defective *papillary* strainers. *Blackmore.*

The *papillous* inward coat of the intestines is extremely sensible. *Aruthnot on Aliments.*

Malpighi concludes, because the outward cover of the tongue is perforated, under which lie *papillary* parts, that in these the taste lieth. *Derham.*

PAPIN (Isaac), a French divine, born at Blois, in 1657. He studied divinity and philosophy at Geneva, and Greek and Hebrew at Orleans. The university of Geneva being divided about the doctrine of grace, he wrote a treatise, entitled *The Faith Reduced to its Just Bounds*, recommending toleration; but he met with so little that he took refuge in England, in 1687, where he was ordained by Dr. Turner, bishop of Ely. Yet, after all, he returned to France, joined the church of Rome, and died in Paris in 1709, while finishing a work on the Toleration of Protestants, and the Authority of the Church.

PAPINIAN, a celebrated Roman lawyer of the third century, under Severus; who had so high an opinion of his worth, that he recommended his sons Caracalla and Geta to his care. Caracalla, having murdered his brother, ordered Papinian to compose an oration, to excuse this murder to the senate and people. This he refused to undertake, and the brutal emperor therefore ordered him to be beheaded, and his body dragged through the streets of Rome. Papinian wrote several treatises in the line of his profession.

PAP'IST, *n. s.* } Fr. *papiste*; Lat. *papista*.
PAP'ISTICAL, *adj.* } *ta*. A Roman Catholic:
PAP'ISTRY, *n. s.* } one that professes the doctrines of the Church of Rome: papistical is popish; adhering to or characteristic of popery: papistry is the system or doctrine of popery.

Papistry, as a standing pool, covered and overflowed all England. *Ascham's Schoolmaster.*

A great number of parishes in England consist of rude and ignorant men, drowned in *papistry*.

There are some *papistical* practitioners among you. *Whitgift.*
Id.

Either let our *papists* suffer this vain opinion of infallibility to be pulled up by the very roots out of their breasts, or else there can be no hope so much as of a consultation of peace. *Bp. Hall.*

The principal clergyman had frequent conferences with the prince, to persuade him to change his religion, and become a *papist*. *Clarendon.*

PAPISTS. See **ROMAN CATHOLICISM**.

PAPPOUS, *adj.* Barb. Lat. *papposus*. Downy; having a soft light down, growing out of the seeds of some plants; and which can be blown any where with the wind.

Another thing argumentative of providence is, that *pappous* plumage growing upon the tops of some seeds, whereby they are wafted with the wind, and by that means disseminated far and wide.

Ray on the Creation.

Dandelion, and most of the *pappous* kind, have long numerous feathers, by which they are wafted every way. *Derham.*

PAPPUS, an eminent philosopher of Alexandria, said by Suidas to have flourished under Theodosius the Great, who reigned from A. D. 379 to 395. His writings show him to have been a consummate mathematician: many of them are lost; the rest continued long in MS. detached parts having only been occasionally published in the seventeenth century, until Charles Manolesius published his remains entire at Bologna, in 1660, in folio.

PAPPUS, in botany, a soft downy substance that grows on the seeds of certain plants, as thistles, hawkweed, &c., serving to buoy them up in the air.

PAPUA. The island of Papua, or The Papuan Archipelago (for whether more than one island has not been described under this name is uncertain), forms a natural division of the grand Eastern Archipelago, being separated on the west from the Molucca Islands by the channel named the Gilolo Passage; on the south from New Holland by Torres Strait; on the north it has the Papua Sea; and on the east is separated from Polynesia by the sea between the New Hebrides and the Friendly Islands. This archipelago possesses neither horned cattle, horses, nor sheep, the domestic animals being confined to hogs and dogs, and of their wild ones we have scarcely any knowledge.

An extent of coast has been traced here reaching in a south-west direction from the Sound of Gilolo about 1200 miles. It is indented by such deep bays that it resembles a chain of peninsulas; the coast, viewed from the sea, rises gradually into hills of considerable elevation; but there are no mountains of which the height is remarkable. The whole is covered with palm trees and timber of a large size, among which the cocoa nut, and the two species of the bread-fruit tree, are found, as also pine-apples and plantains. Nutmeg trees also grow in a wild state. The natives are particularly dexterous in the use of spears, and bows and arrows; and discharge arrows six feet long with bows made of bamboo, having a string of split rattan. In the interior they practise gardening, and some sort of agriculture, supplying the inhabitants on the coast with food, in exchange for axes, knives, and cutlery. These the natives on the coast purchase from the Malays and the Chinese, particularly the latter, from whom they also buy blue and red cloth. In exchange the Chinese carry back missoy bark, slaves, ambergris, sea slug (*biche de mer*), tortoise-shell, small pearls, black and red lories, birds of paradise, and many other species of birds.

On the north-west coast of the island captain Forrest observed dwellings, built on posts, fixed several yards below water-mark, so that the tenement is always above the water; a long stage, supported by posts, going from it to the land just at high water-mark. This tenement contains many families, who live in cabins on each side of a wide common hall that goes through the middle of it, and has doors opening to the stage towards the land and towards the

sea. These habitations seem constructed in this singular manner in order to give them facilities of escape either by sea or land. If attacked from the land, the inmates launch their boats along the stage at any time of the tide; if from the sea, they escape into the woods. Their cabins are furnished only with a mat or two, a fire-place, an earthen pot, and perhaps a china plate or basin, together with some sago flour. As they cook in each cabin, the smoke issues at every part of the roof, so that at a distance the whole seems to smoke. The natives wear their hair bushed out round their heads to the circumference of two and a half and three feet; and, to make it more extensive, comb it out horizontally from their heads, adorning it with feathers. The men wear a thin stuff that comes from the coconut tree, and resembles a coarse kind of cloth, tied forward round the middle, and up behind, between the thighs. The women wear blue Surat baftas, tucked up behind, like the men, so that the body and thigh are almost naked; as boys and girls go entirely. They are fond of glass and china beads, which both sexes wear about the wrist, but the women only on the left ear. Forrest often saw the latter laboring hard in fixing posts in the ground for stages, in making mats, or in forming pieces of clay into earthen pots, while the men were sauntering about.

Some of the horaforas of the interior are said to have long hair, and are of robust appearance; but in the western extremity all the inhabitants seen by voyagers presented the mop head of the oriental negro. The inhabitants of the islands more westerly buy the Papuans for slaves, and the natives of the west coast of New Guinea make slaves of those of the east. The latter have the gristle between the nostrils pierced with tortoise-shell. About April and March the Papuans of New Guinea and Salwatty assemble in great numbers, and make war on Gilolo, Ceram, Amboyna, Amblœ, &c.

The British have had little intercourse with the Papuans. When the Panther, a Bombay cruiser, was in 1791 off their coast, the surgeon of the vessel was decoyed into the canoes of the natives, and murdered; after which they made an attempt on the ship, on which they discharged a shower of arrows, wounding four of the crew, and did not disperse until a discharge of the great guns and small arms asserted her superiority.

PAPUDO, a port of the kingdom of Chili, on the coast of the South Sea. Lat. 32° 36' S.

PAPYRUS, the famous reed from which was made the far-famed paper of Egypt. There was an opinion generally received in Europe that this plant was lost. But Mr. Bruce not only saw the papyrus growing both in Egypt and Abyssinia, but actually made a paper of it in imitation of that of the ancients. He tells us, likewise, that, so far from any part of it being useless, the whole plant is at this day used in Abyssinia for making boats, a piece of the acacia tree being put in the bottom to serve as a keel, like the boats of ancient Egypt. From the scarcity of wood, which was very great in Egypt, this lower part was likewise used in making cups, moulds, and other necessary uten-

Vol. XVI.

sils: one use of the woody part was to serve for what we call boards or covers for binding the leaves, which were made of the bark; we know that this was anciently one use of it, both from Alcæus and Anacreon. The papyrus grows in the marshes of Egypt, or in the stagnant places of the Nile. Its roots are tortuous, and in thickness about four or five inches; its stem is triangular, rising to the height of ten cubits. The stem tapers from the bottom, and terminates in a point. It carries a top or plume of small hairs, and its roots throw to the right and left a great number of small fibres, which support the plants against the violence of the wind. Formerly it used to grow in immense quantities. The Egyptians made of this plant paper fit for writing, which the Greeks called βιβλος or philuria, and also καρτης; hence the Latin charta; for in general charta is used for the paper of Egypt. The ancient botanists placed the papyrus among the graminous plants or dog-grass; ignorant of the particular kind to which it belonged, they were contented to specify it under the name of papyrus, of which there were two kinds, that of Egypt, and that of Sicily. Modern botanists have endeavoured to show that these two plants are one and the same species of cyperus, found in the catalogues and descriptions of plants published since the edition of Morrison's work, where the papyrus is called cyperus Niloticus, vel Syriacus maximus papyraceus.

The papyrus of Sicily is a plant resembling the Egyptian papyrus, in Italy called papero, and, according to Cæsalpin, pipero. This papyrus of Sicily has been cultivated in the garden of Pisa; and Cæsalpin, who himself examined the plant, says it is different from the papyrus of Egypt. The papyrus, says he, which is commonly called pipero in Sicily, has a longer and thicker stem than the plant cyperus. It rises sometimes to four cubits; the angles are obtuse, and the stem at the base is surrounded with leaves growing from the root; there are no leaves on the stem even when the plant is at the greatest perfection, but it carries at the top a large plume, which resembles a great tuft of dishevelled hairs; this is composed of a great number of triangular pedicles, in the form of reeds; at the extremity of which are placed the flowers, between two small leaves of a reddish color like the cyperus. The roots are woody, about the thickness of reeds, jointed, and they throw out a great number of branches, which extend themselves in an oblique direction. These are scented somewhat like the cyperus, but their color is a lighter brown: from the lower part issue many small fibres, and from the higher a number of stems shoot up, which, in proportion as they are tender, contain a sweet juice. The plume of the papyrus of Sicily is pretty well described in a short account of it in the second part of the *Musæum de Boccone*. This plume is a tuft or assemblage of a great number of long slender pedicles, which grow from the same point of division, are disposed in the manner of a parasol, and which carry at the top three long and narrow leaves, from which issue other pedicles, shorter than the former, and terminating in several knots of flowers. Micheli, in his *Nova Plantarum Ge-*

nera, printed at Florence in 1728, has given an engraving of one of the long pedicles in its natural length: it is surrounded at the base with a case of about one inch and a half in height; towards the extremity, it carries three long and narrow leaves, and four pedicles, to which are fixed the knots of flowers. Every pedicle has also a small case surrounding its base. In short, we find in the *Grosto-Graphia* of Schencher, a very particular description of the plume of a kind of cyperus, which appears to be the Sicilian plant. From this account it appears that the papyrus of Sicily is well known to botanists. It were to be wished that we had as particular a description of the papyrus of Egypt; but these two plants have a near affinity to one another; they are confounded together by many authors. Theophrastus says, the sari and papyrus Nilotica have a decided character of resemblance, and only differ in this, that the papyrus sends forth thick and tall stems, which, being divided into slender plates, are fit for the fabrication of paper; whereas the sari has small stems, considerably shorter, and altogether useless for any kind of paper. The papyrus, which served anciently to make paper, must not be confounded with the papyrus of Sicily, found also in Calabria; for, according to Strabon, the papyrus was to be found in no place excepting Egypt and India. The greatest part of botanists have believed that the Sicilian plant is the same with the sari of Theophrastus; others have advanced that the papyrus of Egypt and the sari were the same plant in two different stages of its existences, or considered with respect to the greater or less height; which, according to them, might depend on the qualities of the soil, the difference of the climate, or other accidental causes.

Among many dried plants collected in the East Indies by M. Poivre, there is a kind of papyrus very different from that of Sicily. It carries a plume composed of a considerable tuft of pedicles, very long, weak, slender, and delicate, like single threads, terminating most frequently in two or three small narrow leaves, without any knot of flowers between them; hence this plume must be altogether barren. Those pedicles or threads are furnished with a pretty long membranous case, in which they are inserted; and they issue from the same point of direction, in the manner of a parasol. The plume, at its first appearance, is surrounded with leaves like the radii of a crown. The stem which supports it is about ten feet in height, where there are two feet under water; it is of a triangular form, but the angles are rounded; its thickness is about the size of a walking staff which fills the hand. The interior substance, although soft and full of fibres, is solid, and of a white color. The stem possesses a certain degree of strength, and is capable of resistance. It bends without breaking; and, as it is extremely light, it serves for a cane. This stem is not of equal thickness in its whole length; it tapers insensibly from the thickest part towards the top. It is without knots, and extremely smooth. When this plant grows out of the waters, in places simply moist, it is much smaller, the stems are lower, and the plume is composed of shorter pedicles or threads, termi-

nating at the top in three narrow leaves, a little longer than those at the plume, when the plant grows in the water. From the base of these leaves issue small knots of flowers, arranged as they are in the cyperus; but these knots are not elevated above the pedicles; they occupy the centre of the three leaves, between which they are placed, and form themselves into a small head. The leaves, which spring from the root and the lower part of the stem, resemble exactly those in the cyperus. This plant, which the inhabitants call sanga-sanga, grows in great abundance in their rivers and on their banks, but particularly in the river Tartas, near the Foulpoint in Madagascar. The inhabitants of these cantons use the bark of this plant for mats; they make it also into sails, into cordage for their fishing-houses, and into cords for their nets. This kind of papyrus different from the papyrus of Sicily by the disposition of its flowers, shows that there are two kinds of the cyperus which might easily be confounded with the papyrus of Egypt; whether we consider, on the one hand, to what purposes the inhabitants of the places where they grow have made them subservient; or, on the other, compare their form, their manner of growth, and the points in which they resemble each other. This comparison can be easily made from the accounts which Pliny and Theophrastus gave of the papyrus of Egypt, and by the figure and description given by Prosper Alpin, after having observed the plant on the banks of the Nile. But, as Strabo affirms that the papyrus is found nowhere but in Egypt and in India, it is possible that the papyrus of the isle of Madagascar, situated at the mouth of India, is the same with that of Egypt. Be that as it may, the inhabitants of this island have never derived from it those advantages which have immortalised the papyrus of Egypt.

PAQUASHE LAKE, a lake of North America. Long. 93° 30' W., lat. 50° 48' N.

PAQUILIGASTA, a town of South America, in the province of Tucuman, forty miles S.S.W. of St. Miguel de Tucuman.

PAR, *n. s.* Lat. *par*; Gr. *παρα*, nigh. State of equality, or equal value. This word is chiefly used as a term of commerce.

To estimate the *par*, it is necessary to know how much silver is in the coins of the two countries, by which you charge the bill of exchange. *Lock.*

Exchequer bills are below *par*. *Swift.*

My friend is the second after the treasurer; the rest of the great officers are much upon a *par*. *Id.*

PARA, GRAN, an extensive province of Brasil, bounded north by the kingdom of Granada, Guiana, and the great bay formed by the Atlantic at the entrance of the great river Amazons; east by the province of Maranhão; south by the provinces of Goias and Matto Grosso; and west by Peru. Belem is the capital.

This province is fertile in sugar-canes, coffee, and cocoa, ornamental and odoriferous woods, and other timber. Here is a peculiar species of puchari, or precious fruit tree, not of so large a size as the common kind; but the fruit is more aromatic, and forms an excellent substitute for nutmegs. The real jalap tree abounds also in Para, as well as many other medicinal plants.

There is also abundance of gums, well calculated to supply the place of gum arabic: and one species adapted for making sealing-wax. Several parts of Para abound with yellow ochre, frequently intermixed with a red ochre of brilliant color. The animals are similar to those in the other districts of Brasil. Formerly the sale of the flocks which grazed in the island of Marajo was one of the great resources of this colony; but at present the number of oxen is diminished. A large species of silk-worm, whose ball is three times the size of the common one, is found in great plenty in Para. It feeds on the leaves of the orange trees, but the silk obtained has not as yet proved a profitable article of commerce: but the numerous indigo plantations are in a very flourishing condition. The finest Brasil arnotto is brought from this district. The chief rivers are the Madera, the Topayos, the Zingu, the Araguay, and the Toccantins, which all come from the northern mountains of Brasil, and fall into the Amazons.

PARA, GRAN, the capital of the province of this name, is a handsome city standing on the banks of the river Toccantins, the navigation of which is difficult, except for very small craft: the Confidence sloop of war with great care sailed up it, however, and anchored near the town, several days previous to the British expedition against Cayenne. The commerce is of little consequence: the exports consisting only of a little rice and cocoa, and a few drugs, &c., to Maranh, whence they are embarked for Europe. Some small brigs were sent hither from Barbadoes, after the taking of Cayenne; but the trade must be a bad one, as the inhabitants are in general too poor to purchase English manufactures, except those of necessity. The climate is hot, as may well be supposed; and thunder, with lightning and rain, occur generally every afternoon. It has a citadel and castle, at the entrance of the bay upon the river, and contains about 8000 inhabitants. It is sixty miles from the mouth of the river.

PARA, a river of the above province and kingdom, is, properly speaking, one of the mouths of the Amazons, formed by the island of Joannes. It is about forty miles wide at its mouth, and runs about 200 miles in a north-east direction. Lat. 20° S.

PAR'ABLE, *n. s.* } Fr. *parabole*; Gr. *παράβολη*. A comparison or similitude; PARABOL'ICAL, *adj.* } PARABOL'ICALLY, *adv.* } a relation under which something else is figured; a mysterious speech or maxim: the adjective and adverb follow these senses. Parable, also, as an adjective, (from Lat. *parabilis*,) means easily procured.

And in manye suche *parablis* he pak to hem the word. Wiclif. Mark iv.

Balaam took up his *parable*, and said.

Numbers.

It is evident that some things are purposely couched in *parabolical* and mysterious expression; it is particularly the manner of prophetic instruction.

Barrow.

They were not well wishers unto *parable* physic, or remedies easily acquired, who derived medicines from the phoenix.

Browne.

Such from the text decry the *parabolical* exposition of Cajetan.

Id. *Vulgar Errors*.

These words, notwithstanding *parabolically* intended, admit no literal inference.

Browne.

What is thy fulsome *parable* to me?

My body is from all diseases free. Dryden.

The pellucid coat of the eye doth not lie in the same superficies with the white, but riseth up a hillock above its convexity, and is of an hyperbolical or *parabolical* figure.

Ray.

In the *parable* of the talents, our Saviour plainly teacheth us, that men are rewarded according to the improvements they make.

Nelson.

The scheme of these words is figurative, as being a *parabolical* description of God's vouchsafing to the world the invaluable blessing of the gospel, by the similitude of a king.

South.

The incident ray will describe, in the refracting medium, the *parabolical* curve.

Cheyne.

A PARABLE is a fable or allegorical instruction, founded on something real or apparent in nature or history, from which a moral is drawn by comparing it with something in which the people are more immediately concerned; such are the parables of Dives and Lazarus, of the Prodigal Son, of the Ten Virgins, &c. See ALLEGORY.

PARAB'OLA, *n. s.* Lat. *parabole*. A section of a cone.

The *parabola* is a conick section, arising from a cone's being cut by a plane parallel to one of its sides, or parallel to a plane that touches one side of the cone.

Harris.

Had the velocities of the several planets been greater or less than they are now, at the same distances from the sun, they would not have revolved in concentrick circles as they do, but have moved in hyperbolas or *parabolas*, or in ellipses, very eccentric.

Bentley.

PARABOLIC PYRAMIDOID, a solid figure, so named by Dr. Wallis from its formation. Thus let all the squares of the ordinates of a parabola be so placed that the axis shall pass perpendicularly through all their centres, then the aggregate of all these planes will form the aggregate of the parabolic pyramidoid. It is equal to half its circumscribed parallelopipedon. The solid content is found by multiplying the base by the altitude, and taking half the product.

PARABOLIC SPIRAL, a curve arising from the supposition that the parabola is bent till the axis come into the periphery of a circle, the ordinates still retaining their places with respect to the circle.

PARAB'OLOID, *n. s.* Gr. *παράβολη* and *εἶδος*, form or appearance. A paraboliform curve, in geometry, whose ordinates are supposed to be in subduplicate, subquadruplicate, &c., ratio of their respective abscissæ. There is also another species; for if you suppose the parameter, multiplied into the square of the abscissa, to be equal to the cube of the ordinate; then the curve is called a semi-cubical paraboloid.—Harris.

PARACEL'SUS (Aurelius Philip Theophrastus Bombastus, de Hohenheim), a famous physician, born at Einsfelden, in the canton of Schweiz. He was educated with great care by his father, who was the natural son of a German prince, and made a rapid progress in the study of physic. He afterwards travelled into France, Spain, Italy, and Germany. In his return to Switzer-

land, he stopped at Basle, where he read lectures on physic in the German tongue. He was one of the first who made use of chemical remedies with success, by which he acquired great reputation. See MEDICINE. He gloried in destroying the method established by Galen, and thus drew upon himself the hatred of the other physicians. It is said that he boasted of being able, by his remedies, to preserve the life of man for several generations; but he himself experienced the vanity of such boasting, by dying at Saltzburg, in 1504, at thirty-seven years of age according to some, or forty-eight according to others. The best edition of his works is that of Geneva in 1658, in 3 vols. folio.

PARACENTE'SIS, *n. s.* Fr. *paracentese*; Greek *παράκέντησις*, of *παράκέντω*, to pierce. That operation whereby any of the venters are perforated to let out any matter; as tapping, &c.

PARACENTESIS. See SURGERY.

PARACENTRICAL, *adj.* } Gr. *παρά*, be-
PARACEN'TRIC. } side, and *κέντρον*, a centre. Deviating from circularity.

Since the planets move in the elliptic orbits, in one of whose foci the sun is, and, by a radius from the sun describe equal areas in equal times, we must find out a law for the *paracentric* motion, that may make the orbits elliptic. *Cheyne.*

PARACENTRIC MOTION, the motion or space by which a revolving planet approaches nearer to or recedes farther from the sun, or centre of attraction.

PARACHUTE, a large and strong kind of umbrella, invented by M. Blanchard, the French aéronaut, to break a person's fall from an air balloon, in case of any accident happening to it at a high elevation. See AERONAUTICS.

PARACLETE, the Comforter, a name given to the Holy Ghost.

PARADE, *n. s.* Fr. *parade*; Ital. *parada*; of Lat. *paro*, to contrive or go about a thing. Order; array; procession; show; pomp.

The cherubim stood armed

To their night-watches in warlike *parade*. *Milton.*

Accustom him to make judgment of men by their inside, which often shews itself in little things, when they are not in *parade*, and upon their guard.

Locke on Education.

He is not led forth as to a review, but as to a battle; nor adorned for *parade*, but execution.

Granville.

— I hate the camp,

I hate its noise and stiff *parade*, its blank
And empty forms, and stately courtesy,
Where between bows and blows, a smile and stab,
There's scarce a moment. Soldiers always live
In idleness or peril: both are bad. *Proctor.*

Be rich; but of your wealth make no *parade*.
At least before your master's debts are paid. *Swift.*

PARADE, in a military sense, is the place where troops assemble or draw together, to mount guard, &c.

PARADE, in fencing, implies the action of parrying or turning off any thrust. See FENCING.

PARADIN (William), a French historian of the sixteenth century, born at Cuiseaux, near Chalons, was author of a great number of works; particularly the History of Aristæus respecting the version of the Pentateuch; and *Memorialia insignium Franciæ familiarum*.

PARADIS (Paul), a learned Venetian, who first taught the Hebrew language in the Royal College of Paris; and wrote some pieces on it.

PARADISE, *n. s.* Fr. *paradis*; Gr. *παράδεισος*. The region in which the first pair were placed; any happy region.

Consideration, like an angel, came,
And whipt the' offending Adam out of him;
Leaving his body as a *paradis*,
To envelope and contain celestial spirits.

Shakespeare.

If he should lead her into a fool's *paradis*,
It were very gross behaviour.

Id. Romeo and Juliet.

The earth

Shall all be *paradis*, far happier place
Than this of Eden, and far happier days.

Milton.

The ancients express the situation of the *paradiacal* earth in reference to the sea.

Burnet.

Such a mediocrity of heat would be so far from exalting the earth to a more happy and *paradiacal* state, that it would turn it to a barren wilderness.

Woodward's Natural History.

The summer is a kind of heaven when we wander in a *paradiacal* scene, among groves and gardens; but, at this season, we are like our poor first parents, turned out of that agreeable, though solitary life, and forced to look about for more people to help to bear our labours, to get into warmer houses, and hire together in cities.

Pope.

By Alla! I would answer nay;
Though on Al-Sirat's arch I stood,
Which totters o'er the fiery flood,
With *paradis* within my view,

And all his Houris beckoning through

Byron.

PARADISEA, in ornithology, a genus of birds belonging to the order of picae. The beak is covered with a belt or collar of downy feathers at the base; and the feathers on the sides are very long. 'Birds of this genus,' says Latham, 'have the bill slightly bending; the base covered with velvet-like feathers. The nostrils are small, and concealed by the feathers. The tail consists of ten feathers; the two middle ones, and sometimes more in several of the species, are very long, and webbed only at the base and tips. The legs and feet are very large and strong: they have three toes forward, one backward, and the middle connected to the outer one as far as the first joint. The whole of this genus have, till lately, been very imperfectly known; few cabinets possessing more than one species, viz. the greater, or what is called the common bird of Paradise; nor has any set of birds given rise to more fables, the various tales concerning which are to be found in every author; such as, their never touching the ground from their birth to death; living wholly on the dew; being produced without legs; and a hundred such stories, too ridiculous even to mention. This last error is hardly yet wholly eradicated. The Portuguese first found these birds on the island of Gilolo, the Papua Islands, and New Guinea; and they were known by the name of birds of the sun. The inhabitants of Ternate call them *manuco duwata*, the bird of God; whence the name *manuco diata*, used by some naturalists, is derived. The peculiar length and structure of their scapular feathers hinders them from settling

in high winds, on trees; and, when they are thrown on the ground by these winds, they cannot rise again. When taken by the natives, they are immediately killed, and they defend themselves with great courage with their formidable bills. Latham enumerates eight species, but there are many more.

1. *P. alba*, the white bird of Paradise, is the most rare, and has two varieties; one quite white, and the other black and white. The former is very rare. The second has the fore part black, and the back part white; with twelve crooked wiry shafts, which are almost naked, though, in some places, covered with hairs.

2. *P. makima*, the largest bird of Paradise, is commonly two feet four inches long; the head is small; the bill hard and long, of a pale color. The head and back part of the neck is lemon-colored, a little black about the eyes; about the neck, of the brightest glossy emerald green, soft like velvet; as is also the breast, which is black; the wings are large, and chestnut colored; the back part of the body is covered with long, straight, narrow feathers, of a pale brown color, similar to the plumes of the ostrich. These feathers are spread when the bird is on the wing; for which reason he can keep very long in the air. On both sides of the belly are two tufts of stiff and shorter feathers of a golden yellow, and shining. From the rump proceed two long stiff shafts, which are feathered on their extremities. These birds are found at the Aroo islands, fifteen Dutch miles east of Key, during the west or dry monsoon; and they return to New Guinea as soon as the east or west monsoon sets in. They come always in a flock of thirty or forty, and are led by a bird which the inhabitants of Aroo call the king. This leader is black, with red spots; and constantly flies higher than the rest of the flock, which never forsake him, but settle as soon as he settles; a circumstance that frequently proves their ruin when the king lights on the ground, whence they are not able to rise on account of the singular structure and disposition of their plumage. They are likewise unable to fly with the wind, which would ruin their loose plumage; but take their flight constantly against it, cautious not to venture out in hard blowing weather, as a strong wind frequently obliges them to come to the ground. During their flight they cry like starlings. Their note, however, approaches more to the croaking of ravens; which is heard very plainly when they are in distress from a fresh gale blowing on the back of their plumage. In Aroo, they settle on the highest trees, especially on the ficus benjamina of the hortus malabaricus, commonly called the waringa tree. The natives catch them with bird-lime, or in nooses, or shoot them with blunt arrows; dry and fumigate the bodies with sulphur or smoke, and sell them at Banda for half a rixdollar each; but at Aroo they may be bought for a spike-nail or a piece of old iron. Flocks of these birds are often seen flying from one island to the other against the wind. During the east monsoon their tails are moulted, so that they have them only during four months of the west monsoon.

3. *P. minor*, the smaller bird of Paradise is

about twenty-nine inches long. His beak is lead-colored, and paler at the point. The eyes are small, and enclosed in black about the neck. The head and back of the neck are of a dirty yellow; the back of a grayish yellow; the breast and belly of a dusky color; the wings small, and chestnut-colored. The long plumage is about a foot in length, and paler than in the large species; as in general the colors of this species are less bright than the former; though in most other respects they are alike. They likewise follow a leader, who is blacker, with a purplish cast, and finer in color than the rest. The neck and bill are larger in the male than in the female. They roost on the tops of the highest trees, and do not migrate. The natives sear the birds with a hot iron, and put them in a tube of bamboo for preservation.

4. *P. nigra Amboinensis*, a species of the black bird of Paradise, seen in Amboyna in 1689. This was only one foot in length, with a fine purple hue, a small head, and a straight bill. On its back, near the wings, are feathers of a blue and purple color, as on the other birds of Paradise; but under the wings, and over all the belly, they are yellow-colored, as in the common sort: on the back of the neck they are mouse-colored, mixed with green. Before the wings are two roundish tufts of feathers, which are green edged, and may be moved at pleasure by the bird, like wings. Instead of a tail, it has twelve or thirteen black, naked, wire-like shafts, hanging promiscuously like feathers. Its legs are strong, and have sharp claws. The head and eyes are remarkably small; the latter are surrounded with black.

5. *P. nigra major*, the large black bird of Paradise, is brought without wings or legs for sale; so that no accurate description of it has yet been given. Its figure, when stuffed, is narrow and round, but stretched in length to the extent of four spans. The plumage on the neck, head, and belly, is black and velvet-like, with a strong hue of purple and gold. The bill is blackish, and one inch long. On both sides are two bunches of feathers, which appear like wings. The plumage is soft, broad, similar to peacocks' feathers, with a glorious gloss and greenish hue. The feathers of the tail are of unequal length; those next to the belly are narrow, like hair; the two uppermost are much longer, and pointed; those immediately under them are a span and a half longer than the upper ones; they are stiff, on both sides fringed with a plumage like hair, black above, but glossy below. Birds of this species are brought only from one particular place of New Guinea.

6. *P. nigra minor*, the small black bird of Paradise, has plumage equal in length, but thinner in body, black above, and without any remarkable gloss, not having those shining peacock feathers which are found on the greater species. It wants likewise the three long jointed feathers of the tail, which the larger black species has.

7. *P. regalis*, or *regis*, the king's bird, is about seven inches long, and somewhat larger than a titmouse. Its head and eyes are small; the bill straight; the eyes included in circles of

black plumage; the crown of the head is flame-colored; the back of the neck blood-colored; the neck and breast of a chestnut-color, with a ring of the brightest emerald green. Its wings are in proportion strong; and the quill feathers dark, with red shing plumes, spots, and stripes. The tail is straight, short, and brown. Two long naked black shafts proceed from the rump, at least a hand-breadth beyond the tail; having at their extremities semilunar twisted plumage, of the most glaring green color above, and dusky below. The belly is white and green sprinkled; and on each side is a tuft of long plumage, feathered with a broad margin, being on one side green, and on the other dusky. The back is blood-red and brown, shining like silk. The legs are in size like those of a lark, three fore toes and one back toe. This bird associates not with any of the other birds of Paradise; but flits solitary from bush to bush, wherever he sees red berries, without ever mounting on tall trees.

PARADOX, *n. s.*

PARADOX'ICAL, *adj.*

PARADOX'ICALLY, *adv.*

PARADOX'ICALNESS, *n. s.*

PARADOX'OL'OGY.

in opinion in appearance absurd: the derivatives follow this sense.

A glosse there is to colour that *paradox*, and make it appear in shew not to be altogether unreasonable.

Hooker.

You undergo too strict a *paradox*,

Striving to make an ugly deed look fair.

Shakspeare.

How worthy are they to smart that mar the harmony of our peace, by the discordant jars of their new and *paradoxical* concerns!

Bp. Hall.

'Tis not possible for any man in his wits, though never so much addicted to *paradoxes*, to believe otherwise, but that the whole is greater than the part: that contradictions cannot be both true; that three and three make six; that four is more than three.

Wilkins.

'Tis an unnatural *paradox* in the doctrine of causes, that evil should proceed from goodness.

Holyday.

What hath been every where opinioned by all men is more than *paradoxical* to dispute.

Browne.

Perpend the difficulty, which obscurity, or unavoidable *paradoxology*, must put upon the attempter.

Id.

These will seem strange and *paradoxical* to one that takes a prospect of the world.

Norris.

In their love of God, men can never be too affectionate: it is as true, though it may seem a *paradox*, that in their hatred of sin, men may be sometimes too passionate.

Sprat.

Mankind in the gross is a gaping monster, that loves to be deceived, and has seldom been disappointed; nor is their vanity less fallacious to our philosophers, who adopt modes of truth to follow them through the paths of error, and defend *paradoxes* merely to be singular in defending them.

Mackenzie.

If their vanity of appearing singular puts them upon advancing *paradoxes*, and proving them as *para-soically*, they are usually laught at.

Collier.

PARADOX. No science abounds more with paradoxes than geometry; thus, that a right line should continually approach to the hyperbola, and yet never reach it, is a true paradox; and

in the same manner, a spiral may continually approach to a point, and yet not reach it in any number of revolutions, however great. See M'Laurin's Fluxions. See LOGARITHMS.

PARADOXI, a sort of mimes or buffoons among the ancients, who entertained the people with extempore effusions of drollery. They were also called *Paradoxologi*, *Ordonari*, *Neanicolagi*, and *Aretalogi*.

PARAGAUDE, among the ancient Romans, wreaths of gold, or silk and gold, interwoven in, not sewed to, their garments. The garment was sometimes of one color, with one *paragaude*; sometimes of two colors with two *paragaude*; or three colors, with three, &c. They were worn both by men and women.

PARAGUANA, a peninsula of Venezuela, Colombia, which is united to the continent by a narrow isthmus, on which stands the city of Coro. The isthmus is about a league in width, and the peninsula stretches from south-west to north-west for twenty leagues. It is chiefly inhabited by people of color and Indians, who breed great quantities of cattle on it.

PARAGOANA, a craggy cape on the coast of Venezuela, thirteen leagues from the city of Coro. Lat. 11° 52' N.

PARAGOGE, *n. s.* } Fr. *paragoge*; Gr. PARAGOG'IC. }

in rhetoric, whereby a letter or syllable is added to the end of a word without being essential to the meaning

In Hebrew, the ה is frequently *paragogic*; as in אֲכַרְכָּה, for אֲכַרְךָ, I will praise. The *paragogic* letters are the five following, viz. ו ו' ו' א ה, to which some add the ת. The use of *paragogic* letters is only to give a more full and agreeable sound to words, either for the sake of the verse, or the smoothness of the period. As in the Hebrew, letters are sometimes added 'euphonia gratia', so likewise, the four following letters, viz. ת ו' ו' ו', which, according to the grammatical rules, ought to be present, are omitted.

Dr. A. Rees.

PARAGON, *n. s. & v. a.* French *parangon*; Ital. *paragone*; Gr. *παράγων*. A pattern or model; to match; compare; parallel; be equal to (as in a pattern).

The picture of Pamela, in little form, he wore in a tablet, purposing to *paragon* the little one with Artemisia's length, not doubting but even, in that little quantity, the excellency of that would shine through the weakness of the other.

Sidney.

Alone he rode without his *paragon*.

Spenser.

An angel! or, if not,

An earthly *paragon*.

Shakspeare.

I will give thee bloody teeth,

If thou with Cæsar *paragon* again

My man of men.

Id.

We will wear our mortal state with her, Catharine our queen before, the primest creature That's *paragon'd* i' th' world.

Id. Henry VIII.

Proud seat

Of Lucifer, so by allusion called

Of that bright star to Satan *paragon'd*.

Milton.

PARAGONG, a town of the province of Bootan, North Hindostan, and capital of a district of the same name. It is famous for its manufacture of swords, daggers, arrows, and

images of Boodh. The residence of the governor of the district, whose authority extends from the confines of Thibet to Bengal, has a palace well fortified. He is amenable to the Deb or Deveh rajah of Tassisudon, a tributary of the Grand Lama of Thibet. Long. 89° 21' E., lat. 27° 43' N.

PARAGRAPH, *n. s.* } Fr. *paragraph* ;
PARAGRAPHICAL, *adj.* } Greek *παράγραφη*.
PARAGRAPHICALLY, *adv.* } A distinct part of a discourse.

Of his last *paragraph*, I have transcribed the most important parts. *Swift.*

When one subject is continued to a considerable length, the larger divisions of it should be put into *paragraphs*. *Murray.*

A PARAGRAPH is properly a section or division of a chapter, and in references is marked thus, §.

PARAGUA, a river of New Granada, Colombia, in the province of Maracaibo, which runs S. S. E., and enters the Apure.

PARAGUAY, an extensive government of Buenos Ayres, bounded by Chiquitos, Chacos, and Tucuman, on the north-west and west; by the lake of Xarayes on the north; on the north-east and east by the Portuguese territories; and on the south-east and south by the Parana, which separates it from the missions of Guaira in Buenos Ayres, its jurisdiction ending in the south of the city of Assumption, in 26° 48' S. lat.; and it is divided from Tucuman by the river Paraguay.

The great geographical features of this country are its numerous rivers, lakes, swamps, plains, and woods. The most noted of its rivers are the Paraguay, the Parana, the Porudos, Mbotely, Tobati, Ipane, Piray, in the north; and in the south the Canabe and the Tibiquari. These, in the rainy season, overflow their banks, the ground being flat to the extent of several hundred miles; the inundation spreads into lakes which are of great superficial extent, but little depth. When it subsides large tracts which have been submerged become extremely fertile. The climate in general is moist and temperate, though in some parts it is cold, and white frosts are common in July and August. All kinds of grain, the sugar-cane, beans, peas, melons, cucumbers, and European vegetables, abound in the more fruitful parts; asparagus is found wild, and there is a remarkably fine sort of vine, of which a good wine is made: tobacco and cinchona, or Jesuits' bark; sarsaparilla; rhu-barb; jalap; sassafras; guaiacum; cupay, whose oil is used in medicine; nux vomica; vanilla; cacao, the cedar; the curi or pine, from whose red knots, which contain a varnish, the Indians make images; the algarrobo, or carob tree, which is converted into bread; and the Paraguay tea or matte, a plant which rises about a foot and a half high, with slender branches, and leaves like those of senna, are also found here. This last herb grows about 100 leagues from the capital. The gathering and preparing it consists in drying the leaves, which are scattered on shelves for the purpose over a fire, when they are crumbled into a rough dust, and then put up into packages of from seven to eight arrobas, each arroba weighing 25 lbs. The consumption

of this article, not only in these provinces, but in those of Peru and Chili, is incredible; there is scarcely any person who does not take an infusion of it two or three times in the course of the day, making an infusion of it like tea, with warm water and sugar; the mines would stand still, it is said, if the owners were to neglect to supply the workmen with it. It is infused and made nearly in the same way as Chinese tea, excepting that the branches are put in with the leaves. The pomegranate, fig, lemon, and orange, also flourish in Paraguay. The native fruits include the jujuba, chanar, yacani, quabira (from which candles are made for the churches), the delicious quembe, the mammon, resembling a melon, and growing on the trunk of a tree; the anguay, whose pips, of a rich violet color, and triangular shape, are used by the Indians for necklaces; the bacoba, banana, anana, manioc, the cotton tree, which grows here to a great size, &c. &c.; indigo, cochineal, nacalic, whose beautiful yellow is much used by dyers; and reeds of great size, besides a great number of other useful trees and plants; and an immense variety of beautiful flowers. The largest bird is the cassowary or American ostrich, which is remarkable for its fine plumage and swift motions. Of the humming bird there are nine species. In the woods are also hares, rabbits, partridges, wild boar, deer, &c.; but from the great quantity of neat cattle, the flesh of which is preferred, none of these animals are hunted. In the lakes and shores of the river geese are taken in great numbers. They are enlivened likewise by nightingales, goldfinches, parrots of most beautiful plumage, peacocks, and birds of prey, amongst which there is one called tuca, resembling the crow, but having a beak the length of a hand, and beautifully variegated with red, yellow, and black streaks. The most ferocious animal of Paraguay is the jaguar or tiger, which commits great havoc amongst the cattle, and often attacks man. The puma couga, or the American lion, is a fierce animal, but not to be compared to the African lion; and the black bear is also large and ferocious. The tapir or river cow, the water pig or capibara, the cavies, and various other amphibious animals, frequent the numerous streams; and mosquitoes, with an innumerable variety of insects and snakes, are the plague both of the waters and the land. It is estimated that there are twenty kinds of serpents, of which the rattle-snake is the most common. The great boa constrictor is also found adjoining the rivers. In some parts the vampire bat, seizing on a person asleep, sucks the blood, so as to endanger the life of its victim. There is also a species of butterfly whose bite causes a corroding humor to appear, which forms a nidus for a little worm, that leaves behind an unseemly wound, of tedious cure.

The commerce of this country, chiefly carried on by the river Paraguay, consists in the export of its tea, tobacco, cotton, sugar, tallow, wax, honey, hides, cattle, horses, mules, wool, and leather. The journey to Buenos Ayres by land is seldom performed except by couriers, who are exposed to the attacks of the wandering Indians, even the navigation of the Great river:

not being free from them: on the west are the Tobas and Moscobies, on the south the Abipones, on the north the Guaycurus or Mbayas, and the Panaguas; but the east is free from any close neighbours of this description, though on the distant mountains in this quarter called Yerva, are the Monteses, who give great trouble to the people employed to collect the matti. These unsubdued Indians frequently attack the settlements, which has obliged the inhabitants to form a militia to repel their aggressors; there are also nineteen forts in Paraguay in number, generally near the river, which is furnished with guard boats. The number of Indian villages of the missions was of late considerable; they consist of stone or mud houses, covered with tiles, having a large square, in which is the priest's house, and a good church, the number of inhabitants varying from 500 or 600 to 2000.

Paraguay, after being discovered by Sebastian Cabot in 1526, was governed by Juan de Ayalas, to whom Don Pedro de Mendoza, the first governor of Buenos Ayres, gave a commission, a body of troops, military stores, and other necessities; afterwards, by his orders, Juan de Salinas founded the city of Assumption, the capital. In subjugating this country the Spaniards, under Alvarez Nunes, exercised great cruelty on the inhabitants, and regularly parcelled them out as slaves. To supply workmen for the Spanish plantations, Parana was afterwards conquered; the city of Ciudad Real was founded; and 40,000 Indians were reduced to slavery. In 1556 the Jesuits made their first appearance here, and succeeded by gentleness and policy in reducing many of the natives under the yoke of civilised life. Their success indeed in this benevolent work was astonishing; and it is only to be regretted that the whole order has not been thus employed. They established native towns and villages, which soon under their influence and direction spread over the wilderness: their principal missions were not, however, in Paraguay, but in Buenos Ayres, south of the Parana. When the order was abolished, Spanish South America was divided into governments, and other priests were appointed to succeed them in their administration here. See AMERICA, SOUTH. The population of Paraguay was estimated some time since at 97,480 Indians, Spaniards, or whites, of which the latter do not form much more than a twentieth part. The only important towns are the capital Assumption, Villa-Rica, Curugauty, Concepcion, and Neembucu.

PARAGUAY, a river of South America, which gives name to the above province, and of which the sources are little known. Mr. Mawe fixes them in lat. 13° S., after which it runs a course of about 1800 miles, and enters the ocean at the Rio de la Plata.

PARAGUAY, or PARAGUAY TEA TREE, in ootany, a tree which grows naturally in the above country, and is extremely useful both as food and medicine. It is a middle-sized tree, resembling an orange tree and tasting like mallows. The leaves are the part chiefly used. The natives make three gatherings annually; first, of the buds, before they unfold into leaves: these are reckoned best, but

soonest decay: second, of the full grown leaves, at their first expansion: and third, of the leaves, when they have remained on the tree for some time after they are fully blown. These leaves are roasted, and kept in pits under ground for sale. Quantities to the value of £100,000 are annually exported to Peru and Chili. These trees grow naturally in the morasses on the east bank of the Paraguay; but are now dispersed and cultivated all over the country. The leaves are thus used; being dried and reduced almost to powder, they are put into a cup, with sugar and lemon juice; boiling water is then poured on, and the infusion drunk. They are said to be of service in all disorders of the head, breast, and stomach; to allay hunger, and to purify all kinds of water; to preserve the miners from the noxious effect of the minerals; and to be a sovereign remedy in scurvy and putrid fevers. Mr. Llex ranks this tree as a species of Ilex. See ILEX.

PARAIBA, a province of Brasil, bounded north by the river Grande, east by the Brazilian Sea, south by the province of Itamarca, and divided from it by the river Paraiba. The climate is mild, and the soil fertile; and it abounds more than any other province in Brasil wood. The French took possession of it till the year 1584, when they were driven out by the Portuguese. There are many sugar houses in this province.

PARAIBA, the capital of the above province, is situated on the south bank of the river of the same name, about ten miles from the sea, the river being navigable for a considerable way above. It is a handsome and healthy town, defended by three forts. The cathedral is an elegant edifice. The exports consist chiefly of sugar, dyeing woods, and drugs. Population 4000.

PARAIBA, a large river of the above province, which rises in the mountains of the interior, and at its mouth forms the great bay of Paraiba. Its shores are covered with villages and sugar houses. Also a large river of Brasil, in the province of Rio Janeiro, which has its source in the mountains of the province of St. Paul. After a very winding course of 150 miles it enters the province of Rio Janeiro, and, pursuing the same irregular direction, it enters the Atlantic in lat. 21° 34' 30" S.

Mr. Caldcleugh gives us an amusing picture of the country on the banks of this river; and some valuable particulars of its productions. 'After many ascents and descents, over a soil of a deep brick-dust color, we arrived,' says he, 'on the bank of the Rio Paraiba. Near it I observed many rounded waterworn masses of green-stone, but I could discover none in situ. Some gneiss appeared very considerably inclined. On the opposite, or left bank, the register-office is built, where all mules and passengers arriving from the mines are closely examined for diamonds and gold dust, two articles strictly prohibited. The commandant had a guard of twelve soldiers, and an armed boat, which rowed up and down at night, to prevent any persons crossing the river, in this place about 100 yards across. The current is rapid, about seven miles an hour,

and the water cool, being twelve degrees under the temperature of the air, which was 80°. After exhibiting my portaria, or license to travel, I left the registro of the Paraiba, and immediately commenced a long and painful ascent. The road was excessively bad, being extremely narrow, with a gully down the centre; and the soil, being a red clay, was very insecure from the humidity. From the summit, the views on all sides were magnificent; but more particularly the one which extended along the valley of the Paraiba. Here and there the eye caught a glimpse of the river glistening amidst the deepest and most luxuriant vegetation. My tropeiro brought me some pieces of the Quina or Bark, and pointed out many trees. It was extremely bitter, and is, I have no doubt, as good a febrifuge as the Peruvian. All those who pass through these woods use it for the teeth and in cases of loss of appetite. This bark is of a higher color than the 'Jesuits', and I presume of a very different species. The track now led down a descent, and afterwards ascended by a zigzag and most laborious road to nearly its former elevation. The heat was intense, and the mules suffered considerably, and drank at every stream. Large masses of undecomposed feldspar rose in places out of the deep red earth. In other spots the soil was a stiff red clay. The thick wood, although boasting of a large proportion of evergreens, showed, at least the highest trees, a wintry appearance.

'We had not long left the Paraiba, when an immense boa constrictor showed himself among the foliage over my head and the tropeiro's. He was playing about, and instantly retired; he was so close to me that I had a good opportunity of examining his length and the dark brown spots with which he was marked, before my mule and the tropeiro's horse descried him, when the former sprung forward, and the latter turned round, and with great difficulty was brought up again to the spot, which he passed in a trembling state. Rosario and Adam were in advance with the mules and the gun, and had seen nothing of the monster. This was the largest boa I ever saw alive, and I should conceive measured sixteen or eighteen feet. Some skins I subsequently measured were of much greater length. They were brought from the sertão, or country not at all traversed; and when tanned formed an excellent boot quite impervious to the wet. Many of the respectable miners wear boots of this description. The heat was so oppressive on this day that we saw few birds: they appeared to have retired to the very depths of the woods. The trees which we passed were of immense height: for, although in many instances they rose from a depth of forty feet below us, they towered as many over our heads. They were chiefly the tree which produces the gum copaiba.

'We proceeded onwards to a rancho called Payal, and thence over the summits of many serras, ascending and descending continually, until seven o'clock in the evening, when we came in sight of and descended to the bank of the *Paraibuna*. The temperature of the water was 71° and of the air 78°. The distance completed this day was about six leagues, but the heat was

so oppressive, and the track, from the repeated ascents and descents, so extremely fatiguing, that the mules arrived at the river in a very exhausted state. After unloading them, we allowed them to lie down or wander about for an hour or two, before we attempted to feed them; but even then they would not touch the Indian corn, and we were at last obliged to add some handfuls of salt, to get them to eat any. Our own chase had been very unfortunate: only one large bird had been killed; but on 'aking off the skin, for the sake of the plumage, the body was evidently too small for supper. A fortunate occurrence obtained us, however, an excellent repast. My man, previous to leaving Rio de Janeiro, bought the old hat of a priest, which, from its very broad flaps, he conceived would be an effectual shelter from the sun. When we came down to the huts of the *Paraibuna*, one of the inhabitants thought he recognised in Rosario a priest who had once said mass there, and, knowing he could procure nothing fit to eat, had a fowl instantly killed, dressed with rice, and sent it to us. In fact, there is little or nothing to be got in these villages; the mule drivers live on feijoes or beans and pork, which they carry with them, and the inhabitants have little more than is sufficient for their own consumption. The land which they take the trouble to cultivate is cropped with Indian corn, and is entirely consumed on the spot. The inhabitants are a mixed race of blacks and mulattoes, and occasionally with a dash of Indian blood. They are chiefly free; they are excessively indolent, as it may be supposed, and do not appear stimulated even by the idea of gain. Their huts are formed of mud, with a covering of broad leaves; the better description have a ceiling formed of split canes, called *taquarra*.

'The registro of the *Paraibuna* is built on the opposite side of the river, and about 100 small huts or houses surround it. The *Paraibuna* flows down from the back of the Serra da Mantiqueira, under the name of the Rio Preto, which is in fact a mere translation of the Indian word *Paraibuna*. Para, river, and ibuna, black. It is here about fifty yards across, and flows with a turbid but rapid current, half a degree farther to the east, where it joins the Paraiba, and their united streams enter the sea under the name of the Southern Paraiba. Its sand is eminently auriferous, and in front of the registro many canoes were at work. By means of a windlass and an iron scoop, the gold washers dredge up into the canoe a portion of the bed of the river, and, when they have procured as much as they can carry, they move to their washing place, which is a kind of platform projecting over the river; the cascallo or gravel and sand is then shovelled into a large trough, and upon it a neighbouring stream is conducted by means of large bamboos. The canoes are very large, and formed out of a single tree. There were usually three blacks in the canoe, and two on the platform, who received a *patach* (320 reis) per diem each, which for five amounted to 1600 reis; and as the daily gain was generally equal to 2200, about ten shillings, there was a balance of 600 reis for the owners of the boat. One of the

patraos informed me that he frequently collected with three boats five or six octavas of gold (seventy-two grains each) in the course of the day. The gold he showed me was fine grained and of good color. The gravel brought up with it consisted chiefly of quartz of a brilliant whiteness, appearing at first like white topazes, rounded cornelians of a yellowish tint with the red, some agates, and aquamarines of a muddy bad color. I obtained from the mass of refuse several specimens of this description, and a few waterworn wine-yellow topazes. On the bank of the river I observed many large masses of ferruginous quartz, destined, perhaps, when the progress of decomposition is completed, to add a small stock of gold to the sands of the stream, from which large quantities have been already obtained.

PARALLAX, *n. s.* Greek *παράλλαξις*. The distance between the true and apparent place of the sun, or any star, viewed from the surface of the earth. See below.

By what strange *parallax* or optick skill

Of vision multiply'd. *Milton's Paradise Regained.*

Light moves from the sun to us in about seven or eight minutes time, which distance is about 70,000,000 English miles, supposing the horizontal *parallax* of the sun to be about twelve seconds.

Newton's Opticks.

PARALLAX, in astronomy, is otherwise defined, the difference between the places of any celestial objects as seen from the surface, and from the centre of the earth at the same instant. See **ASTRONOMY**. The whole effect of parallax is in a vertical direction : for the parallactic angle is in the plane passing through the observer and the earth's centre ; which plane is necessarily perpendicular to the horizon, the earth being considered as a sphere. The more elevated an object is above the horizon, the less is the parallax, its distance from the earth's centre continuing the same. When the object is in the zenith, it has no parallel ; but when in the horizon, its parallax is greatest. The horizontal parallax being given, the parallax at any given altitude may be found by the following rule :—To the logarithmic cosine of the given altitude, add the log. sine of the horizontal parallax ; the sum, rejecting ten from the index, will be the log. sine of the parallax, in altitude. The longitude, latitude, right ascension, and declination of an object, are affected by parallax. The difference between the true and apparent longitudes is called the parallax in longitude ; in like manner, the differences between the true and apparent latitudes, right ascensions, and declinations, are called the parallax in latitude, right ascension, and declination, respectively.—When the object is in the nonagesimal, the parallax in longitude is nothing, but that in latitude is greatest ; and, when the object is in the meridian, the parallax in right ascension vanishes, and that in declination is a maximum. The apparent longitude is greater than the true longitude, when the object is east of the nonagesimal, otherwise less ; and, when the object is in the eastern hemisphere, the apparent right ascension exceeds the true, but is less than the true right ascension when the object is in the western hemisphere. The apparent place of an object is more distant from the ele-

vated poles of the ecliptic and equator than the true place ; hence, when the latitude of the place and elevated pole of the ecliptic are of the same name, the apparent latitude is less than the true latitude, otherwise greater ; and the apparent declination will be less or greater than the true declination, according as the latitude of the place and declination of the object are of the same or of a contrary denomination. The parallaxes in longitude, latitude, right ascension, and declination, in the spheroidat hypothesis, may be found by the following formulæ ; in which *L* represents the latitude of the place, diminished by the angle contained between the vertical and radius of the given place ; *P* the horizontal parallax for that place ; *a* the altitude of the nonagesimal at the given distance ; *d* the apparent distance of the object from the nonagesimal ; *l* λ the true and apparent latitudes of the object ; *D* δ the true and apparent declinations respectively ; and *m* its apparent distance from the meridian. Then *par. in long.* = *P. sine a. sine d, secant l, to radius unity* ; and *par. in lat.* = *P. cosine a. cosine a. cosine l \mp p. cosine d. sine a. sine l*. The sign — is used when the apparent distance of the object from the nonagesimal and from the elevated pole of the ecliptic are of the same affection, and the sign + if of different affection. If the greatest precision be required, the following quantity 0.00000121216. *par. long.* ², sine 2 *l*, is to be applied to the parallax in latitude found as above, by addition or subtraction, as the true distance of the object from the elevated pole of the ecliptic is greater or less than 90°. Again, *par. in right ascen.* = *P. cosine L. sine m. secant D, to radius unity* ; and *par. in declination* = *P. sine L. cosine δ \mp P. cosine L. sine δ , cosine m*. The upper or lower sign is to be used, according as the distance of the object from the meridian and from the elevated pole of the equator are of the same or different affection. Part second of *par. in declination* = 0.00000121216 *par. in right ascen.* ², sine 2 *D* ; which is additive to, or subtractive from part first of the parallax in declination, according as the true distance of the object from the elevated pole of the equator is greater or less than 90°.

PARALLAX is also used to denote the change of place in an object arising from viewing it obliquely with respect to another object. Thus the minute hand of a watch is said to have a parallax when it is viewed obliquely ; and the difference between the instants shown by it, when viewed directly and obliquely, is the quantity of parallax in time.

PARALLAX OF THE EARTH'S ANNUAL ORBIT, is the difference between the places of a planet as seen from the sun and earth at the same instant. The difference between the longitudes of the planet as seen from the sun and earth is called the parallax in longitude ; and the difference between its latitudes is the parallax in latitude.

PAR'ALLEL, *adj., n. s. & }* Fr. *parallèle* ; **PAR'ALLELISM**. [*v. a.*] Gr. *παράλληλος*. Equidistant ; lineally extended in the same direction : hence, having the same tendency ; equal ; like : parallelism is the state of being parallel, or an instance of it.

His life is *parallel*'d
Ev'n with the stroke and line of his great justice.

Shakspeare.

The *parallel* holds in the gainlessness, as well as
laboriousness of the work.

Decay of Piety.

But the time and occasion call my thoughts home-
ward, and invite me rather to spend the rest of my
hours in *paralleling* Israel's blessings, sins, and
threats of judgment with our own.

Bp. Hall.

Such a resemblance of all parts,
Life, death, age, fortune, nature, arts;
She lights her torch at theirs to tell,
And shew the world this *parallel*.

Denham.

The foundation principle of peripateticism is ex-
actly *parallel* to an acknowledged nothing.

Glanville.

Distorting the order and theory of causes perpen-
dicular to their effects, he draws them aside unto
things whereto they run *parallel*, and their proper
motions would never meet together.

Browne.

The Azores having a middle situation between
these continents and that vast tract of America, the
needle seemeth equally distracted by both, and di-
verting unto neither, doth *parallel* and place itself
upon the true meridian.

Id.

The loyal sufferers abroad became subjected to the
worst effect of banishment, and even there expelled
and driven from their flights; so *paralleling* in their
exigencies the most immediate objects of that mon-
ster's fury.

Fell.

The *parallelism* and due proportioned inclination
of the axis of the earth.

More's Divine Dialogues.

In the fire, the destruction was so swift, sudden,
vast, and miserable, as nothing can *parallel* in story.

Dryden.

I *paralleled* more than once our idea of substance
with the Indian philosopher's he-knew-not-what,
which supported the tortoise.

Locke.

Speaking of the *parallelism* of the axis of the earth
I demand, whether it be better to have the axis of the
earth steady and perpetually *parallel* to itself, or to
have it carelessly tumble this way and that way.

Ray on the Creation.

That he stretched out the north over the empty
places, seems to *parallel* the expression of David, he
stretched out the earth upon the waters.

Burnet.

Thou ungrateful brute, if thou wouldst find thy
parallel, go to hell, which is both the region and the
emblem of ingratitude.

South.

Dissensions, like small streams, are first begun,
Scarce seen they rise, but gather as they run;
So lines, that from their *parallel* decline,
More they proceed, the more they still disjoin.

Garth.

When honour runs *parallel* with the laws of God
and our country, it cannot be too much cherished;
but, when the dictates of honour are contrary to those
of religion and equity, they are the great deprivations
of human nature.

Addison.

A reader cannot be more rationally entertained
than by comparing and drawing a *parallel* between
his own private character, and that of other persons.

Id.

In the *parallel* place before quoted.
For works like these, let deathless journals tell,
None but thyself can be thy *parallel*.

Ope.

Who made the spider *parallels* design,
Sure as De Moivre, without rule or line? *Id.*
'Twixt earthly females and the moon,

All *parallels* exactly run.

Swift's Miscellanies.

Compare the words and phrases in one place of an
author, with the same in other places of the same
author, which are generally called *parallel* places.

Watts.

PARALLEL, in geometry. See GEOMETRY.

PARALLEL SPHERE, that situation of the
sphere wherein the equator coincides with the
horizon, and the poles with the zenith and nadir.

PARALLELS OF ALTITUDE, or *ALMUCANTARS*,
are circles *parallel* to the horizon, imagined to
pass through every degree and minute of the
meridian between the horizon and zenith, having
their poles in the zenith.

PARALLELS OF DECLINATION, in astronomy,
are the same with *parallels* of latitude in geo-
graphy.

PARALLELS OF LATITUDE, in astronomy, are
lesser circles of the sphere *parallel* to the eclip-
tic, imagined to pass through every degree and
minute of the colures.

PARALLEL OGRAM, *n. s.* Fr. *parallelo-*
gramme; Gr. *παράλληλος* and *γραμμή*, a figure.
In geometry, a right lined quadrilateral figure,
whose opposite sides are *parallel* and equal.

The experiment we made in a loadstone of a *pa-*
rallelogram, or long figure, wherein only inverting
the extremes, as it came out of the fire, we altered
the poles.

Browne.

We may have a clear idea of the area of a *parallelo-*
ogram, without knowing what relation it bears to the
area of a triangle.

Watts.

PARALLELOPIPED, *n. s.* Fr. *parallelo-*
pipede. A solid figure contained under six *paral-*
lelograms, the opposite sides of which are
equal and *parallel*; or it is a prism, whose base
is a *parallelogram*.

Two prisms alike in shape I tied, so that, their
axes and opposite sides being *parallel*, they composed
a *parallelopiped*.

Newton.

Crystals that hold lead are yellowish, and of a
cubic or *parallelopiped* figure.

Woodward.

PARALLELOPIPEDIA, in the old miner-
alogy, a genus of spars, externally of a deter-
minate and regular figure, always found loose,
detached, and separate from all other bodies, and
in form of an oblique *parallelopiped*, with six
parallelogram sides, and eight solid angles;
easily fissile either in an horizontal or perpendi-
cular direction; being composed of numbers of
thin plates, and those very elegantly and regu-
larly arranged bodies, each of the same form
with the whole mass, except that they are thin-
ner in proportion to their horizontal planes, and
naturally fall into these and no other figures, on
being broken with a slight blow.

PARALOGISM, or *?* Fr. *paralogisme*; Gr.
PARALOGY, *n. s.* *?* *παράλογισμος*. A false
argument.

That because they have not a bladder of gall, like
those we observe in others, they have no gall at all,
is a *paralogism* not admissible, a fallacy that dwells
not in a cloud, and needs not the sun to scatter it.

Browne's Vulgar Errors.

That Methuselah was the longest liver of all the
posterity of Adam, we quietly believe; but that he
must needs be so, is perhaps below *paralogy* to deny.

Browne.

Modern writers, making the drachma less than the
denarius, others equal, have been deceived by a
double *paralogism*, in standing too nicely upon the
bare words of the ancients, without examining the
things.

Arbuthnot.

If a syllogism agree with the rules given for the
construction of it, it is called a true argument: if it

disagree with these rules, it is a *paralogism*, or false argument. *Watts.*

PARALOGISM, in logic, also implies a consequence drawn from principles that are false; or, though true, are not proved; or when a proposition is passed over that should have been proved.

PARALYSIS, *n. s.* Fr. *paralytic*; Gr. *παλυσος*. A palsy. See **MEDICINE**, Index.

PARALYTICAL, or } Palsied; inclined
PARALYTIC, *adj.* } to palsy.

Nought shall it profit, that the charming fair,
Angelick, softest work of heaven, draws near
To the cold shaking *paralytick* hand,
Senseless of beauty. *Prior.*

The difficulties of breathing and swallowing, without any tumor after long diseases, proceed commonly from a resolution or *paralytical* disposition of the parts. *Arbuthnot.*

If a nerve be cut, or straitly bound, that goes to any muscle, that muscle shall immediately lose its motion: which is the case of *paralyticks*. *Derham.*

The temporary motion of a *paralytic* limb is likewise caused by passing the electric shock through it; which would seem to indicate some analogy between the electric fluid and the nervous fluid, which is separated from the blood by the brain, and thence diffused along the nerves for the purposes of motion and sensation. *Darwin.*

PARAMARIBO, a handsome town of Guiana, the capital of the province of Surinam, is situated on the right bank of the Surinam river, about eighteen miles from its mouth. It is about a mile and a half in length, and about half as much in breadth, and built in the form of an oblong square. The streets, which are straight, are lined with orange, shaddock, tamarind, and lemon trees, which appear in perpetual bloom. It is generally crowded with planters, sailors, soldiers, Jews, Indians, and negroes, while the river is constantly covered with barges and canoes. The town-hall, Protestant church, Lutheran chapel, and Jewish synagogue, are all respectable buildings. Here is a citadel of some strength, separated by an esplanade from the town. Inhabitants 5000.

PARAMATTA, a town of New Holland, situated above the head of Port Jackson harbour, and built along a small stream that falls into the river which terminates in that arm of the sea. Its distance from Sydney is about twelve miles by land, and eighteen by water; but, for the last six or seven miles, the river can only be navigated by boats. The town consists principally of a single street, about a mile long, and is much inferior to Sydney in point of building, though it contains several good houses. These, with the church, the government house, the new orphan house, and some gentlemen's seats situated on the surrounding eminences, give it a respectable appearance. There are likewise two good inns. Here is also a factory, where the female convicts who are found unfit for servants are employed in manufacturing coarse cloth. The population consists principally of inferior traders, publicans, artificers, and laborers; and, including the soldiers stationed there, may be estimated at about 1200 individuals. Benevolence, too, has taken up her residence there, and one of the institutions

that first claims the attention of the philanthropist, is the school that was established a few years since for the instruction of the aborigines. It lately contained nearly twenty children of the natives, who had been voluntarily placed there by their parents, and whose progress in their studies was found to be not inferior to that of European children of the same age.

A superintendent receives wool from the settlers, and gives them a certain portion of the manufactured article in exchange. What is reserved is only a fair equivalent for the expense of making it, and is used in clothing the jail gang, the reconvicted culprits who are sent to the coal river, and the inmates of the factory. This town has made but a slow progress compared with the town of Sydney; and the value of land in its neighbourhood is consequently not so great by any means. In 1818 there were cleared in the district of this name 13,302 acres of land, containing 10,429 head of cattle, 33,673 sheep, 745 horses, and 3960 hogs.

PARAMITHIA, a considerable town of Albania, Greece, the capital of a district of nearly forty miles in circumference, inhabited by a rude tribe, mostly of the Mahometan religion; but their language is Greek. They have hardly any regular government, but are a brave race, to which, joined to the mountainous and inaccessible nature of their country, they owe the independence they enjoy. They are said to amount to 15,000. Nineteen miles south-west of Joannina.

PARAMO (Lewis de), a Spanish inquisitor who published at Madrid, in 1598, a curious work upon the tribunal called The Holy Office. He writes with candor, omits no fact, but enumerates impartially all the victims of the Inquisition.

PARAMOUNT, *adj.* Fr. *paramount*; or par and mount. Superior; having the highest jurisdiction: as, lord paramount, the chief of the seignior: taking to before the object.

Leagues within the state are ever pernicious to monarchies; for they raise an obligation, *paramount* to obligation of sovereignty, and make the king, *tantum unus ex nobis*. *Bacon.*

John a Chamber was hanged upon a gibbet raised a stage higher in the midst of a square gallows, as a traitor *paramount*; and a number of his chief accomplices were hanged upon the lower story round him. *Id.*

The dogmatist's opinioned assurance is *paramount* to argument. *Glanville.*

In order came the grand infernal peers,
'Midst came their mighty *paramount*. *Milton.*

If all power be derived from Adam, by divine institution, this is a right antecedent and *paramount* to all government; and therefore the positive laws of men cannot determine that which is itself the foundation of all law. *Locke.*

Mankind, seeing the apostles possessed of a power plainly *paramount* to the powers of all the known beings, whether angels or demons, could not question their being inspired by God. *West.*

PARAMOUNT, in English law, the highest lord of the fee of lands, of tenements, and hereditaments. As there may be a lord mesne where lands are held of an inferior lord, who holds them of a superior under certain services; so this su-

perior lord, is lord paramount. Also the king is the chief lord, or lord paramount, of all the lands in the kingdom. *Cok. Lit. 1.*

PARAMOUR, *n. s.* Fr. *par amour*: *par amore*. A lover or wooer.

For in this world n'is dogge for the bows,
That can hurt dere from an hole yknowe,
Bet than this Sompnour knew a slie lechour,
Or an avouter or a *paramour*.

Chaucer. Cant. Tales.

Upon the floor
A lovely bevy of fair ladies sat,
Courtod of many a jolly *paramour*,
The which them did in modestwise amate,
And each one sought his lady to aggrate.

Spenser.

Shall I believe
That unsubstantial death is amorous,
And that the lean abhorred monster keeps
Thee here in dark to be his *paramour*? *Shakespeare.*

No season then for her

To wanton with the sun her lusty *paramour*.

Milton.

PARANA, a river of South America, which rises in Brasil, in the province of Matto Grosso, and, after a long and winding course, falls into the Paraguay, in lat. 27° 25' S., when the united stream assumes the name of the Plata. In lat. 24° it passes over a ledge of rocks that has been denominated a cataract, but it does not materially obstruct the navigation, as boats are hauled up it by means of ropes. The base of this fall is formed by a chain of rocks that rise in separate masses, and leave channels, like embrazures, for the stream. The Parana is here very wide, and, when swelled by the rains, very rapid. In the lower part of its course the Parana is covered with numerous islands, which conceal its immense breadth. Many of these islands are covered with trees; but none are inhabited except by wild animals. The Parana has its greatest flood in December, January, and sometimes in February; and there is another inundation in June and July. The river at these times rises from eighteen to twenty feet above the level of the islands; and the animals with which they abound then swim over to the main land. On some occasions the inhabitants of Santa Fe have contemplated forsaking their city, which is often wholly surrounded with water.

PARANAIBA, a large river of Brasil, which runs S.S.E. for many leagues, and enters the Parana near its source.

PARANAIBA, a river of Guiana, an arm of the Amazons, running out from and returning to it, and enclosing the large island of Ramos.

PARANAPURAS, a river of Quito, which rises in the Andes, and enters the Guallaga. Also the name of a settlement on this river.

PARANYMPH, *n. s.* Fr. *paranymphe*; Gr. *παρά* and *νύμφη*, a bride. A bride-man; one who leads the bride to marriage.

The Timnian bride

Had not so soon preferred

Thy *paranymp* worthless to thee compared,

Successor in thy bed.

Milton's Agonistes.

Sin hath got a *paranymp* and a solicitor, a warrant and an advocate. *Taylor's Worthy Communicant.*

PARANYMPH, among the ancients, the person who waited on the bridegroom, and directed the

nuptial solemnities; called also *pronubus* and *auspex*, because the ceremonies began by taking auspicia. As the *paranymp* officiated only on the part of the bridegroom, a woman called *pronuba* officiated on the part of the bride.

PARAPEGM, *n. s.* Gr. *παράπηγμα, παράπηγμα*. A brazen table fixed to a pillar, on which laws and proclamations were anciently engraved: also a public table, containing an account of the movements of the heavenly bodies, seasons of the year, &c., whence the astrologers give this name to the tables on which they draw their figures.

Our forefathers, observing the course of the sun, and making certain mutations to happen in his progress through the zodiack, set them down in their *parapegms*, or astronomical canons. *Browne.*

PARAPET, *n. s.* Fr. *parapet*; Ital. *parapetto*. A wall breast high.

There was a wall or *parapet* of teeth set in our mouth to restrain the petulancy of our words.

Ben Jonson.

The *parapet* of the covert-way is what covers that way from the sight of the enemy; which renders it the most dangerous place for the besiegers, because of the neighbourhood of the faces, flanks, and curtains of the place. *James.*

PARAPET, in fortification, an elevation of earth designed for covering the soldiers from the enemy's cannon or small shot. See **FORTIFICATION**.

PARAPHERNA'LIA, *n. s.* Fr. *parapher-naux*; Lat. *paraphernalia*. Goods in the wife's disposal.

Paraphernalia, or *parapherna*, in the civil law, are those goods which a wife brought her husband, besides her dower, and which were still to remain at her disposal, exclusive of her husband, unless there was some provision made to the contrary in the marriage-contract.

Dr. A. Rees.

PARAPHRASE, *n. s. & v. a.*

PARAPHRAST, *n. s.*

PARAPHRAS'TIC, or

PARAPHRAS'TICAL, *adj.*

Fr. *para-phrase*; Gr.

παραφρασις.

A free or lax interpretation; an explanation in many words: to *paraphrase* is, to interpret or translate loosely. a *paraphrast*, a lax interpreter: the adjectives follow these senses.

The fittest for public audience are such as, following a middle course between the rigor of literal translators and the liberty of *paraphrasts*, do, with great shortness and plainness, deliver the meaning.

Hooker.

The clearest and shortest way of explication is by *paraphrase*.

Bp. Hall.

We are put to construe and *paraphrase* our own words, to free ourselves from the ignorance and malice of our adversaries.

Stillingfleet.

In *paraphrase*, or translation with latitude, the author's words are not so strictly followed as his sense, and that too amplified, but not altered: such is Mr. Waller's translation of Virgil's fourth *Æneid*.

Dryden.

What needs be *paraphrase* on what we mean? We were at worst but wanton; he's obscene. *Id.*

All the laws of nations were but a *paraphrase* upon this standing rectitude of nature, that was ready to enlarge itself into suitable determinations, upon all emergent objects and occasions.

South.

The Chaldean *paraphrast* renders Gerah by Meath.

Arbuthnot.

Where translation is impracticable, they may *paraphrase*.—But it is intolerable that, under a pretence of *paraphrasing* and translating, a way should be suffered of treating authors to a manifest disadvantage. *Felton on the Classics.*

PARAPHIRENITIS, *n. s.* *Fr. paraphrenesie*; *Gr. παρα φρενιτις*, phrenzy.

Paraphrenitis is an inflammation of the diaphragm. The symptoms are a violent fever, a most exquisite pain increased upon inspiration, by which it is distinguished from a pleurisy, in which the greatest pain is in expiration. *Arbuthnot.*

PARAPHYMO'SIS disorders. See **MEDICINE** and **SURGERY**.

PARARA, an Anglo-American word, used in the Northern United States, for what is called in the Southern States a savannah, i. e. an extensive rich plain, without trees, but covered with grass. Some of these are forty miles broad, and several hundred miles long; and exhibit fine prospects.

PARASANG, *n. s.* *Barb. Lat. parasanga*. A Persian measure of length.

Since the mind is not able to frame an idea of any space without parts, instead thereof it makes use of the common measures, which, by familiar use, in each country, have imprinted themselves on the memory; as inches and feet, or cubits and *parasangs*. *Locke.*

The **PARASANG** is an ancient measure, differing at different times, and in different places; being usually thirty, sometimes forty, and sometimes fifty stadia, or furlongs. The word, according to Littleton, has its rise from *parasch angarias*, *q. d.* the space a postman rides from one station, *angaria*, to another.

PARASCENIUM, in the Grecian and Roman theatres, was a place behind the scenes whither the actors withdrew to dress and undress themselves. The Romans more frequently called it **Postcenium**. See **THEATRE**.

PARASELENE, in natural philosophy, a mock moon; a meteor or phenomenon encompassing or adjacent to the moon, in form of a luminous ring; wherein are observed sometimes one and sometimes two or more images of the moon.

PARASEMON, *Παρασημον*, among the Greeks, was the figure carved on the prow of the ships to distinguish them from each other. This figure was generally that of a bull, lion, or other animal; sometimes the representation of a mountain, tree, flower, &c.

PARASITE, *n. s.* } *Fr. parasite*; *Lat. parasitic*, *adj.* } *sita*; *Gr. παρα και σιτρος*, *PARASIT'ICAL.* } bread. A flatterer at one's table; one that earns his welcome at table by flattery.

He is a flatterer,
A *parasite*, a keeper back of death,
Who gently would dissolve the bands of life,
Which false hopes linger. *Shakspeare.*

Most smiling, smooth, detested *parasites*,
Courteous destroyers, affable wolves, meek bears,
You fools of fortune. *Id.*

Diogenes, when mice came about him, as he was eating, said, I see that even Diogenes nourisheth *parasites*. *Bacon.*

O, your *parasite*
Is a most gracious thing, dropped from above;

Not bred 'mongst clods, and clod-polls here on earth.
I muse; the mystery was not made a science,
It is so liberally profest. *Ben Jonson.*

Some *parasitic* preachers have dared to call those martyrs, who died fighting against me.

King Charles.
The bishop received small thanks for his *parasitic* presentation. *Hakewell on Providence.*

Thou, with trembling fear,
Or like a fawning *parasite*, obeyed;
Then to thyself ascribest the truth foretold. *Milton.*

The people sweat not for their king's delight,
T' enrich a pimp, or raise a *parasite*. *Dryden.*

PARASITE, among the ancient Greeks, was originally a very reputable title; the *parasites* being a kind of priests, at least ministers, of the gods, in the same manner as the *epulones* were at Rome. They took care of the sacred corn, or the corn destined for the service of the temples and the gods, viz. sacrifices, feasts, &c. They had even the intendance over sacrifices; and took care that they were duly performed. At Athens there was a kind of college of twelve *parasites*; each people of Attica furnishing one, who was always chosen out of the best families. Polybius adds, that a *parasite* was also an honorable title among the ancient Gauls, and was given to their poets.

PARASOL, *n. s.* *Fr. parasol* (from *sol*, the sun); *Ital. parrasole*. A small canopy or umbrella carried over the head, to shelter from rain and the heat of the sun.

It is made of leather, taffety, oil cloth, &c., mounted on a stick, and opened or shut at pleasure, by means of pieces of whalebone that sustain it. The East Indians never stir without a *parasol*. *Dr. A. Rees.*

PAR'BOIL, *v. a.* *Fr. parbouiller*. To half boil; boil in part.

Parboil two large capons upon a soft fire, by the space of an hour, till, in effect, all the blood be gone. *Bacon.*

From the sea into the ship we turn,
Like *parboiled* wretches, on the coals to burn. *Donne.*

PAR'BREAK, *v. n. & n. s.* *Belg. brecker*; *Teut. verbrecke*. To vomit. Obsolete.

Her filthy *parbreak* all the place defiled has. *Spenser.*

PARBUNCLE, in a ship, a rope almost like a pair of slings; it is seized both ends together, and then put almost double about any heavy thing that is to be hoisted in or out of the ship; having the hook of the runner hitched into it, to hoist it up by.

PARCÆ, in heathen mythology, goddesses who were supposed to preside over the accidents and events, and to determine the date or period of human life. The *Parcæ* were three, *Clotho*, *Lachesis*, and *Atropos*. They spun the thread of men's lives; *Clotho* held the distaff and drew the thread; *Lachesis* twirled the spindle, and spun it; and *Atropos* cut it. The ancients represent the *Parcæ* divers ways: *Lucian*, in the shape of three poor old women, having large locks of wool, mixed with daffodils on their heads. Others represent *Clotho* in a long robe of divers colors, wearing a crown upon her head adorned with seven stars; *Lachesis* in a robe

beset with stars; and Atropos clad in black. The ancients imagined that the Parcae used white wool for a long and happy life, and black for a short and unfortunate one.

PAR'CEL, *n. s. & v. a.* Fr. *parcelle*; Barb. Lat. *particula*. A small bundle; small part of a whole; any small quantity: to parcel is, to divide out into parts or portions; also (obsolete) to make up into a mass.

And they set themselves in the midst of that parcel, and delivered it, and slew the Philistines.

1 Chron. xi. 14.

This youthful parcel

Of noble batchelors stand at my bestowing.

Shakespeare.

What a wounding shame, that mine own servant should parcel the sum of my disgraces by addition of his envy!

Id.

Women, Silvius, had they marked him
In parcels, as I did, would have gone near
To fall in love with him.

Id.

An inventory thus importing

The several parcels of his plate, his treasure,
Rich stuffs and ornaments of household.

Id.

This is to drive a wholesome trade, when all other petty merchants deal but for parcels.

Decay of Piety.

Those ghostly kings would parcel out my power,
And all the fatness of my land devour.

Dryden.

They came to this conclusion; that unless they could, by a parcel of fair words and pretences, engage them into a confederacy, there was no good to be done.

L'Estrange.

With what face could such a great man have begged such a parcel of the crown lands, one a vast sum of money, another the forfeited estate?

Davenant.

If they allot and parcel out several perfections to several deities, do they not, by this, assert contradictions, making deity only to such a measure perfect? whereas a deity implies perfection beyond all measure.

South.

What can be rationally conceived in so transparent a substance as water for the production of these colours, besides the various sizes of its fluid and globular parcels?

Newton.

The same experiments succeed on two parcels of the white of an egg, only it grows somewhat thicker upon mixing with an acid.

Arbutnot.

I have known pensions given to particular persons, any one of which, if divided into smaller parcels, and distributed to those who distinguish themselves by wit or learning, would answer the end.

Swift.

PARCELLES (John), PARCELLES (Julius), two eminent Flemish painters of the seventeenth century, father and son, who excelled in painting sea-pieces.

PAR'CENER, *n. s.* } In common law.

PAR'CENARY. }

When one dies possessed of an estate, and having issue only daughters, or his sisters be his heirs; so that the lands descend to those daughters or sisters; these are called parceners, and are but as one heir: hence parcenary, from Fr. *parsonier*, is holding or occupying of land by more persons pro indiviso, or by joint tenants, otherwise called co-parceners; for if they refuse to divide their common inheritance, and choose rather to hold it jointly, they are said to hold in parcinarie.

PARCH, *v. a.* From Gr. *περκαυσω*, says Junius; from *percoquo* (Skinner), 'perhaps,' adds Dr. Johnson, 'from *perustus*, burnt, or from

parchment, the effect of fire upon parchment being almost proverbial.' To scorch; burn, slightly or superficially; dry up.

The parched ground shall become a pool.

Isaiah xxxv. 5.

Hath thy fiery heart so parcht thine entrails,
That not a tear can fall?

Shakespeare.

Did he so often lodge in open field,
In winter's cold, and summer's parching heat,
To conquer France?

Id. Henry IV.

Torrid heat,

And vapours as the Libyan air adust,
Began to parch that temperate clime.

Milton.

I'm stupified with sorrow, past relief
Of tears; parch'd up and withered with my grief.

Dryden.

The Syrian star

With his sultry breath infects the sky;
The ground below is parched, the heavens above us fry.

Id.

Without this circular motion of our earth, one hemisphere would be condemned to perpetual cold and darkness, the other continually roasted and parched by the sun beams.

Ray.

If, to prevent the acrospiring, it be thrown thin,
many corns will dry and parch into barley.

Mortimer.

Full fifty years

I have endured the biting winter's blast,
And the severer heats of parching summer.

Rowe.

A man distressed with thirst in the parched places of the wilderness, searches every pit, but finds no water.

Rogers.

The skin grows parched and dry, and the whole body lean and meagre.

Blackmore.

PARCH'MENT, *n. s.* Fr. *parchemin*; Latin *Pergamena*, *charte*. Skins dressed for writing. The skins of sheep are, in particular, called parchment; those of calves vellum.

I have mo things to write to you, and I wolde not bi parchemyn and enke, for I hope I schal come to you and speke mouth to mouth that youre ioie be ful.

Wiclif. 2 Jon.

Is not this a lamentable thing, that the skin of an innocent lamb should be made parchment; that parchment being scribbled over, should undo a man?

Shakespeare. Henry VI.

In the coffin, that had the books, they were found as fresh as if newly written, being written in parchment, and covered with watch candles of wax.

Bacon.

Like flying shades before the clouds we shew,
We shrink like parchment in consuming flame.

Dryden.

PARCHMENT, the skins of sheep and goats prepared for writing upon, covering books, &c. The word comes from the Latin *Pergamena*, the ancient name of this manufacture, which is said to have been taken from the city of Pergamos, to Eumenes, the king of which, its invention is usually ascribed; though, in reality, that prince appears rather to have been the improver than the inventor of parchment. For the Persians of old, according to Diodorus, wrote all their records on skins; and the ancient Ionians, as we are told by Herodotus, made use of sheep skins and goat skins in writing. The manufacture of parchment is begun by the skinner, and finished by the parchment-maker. The skin being stripped of its wool and placed in the lime-pit;

norance of it; and so passing all his days in the disconsolate, uneasy vicissitudes of hopes and fears, at length go out of the world, not knowing whither he goes.

South.

A blind man sitting in the chimney corner is *pardonable* enough, but sitting at the helm, he is intolerable.

Id.

I have sent you the history of my mind on this subject without any disguise: if it does not please you, *pardon* it at least, for it is the truth.

Cowper.

PARDON, in criminal law, is the remitting an offence committed against the king. His power of pardoning was said by our Saxon ancestors to be derived à lege sive dignitatis: and it is declared in parliament, by stat. 27 Hen. VIII. c. 24, that no other person has power to pardon or remit any treason or felonies whatsoever; but that the king hath the whole and sole power thereof united and knit to the imperial crown of this realm. In democracies there is no power of pardoning. The king may pardon all offences merely against the crown or the public; excepting, 1. That, to preserve the liberty of the subject, the committing any man to prison out of the realm, is by the habeas corpus act, 31 Car. II. c. 2, made a præmunire, unpardonable even to the king. Nor, 2, can the king pardon where private justice is principally concerned in the prosecution of offenders: Non potest rex gratiam facere cum injuria et damno aliorum. Therefore, in appeals of all kinds (which are the suit, not of the king, but of the party injured), the prosecutor may release, but the king cannot pardon. Neither can he pardon a common nuisance, while it remains unredressed, or so as to prevent an abatement of it; though afterwards he may remit the fine: because, though the prosecution is vested in the king to avoid the multiplicity of suits, yet (during its continuance) this offence savours more of the nature of a private injury to each individual in the neighbourhood, than of a public wrong. Neither, lastly, can the king pardon an offence against a popular or penal statute, after information brought; for thereby the informer hath acquired a private property in his part of the penalty. There is also a restriction of a peculiar nature that affects the prerogative of pardoning, in case of parliamentary impeachments, viz. that the king's pardon cannot be pleaded to any such impeachment, so as to impede the enquiry and stop the prosecution of great and notorious offenders. In the reign of Charles II., when the earl of Danby pleaded the king's pardon, the commons voted, 'That a pardon is not pleadable in bar of an impeachment.' And it was enacted by the act of settlement, 12 & 13 W. III. c. 2, 'That no pardon under the great seal of England shall be pleadable to an impeachment by the commons in parliament.' But, after the impeachment has been solemnly heard and determined, it is not understood that the king's royal grace is farther restrained or abridged: for, after the impeachment and attainder of the six rebel lords in 1715, three of them were from time to time reprieved by the crown; and at length received the king's most gracious pardon. The effect of such pardon by the king is, to make the offender a new man; to acquit him of all corporal penalties and forfeitures annexed to that offence for which he obtains his

VOL. XVI.

pardon; and not so much to restore his former, as to give him new credit and capacity. But nothing can restore or purify the blood when once corrupted, if the pardon be not allowed till after attainder, but the high and transcendent power of parliament. Yet if a person attained receives the king's pardon, and afterwards has a son, that son may be heir to his father; because the father, being made a new man, might transmit new inheritable blood; though, had he been born before the pardon, he could never have inherited at all. See **KING**.

PARE, *v. a.* } Fr. *parer*; Lat. *paro*. De-
PA'RING, *n. s.* } duced by Skinner from the
French '*parer les ongles*,' to dress the horses' hoofs when they are shaved by the farrier: thus we first said, *pare* your nails; and from thence transferred the word to general use. To cut off extremities; to cut away by little and little; diminish. If *pare* be used before the thing diminished, it is followed immediately by its accusative; if it precedes the thing taken away, or agrees in the passive voice with the thing taken away, as a nominative, it requires a particle, as *away*, off: a *paring* is that which is *pared* off; the *rind*.

And thou shalt bring her home to thine house; and she shall shave her head and *pare* her nails.

Deut. xxi. 12.

The creed of Athanasius, and that sacred hymn of glory, than which nothing doth sound more heavenly in the ears of faithful men, are now reckoned as superfluities, which we must in any case *pare* away, lest we cloy God with too much service.

Hooker.

I am a man, whom fortune hath cruelly scratched. — 'Tis too late to *pare* her nails now.

Shakspeare.

I have not alone
Employed you where high profits might come home;
But *pared* my present havings to bestow
My bounties upon you.

Id. Henry VIII.

The lion moved with pity, did endure,
To have his princely paws all *pared* away.

Shakspeare.

Virginity breeds mites, much like a cheese; and consumes itself to the very *paring*.

Id.

The king began to *pare* a little the privilege of clergy, ordaining that clerks convicted should be burned in the hand.

Bacon's Henry VII.

Pick out of tales the mirth, but not the sin,
He *pares* his apple, that will cleanly feed.

Herbert.

A hone and a *parer*, like sole of a boot,
To *pare* away grasse, and to raise up the root.

Tusser.

Whoever will partake of God's secrets must first look into his own, he must *pare off* whatsoever is amiss, and not without holiness approach to the holiest of all holies.

Taylor.

The most poetical parts, which are description and images, were to be *pared away*, when the body was swoln into too large a bulk for the representation of the stage.

Dryden.

In May, after rain, *pare off* the surface of the earth, and with the *parings* raise your hills high, and enlarge their breadth.

Mortimer.

All the mountains were *pared off* the earth, and the surface of it lay even, or in an equal convexity every where with the surface of the sea.

Burnet.

The sword, as it was justly drawn by us, so can it scarce safely be sheathed, till the power of the great

2 P.

troubler of our peace be so far *pared* and reduced, as that we may be under no apprehensions.

Aiterbury.

'Twere well if she would *pare* her nails. *Pope.*

To his guest, tho' no way sparing,
He eat himself the rind and *paring*. *Id.*

PARÉ (Ambrose), an eminent French surgeon of the sixteenth century, born at Laval in Maine. He was surgeon to several kings of France. Being a Protestant he would have been involved in the massacre of St. Bartholemew's day, had not Charles IX. himself shut him up in his chamber, saying, 'a man so useful to all the world ought not to perish in such a manner.' He died at an advanced age, in 1590.

PARÉ, or PARENS (David), D. D., a celebrated Protestant divine, born in 1548, at Francolstein, in Silesia. He studied at Hemsburg under the learned Christopher Schilling; afterwards at Heidelberg, under Zach. Ursin. He was much patronised by Albert Kindler, and prince Casimir; was admitted minister of Schlettenbach in 1571; afterwards of Hemsbach, in Worms, where, in 1574, he married the sister of John Stibelius; in 1577 he became minister of Ogersheim; and in 1584 professor in the college of Heidelberg. In 1591 he was admitted D. D., and in 1602 succeeded Tossanus as professor of divinity. He published, 1. The German Bible, with notes, at Neustadt, in 1589; 2. A Commentary on the Epistle to the Romans; 3. Several tracts against Bellarmin and the Jesuits: with other polemical pieces; and died at Pareanum in 1622.

PARÉ (Philip), son of the preceding, was born at Hemsbach in 1576; studied at Neustadt and Heidelberg; became eminent for grammatical erudition; and, under the patronage of the elector palatine, visited the universities of Basil in 1599, and Geneva in 1600. He became rector of Neustadt College in 1612; principal of that of Hanau in 1645; published his father's life and exegetical works in 1647; several tracts on grammar; with commentaries on the Scriptures, and other theological works.

PARÉ (Daniel), son of Philip, was also eminent for classical learning, and particularly for his skill in the Greek language. He published many learned pieces; particularly *Museus's Hero* and *Leander*, with notes; *Mellificium Atticum*, a selection from Greek Authors, &c. He was murdered by robbers in 1645.

PARÉJA (John), an eminent painter, born in the West Indies, and originally a slave to Diego Velasquez, a celebrated painter. He acquired the art by studying it privately, without his master's knowledge. Philip IV. one day visiting Velasquez's museum, discovered his merit and gave him his liberty; yet his attachment to Velasquez was so strong that he continued with him till his death. His portraits are equal to those of Velasquez. He died in 1670, aged sixty.

PARÉIRA FRAYA, in the materia medica, a kind of oblong and large root brought from Brasil.—It is a diuretic of no mean character, and has done great service in nephritic cases. In pleurisies and quinsies it has been attended with more success than almost any medicine we know of singly.

PARÉLCON, in grammar, a figure by which a word or syllable is added to the end of another.

PARÉMBOLE, in rhetoric, a figure wherein something relating to the subject is inserted in the middle of a period. All the difference between the *parembole* and the *parenthesis*, according to Vossius, is, that the former relates to the subject in hand, whereas the latter is foreign to it.

PARÉNCHYM'ATOUS, or } From *paren-*
PARÉNCHYMOUS, *adj.* } *chyma*. Greek

παρεγχυμα, a spongy or porous substance; in physis, a part through which the blood is strained: relating to the *parenchyma*; spongy.

Ten thousand seeds of the plant hart's-tongue, hardly make the bulk of a pepper-corn. Now the covers and true body of each seed, the *parenchymatous* and *ligneous* parts of both moderately multiplied, afford an hundred thousand millions of formed atoms in the space of a pepper-corn. *Grew.*

Those parts, formerly reckoned *parenchymatous*, are now found to be bundles of exceedingly small threads. *Cheyne.*

PARÉNCHYMA, in anatomy, is a term introduced by Erisistratus signifying all that substance which is contained in the interstices betwixt the blood-vessels of the viscera, which he imagined to be extravasated and concreted blood.

PARÉNCHYMA OF PLANTS. Grew applies this term to the pith or pulp, or that inner part of a fruit or plant through which the juice is supposed to be distributed.

PARENT (Anthony), as Dr. Watkins calls him, or Unsoine, according to others, a mathematician, born at Paris in 1666. He showed an early propensity to mathematics. At fourteen he was put under a master, who taught rhetoric at Chartres. Here he saw a dodecahedron upon every face of which, except the lowest, was delineated a sun-dial. Struck with the curiosity of these dials, he attempted drawing one himself. He then undertook to write a Treatise upon Gnomonics, and a book of Geometry. His friends then sent for him to Paris to study the law; but these studies were no sooner finished than he returned to mathematics. He then took pupils; and, fortification having attracted particular notice, he turned his attention to it, and made two campaigns with the marquis of Aligre, by which he instructed himself in viewing fortified places; of which he drew a number of plans. M. de Billettes, being admitted in the Academy of Sciences at Paris in 1699, as their mechanician, nominated, for his disciple, Parent, who excelled chiefly in this branch. Though his abilities were acknowledged, yet his impetuosity of temper provoked opposition; and he rose no higher than assistant member for geometry. He enjoyed this promotion but a short time; for he was taken off by the small pox the same year, 1716, aged fifty. He was author of many pieces, chiefly on mechanics and geometry.

PAR'ÉNT, *n. s.* } Fr. *parent*; Lat. *parens*.
PAR'ÉNTAGE, } A father or mother: pa-
PARÉNTAL, *adj.* } rentage is birth; extraction;
condition by birth: parental, pertaining to, or becoming a parent.

All true virtues are to honour true religion as their parent, and all well ordered commonweals to love her as their chiefest stay. *Hooker.*

A gentleman of noble *parentage*,
Of fair dameans, youthful and nobly allied.
Shakespeare.

Though men esteem thee low of *parentage*,
Thy father is the eternal king.
Milton.
It overthrows the careful course and *parental* pro-
vision of nature, whereby the young ones, newly ex-
cluded, are sustained by the dam.
Brown.

His custom was, during the warmer season of the
year, to spend an hour before evening-prayer in
catechising; whereat the *parents* and elder sort were
wont to be present.
Fell.

As a public *parent* of the state,
My justice, and thy crime, requires thy fate.
Dryden.

To his levees go,
And from himself your *parentage* may know. *Id.*
In vain on the dissembled mother's tongue
Had cunning art, and sly persuasion hung;
And real care in vain and native love
In the true *parent's* panting breast had strove.
Prior.

We find him not only boasting of his *parentage*, as
an Israelite at large, but particularizing his descent
from Benjamin.
Atterbury.

These eggs hatched by the warmth of the sun into
little worms, feed without any need of *parental* care.
Derham.

Young ladies, on whom *parental* controul sits
heavily, give a man of intrigue room to think that
they want to be parents.
Clarissa.

So thou, sweet rose-bud, young and gay,
Shalt beauteous blaze upon the day,
And bless the *parent's* evening ray
That watched thy early morning.
Burns.

Sorrow has, since they went, subdued and tamed
The playful humor; he could now endure
(Himself grown sober in the vale of tears),
And feel a *parent's* presence no restraint.
Cowper.

'Tis the most asinine employ on earth,
To hear them tell of *parentage* and birth,
And echo conversations dull and dry,
Embellished with—He said, and so said I. *Id.*

On cliff he hath been known to stand,
And rave as to some bloody hand
Fresh severed from its *parent* limb,
Invisible to all but him,
Which beckons onward to his grave,
And lures to leap into the wave.
Byron.

PARENT AND CHILD. The law of England
on this subject may be divided into the *duties*
and *authority* of parents, first, as to their legiti-
mate children; secondly, their illegitimate
children; and, lastly, the duties of children to
their parents, and their rights and incapacities.

SECT. I.—OF THE DUTY OF PARENTS TO THEIR LEGITIMATE CHILDREN, AND THEIR AU- THORITY.

A legitimate child is he that is born in lawful
wedlock, or within a competent time afterwards.
Pater est quem nuptiæ demonstrant is the rule
of the civil law, and which holds whether the
nuptials happen before or after the birth of the
child. But in the English law the rule is nar-
rowed; for the nuptials must be precedent to the
birth, of which we shall further treat in the
second section.

1. *Maintenance.* It is a principle of the
English law that there is an obligation on every
man to provide for his children, and the manner
in which this obligation shall be performed is
thus pointed out by various statutes. The father

and mother, grandfather and grandmother, of poor
impotent persons shall maintain them at their
own charge, if of sufficient ability, according as
the quarter sessions shall direct; and, if a parent
runs away and leaves his children, the church-
wardens and overseers of the parish shall seize
his rents, goods, and chattels, and dispose of
them towards their relief. By the interpreta-
tions which the courts of law have made upon
these statutes, it is said by Blackstone that if a
mother or grandmother marries again, and was
before such second marriage of sufficient ability
to keep the child, the husband should be charged
to maintain it; for this, being a debt of hers when
single, should like others extend to charge the
husband. But at her death, the relation being
dissolved, the husband was under no further obli-
gation. The statute upon which the construc-
tion is here given is 43 Eliz. c. 2; but it has
since been determined that this statute extends
to relations by blood only, and not those by affi-
nity, and that, therefore (contrary to the position
in the commentaries), a man is not bound to
maintain the children of his wife by a former
husband. See *Rex, v. Munden*, 1 Stra. 190;
Tubb, v. Harrison, 4 Term Rep. 118. No per-
son is, however, bound to provide a maintenance
for his issue, unless where the children are im-
potent and unable to work either through infancy,
disease, or accident, and then is only obliged to
find them necessaries, the penalty on refusals being
no more than 20s. a month.

A late statute, the 5 Geo. IV. c. 83, provides
that persons, being able but wilfully neglecting
to work to support their families, whereby they
become chargeable to the parish, shall be deemed
idle and disorderly, and be punishable by im-
prisonment and hard labor, not exceeding a
month. Every person running away and leaving
his wife or child chargeable shall also be
deemed a rogue and vagabond. The wages of
seamen and other persons in public employments
who abscond from their families, as well as the
allowance of Greenwich pensioners, are applica-
ble for the maintenance of their children under
the provisions of 59 Geo. III., c. 12.

2. *Protection* is a duty rather permitted than
enjoined by any municipal laws, nature in this
respect working so strongly as to need rather a
check than a spur. A parent may, by our laws,
maintain and uphold his children in their law-
suits without being guilty of the legal crime of
maintaining quarrels. A parent may also justify
an assault and battery in defence of the persons
of his children.

3. *Education.* The last duty of parents to
their children is that of giving them an education
suitable to their station in life: a duty pointed
out by reason, and of far the greatest importance
of any. Our laws, though defective in this par-
ticular, have in one instance made a provision
for training the rising generation: since the poor
and laborious part of the community, when past
the age of nurture, are taken out of the hands of
their parents by the statutes for apprenticing
poor children. The rich, however, are left at
their own option whether they will breed up
their children to be the ornaments or disgrace of
their family.

4. The *authority* or power of parents over their children is derived from the former consideration, their duty: this authority being given them partly to enable the parent more effectually to perform his duty, and partly as a recompense for his care and trouble in the faithful discharge of it. He may lawfully correct his child, being under age, in a reasonable manner; for this is for the benefit of his education. The consent or concurrence of the parent to the marriage of his child under age was also directed by our ancient law to be obtained, but now it is absolutely necessary, for without it the contract is void. A father has no more power over his son's estate than as his trustee or guardian; for though he may receive the profits during the child's minority, yet he must account for them when he comes of age. He may indeed have the benefit of his children's labor while they live with him; but this is no more than he is entitled to from his apprentices or servants. The legal power of a father (for a mother as such is entitled to no power, but only to reverence and respect), over the persons of his legitimate children, ceases at the age of twenty-one, for they are then enfranchised by arriving at years of discretion, or that point which the law has established (as some must necessarily be established), when the empire of the father or other guardian gives place to the empire of reason. Yet till that age arrives this empire of the father continues even after his death; for he may by his will appoint a guardian to his children. He may also delegate part of his parental authority during his life to the tutor or schoolmaster of his child, who is then in loco parentis, and has such a portion of the power of the parent committed to his charge, viz. that of restraint and correction, as may be necessary to answer the purposes for which he is employed.

SECT. II.—OF ILLEGITIMATE CHILDREN, AND THE LIABILITY AND AUTHORITY OF THEIR PARENTS.

1. *Who are deemed illegitimate.* A bastard, by our English law, is one that is not only begotten but born out of lawful matrimony. The civil and canon laws do not allow a child to remain a bastard if the parents afterwards intermarry. But whether they are to be considered as legitimate from the time of the marriage of their parents only, or whether their legitimacy has relation back to the time of their birth, is a point variously disputed by the civilians and canonists; the prevailing opinion seems to be that they are to be considered as legitimate from the time of their birth to all purposes, but those in which to consider them as such would operate to the detriment of a third person (Co. Lit. 233, n. 1); and herein they differ most materially from our law, which, though not so strict as to require that the child shall be begotten, yet makes it an indispensable condition to make it legitimate that it shall be born after lawful wedlock. All children, therefore, born before matrimony, are bastards by our law; and so it is of all children born so long after the death of the husband that, by the usual course of gestation, they could not be begotten by him. But, this being a matter of some uncertainty, the law is not

exact to a few days. See Co. Lit. 123 n. (1 and 2). And this gave occasion to a proceeding at common law, where a widow is suspected to feign herself with child in order to produce a supposititious heir to the estate. In this case the heir presumptive may have a writ de ventre inspiciendo to examine whether she be with child or not, and if she be to keep her under proper restraint till delivered; but if the widow be, upon due examination, found not pregnant, the presumptive heir shall be admitted to the inheritance, though liable to lose it again on the birth of a child within forty weeks from the death of the husband; but if a man dies and his widow soon after marries again, and a child is born within such a time as that by the cours: of nature it might have been the child of either husband, in this case he is said to be more than ordinarily legitimate; for he may, when he arrives at the years of discretion, choose which of the fathers he pleases. Co. Lit. 8. But this doctrine is questioned by Brooke, from which it seems as if he thought it reasonable that the circumstances of the case, instead of the choice of the issue, should determine who is the father. Supra. n. (7); and see Co. Lit. 123, latter part of n. (1).

As bastards may be born before the coverture or marriage state is begun, or after it is determined, so also children, born during wedlock, may in some circumstances be bastards. As if the husband be out of the kingdom of England (or, as the law somewhat loosely phrases it, extra quatuor maria) for above nine months, so that no access to his wife can be presumed, her issue during that period shall be bastards. But generally during the coverture access of the husband, it is said, shall be presumed, unless the contrary can be shown, which is such a negative as can only be proved by showing him to be elsewhere. Subsequent decisions, however, have relaxed this rule; and it is now held to be unnecessary that proof should be adduced of the non access of the husband; the modern practice (if not the more ancient, see 1 Salk 123, Stra. 925, 3 P. Wms. 276) being to leave it to the jury to decide, under all the circumstances of the case, whether access may reasonably be presumed to have been had or not. 4 Term. Rep. 25. Ibid. 366. In a divorce, a mensâ et thoro, if the wife breeds children they are bastards, for the law will presume the husband and wife conformable to the sentence of separation, unless access be proved; but, in a voluntary separation by agreement, the law will suppose access, unless the negative be shown. So also, if there be an apparent impossibility of procreation on the part of the husband, as if he be only eight years old, or the like, there the issue of the wife shall be bastard. Likewise in case of divorce in the spiritual court, a vinculo matrimonii, all the issue born during the coverture are bastards, because such divorce is always upon some cause that rendered the marriage unlawful and null from the beginning.

2. *Of the liability of parents for their illegitimate children.*—The method in which the English law provides maintenance for them is as follows:—When a woman is delivered, or declares herself

with child, of a bastard, and will by oath, before a justice of peace, charge any person as having got her with child, the justice shall cause such person to be apprehended, or appear at the next quarter sessions, to dispute and try the fact. But if the woman dies, or is married before delivery, or miscarries, or proves not to have been with child, the person shall be discharged; otherwise the sessions, or two justices out of the sessions, upon original application to them, may take order for the keeping of the bastard by charging the mother or the reputed father with the payment of money or other sustentation, for that purpose. And if such putative father or lewd mother run away from the parish, the overseers, by direction of two justices, may seize their rents, goods, and chattels, in order to bring up the bastard child. Yet such is the humanity of our laws that no woman can be compulsively questioned concerning the father of her child till one month after delivery, which indulgence is, however, frequently a hardship upon parishes by giving the parents opportunity to escape.

Besides the expense of maintenance the father is liable, by 49 Geo. III. c. 68, to the expenses of the accouchement, with the costs of apprehending, and order of filiation, not exceeding £10, and subject to the discretion of the magistrates or quarter sessions. The order must be made by two justices or more. By the same statute, a justice may commit the father to jail for three months, to hard labor, if he refuse to pay without sufficient cause. An appeal against the order of filiation must be made to the next sessions, and ten days previous notice given to the justices and overseers. If the father agree to indemnify the parish, the security given is vested in the overseers, who may sue as such. The parish however is only entitled to indemnify for actual expense; and if a sum be paid, in gross, as a discharge for the liability, and the child should die, or cease to be a burthen before the sum is expended, the father may recover back the difference; the reason for which is that otherwise it would be the interest of the parish to neglect the child, against which the law thus humanely provides.

3. *Of the power of the parents as to illegitimate children.*—Though the father of a legitimate child is entitled to the custody of it, the mother is preferred to the putative father of an illegitimate child; and if the putative father of a bastard obtain possession of it by fraud, the court will order it to be restored on the application of the mother. 5 Term Reports 278.

SECT. III.—OF THE DUTIES OF CHILDREN: AND THEIR RIGHTS AND INCAPACITIES.

1. The duties of children to their parents arise from a principle of natural justice and retribution; for to those who gave us existence we naturally owe subjection and obedience during our minority, and honor and reverence ever after. They who protected the weakness of our infancy are entitled to our protection in the infirmity of their age; they who, by sustenance and education, have enabled their offspring to prosper, ought in return to be supported by that offspring in case they stand in need of assistance. Upon

this principle proceed all the duties of children to their parents which are enjoined by positive laws. The law does not hold the tie of nature to be dissolved by any misbehaviour of the parent, and therefore a child is equally justifiable in defending the person or maintaining the cause or suit of a bad parent as a good one; and is equally compellable, if of sufficient ability, to maintain and provide for a wicked and unnatural progenitor as for one who has shown the greatest tenderness and parental duty. Dr. Brown, it seems, was inclined to think, contrary to the opinion of lord Holt, that a grandchild is not compellable to relieve an indigent grandfather; but, according to professor Christian, there seems no doubt that the court of king's bench would determine the duty to be reciprocal, and would construe any ambiguous expression in favor of the discharge of such a natural and moral obligation.

2. Our law has made no provision to prevent the *disinheriting of children* by will: leaving every man's property in his own disposal upon a principle of liberty in this as well as every other action. Heirs, however, and children are favorites of our courts of justice, and cannot be disinherited by any dubious or ambiguous words, there being required the utmost certainty of the testator's intentions to take away the right of an heir.

3. *Of the rights and incapacities of bastards.*—The rights of a bastard are few, being only such as he can acquire; for he can inherit nothing, being looked upon as the son of nobody, and sometimes called *filius nullius*, sometimes *filius populi*. Yet he may gain a surname by reputation, though he has none by inheritance. All other children have their primary settlement in their father's parish, but a bastard in the parish where born, for he has no father. However in cases of fraud, as if a woman be sent either by order of justices, or comes to beg as a vagrant to a parish which she does not belong to, and drops her bastard there, the bastard shall in the first case be settled in the parish whence she was illegally moved, or in the latter case in the mother's own parish, if the mother be apprehended for her vagrancy. Bastards also born in any licensed hospital for pregnant women are settled in the parishes to which the mothers belong.

4. The *incapacity* of a bastard consists principally in this, that he cannot be heir to any one, neither can he have heirs but of his own body; for, being *nullius filius*, he is therefore of kin to nobody, and has no ancestor from whom any inheritable blood can be derived. By the common law it is held that a bastard is incapable of holding any ecclesiastical benefice.

In all other respects there is no distinction between a bastard and another man. A bastard may lastly be made legitimate and capable of inheriting by the transcendent power of an act of parliament, and not otherwise, as was done in the case of John of Gaunt's bastard children by a statute of Richard II.

PARENTALIA, in antiquity, funeral obsequies, or the last duties paid by children to their deceased parents.

PARENTHESIS, *n. s.* Fr. *parenthese*; Gr.

κατα ἐν τῷ ἑνὶ. A sentence so included in another, as that it may be taken out, without injuring the sense of that which encloses it: and commonly marked thus, ().

In vain is my person excepted by a *parenthesis* of words, when so many are armed against me with swords. *King Charles.*

But to return from my *parenthesis.* *Barrow.*

In his Indian relations are contained strange and incredible accounts; he is seldom mentioned without a derogatory *parenthesis*, in any author. *Broune.*

Thou shalt be seen,

Tho' with some short *parenthesis* between,

High on the throne of wit. *Dryden.*

Don't suffer every occasional thought to carry you away into a long *parenthesis*, and thus stretch out your discourse, and divert you from the point in hand. *Watt's Logic.*

PARENTHESIS is defined by others, certain intercalary words inserted in a discourse, which interrupt the sense, but seem necessary for the better understanding of the subject. But this is not a definition of the parenthesis, but of the sentences included in it. Dr Johnson's is strictly accurate. The parentheses are often misapplied by authors and printers, by being made to enclose words at the end of a sentence, where they are quite unnecessary, and still more, when they are made to enclose clauses without which the sentence is incomplete.

PARENTIUM, an ancient sea-port town of Istria; (*Plin.* iii. c. 19).

PARER'GY, *n.s.* Gr. *παρά* and *εργον*, a work. Something unimportant; something done by the bye.

Scripture being serious, and commonly omitting such *parergies*, it will be unreasonable to condemn all laughter. *Broune.*

PAREISIS, in medicine, a palsy of the bladder, wherein the urine is either suppressed or discharged involuntarily.

PARETONEUM, in mineralogy, an earth found on the shores of Egypt, Cyrene, and Crete, used by the ancients in painting. It had its name either from a part of Egypt, near which it was gathered, or from a town in that kingdom, where it was usually sold. Vitruvius is of the first opinion, and Volaterrus of the last. Of late it was thought to be lost; but it is still common on the shores of most of the islands of the Archipelago, though not observed or regarded; and is truly a very heavy and tough clay, of a fine white color, found in masses of different sizes, generally as soft as the softer clays within the strata; and, by rolling about on the beach in this state, it gathers up the sand, small shells, and other foulnesses we always find about it. It is likely there are strata of it fine and pure in the cliffs there, and that the sea washes off masses of them in storms and high tides, which are what we find.

PARFAIT (Francis), a French dramatic writer, born at Paris in 1698. He wrote a tragedy entitled *Atrée*, and a comedy called *Panurge*; but his greatest work was a General History of the French Theatre, from its origin to his own time, in 15 vols. 12mo. He died in 1753, aged fifty-five.

PARFRE (John), an old dramatic writer of England, of whom nothing is recorded, except

that he wrote a piece, entitled *Candlemas Day* or the Killing of the children of Israel; a mystery; 1512; republished in Mrs. Hawkins's Collection of Old Plays, in 1773.

PARGA, a strong sea-port town on the coast of Albania, opposite the southern point of the island of Corfu. It was first built on the present rocky site on the decline of the Roman empire, near the Achem of ancient history, and has a double harbour, defended by a battery. The citadel commands a noble prospect. It has often been independent.

In 1401 it entered into an alliance with Venice, which continued to 1797. While independent of Ali Pacha it was an asylum to all the refugees of Albania and Greece: but in 1798 he reduced Bucintoro, Prevesa, and the other fortified places on the adjacent coast. Parga alone bade defiance to him. In 1814 he marched against it with a military force: the Pargiots withstood the attack, but applied to the British in Corfu, and received a garrison from them, in the hope of being incorporated with the new republic of the Ionian islands. To this, however, the British government did not give countenance; and ultimately Ali, paying a pecuniary indemnity to those of the inhabitants who should refuse to remain, obtained the transfer of the island. This compensation was so large (about £200,000 sterling) that hardly any of the Pargiots chose to submit to the tyrant; and the evacuation took place in 1819, most of them removing to the Ionian Islands. Thirty miles south-west of Joannina.

PARGET, *n.s.* Fr. *pargette*. Plaster laid upon roofs of rooms.

Gold was the *parget*, and the ceiling bright
Did shine all scaly with great plates of gold;
The floor with jasp and emerald was dight. *Spenser.*

There are not more arts of disguising our corporeal blemishes than our moral; and yet, while we thus paint and *parget* our own deformities, we cannot allow any the least imperfection of another's to remain undetected. *Government of the Tongue.*

Of English talc, the coarser sort is called plaster or *parget*: the finer, spald. *Woodward.*

PARGET, in mineralogy, a name giving to several kinds of gypsum, or plaster stone.

PARGETING, in building, is used for the plastering of walls, and sometimes for plaster itself. Pargeting is of various kinds: as, 1. White lime and hair-mortar laid on bare walls. 2. On bare laths, as in partitioning and plain ceiling. 3. Renewing the insides of the walls, or doubling partition walls. 4. Rough-casting on heart-laths. 5. Plastering on brick-work with finishing mortar, in imitation of stone-work; and the like upon heart-laths.

PARHE'LION, *n.s.* Gr. *παρά* and *ἥλιος*. A mock sun. See below.

To neglect that supreme resplendency that shines in God for those dim representations of it, that we so doat on in the creature, is as absurd, as it were for a Persian to offer his sacrifice to a *parhelion*, instead of adoring the sun. *Boyle.*

PARHELIUM, or **PARHELION**, formed from *παρά* near, and *ἥλιος*, sun, in physiology, a mock sun or meteor, being a part of the heavens strongly illuminated by the image of the sun, and appearing like another sun, but often color-

ed and drawn out to a considerable length, in the form of a tail.

The parhelia usually accompany the coronæ, or luminous circles, and are placed in the same circumference, and at the same height. Their colors resemble those of the rainbow; the red and yellow are on the side towards the sun, and the blue and violet on the other. Though there are coronæ sometimes seen entire, without any parhelia; and sometimes parhelia without coronæ.

The apparent size of parhelia is the same as that of the true sun; but they are not always round, nor always so bright as the sun; and, when several appear, some are more bright than others. They are tinged externally with colors like the rainbow, and many of them have a long fiery tail opposite to the sun, but paler towards the extremity. Some parhelia have been observed with two, and others with three tails. These tails appear for the most part in a white horizontal circle, which generally passes through all the parhelia; and, if it were entire, would go through the centre of the sun. Sometimes there are arcs of lesser circles, concentric to this, touching these colored circles which surround the sun. They are also tinged with colors, and contain other parhelia. Parhelia are generally situated in the intersections of circles; but Cassini says that those which he saw, in 1683, were on the outside of the colored circle, though the tails were in the circle that was parallel to the horizon. M. Épinus apprehends that parhelia with elliptical coronæ are more frequent in the northern regions, and those with circular ones in the southern. They have been visible for one, two, three, and four hours together; and in North America they are said to continue some days, and to be visible from sun-rise to sun-set. When the parhelia disappear, it sometimes rains, or there falls snow in the form of oblong spiculæ, as Maraldi, Weidler, Krafz, and others, have observed; and because the air in North America abounds with such frozen spiculæ, which are even visible to the eye, according to Ellis and Middleton, such particles have been thought to be the cause of all coronæ and parhelia.

Parhelia are sometimes double, triple, &c.

Aristotle observes that two were seen in the Bosphorus from morning to evening; though in general, he observes, they are not seen, except when the sun is near the horizon. Pliny relates under what consults this phenomenon was ever seen at Rome.

In the year 1629 was seen at Rome, by Scheiner, a parhelion of four suns, and the same number was seen by M. Muschenbroeck at Utrecht; Gassendi says that in 1635 and 1636 he often saw one mock sun; in 1661 Hevelius observed at Dantzic one of seven suns; and in 1666 another was seen at Arles, of six.

Phenomena of this kind have also been observed by M. de la Hire at Paris, in 1689, and by M. Cassini, in 1693; by Mr. Grey, in 1700; by Halley, in 1702; and Maraldi in 1721.

Aristotle (*Meteor. cap. 3*) was of opinion that rainbows, halos, and mock suns, were all occasioned by the reflection of the sun beams in dif-

ferent circumstances, by which an imperfect image of his body was produced, the color only being exhibited, and not his proper figure. The image, he says, is not single, as in a mirror; for each drop of rain is too small to reflect a visible image; but the conjunction of all the images is visible. See OPTICS.

PARIA, a province of Buenos Ayres, formerly included in Peru, is bounded on the north by Pacajes, on the north-east by Oruro, east and south-east by Porco, south-west by Lipes, and west by Caranjas. It takes its name from a lake along the border of which it extends, and which is also called Paria, though more commonly Chucuito. It is cold and produces little grain, but abundant pasture, and cattle of all kinds are plentiful. It contains salt and silver mines, saline lakes, and hot springs. The cheese made of sheep's milk is esteemed a delicacy. Population 10,000.

PARIA, the capital of the above province, is 210 miles north-west of La Plata.

PARIA, GULF OF, a gulf of South America, in the Caraccas, which has on the east the island of Trinidad, and on the west the province of Cumana. From these two lands on the north, two points jut out, with two islands intervening, which leave four openings, called the Mouths of the Dragon, by which the gulf communicates with the Carribean Sea. This gulf is twenty-five leagues from east to west, and fifteen from north to south: there is anchorage in all that extent, but its depth varies from eight to thirty fathoms. Upon the coast of Paria its soundings are less. It has a muddy bottom, except near the coast of Terra Firma, where there are shoals and sand banks. It receives on the S. S. W. the different mouths of the Orinoco, which enters it with a velocity that very much incommodes the vessels which steer that way; and they discharge themselves into the Carribean Sea by the Mouths of the Dragon, which it is therefore impossible to enter, especially the small ones, unless highly favored by the winds: and it is at least as difficult to enter the gulf on the south as on the north. The wind must be south-east to be able to enter with any certain prospect of safety. The tide is not only perceptible, but even formidable in the gulf of Paria, where it discovers a violence not to be conceived by those who are not well acquainted with this sea. There are several ports and roads along the coast which greatly facilitate the communication with Trinidad.

PARIAN CHRONICLE. See ARUNDELIAN MARBLES. Under that article we have given the arguments for and against the authenticity of the Parian Chronicle, as fully as the subject seemed to require, or as the nature of our work would admit. Such of our readers, however, as wish for further information on this subject, we must refer to Robertson's attack, and to Gough's Learned and Judicious Vindication of their authenticity, published in *Archæologia* for 1789. The extent of his learning, and the solidity of his arguments, appear upon the whole to outweigh the objections of his sensible and plausible opponent, and the accession of persons to this side of the argument gives it no small additional weight.

Hewlett's book upon the same side of the question is also ingenious.

PARIAN MARBLE, in the natural history of the ancients, the white marble used then, and to this day, for carving statues, &c.; and called by us at this time statuary marble. Too many of the later writers have confounded all the white marbles under the name of the Parian; and, among the workmen, this and all the other white marbles have the common name of alabasters; so that it is in general forgotten among them, that there is such a thing as alabaster different from marble; which, however, is truly the case. Almost all the world also have confounded the Carrara marble with this, though they are really very different; the Carrara kind being of a finer structure and clearer white than the Parian; but less bright and splendid, harder to cut, and not capable of so glittering a polish. The true Parian marble has usually somewhat of a faint bluish tinge among the white, and often has blue veins in different parts of it. It is supposed by some to have had its name from the island Paros (see **PAROS**), where it was first found; but others will have it to have been so called from Agoratrius Parius, a famous statuary, who ennobled it by cutting a statue of Venus in it.

PARIAS, or **PERREAS**, a degraded tribe of Hindoos, who live by themselves in the outskirts of towns: and, in the country, build their houses apart from the villages, or rather have villages of their own. They dare not in cities pass through the streets where the Brahmins live; nor enter a temple of the superior castes. They get their bread by sowing, digging, and building the walls of mud houses; most of those inhabited by the common people being raised by the Parias; who perform all kinds of menial work: their diet is also wretched. One would scarcely imagine that contentions for precedence should ever occur among a people who seem to have renounced all cleanliness, and who are held in such utter contempt by the rest of the Hindoos; yet pride has divided the Parias into two classes: the first simply called Parias, the other Seriperes.

PARI'ETAL, *adj.* Lat. *paries*. Constituting the sides or walls.

The lower part of the *parietal* and upper part of the temporal bones were fractured. *Sharp.*

PARIETALIA OSSA. See **ANATOMY**.

PARIETARIA, pellitory of the wall; a genus of the monœcia order, and polygamia class of plants: natural order fifty-third, scabridæ: hermaphrodite **CAL.** quadrifid: **COR.** none; there are four stamina; one style; and one seed, superior and elongated: **FEMALE CAL.** quadrifid: **COR.** none: nor are there any stamina. There is one style; and one seed superior and elongated. Species six, of which the

P. officinalis is used in medicine. This has a creeping root. The stalk grows erect, is rough to the touch, and adhesive. The leaves are alternate, elliptical, lanceolate, veined, and a little rough. The flowers grow out of the axæ of the leaves, in sessile, branched, verticillate clusters, of a greenish color tinged with red. The anthers have a great degree of sensibility; for, if irritated with the point of a pin, they fly from

the calyx with elastic force, and throw out their powder. The plant has a cooling and diuretic quality. Three ounces of the juice taken internally, or a fomentation externally applied, have been found serviceable in the strangury. The plant, laid upon heaps of cotton infested with weevils, is said to drive away those destructive insects.

PARIETES, in anatomy, a term used for the enclosures or membranes that stop up or close the hollow parts of the body; especially those of the heart, the thorax, &c. The parietes of the two ventricles of the heart are of unequal strength and thickness; the left exceeding the right, because of its office, which is to force the blood through all parts of the body; whereas the right only drives it through the lungs.

PARIMA, a lake of Guiana, in the interior. It was formerly reported by travellers to be 100 miles long and fifty broad, with an island in the middle, of glittering mica, the celebrated seat of El Dorado, the imaginary city whose streets were paved with gold. It is now, however, said to be nothing more than an overflow of some of the head branches of the Parima or Branco. Long. 45° 20' W., lat. 3° 40' N.

PARIMA, or Branco, a river of South America, which rises in the above lake, and running south for above 400 miles, and collecting the waters of several other rivers, enters by four mouths the Rio Negro.

PARINA-COCHAS, a province of Peru, bounded on the north by the province of Aimaraes, north-west by that of Valcas-huaman, east by that of Chimbivilcas, south by that of Arequipa, and west by that of Lucanas. It is thirty-five leagues long, and of irregular breadth. The situation is elevated and cold, with the exception of some hollows among the Andes. Here numerous breeds of cattle, particularly sheep, are found, and the mountains abound in mines of silver and gold, and herds of Guanucus or Peruvian camels; most of the inhabitants of this part, therefore, are drovers or woollen manufacturers. It contains thirty settlements, and 11,000 inhabitants.

PARINA-COCHA, a lake in the above province, seven leagues long and one broad.

PARINI (Joseph), a modern Italian poet, was the son of a poor peasant, and born on the shores of Lake Pusiano, about seven leagues from Milan. The monks bestowed on him a gratuitous education, to fit him for a subordinate ecclesiastical office; but a thirst for learning induced him to acquire farther knowledge; until his prospects of promotion in the church were blasted by an attack of paralysis in his nineteenth year. This rendered him a cripple for life. He at first was obliged to struggle through nearly twenty years of obscurity and indigence to procure the means of support for himself and his widowed mother; but a sudden change in his fortunes was produced by the appearance of his fine satirical work, *Il Giorno*, intended to exhibit a humorous delineation of the Milanese nobility. He was also the author of several lyric compositions, which display the same strain of moral satire. Towards the close of his life he enjoyed a large share of popularity. Once when the democratic spirit ran high, and the people

were tumultuously assembling at Milan: with cries of 'Viva la Repubblica! Morti ai Tiranni, ai Patrizii!' Parini issuing forth from a hotel exclaimed, 'Viva la Repubblica, e morte a nes-

suno; canaglia stolta.' 'The republic for ever, and death to nobody, you stupid people.' He lived much esteemed and respected to his seventieth year.

PARIS.

PARIS, Lutourez, Lutetia, one of the largest, richest, and most flourishing cities of Europe, the capital of the kingdom of France, the seat of the government, and the residence of the king, royal family, and ministers of state. It is locally situated in the Isle of France, department of the Seine, of which it is the chief place. Here are held the meetings of the two chambers of deputies, of the court of cassation, the court of accounts, a royal court for the departments of the Aube, the Eure-et-Loire, the Marne, the Seine-et-Marne, and the Seine; an inferior court of judicature; and a chamber of commerce for twelve cantons and twelve mayoralties; a general court for superintendence of the customs, of waters and forests, of bridges and highways, &c.; a general administration of the post, of exchanges and lotteries; royal manufactories of tobacco; the archives of the kingdom; a royal printing office; a prefecture of the police; the bank of France; a university academy; a school of medicine; an academy of belles lettres; a royal atheneum; a polytechnic school; a military school; a school of the fine arts; an institution for the deaf and dumb; a court of longitude; a society of music; and numerous other learned institutions. Its population is about 717,000.

This city is situated on the two banks of the Seine, in a pleasant valley, overlooked by lofty hills, on the sides of which part of it is built. The river crosses it from east to west, dividing it into two nearly equal parts; it then divides itself into two branches, which unite again after forming three tolerably large islands. The communication between the two banks and the islands is effected by a great number of bridges, some of which are remarkable for the beauty of their construction, and abut upon grand quays, bordered by elegant houses, which have a very imposing appearance. Most of the streets are wide, airy, watered by numerous fountains, and full of magnificent hotels, shops, and warehouses of every description. The pleasantness of the boulevards planted with trees, the numerous public squares adorned with triumphal arches, columns, and statues, the majestic architecture of the public buildings, the beauty of the suburbs, the mildness of the climate, the various manufactures carried on here, the celebrated artists and learned men that reside in it, and the multitude of establishments devoted to the sciences and arts, well combine with its political importance to render Paris a resort of foreigners from all parts of the globe. According to the most recent accounts there are twenty-eight royal roads that meet here, fifty-six barriers, some of them very elegant, eighteen boulevards, thirty-one quays, sixteen bridges, three islands, eighty

squares, 1085 streets, 26,801 houses, thirty-seven public markets, seven of which are under cover, eighty-five fountains, eight public libraries, twelve theatres, seven civil and military prisons, twelve parish churches, thirty-six chapels of ease, three protestant temples, three Jews' synagogues, twenty-four barracks, twenty-six civil hospitals, and four for the military, besides numerous infirmaries. The outer circumference of the boulevards is about twenty-one miles, and the superficial extent 34,396,800 square metres.

Paris was, at the time of the Roman invasion, only a miserable township, built by the Gauls in the island called now the city. It was, however, the capital of the Parisiaci, one of the ninety-eight tribes, of which, according to Julius Cæsar, Celtic Gaul consisted. Struck with the advantages of its situation, Cæsar made himself master of it after a very vigorous resistance. A city was soon raised on the yet smoking ruins of the ancient habitations, which received the name of Lutetia. It considerably increased during the five centuries that the Romans were in possession of it, was the seat of one of the prefectures of Gaul, and at different periods became the temporary residence of several of the Roman emperors, who here built an aqueduct and a palace, the remains of which are visible.

History assigns no date to the foundation of the Gaulish town. The form of government of the tribe settled here was republican: and there is reason to think that this was a numerous people, brave, and jealous of their independence, since they defeated Cæsar's lieutenant Labienus, who was first sent against them; in a second encounter, however, they were not so successful: the courage of their old general Camulogenes was of no avail; he was slain, and thus spared the mortification of seeing his tribe subjugated by the enemy. They afterwards set fire to their capital: but Cæsar caused it, as we have stated, to be rebuilt, surrounded it with walls, and fortified with towers at short intervals. Some of these fortifications were in existence at the time of the siege of the Normans in 885. Its advantageous situation soon made it a place of great trade. About the year 350 a few churches were erected, and, a few years after, Julian, who resided at the palace of Thermes, was there proclaimed emperor by the soldiers. In 380 it began to be called the city of the Parisii, or Paris. It was invaded in 451 by the Franks, under the conduct of Merovée, who drove out Ætius, the last of the Roman governors. At length Clovis, after having accomplished the conquest of the Gauls, fixed upon Paris as the capital of his states. Under Charlemagne learning and science began to flourish here. Left to its own resources, by the feeble successors of this monarch, it was

several times ravaged by the Normans, who began their attacks in 845, set fire to it in 857, and besieged it for three months in 885-6, continued their ravages until the year 910, and finally destroyed even the remains of those monuments which the power of the Romans had erected.

The kings of the third race, wishing to render their capital worthy of a great kingdom, granted to it some important privileges, and executed some splendid works for its embellishment. Under Philip Augustus the foundations of Notre Dame were laid, the streets began to be paved, the city was surrounded with walls, flanked with 500 towers, and augmented by the addition of four new quarters. The establishment of the schools of surgery, and of the Three Hundred, and the enlargement of the Hotel Dieu, were the work of St. Louis. Under Philip the Fair the chamber of accounts and the exchange were established, and Charles the Good added eight new quarters, and built the bridges of St. Michael and Notre Dame. In 1420 Paris was taken by the English, who were forced to evacuate it fifteen years afterwards. The same year a great part of the population was carried off by cold and famine, and in 1438 more than 50,000 of the inhabitants died of famine and the plague; so that troops of hungry wolves, after venting their rage in the country parts, entered the city by means of the river, and committed dreadful devastation. So great was the mortality, owing to the heat of the weather, in 1466, that it was found necessary, we are told, to open an asylum to malefactors from all parts in order to repeople the capital! Under Louis XI. the post office was established, and the city greatly extended. The foundation of the royal college was laid by Francis I., and this prince raised a noble palace on the site of the old towers of the Louvre. Streets were formed in different parts, edifices of Grecian architecture arose in the place of the old Gothic buildings, and several magnificent churches were built in the same reign. In the time of Henry IV. the faubourg of St. Germain was added, and a great number of streets were laid out in the quarter of the Marsh; the Place Dauphine, the Place Royale, and the Pont Neuf, were built, and several other public squares were made more regular. Under Louis XIII. were erected the gate of St. Gervais, the aqueduct of Arcueil, the quays and bridges of the island of St. Louis, the palace of the Luxembourg, the Sorbonne, the college of Louis the Great, and the statue of Henry IV. At the same time the foundations of the Palais Royal were laid, and the botanical garden planted. Louis XIV. built the Hospital of Invalids, the Observatory, the colonnade of the Louvre, the Place Vendome, and the gates of St. Martin and St. Denis. The military school, the schools of medicine and law, the gates of St. Sulpice and St. Eustathius, and the church of St. Geneviève, were the works of Louis XV. In the reign of Louis XVI. the fountain of the Innocents was repaired for the first time; the corn market, the theatres of the Odeon, the Italians, and Feydeau, the Mont de Piété, and the bridge in the Place de Louis XV. were built, and the botanical garden was enlarged. In 1782 this monarch ordered

the farmers-general to erect new walls round the enclosure of the fauxbourg, with openings at intervals for the admission of merchandise and provisions for the capital. The Place du Carrousel, the triumphal arch which adorns it, the gallery parallel to that of the museum, some immense quays, several gates, the bridges of the Arts and of Austerlitz, the military school, a number of new streets, particularly those of Rivoli and la Paix, the column in the Place de Vendome, that of the Place du Châtelet, the triumphal arch of the Etoile, the wine-market, the granary, many of the markets and fountains in Paris, the front of the hall of the legislative body, the exchange, and the repair of the Louvre, the Luxembourg, and several other public edifices, were undertaken and nearly finished under the reign of Napoleon. Louis XVIII. erected the new equestrian statue of Henry IV., and those of Louis XIII. and XVI., and finished the exchange and the Magdalen.

Situated nearly in the centre of France, this city has been the theatre of the greatest events of more than ten centuries. Under Charles IX., of hateful memory, a dreadful massacre of the Protestants took place here on the night of St. Bartholomew's day; Henry III. and Henry IV. laid siege to this capital; in the seventeenth century it was the theatre of the war of the Fronde, during which the court was obliged to leave the place. Towards the end of the eighteenth century the abuses and exactions, which the nation had for a long time endured, becoming intolerable, a terrible revolution broke out here, when Louis XVI. was condemned and executed, the monarchy was abolished, and a republic decreed; after several years of anarchy Buonaparte, at first nominated consul, and afterwards emperor of the French under the title of Napoleon I., was crowned here by pope Pius VII. In 1814 the foreign powers took Paris by capitulation, and Louis XVIII. made his public entry; Napoleon again entered it as emperor on the 20th of March 1815; but was obliged to abdicate the throne in three months, when it was a second time taken possession of by the allied armies, and the king once more brought in.

Among the numerous public buildings we can only particularise the following: 1. The palace of the Louvre. This superb edifice is of high antiquity. In the reign of Dagobert it was a royal residence; and, burnt by the Normans, it was rebuilt by Louis the Young; Philip I. repaired and enlarged it; but it was still only a pile of buildings of very simple construction and without any marks of symmetry, flanked with a great number of towers, and surrounded with broad and deep ditches. In the centre of these rose a great tower, called the tower of the Louvre, which was successively the residence of kings, an arsenal, and state prison. Philip Augustus and his successors made it their treasury. It was Francis I. who laid the foundation of what is now called the Old Louvre, which was completed in the reign of Henry II. The gallery on the side of the Seine was built by Henry III., and Henry IV.; Louis XIV. built the principal front, which is a fine specimen of architecture, executed by Claude Herault; but the construc-

tion of the gallery on the side of the Rue St. Honoré, and the completion of the Louvre, must be attributed to Napoleon. The form of this palace is square, with a square court in the centre, surrounded with buildings three stories high, the principal of which is ornamented with columns and the rest with bas-reliefs. Four spacious vestibules lead to the interior of the apartments and to the stair cases, the principal of which is very grand. The grand front is towards the church of St. Germain l'Auxerrois; it is 850 feet long, and not inferior to the most beautiful monuments of antiquity. The chief gate is in the centre, adorned with double pillars and crowned with a pediment, the coping of which is formed of only two stones, fifty-four feet long and eight broad. A project was formed during the times of the empire, and is still carrying on, for joining the Louvre to the Thuilleries by a double gallery, one on the side of the Seine which is accomplished, and the other from the north-west pavilion.

2. *The Thuilleries*.—This palace has taken its name from a place where there were several tile-kilns. It was commenced by Catherine de Medici in 1564, after the plans of Philibert de l'orme; the building was continued by Henry IV. and Louis XIII., and finished by Louis XIV. The front consists of five pavilions and four more buildings in the same line, the length of the whole being about 1000 feet. It is composed of almost all the different orders of architecture. The vestibule has five openings, so well planned that through the arcades you have a view of the whole length of the garden, as far as the top of the Elysian fields, presenting a most magnificent perspective. The arrangement and ornaments of the interior of this building constitute it the finest palace in Europe. The apartments are decorated with splendid pieces of painting and sculpture, executed by the most celebrated artists, both Frenchmen and foreigners. Before the front of the carousel is a spacious court, separated from an immense square by an elegant breast high railing; at the central gate is a triumphant arch, upon which were lately placed the four bronze horses which for 500 years adorned St. Mark's Square in Venice.

3. *The Luxembourg*.—This palace was commenced in 1615 by Mary de Medici, and built in the space of six years, under the direction of Jean de Bresse, on the model of the palace of Pitti at Florence. It forms a rectangle of 300 feet in the front, and 360 feet in depth. The front, on the side of the Rue de Tournon, is composed of two pavilions, united by terraces supporting open galleries, in the middle of which rises a cupola united to the main building by two wings raised one story above it; four great square pavilions, the roofs of which terminate in a point, are at the angles of the principal building. The decorations are of the Tuscan, the Doric, and the Ionic orders. On the front of the side towards the court is an allegorical design, relative to commerce. Since the revolution this palace has received considerable additions and embellishments. The principal bodies of the state have successively held their meetings here, and it is at present the place of sitting for the cham-

ber of peers. It contains several vast galleries, in which are exhibited the masterpieces of the French living artists.

4. *The palace of the chamber of deputies*, built in 1721, may bear comparison with the finest palaces of Italy. The entrance in the square is very fine, and the great gateway is adorned on each side with a colonnade of the Corinthian order. In the centre is a portico decorated with eight columns, surmounted by an attic, on the front of which is represented, in basso-relievo, the law protecting innocence and punishing crime. The hall of the assembly is semicircular and arranged in the form of an amphitheatre, the partition walls are of stucco of antique green color, and fringed with drapery; six side niches contain statues of the most celebrated orators of Rome and Athens. The front on the side of the Seine was built between the years 1804 and 1807; it has twelve immense Corinthian columns, supporting an entablature and approached by a vast flight of steps, eighteen feet in height, divided by a balustrade, and about 100 feet broad.

5. *The hall of justice* is an edifice founded in the earliest times of the French monarchy. St. Louis and Philip the Fair made great additions to it; Charles V. and Francis I. made it their residence; in 1776 part of it was consumed by fire, and in the reign of Louis XVI. the grand front was raised, and the court enclosed by a fine railing. The entrance to it is in a semicircular spot, at the end of which runs the Rue de la Barillerie. It consists of a central building and two advanced wings, presenting fronts, each decorated with four Ionic columns. A flight of steps, sixty feet long and seventeen high, lead to the central building, which presents also four columns, with four colossal statues representing Power, Plenty, Justice, and Prudence. The two side wings of the court are pierced, level with the ground, with arcades, above which are raised two floors of buildings. The space occupied by this edifice reaches from the Change Bridge to the Place Dauphine, and takes in the breadth of half of the island of the city. This palace, devoted to the administration of justice by Louis XII., is the seat of the court of cassation, the court of accounts, the royal court, and an inferior court of judicature.

6. *The exchange* is a superb edifice, situated at the end of the Rue Vivienne, on the site of the ancient convent of the nuns of St. Thomas. It is a rectangle, the base of which is 206 feet long and 122 wide. Sixty-six columns support the entablature and an attic, and form a covered gallery round the building. A raised flight of steps, the whole breadth of the western front, leads to this gallery and to the principal entrance. The public saloon in the centre is 114 feet long by seventy-five broad, and receives its light from the cupola.

7. *The palace of the legion of honor* is an elegant structure, once intended for the residence of the prince of Salm Salm. At the entrance is a triumphal arch, decorated with pillars of the Ionic order; from this two galleries lead to two pavilions, which stand forward in the building, of which the attic is covered with bas-reliefs; an Ionic peristyle runs round the court, forming a

continuous covered walk. The principal part of the edifice is at the end of the court; its front is heightened by a set of columns of the Corinthian order.

8. *The palais royal* was built in the year 1629 by cardinal Richelieu, after the designs of James Lemercier. At first it was called *Hotel de Richelieu*, then *palais-cardinal*. In 1639 that minister presented it to Louis XIII. The outer front, on the side of the Rue de St. Honoré, presents to the view pavilions ornamented with Doric and Ionic columns, and crowned with a pediment; it forms a terrace before the court, entered by three fine gates. The main building at the bottom of the first court is pierced with three arches, of which the lowermost forms a vestibule decorated with columns, and leading to a grand flight of stairs. The second court is closed by galleries of wood, under which is the entrance to the garden, which is a rectangle planted with linden trees, in the midst of which are two grass plots, separated by a circular basin sixty feet in diameter, having in its centre a superb fountain. At the end of the garden are three buildings four stories high, the front of which presents 182 porticoes, separated by Corinthian pilasters supporting an entablature with a frieze pierced with windows. A balustrade with vases at intervals on the pedestals surmounts this building in all its extent. A narrow gallery runs quite round the garden, under which persons may walk conveniently, and which receives light through the arcades. These are furnished with brilliant shops, exhibiting every species of merchandise.

9. *The town-hall* was commenced in the year 1533 under the reign of Francis I. It is a Gothic building, very regular and rather harmonious in its proportions; but the bad taste of the age is manifest in all the details. A large flight of steps leads from the Place de Grève to the principal entrance; above the gate is an equestrian statue in bronze, demi-relievo, on a pedestal of black marble, representing Henry IV. The clock, which is considered as a masterpiece, is decorated with an elegant enamelled dial, enlightened at night by a reflector. This edifice has been the theatre of several remarkable political events, and is now the public office of the prefecture of the department of the Seine.

10. *The mint* is situated on the banks of the Seine, almost in the centre of Paris. The first stone of it was laid by the abbé Terrai, controller-general of the finances, in 1771. Six Ionic columns surmounted with a surbase of five arcades adorn the front, and a grand entablature crowns the whole. The principal building is surmounted with an attic, on which are the figures of Prudence, Fortitude, Commerce, Plenty, and Peace, and the principal court is galleries.

11. *The hospital of invalids* is a magnificent establishment, which was founded in 1672 by Louis XIV., as a retreat for officers and soldiers that have been disabled in the service. It stands at the entrance of the plain on Grenelle, and covers a space of sixteen acres of a healthy spot near the Seine. A vast esplanade planted with trees, a grand railing, and a court surrounded with ditches lined with freestone and breast high,

give this place a very imposing aspect. The front is 613 feet in extent. Above the gate is an equestrian statue of Louis. By this entrance you proceed into a large court, having four rows of buildings, in the front of which are two rows of arcades one above the other, forming corridors or galleries. The middle of each front juts out before the rest of the building, and there are four stories of apartments very conveniently arranged. At the end of the royal court is the entrance to the church, which consists of a large nave and two aisles decorated with Corinthian pilasters; it is in the form of a Greek cross, and beyond it is the dome, one of the finest structures in France. Round its circumference are six chapels richly ornamented with paintings and sculpture; on the right side is the tomb of Turenne, and opposite to it that of Vauban. The entrance is at the back of the hospital, looking towards the Boulevards, elevated on a lofty flight of steps and decorated after the Ionic and Corinthian order, with a triangular front. A row of Corinthian columns runs round the dome covering a cupola surmounted with a lantern, above which is a cross about 300 feet from the ground. The dome is covered with lead and richly gilt. This hospital contains 7000 pensioners, who are all well lodged and maintained. The governor is always one of the marshals of France.

12. *The military school* was erected, in 1751, for the instruction of young men of noble families who are designed for the army. The principal entrance is on the city side, and presents a vast court surrounded with extensive apartments and enclosed by a railing. The opposite front overlooks the Champ-de-Mars, originally designed as a place of exercise for the school.

13. *The observatory* was begun in 1667, and finished in 1672. There is neither iron nor wood employed in its construction. Its form is that of a rectangular parallelepipedon, with four fronts towards the four cardinal points. Two octagonal towers are built at the two corners of the southern front, and a third, which is square, in the middle of the entrance of that on the north. The platform on the top of the edifice is eighty-five feet from the ground; and the under-ground apartments are of an equal depth below, and a flight of 360 steps leads to the top. The interior is divided into chambers, and saloons appropriated to astronomical and physical observations. Six of these latter have openings corresponding to the different points of the heavens. Under the platform are cabinets adapted for the use of the different instruments. Here is a meridian for observing the longitudes; and, on the first floor of the western tower, a geographical chart, or planisphere, twenty-seven feet in diameter, traced with the utmost precision under the direction of Cassini.

14. *The triumphal arch of the Carousel* was raised in the year 1806, to commemorate the exploits of the grand army: it is forty-five feet high, sixty broad, and twenty-one deep. Like those of the ancients, this arch consists of three arcades cutting three others in a transverse direction. It is built of hard freestone; eight columns of red Languedoc marble, with chapters of the Corinthian order executed in bronze, adorn the

two fronts, supporting an entablature with frieze of Italian marble. On the top were placed the famous Corinthian horses which were brought from Venice.

15. *The triumphal arch of the Etoile* was begun in 1806, but the building was interrupted in 1814. An ordonnance of Louis XVIII., however, issued in 1825, caused the works to be resumed. It will be 135 feet high; its front is pierced with a single arch, eighty-seven feet high, and forty-seven in the span.

16. *The gate of St. Denis* is a triumphal arch, and one of the finest monuments in Paris: it was erected in 1672. It is open like those of Titus and Constantine at Rome; it is generally thought that neither Rome nor Greece possesses any thing more perfect in its kind. It is seventy-two feet high and as many broad; the portico in the middle is an opening of fourteen feet by twenty-four; within the arch are trophies of arms and two globes, with the arms of France, surmounted by a crown; at the bottom stand two colossal statues, one representing Holland under the figure of a terrified woman sitting on a lion, which holds in one of its paws seven arrows, representing the seven united provinces; the other representing the genius of the Rhine resting on a lion and holding a cornucopia.

17. *St. Martin's Gate*, situated at the end of the street of the same name, was built in 1674, by the city of Paris, in honor of Louis XIV. It is fifty feet high by as many broad; has three openings, of which that in the middle is the largest; and is adorned with four bas reliefs, representing the taking of Besançon, the breaking of the triple alliance, and the defeat of the Germans by Louis, who is represented under the figure of Hercules, with a club in his hand, beating down an eagle.

18. *The triumphal column of the Place Vendôme*, raised to the honor of the French victories in Germany, was commenced in 1806, and finished in 1810. It is 200 feet high and twelve feet in diameter; the pedestal is twenty-two feet high and from seventeen to twenty feet broad. Trophies of arms and the dresses of Austrian and Russian officers cover the sides of this part of the monument; at each angle, above the cornice, is a colossal eagle supporting a crown of laurel. There are also the beginnings of a set of bas reliefs commemorating the principal actions of the campaign of 1805. On the top of the chapter is a gallery, to which there is a flight of 160 steps in the interior of the building, and in the midst of it is a little dome, designed at first to receive a statue of Charlemagne, but on which they had placed one of Napoleon; in the place of which, in 1814, a fleur de lis was substituted. The railing round this column is distinguished for its beauty and elegance. This pillar was constructed out of the 200 pieces of cannon taken from the Russians and Austrians in a campaign of three months: the whole weight of the brass amounted to 1,800,000 lbs.

There are in Paris fifty-six churches, temples, or chapels, several of which are masterpieces of architecture; the chief of them are,

19. *The metropolitan church of Notre Dame*, a fine gothic edifice, which presents a boldness of construction that constitutes the true beauty of

that style. The solidity and noble arrangements of all its parts are highly creditable to the skill of the architect. It is built in the form of a cross, and is 390 feet high, and 144 broad. The principal front is remarkable for its elevation, and its sculpture: it is terminated by two great square towers 280 feet high, ascended by 380 steps, and communicating by galleries within, which support several Gothic columns of astonishing delicacy. The whole of the interior of the nave and choir is supported by twelve pillars, and there are large galleries separated by columns of a single piece; in these the audience are placed to see the grand ceremonies. Behind the chief altar is a group of four figures in white marble, the principal of which are eight feet high; it represents the descent from the cross, and is an admirable work, executed by Coustou in 1723.

20. *The pantheon*, or new church of St. Genevieve, erected after the designs of Soufflot, is one of the finest monuments that have been raised in France since the revival of the arts. It is in the form of a Greek cross, and its portico is similar to that of the pantheon at Rome. The exterior consists of four naves, in the middle of which rises the dome adorned with thirty-two Corinthian columns; the height is about 282 feet. The double cupola in the interior is a masterpiece for its boldness and lightness. By a decree of the 4th of April, 1791, this church received the name of the pantheon, and was consecrated to the reception of the ashes of those who have deserved well of their country. On the front of the peristyle it until lately bore the following inscription in French,—

‘A grateful country to its great men.’

In February 1806 the name of St. Genevieve was restored, and it was devoted to the sepulture of the great officers of the legion of honor, and those citizens who had rendered eminent services to their country. Lastly, by an ordinance of the king in the month of December 1821, it was restored to the Catholic worship; the French inscription was changed for a Latin one; and the remains of Voltaire and Rousseau were clandestinely removed to make way for the relics of St. Genevieve, which had been burned and dispersed during the revolution, but of which the new authorities had succeeded in procuring a fresh supply!

21. The church of *St. Sulpice* was begun in 1678 and finished in 1745. The portico is considered a very fine piece of architecture: it is 384 feet in front, with a flight of fifteen steps ascending to it, on the top of which is a grand platform. The towers are 210 feet high. The choir contains the figures of Jesus Christ, St. Paul, and St. Peter, sculptured by the celebrated Bouchardon. The chapels are decorated with paintings in fresco of great beauty, and the pulpit, to which the ascent is by marble steps, excites the attention of all connoisseurs.

22. The church of *St. Germain l'Auxerrois*, which was founded in the seventh century, but destroyed by the Normans, and afterwards rebuilt and beautified at different epochs. The grand portico is the production of the fourteenth century.

23. The building of new *Magdalen* church was commenced in 1764, by order of Louis XV., and continued under the following reign; but owing to the revolution the work was stopped from 1789 to 1806, when Napoleon conceived the idea of making it a temple to glory, dedicated to the grand army. The works were accordingly recommenced and a second time suspended. In 1816 a royal ordinance determined that this church should be finished on a new plan and devoted to the reception of the expiatory monuments of Louis XVI., and Marie Antoinette. The interior of the temple of glory was to have been a parallelogram decorated with pilasters; its ulterior destination must make many changes in the plan and arrangement. Besides these, the churches of St. Roch, St. Eustathius, St. Gervaise, le Val-de-Grace, the Sorbonne, the Holy chapel, St. Steven of the Mount, the Oratoire, &c., are well worthy of attention.

Seventeen bridges, twelve of which are of stone and very beautiful, communicate with the different parts of Paris. The bridge of Austerlitz, or of the botanical garden, connects the botanical garden with the arsenal. It consists of five arches of cast-iron, supported on piles and abutments of freestone; it is 400 feet long and thirty-seven wide, and cost 3,000,000 of francs, which is defrayed by a toll on carriages and foot passengers. The bridge of Grammont joins the arsenal to the isle Louvieres. St. Mary's bridge connects the Elms quay with the island of St. Louis. The bridge of the Tournelle, forms a communication between the quay of the same name, and the isle of St. Louis. The city bridge, built in 1804, joins the city to the island, the abutments are of stone, and its arch wood. The Pontau-Double connects the Rue de la Bûcherie with the bishopric; it was built in 1634. The Little Iron Bridge, erected in 1606 over a small arm of the Seine, establishes a communication in the interior of the Hotel-Dieu. The Little Bridge, uniting the quarter of St. James's to the city, may be regarded as one of the most ancient in Paris; as it formed, with the Change Bridge, the two entrances of Parisii or Lutetia, in the time of the Romans. The latter, thrown over the grand arm of the river, is the largest in Paris; it has seven arches. The Bridge of Notre Dame, remarkable for its solidity and elegance, forms the communication between the quay Le-pelletier, and Dessaix Quay. Here is an hydraulic engine which furnishes water to several parts of Paris. St. Michael's bridge joins the Augustine's Quay with the New Market. Three bridges had been built on this spot, when in 1616 the present one was erected by a company, on the condition of being allowed to build houses; of these there were thirty-two, but they were pulled down in 1804. Pont Neuf, consisting of twelve arches, was begun in 1578 and finished in 1604 under the reign of Henry IV. It is thrown over two arms of the river, in the middle of which is the island of the City; and is 468 feet long by seventy-eight broad. The platform between is occupied by the statue of the good king Henry on horseback; the bronze group which composes this monument is fourteen feet high. The bridge of the arts is situated between

the palace of the Louvre and that of the fine arts, from which it takes its name. It consists of nine iron arches with stone abutments; its length is 516 feet, and its breadth thirty; foot passengers pay a toll here. The Royal Bridge was built in 1685, by order of Louis XIV., and joins the Louvre Quay with Voltaire's Quay. It is 432 feet long, and fifty-two broad. From this bridge the passenger has a most delightful view over the capital, embracing the Thuilleries, the Louvre, the two arms of the Seine, &c. &c. Louis XVI's. Bridge, commenced in 1787 and finished in 1791, joins the square of Louis XV. with the quays of Orsay and the Invalids. It was built by the architect Peyronnet, and is remarkable for the boldness of its arches, the vast extent of the square in which it abuts, and the elegant buildings of which it commands a view. The bridge of the Military School forms a line of communication between the Champ de Mars and the road to Versailles; it is 460 feet long, by forty-two broad, and perfectly horizontal. The Suspension Bridge of the invalids, uniting the esplanade of that hospital with the Elysian Fields. It is supported by four columns ten feet in diameter at their bases, and the chain, comprising the curve which it describes, is 240 metres in extent, formed of long links, and sustained by masonry imbedded thirty feet deep. The breadth of this bridge is forty-two feet.

The numerous fountains that embellish this capital, and contribute to the health and comfort of its numerous inhabitants, are supplied from three reservoirs, two steam pumps, and one hydraulic machine. The reservoir of Cassini distributes the waters, which are brought to it by the aqueduct of Arcueil; the reservoir of St. Martin's boulevard is supplied from the canal of the Ourcq; and that of the Palais Royal receives the waters of the Seine and the Arcueil. The Fountain of the Innocents is the finest in Paris: it was built in 1551 after the designs of Pierre Lescot. It is ornamented with basso-relievo and figures of great beauty; the water issues from a large vase and falls in magnificent cascades. This monument is forty-two feet in height. The fountain of Grenelle is the work of the chisel of the celebrated Bouchardon; it is decorated with seven statues, the three principal of which are grouped and represent the city of Paris seated on a pedestal with the Seine on one side and the Marne on the other, rendering homage to her and bringing to her all the productions of the seasons, which are designed by four figures placed around the group. The fountain Dessaix was erected in 1801 to 1803, to the memory of general Dessaix, who was killed at the battle of Marengo. It represents a military genie crowning the figure of Dessaix; two figures of Fame are inscribing on two rolls, one, Thebes and the pyramids, and the other Kel and Marengo; on the front of the pedestal the name of the warrior is engraven in letters of gold. The Fountain of the Palm-tree, finished in 1808, is situated in the centre of the Place du Chatelet. It is of a quadrilateral form, and in the midst of it rises, from a basin twenty feet in diameter, a column in the Egyptian style representing a palm-tree; the jet which serves for a base rests on an elevated

platform, each angle of which is adorned with a cornucopia, from which issues the water. Above the column is a ball, on which is a figure of Fame with spread wings and extended arms, and holding a civic crown in each hand. Below are four statues representing Justice, Fortitude, Vigilance, and Prudence. The pillar is cut at equal intervals by bracelets, on which are inscribed in letters of brass the names of the principal battles gained by the French armies; the chapter is ornamented with feathers and palm-leaves, and the pedestal has an eagle with outstretched wings and is encircled with laurel. The fountain of the Medical School consists of a grotto formed by four fluted columns of the Doric order; the waters fall from the arch above, and are supplied from the Seine. Besides these there are several others very beautiful.

Paris contains several fine squares or public places, the most remarkable of which are, the Place du Carrousel; between the Louvre and the Thuilleries, which is one of the largest in Europe. The principal ornament which it presents is the triumphal arch already mentioned. The Place Vendôme, executed after the designs of Mansard was commenced in 1699 and finished in 1715. It is octagonal, with four long and four short sides. The centre was occupied by an equestrian statue of Louis XIV., which was thrown down in 1792, and its place is now occupied by the triumphal column raised to the honor of the French armies. The Place des Victoires, of an oval form, was built in 1686, after the designs of Mansard. It is surrounded with beautiful buildings ornamented with pilasters of the Ionic order. Before the revolution here stood the statue of Louis XIV., treading on a Cerberus, the symbol of the triple alliance over which he had triumphed, and behind him was the figure of Victory; at the four corners were four slaves in bronze, chained and sitting on trophies, representing the nations France had conquered. This was destroyed in 1792 and is now replaced by another of more recent execution. The Place Louis XV., which has been successively called the Place de la Revolution and the Place de la Concorde, was finished in 1772. It is a parallelogram of 780 feet in length by 630 broad, surrounded by large ditches fenced with stone balustrades. Its four outlets present magnificent views of the Thuilleries, the Magdalen, the arch of the Etoile, and the palace of the legislative body. Here it was that Louis XVI. and Marie Antoinette were beheaded in 1793; an expiatory monument is now built on the spot in memory of this deplorable event. There are other public places which deserve mention, as the Place Royale with the statue of Louis XIII.; the Place Dauphine, the centre of which is occupied by a fountain with the statue of general Dessaix; the Place du Chatelet, remarkable for the palm fountain; the Place de l'Hotel-de-Ville, surrounded with very ancient houses; the Place St. Antoine; the Place Maubert, &c. &c.

This city also contains a number of public establishments, remarkable for the elegance of their construction, in its halls, markets, hospitals, prisons, cemeteries, &c. There are thirty-seven halls or markets, the principal of which are the follow-

ing:—The corn market, built in 1767 on the ancient site of the Hotel de Soissons, is a circular building isolated and open on all sides, being pierced with twenty-five arcades six feet and a half wide, answering to as many streets, which they front. It is of the Tuscan order of architecture. Above these are vast granaries, vaulted with brick and stone, with which two flights of stairs communicate. The cupola, which was considered very fine, was consumed by fire in 1802; but in 1811 it was replaced by an iron one. The market of the Innocents is in the same quarter with several others in a vast area once occupied by the church and cemetery of the Innocents; it is a great square, surrounded with large and convenient galleries; in the centre is a superb fountain with four jets at the four angles. Here the wholesale market of fruits and vegetables commences at break of day, and closes between nine and ten o'clock; then begins the retail trade, which lasts through the day. The cloth market was built in 1786; it is isolated on all sides, and surrounded with a foot path enclosed within a railing; it is 400 feet long and fifty feet broad. The roof is vaulted and covered with tinned copper. It is open every day for the sale of cloths, and three days in the month for linen. The poultry and game market, erected on the site of the old convent of the Great Augustines, was finished in 1811; it is built of free-stone, covered with slates, and consists of three galleries, separated by pillars supporting arches. It is 190 feet long and 141 feet broad. The calf market was built in 1774, and is surrounded by four streets. It is open every Wednesday and Saturday for the sale of calves, and on Fridays for the sale of tallow. Among the markets we might also mention the wine market, the flower and shrub market on Dessaix quay, the Jacobins market, &c. &c. Besides these there is the granary of reserve, a vast edifice begun in 1807, consisting of a long line of five square pavilions, united by four principal buildings. Here are deposited about 25,000 sacks of flour, belonging to the bakers of Paris.

Of the several large and well conducted hospitals in this city we may particularise the Hotel Dieu for the reception of 4000 sick; the general hospital de la Salpêtrière, designed for women; the Val de Grâce, a military hospital; the hospital of St. Louis; the lying-in hospital; the Foundling Hospital, &c. &c. Paris contains ten prisons:—the Conciergerie, where persons committed for trial are confined; the great and little Force; the St. Pelagie, where are destined those who are arrested for debt, and persons convicted of political crimes; Les Madelonnettes, a prison designed for women who are condemned for any crimes; St. Lazare; l'Abbaye, a prison for the military; the Montaign; the Refuge; and the Hotel de Bazancourt, a place of confinement for the national guard. Since the practice of burying the dead within the cities has been abolished there have been only five burial grounds:—the cemetery of Vaugirard, that of Mount Parnassus, of St. Catherine, of Mont Martre, and St. Louis, or the Père Lachaise. This last is the largest in Paris, containing an area of eighty acres, and a vast number of monuments, among which may

be mentioned those of Molière, La Fontaine, Chenier, Monge, Foi, Massena, Parmentier, Grètry, Mehul, Girodet, Delille, and many others. The cemetery, which has several rising grounds, affords a picturesque walk, and is much frequented in fine weather. The catacombs are vast subterraneous caverns, in which, during the eighteenth century, the bones taken out of all the burial grounds of the city were deposited. These were formerly quarries, from which has been dug most of the stone for the churches, palaces, and other public buildings, and they now serve as a depository for the remains of past generations. They have three entrances, the first by the western pavilion of the *barrière d'Enfer*, the second at the tomb *Isore*, and the third in the plain of Mount *Souris*. The first is most used, and visitors are admitted on producing a ticket from the inspector general, or any of the superintending engineers.

Among the public establishments of Paris should be noticed the *baths*, which have much increased in number within these few years past, and received considerable improvements in regard to neatness, convenience, and elegance. There is still wanting, however, an establishment of this kind where the working class could, for a small sum, or even gratuitously, enjoy this healthful exercise. There are twenty-five public baths; the most frequented of which are those of *St. Sauveur*, *Montesquieu*, *Chinois*, *Turcs*, *Tiquetonne*, *Géures*, and *Vigur* upon the *Seine*, near *Pont Marie*, *Pont Neuf*, and *Pont Royal*; raised two or three stories high on elegant boats as large as great vessels, and containing 150 bathing boxes.

There are many fine gardens, among which the following are particularly worthy of notice:—The garden of the *Thuileries*, planted by the celebrated *Le Notre*, consists of two parts, one near the palace, occupied by beds of flowers, the other by immense trees, and the whole encircled with spacious terraces. The different *parterres* are divided by grass plats, and among them are three circular pieces of water, stocked with fish and swans, and a fountain in the centre; to these follow two masses of trees, equal in extent, and arranged on the right and left of the middle alley; they are principally chestnuts and elms. At the extremity of these is an immense octagonal basin, with a fountain, beyond which is the railing of the *Champs Elisées*; here the two principal terraces terminate, and the angle which they form is occupied by a platform of great length, planted with shrubs of various sorts; these terraces are covered with avenues of trees. Besides the common plants here are found some most beautiful orange trees, and other exotics, which are brought out in the spring, and continue till the chill nights of autumn. Statues and groups, copies of the masterpieces of antiquity, or the work of skilful modern artists, add to the beauties of this delightful garden. The *Luxembourg* garden, which owes its origin to the duke of *Luxembourg*, but was almost entirely laid out afresh in 1806, rivals that of the *Thuileries* in the thick clusters of its trees and the beauty of its *parterres*. Here also are scattered copies of a great number of antique statues, placed in such a manner as to

vary and embellish its whole extent. The botanical or king's garden, established in 1636, by *Guy de la Brosse*, physician to *Louis XIII.*, for the cultivation of foreign plants, has received considerable additions since that period; but it is particularly to the celebrated *Buffon* that it owes its present splendor, being the finest of the kind in Europe. It consists of a garden of plants methodically arranged; a menagerie, an amphitheatre for the lectures, and a library. The garden, reaching to the banks of the *Seine*, presents one of the largest, pleasantest, and most healthy walks in the neighbourhood of Paris; here are found trees, shrubs, and vegetables from every country upon earth. In the upper part, which is planted with evergreens, and called the *Swiss valley*, there is a little eminence, ascended by a spiral road, whence you enjoy a most delightful view. This hill is crowned with a pavilion in bronze very elevated, and surmounted by a sphere. One of the most interesting parts of this garden is the menagerie, where the animals range at liberty within greater or less enclosures, suited to their different natures. The *Elysian fields*, a fine promenade opposite the grand alley of the *Thuileries*, of which it seems only a continuation, was planned in the reign of *Louis XIV.*, and partly replanted in 1770. In this place and the squares adjacent to the avenue of *Neuilly* the public rejoicings take place. The *Champ de Mars* is a vast rectangle 2700 feet long by 900 broad, and reaches from the military school to the *Seine*. It is surrounded with ditches coped with masonry and sloping terraces, and adorned both within and without with four rows of trees, and five iron railings connected with the five gates. This place is capable of containing 400,000 persons, and it was here that, on the 14th of July 1790, *Louis XVI.* took the constitutional oath, and it was on that occasion that the idea was conceived of making slopes or steps to accommodate the spectators; but the work was advancing very slowly, though 12,000 workmen were employed in it, when the inhabitants of Paris spontaneously engaged in the undertaking, and it was finished with the greatest ardor and celerity. Here, during the same year, a funeral ceremony was performed in honor of the citizens who had fallen before *Nancy*; here were held the anniversaries of the 14th of July and the 10th of August, the festivals of reason and of the Supreme Being! Here the directory received the statues from Italy, and here in 1815 *Napoleon* reviewed the whole of the imperial guard, and about 60,000 of the national guard of Paris.

This city is externally surrounded by boulevards, forming three alleys bordered by four rows of trees; the middle of the principal alley is occupied by a road; the side alleys are gravelled, and afford very pleasant walks. The old boulevard within the city was commenced in 1536, at the time that the English were ravaging *Picardy* and menacing the capital; in 1668 they began to plant trees. It runs from the banks of the *Seine*, near *St. Martin's* lock, to the entrance of the *Rue Royale*, and is about 2400 feet in extent. It is one of the most frequented walks in the capital, both on account of the fine view which it presents of gardens, hotels, shops, the-

atres, coffee-houses, and other public buildings, and the multitude of spectators met with at every step. Some years before the revolution the farmers general, having obtained permission of Louis XVI. to extend the limits of Paris, built walls and constructed numerous barriers at all the issues from the city, some of which are models of taste and elegance.

Among the numerous public establishments of this metropolis the theatres undoubtedly hold a high rank. Of these there are five royal and eight secondary, for the most part extremely well filled, 10,000 persons at least daily frequenting them. The annual produce is about 72,000,000 francs, yielding 720,000 francs to the poor of Paris. The Opera house is the most celebrated in Europe for the magnificence of its decorations, the beauty of the scenes, the perfection of the dancing, the composition of the ballets, and the skill of the musical performers; it contains seats for 1937 persons. It owes its origin to the abbé Perrin, was established at first as a tennis court, and was transferred from place to place, till at last the saloon of the palais royal was occupied for the purpose. This place being consumed by fire, in 1781, the opera was again removed to several places, until it was fixed in the Rue de Richelieu; but in 1820, the duke of Berri having been assassinated as he was coming out of this place, it was shut up and soon after pulled down, a new house having been erected in the Rue Lepelletier. The royal French theatre was opened in 1790; it is situated in the Rue de Richelieu, and has a front adorned with twelve Doric pillars, with Corinthian chapters, and an entablature. It is 166 feet long and 105 broad, the front of the stage being thirty-eight feet wide; it will seat about 1500 spectators. In the middle of the vestibule is a statue of Voltaire. The theatre for comic operas, built in 1791, has recently been pulled down in order to accomplish the projected improvements in the quarter of the exchange; it has since been rebuilt on a new site. The performances at this theatre are aided by the labors of some of the first composers of the day. The royal theatre of the Odeon was first built in 1782, but has been burned down twice, in 1799 and 1818; it was rebuilt in 1821, and constituted the second French theatre. The front is in a simple and noble style of architecture, having a peristyle in advance, ornamented with eight Doric pillars; under the porch three doors lead into a vestibule decorated after the Tuscan style. The body of the building is entirely isolated, but joined by three galleries pierced with forty-six arcades. The interior is of an oval form, fifty-six feet long and forty-seven broad; the king's box is in the middle, and is richly decorated. The royal Italian theatre is situated in the Rue de Louvois, and is open three times a week for serious and comic operas of the different Italian schools. The secondary theatres are the Vaudeville, *Les Variétés*, the Dramatic Gymnasium, *La Porte St. Martin*, *La Gaité*, *L'Ambigu-Comique*, the Olympic Circus, and the Magic or Children's Theatre.

The *French Academy* holds the first rank among institutions for the encouragement of the arts and sciences. It was founded in 1635 by

cardinal Richelieu, but suppressed by the convention in 1793; this same convention, after having overturned the tyranny of Robespierre, by a decree of the 28th of October, 1795, founded the Institute in the room of the Academy of Sciences, the French Academy, the Academy of Inscriptions and the Belles Lettres, and the Academy of Painting, Sculpture, and Architecture. In the year 1803 Buonaparte, who had been nominated a member of the Institute, on his being created consul made a fresh arrangement into four classes: that of natural philosophy and mathematics to consist of sixty members; languages and French literature forty members; history and ancient literature forty members; and the fine arts thirty members, which has been since increased to forty. At the return of the king, in 1814, Lucien and Joseph Buonaparte, members of the second and third classes, were expelled. The year following M. Vaublanc gave a new constitution to the Institute; the names of Regnault de St. Jean d'Angely, Cambacères, Merlin, Maury, Gregoire, Lebreton, Arnaud, St. Etienne, the celebrated David, and others, were erased, and (a thing unheard of before) the king nominated to the vacant places. The sittings of the Institute are held at the Palais des Beaux Arts.

In no city in the world are scientific establishments, and the means of instruction, so multiplied as in Paris. There are thirty-six great institutions for public education, besides more than 300 private seminaries, where the different branches of science are taught. The university was suppressed in the year 1793, but re-established in 1808, and re-organised in 1821. The faculty is composed of five orders, and is under the direction of a minister of state, who superintends the ecclesiastical business and the public instruction. The five orders are the faculties of theology, law, medicine, natural philosophy and mathematics, and belles lettres, and they consist of a grand master, a director of public instruction, several inspectors general of the studies, honorary inspectors general, inspectors of academies, rectors, provisors, &c. The principal establishments of education are the Royal College, the abovementioned faculties, the royal colleges of Louis le Grand, Henry IV., Bourbon, Charlemagne, and St. Louis; the colleges of St. Barbe, Stanislas, and the British; the royal polytechnic school; the royal colleges of oriental languages, mines, bridges, and highways; of charters, music, and riding; the institution for the deaf and dumb, &c.

Besides the establishments particularly devoted to instruction, Paris contains a number of societies which have rendered great services to science, the arts, commerce, and industry; the chief of them are, the Central Agricultural Society, the Society for the Encouragement of National Industry, the Royal Society of Antiquaries, the Geographical Society, the Society for Elementary Instruction, the Royal Academic Society of Sciences, the Athenæum of Arts, the Polytechnic Society, the Royal Athenæum, the Grammatical and Philomathical societies, the Literary Society, the Society of Friends of the Arts, the Academic Society of the Children of Apollo, the Writing

Society, the Linnæan Society, the Protestant Bible Society, the Asiatic Society, the Society of Animal Magnetism, the Lyric Society of Momus, and the Catholic Book Society.

There are numerous public libraries, some of them containing immense collections of books and manuscripts. These are open to the public and to men of letters almost the whole year, and present inexhaustible sources of instruction. Most of them have a large saloon, well warmed in the winter for the accommodation of the visitors. The king's library, the foundation of which goes as far back as the reign of Charles V., contains nearly 600,000 printed volumes, and 80,000 MSS. It consists of the library properly so called, a cabinet of antiquities and medals, a cabinet of prints, and the gallery of MSS. It is open every day from ten to two: the vacation commences on the 1st of September and closes on the 15th of October. Monsieur's library, or that of the arsenal, is the second in Paris for the number and value of the works it contains. There are about 200,000 volumes and 10,000 MSS; but very few modern works. It is open from ten to two, except in the vacation from the 15th of September to the 3d of November. The city library is open every day from twelve to four, except on festivals and the days of the sittings of the medical and agricultural societies. It contains 42,000 volumes, among which are many modern works. Vacation from the 1st of September to the 15th of October. The library of St. Genevieve, or the Pantheon, remarkable for the beauty of its architecture and decorations, as well as for the choice of books it contains, reckons about 112,000 volumes, and 3000 MSS. It is open every day from ten to two, and its vacation continues from the 1st of September to the 12th of November. The Mazarine library, at the Institute, is open every day, except from the 15th of August to the 15th of October, and on Thursdays and Sundays. It contains 93,000 volumes and 4000 MSS. The library of the Institute is not public, but admission is easily procured on the recommendation of a member. It contains about 70,000 volumes. The library of the king's garden, in the museum of natural history, presents a rich and varied collection of works relative to the natural sciences, herbaries, designs of plants and flowers, and paintings of animals. It is open to the students on Mondays, Wednesdays, and Saturdays, from eleven to two, and to the public from four to seven during the spring and autumn, and from three till dark during the autumn and winter. The library of the medical school contains about 30,000 volumes, including all the treatises on medicine and chemistry published since the time of Philip Augustus, down to the most modern works of this description. It is open on Mondays, Wednesdays, and Fridays, from eleven to two, and its vacation is from the 15th of August to the 1st of November.

The school of medicine is one of the finest establishments in Paris; its amphitheatre, capable of holding at least 12,000 persons, is adorned with paintings by Gibelin, and has the busts of Peyronie and Martiniere, the founders of the school. In a long gallery are seen skeletons of both sexes and all ages, from the skeleton of the

foetus, which presents scarcely any osseous fibres, to that of the old man, in which ossification is so far advanced that cavities and sutures are almost entirely effaced. Here are also many skeletons of animals, for the study of comparative anatomy. Opposite to this gallery are specimens of all sorts of diseases of the bones, and deformities in their conformation; a number of injected preparations exhibit the systems of the vessels, the blood, the arteries, the veins, and the lymphatic organs; here is likewise a collection of voided stones, and stony concretions formed in various sorts of animals; also a number of monstrous productions and pieces of comparative anatomy, preserved in spirits of wine. A second room presents the whole apparatus of the surgery. In a third room are wax figures illustrative of the nervous, vascular, sanguineous, and lymphatic systems. There are also representations in wax of a great number of pathological cases. Two figures, in particular, surpass every thing of this kind that has ever been executed; they exhibit the whole of the lymphatic system, external and internal. These masterpieces, as well as several others, were executed by M. Lavoisier, a surgeon of Rouen. A fourth room contains all the natural substances which the three kingdoms of nature furnish to the *matéria medica*; and a fifth is devoted to demonstrations of the lectures on medical physics.

Besides the libraries already enumerated, there are those of the chamber of peers containing 10,000 volumes, of the chamber of deputies 30,000, of the minister of the interior 7000, of the observatory 2000, of the school of bridges and highways 4000, of the school of the mines 6000, the polytechnic school 24,000, of the college of Louis the Great 30,000, the conservatory of arts and trades 10,000, the prefecture of the police 8000, the seminary of St. Sulpice 20,000, of the ministry for foreign affairs 15,000, the king's cabinet in the gallery of the Louvre 30,000 the museum of the Louvre 3000, the school for music and declamation 5000, the dépôt of charts and plans for the navy 12,000, that of the minister of war 4000, the central dépôt of the artillery 6000, the dépôt for charts and plans of wars 10,000, the hospital of invalids 25,000, of the minister of justice 8000, of the royal printing office 3000, of the court of cassation 30,000, and the lower court 20,000 volumes.

The royal museum of the Louvre is the greatest collection in Europe, and, notwithstanding the losses it has experienced, it contains many masterpieces of all the schools. It consists of three principal divisions, the first containing the statues, the second the pictures, and the third the designs. The museum of antiques is on the ground floor, that of the drawings on the first floor, and the paintings occupy the saloon and the grand gallery that unites the Louvre to the Thuilleries. The first three divisions of this gallery are devoted to the productions of the French school; the second three to the German, Flemish, and Dutch, schools, and the last three to the Italian. An exhibition of the pictures and sculptures of French living artists takes place every two years in the gallery of the Louvre. The museum is open to the public every Sunday from ten to four. The royal museum of the Luxembourg contains

several rooms devoted to the exhibition of the principal pictures of living artists, when these pictures become the property of the government. It is open on the same days as the Louvre. The museum of Natural History consists of a botanical garden, with hot-houses and green-houses of several galleries, in which the productions of the three kingdoms are methodically arranged, a menagerie of living animals, a library of natural history, a cabinet of comparative anatomy, and an amphitheatre with laboratories for the courses of lectures.

The conservatory of arts and trades, for the reception of all the newly invented instruments and machines, contains a numerous collection of instruments, tools, models, drawings, descriptions, and books of every trade and art. It is open to the public on Sundays and Thursdays from twelve to four o'clock. The royal manufactory of the Gobelins, or tapestry of the crown, was founded by Gilles Gobelins in the reign of Francis I.; but it is to Colbert that France partly owes the perfection of this fine establishment. Nothing can be richer or more wonderful than the tapestry fabricated here; it will bear comparison with the most celebrated printed linens, and often surpasses them in the splendor of its colors. The pictures wrought at the manufactory of the Gobelins represent subjects taken from history and are destined to adorn the palaces of kings and princes. The royal tapestry manufactory, called la Savonnerie; here are manufactured foot carpets on the same style as at the Gobelins. The royal looking-glass manufactory was founded in 1634, under the direction of Colbert. Before that time France had been supplied with glasses from Venice. They cast glasses at St. Gobain, ten feet high by from four to five broad, and convey them by the Oise to Paris, where they are silvered and polished.

The manufactures of Paris consist of fine cloths, merino and cachemere tissues, shawls, gauzes, silks, crapes, ribands, blonds, prints, paper-hangings, gold and silver lace, mercery goods, caps, hats, embroidery, modes, straw silk and cotton hats, artificial flowers, saddles and harness, coaches, furniture, bronze and gilt articles, polished steel, cutlery, goldsmiths' articles, clocks and watches, jewellery, gold and silver plating, metal buttons, files, tools, mathematical instruments, instruments for natural philosophy and astronomy, fine ironmongery, mock pearls, draught and chess boards, perfumery, chocolate, liqueurs, leather gloves, pasteboard, brushes, pencils, corks, catgut, shot, sheet-lead, printing types, nails, wax candles, glue, starch, oils of different kinds, mineral acids, chemicals, saltpetre, soap, white-lead, leather, varnish, porcelain, and crystal. There are numerous silk, woollen, and cotton dye-houses, wax bleaching-houses, sugar and salt refineries, tan yards, curriers' shops, morocco leather factories, cotton, woollen, and cachemere down spinning factories, gas works, royal manufactories of carpets, looking-glasses, and tobacco. A considerable trade is carried on in all the above articles, also in corn, flour, dry vegetables, wines, brandies, vinegar, mineral waters, butter, cheese, and provisions of all sorts; fruit, fish, grocery, colonial produce, and provisions; coal, charcoal, wood, colors, marble, free-

stone, tiles, slates, delfware, glass, &c. &c. It is the great market for provisions, &c., for the consumption of Paris; and there are excellent races during the first fortnight in September, for twenty-one departments, at which a royal plate is run for, of the value of 6000 francs or £240.

This was the native place of Voltaire, Boileau, Moliere, D'Alembert, J. B. Rousseau, Helvetius, Loubet, Segur, Arnaud, Cauchois le Maire, Dessault, Norvins, Perceval-Grandmaison, Volkeimaer, Mercier, La Harpe, Jaucourt, Pougens, Villemain, and Cousin, men of letters; Bernard Marivalt, Destouches, Favart, La Mothe Beaumarchais, Marsollier, and Picard, dramatic authors; Madame de Sevigné, Santeuil the poet, Beranger, Kain, Talma, Mole, and Martin, celebrated actors; of Lavoisier, the great chemist, beheaded at Paris during the revolution in 1793, Gassecourt jun. the famous apothecary, the abbé l'Epée, the founder of the deaf and dumb asylum; Rollin, Henault, and Le Beau, historians; Condamine, the traveller and astronomer; of Le Maistre de Sacy and Anquetil, oriental scholars; Millin, the learned antiquary; of the celebrated painters David, le Sueur, le Brun, Drouais, Vouet, and Horace-Vernet; of Perault and Mansard, architects; of Goujon, Pigale, Cartellier, and Moithe, sculptors; of the geographers D'Anville, Buache, de Lisle, Lacroix, Robert de Vaugondy, Barbier du Bocage, and Mentelle; of Arnaud, Trouchet, and Billoccocq, lawyers; of Dupont de Nemours, one of the most honorable characters of the revolution; of Dupont-du-Ferret, one of the worthiest citizens who lost his life at that time; of Herauld de Sechelles, a member of the convention, beheaded in 1793; of Lepelletier de St. Fargeau, president of the parliament, who was assassinated on the 20th of January the same year; of the unfortunate Bailly, mayor of the city, beheaded on the 9th of November; of cardinal Richelieu; Voyer d'Argenson and Metchin, deputies; Malesherbes, the advocate of Louis XVI., beheaded in 1794; of the great Conde; of marshal Catinat, prince Eugene, the duke of Orleans; of Ninon d'Enclos, marshal Augereau, who gained the battles of the bridge of Lodi, Arcola, &c.; of generals Canciaux, Baraquay, d'Hilliers, and Montholon; of the navigator Bougainville, the traveller Chardin, the printers Anisson Duperron, Pankouque, and Boisle; of John Châtel, the pupil of the Jesuits, the assassin of Henry IV., &c. &c.

Paris is situated on the first meridian according to the French measurement, 20° E. of the meridian of Ferro, and 2° 15' E. of London; in N. lat. 48° 50'. It is 294 miles S. E. of London, 678 S. S. E. of Edinburgh, 654 south-east of Dublin, 222 south of Brussels, 342 south of Amsterdam, 735 south-west of Berlin, 816 S. S. W. of Copenhagen, 1170 S. S. W. of Stockholm, 1650 south-west of Petersburg, 795 west of Dresden, 618 N. N. W. of Vienna, 378 north-west of Geneva, 1146 N. N. W. of Rome, 855 north-west of Venice, 1800 W. N. W. of Constantinople, 1362 N. N. W. of Naples, 960 N. N. E. of Madrid, 1320 north-east of Lisbon, 3900 E. N. E. of Washington, 13,563 E. N. E. of Acapulco, 7233 north-east of Lima, and 5556 W. N. W. of Pekin.

PARIS, in fabulous history, the son of Priam, king of Troy, by Hecuba, also named Alexander. He was decreed, even before his birth, to become the ruin of his country; and when his mother, in the first months of her pregnancy, had dreamed that she should bring forth a torch which would set fire to her palace, the soothsayers foretold the calamities which were to be expected from the imprudence of her future son, and which would end in the ruin of Troy. Priam, to prevent so great a calamity, ordered his slave Archelaus to destroy the child as soon as he was born. The slave only exposed the child on Mount Ida, where the shepherds of the place found him, and educated him as their own. Some say a she bear suckled him. Though educated among shepherds and peasants, he gave very early proofs of courage and intrepidity; and, from his care in protecting the flocks of Mount Ida from the rapacity of wild beasts, he was named Alexander, a helper of men. He gained the esteem of all the shepherds, and his manly deportment recommended him to Cnone, a nymph of Ida, whom he married, and with whom he lived with the most perfect tenderness. Their conjugal peace was, however, of no long duration. At the marriage of Peleus and Thetis, Ate, the goddess of discord, who had not been invited to partake of the entertainment, showed her displeasure, by throwing into the assembly of the gods who were at the celebration of the nuptials, a golden apple, on which were written the words, Let it be given to the fairest. All the goddesses claimed it as their own; the contention at first became general; but at last only three, Juno, Venus, and Minerva, wished to dispute their respective right to beauty. The gods, unwilling to become arbiters in an affair so delicate in its nature, appointed Paris to adjudge the prize. The goddesses appeared before their judge without covering or ornament, and each endeavoured by promises to influence his judgment. Juno promised him a kingdom; Minerva, wisdom and military glory; and Venus the fairest woman in the world for his wife. (Ovid. *Heroid.* 17. v. 118). After he had heard their several claims and promises, Paris adjudged the prize to Venus, and gave her the golden apple. This decision drew upon the judge and his family the resentment of the two other goddesses. Soon after, Priam proposed a contest among his sons and other princes, and promised to reward the conqueror with one of the finest bulls of Mount Ida. His emissaries were sent to procure the animal, and it was found in the possession of Paris, who reluctantly yielded it. But he went to Troy and entered the lists of the combatants. He was received with applause, and obtained the victory over his rivals, Nestor the son of Neleus, Cynus son of Neptune, Polites, Helenus, and Deiphobus, sons of Priam. He likewise obtained a superiority over Hector himself; who, enraged to see himself conquered by an unknown stranger, pursued him closely; and Paris must have fallen a victim to his rage had he not fled to the altar of Jupiter. This sacred retreat preserved his life; and Cassandra, the daughter of Priam, struck with the similarity of the features of Paris with those of her brothers,

enquired his birth and his age. From these circumstances she discovered that he was her brother, and as such introduced him to her father and to her brothers. Paris acknowledged Paris as his son, and all jealousy ceased among the brothers. Paris did not long remain inactive; he equipped a fleet, as if willing to redeem Hecuba, his father's sister, whom Hercules had carried away, and obliged to marry Telamon the son of Eacus. This was the pretended motive of his voyage, but the causes were far different. Helen was the fairest woman of the age, and Venus had promised her to him. He therefore went to Sparta, the residence of Helen, who had married Menelaus. He was received with great respect; but he abused the hospitality of Menelaus, and, while the husband was absent in Crete, persuaded Helen to elope with him, and to fly to Asia. Priam received her without difficulty, as his sister was then detained in a foreign country, and, as he wished to show himself as hostile as possible to the Greeks. This affair was soon productive of serious consequences. When Menelaus had married Helen, all her suitors had bound themselves by a solemn oath to defend her from every violence; and therefore he reminded them of their engagements, and called upon them to recover her. Upon this all Greece took up arms; Agamemnon was chosen general of the combined forces, and a regular war was begun. Paris, meanwhile, who had refused Helen to the petitions and embassies of the Greeks, armed himself, with his brothers and subjects, to oppose the enemy; but he fought with little courage, and at the very sight of Menelaus, whom he had so recently injured, his courage vanished, and he retired from the army. In a combat with Menelaus, Paris must have perished, had not Venus interfered. He wounded, however, in another battle, Machaon, Eurypylus, and Diomedes; and, according to some, he killed with an arrow the great Achilles. The death of Paris is differently related: some say he was mortally wounded by one of the poisoned arrows of Philoctetes; and that when he found himself languid by his wounds, he ordered himself to be carried to the feet of Cnone, whom he had basely abandoned, and who had foretold him that he would solicit her assistance in his dying moments. He expired before he came into the presence of Cnone, who threw herself upon his body, and stabbed herself to the heart. According to others, Paris did not immediately go to Troy when he left the Peloponnesus, but he was driven on the coasts of Egypt, where Proteus, the king of the country, detained him. He died about 1188 B. C. See *TROY*.

PARIS (Matthew), one of the best English historians, from William the Conqueror to the latter end of the reign of Henry III. Leland, his original biographer, informs us that he was a monk of St. Alban's, and that he was sent by pope Innocent to reform the monks of the convent at Holm in Norway. Bishop Bale adds, that, on account of his extraordinary gifts, he was much esteemed by Henry III., who ordered him to write the history of his reign. Fuller makes him a native of Cambridgeshire, and says, he was sent by the pope to visit the monks in the dio-

cese of Norwich. Paris died in the monastery of St. Alban's in 1259. He was a man of extraordinary knowledge for the thirteenth century; of an excellent moral character, and, as an historian, of strict integrity. His works are, 1. *Historia ab Adamo ad Conquestum Angliæ*, lib. i. MS. col. C. C. Cantab. c. ix. Most of this book is transcribed by Matthew of Westminster into the first part of his *Florilegium*. 2. *Historia Major, seu rerum Anglicanarum Historia à Gul. Conquestoris Adventu ad annum 43 Henrici III.*, &c., several times printed. 3. *Vitæ duorum Offarum, Mercie regum, S. Albani fundatorum*. 4. *Gesta 22 abbotum S. Albani*. 5. *Addimenta Chronicorum ad Hist. Majorem*: printed. 6. *Historia Minor, sive Epitome Majoris Historiæ*; MS. Besides many other things in MS.

PARIS, in botany, herb paris, or true-love, a genus of the order trigynia, and class octandria; natural order eleventh, samentaceæ: CAL. tetraphyllous; petals four, narrow in proportion; the berry quadrilocular. There is but one species, growing naturally in woods and shady places both in Scotland and England. It has a single naked stem, greenish blossoms, and bluish black berries. The leaves and berries are said to partake of the properties of opium; and the juice of the berries is useful in inflammations of the eyes. Linnæus says that the root will serve as an emetic as well as ipecacuanha, but must be taken in double the quantity. Goats and sheep eat the plant; cows, horses, and swine, refuse it.

PARIS, PLASTER OF. See PLASTER.

PARISH, *n. s. & adj.* } Fr. *paroisse*; Ital.,
PARISH'IONER, *n. s.* } Span., Port. and Barb.
Lat. *parochia*; Gr. *παροικία*, i. e. *παρα* near, and *οικος*, a house. 'A multitude of neighbours pertaining to one church,' says Minshew: hence the particular charge of 'a secular priest,' according to Dr. Johnson; a particular district of land; and, as an adjective, belonging to, appointed over, or maintained by, a parish: a parishioner is one who belongs to a particular parish.

Dametas came piping and dancing, the merriest man in a parish. Sidney.

I praise the Lord for you, and so may my parishioners; for their sons are well tutored by you. Shakspeare.

Hail, bishop Valentine, whose day this is,

All the air is thy diocese;

And all the chirping choristers

And other birds, are thy parishioners. Donne.

At every point that concerns himself, the good parishioner turns down a leaf in his heart; and rejoiceth that God's word hath pierced him, as hoping that whilst his soul smarts, it heals. Fuller.

In the greater out-parishes, many of the parishioners, through neglect, do perish. Graunt.

By the Catholick church is meant no more than the common church, into which all such persons as belonged to that parish, in which it was built, were wont to congregate. Pearson.

The tithes, his parish freely paid, he took;

But never sued, or cursed with bell or book. Dryden.

A parish priest was of the pilgrim train,

An awful, reverend, and religious man. Id.

I have deposited thirty marks, to be distributed among the poor parishioners. Addison's Spectator.

The office of the church is performed by the parish priest, at the time of his interment. Ayliffe.

Not parish clerk who calls the psalms so clear. Gay.

A man, after his natural death, was not capable of the least parish office. Arbuthnot and Pope.

The parish allowance to poor people is very seldom a comfortable maintenance. Law.

A PARISH, in law, is the precinct of a parochial church, or a circuit of ground inhabited by people who belong to one church, and are under the particular charge of its minister. The word comes from *παροικία*, habitation; or of *παρα*, near, and *οικος*, house. Du Cange observes that the name *παροικία* was anciently given to the whole territory of a bishop, and derives it from neighbourhood; because the primitive Christians, not daring to assemble openly in cities, were forced to meet secretly in neighbour houses. In the ancient church there was one large edifice in each city for the people to meet in; and this they called *parochia*, parish. But the signification of the word was afterwards enlarged, and meant a diocese, or the jurisdiction of a bishop, consisting of several churches. Du Pin observes that country parishes had not their origin before the fourth century; but those of cities are more ancient. Alexandria is said to have been divided into parishes. In the early ages of Christianity, in this island, parishes were unknown, or at least signified the same that a diocese now does. There was then no appropriation of ecclesiastical dues to any particular church; but every man was at liberty to contribute his tithes to any priest or church he pleased, but he was obliged to do it to some; or, if he made no special appropriation, they were paid to the bishop, to distribute them among the clergy, and for other pious purposes. Sir Henry Hobart maintains that parishes were first erected by the council of Lateran, held A. D. 1179. But Selden proves that the clergy lived in common, without any division of parishes, long after the time mentioned by Camden (A. D. 636); and it appears, from the Saxon laws, that parishes were in being long before the council of Lateran in 1179. The distinction of parishes occurs in the laws of king Edgar about 970. It seems pretty clear and certain, says Blackstone, that the boundaries of parishes were first ascertained by those of a manor or manors; because it very seldom happens that a manor extends itself over more than one parish, though there are often many manors in one parish. The lords, he adds, as Christianity spread, began to build churches upon their own demesnes or wastes, to accommodate their tenants in one or two adjoining lordships; and, that they might have divine service regularly performed therein, obliged all their tenants to appropriate their tithes to the maintenance of the one officiating minister, instead of leaving them at liberty to distribute them among the clergy of the diocese in general; and this tract of land, the tithes of which were so appropriated, formed a distinct parish; and this accounts for the frequent intermixture of the parishes one with another. For if a lord had a parcel of land detached from the main of his estate, but not sufficient to form a parish of itself, it was natural for him to en-

dow his newly erected church with the tithes of such lands. Extra-parochial wastes and marsh lands, when improved and drained, are by 17 Geo. II., cap. 37, to be assessed to all parochial rates in the parish next adjoining.

In every parish in England the parson has a parish-clerk under him, who is the lowest officer of the church. These were formerly clerks in orders, and their business at first was to officiate at the altar; for which they had a competent maintenance by offerings; but they are now laymen, and have certain fees with the parson on christenings, marriages, burials, &c., besides wages for their maintenance. The law looks upon them as officers for life; and they are chosen by the minister of the parish, unless there is a custom for the parishioners or churchwardens to choose them; in which case the canon cannot abrogate such custom; and, when chosen, it is to be signified, and they are to be sworn into their office by the archdeacon, for which the court of king's bench will grant a mandamus.

PARISI, ancient Britons, who inhabited the counties now called Durham, Westmoreland, and Cumberland.

PARISII, an ancient people of Gallia Celtica, who inhabited the country about the Sequana and Marona, since called the Isle of France.

PARITOR, *n. s.* Corrupted from apparitor. A beadle; the summoner of a civil court.

You shall be summoned by an host of *paritours*; you shall be sentenced in the spiritual court. *Dryden.*

PARTY, *n. s.* French *parité*; Lat. *paritas*. Equality: hence likeness; resemblance.

That Christ or his apostles ever commanded to set up such a *parity* of presbyters, and in such a way as those Scots endeavour, I think is not very disputable.

King Charles.

We may here justly tax the dishonesty and shamefulness of the mouths, who have upbraided us with the opinion of a certain stoical *parity* of sins.

Hall.

Women could not live in that *parity* and equality of expense with their husbands, as now they do.

Graunt.

Those accidental occurrences, which excited Socrates to the discovery of such an invention, might fall in with that man that is of a perfect *parity* with Socrates.

Hale.

Their agreement in essential characters makes rather an identity than a *parity*.

Glanville.

Survey the total set of animals, and we may, in their legs or organs of progression, observe an equality of length and *parity* of numeration; not any to have an odd leg, or the movers of one side not exactly answered by the other.

Browne.

By an exact *parity* of reason, we may argue, if a man has no sense of those kindnesses that pass upon him, from one like himself, whom he sees and knows, how much less shall his heart be affected with the grateful sense of his favours whom he converses with only by imperfect speculations, by the discourses of reason, or the discoveries of faith!

South.

PARIUM, in ancient geography, a noble city of Mysia Minor, with a port on the Propontis; called Adrastia by Homer, according to Pliny; according to others, it is the Paestus of Homer. It was the birth place of Neoptolemus, surnamed Glossographus.—Strabo. Here stood a Cupid, equal in workmanship to the Cnidian Venus.

PARK, *n. s. & v. a.* Sax. *peapiruc*; Goth. and Swed. *park*; Fr. *parc*; Span. *parque*, of Latin *parco*, to preserve. An enclosure in which wild animals are preserved, 'which a man may have,' in England, 'by prescription of the king's grant,' say the law authorities. See below. To park is to enclose as in a park.

How are we *parked*, and bounded in a pale!

A little herd of England's tim'rous deer,

Mazed with a yelping kennel of French curs.

Shakespeare.

We have *parks* and inclosures of all sorts of beasts and birds, which we use not only for view or rareness, but likewise for dissections and trials. *Bacon.*

The man of wealth and pride

Takes up a place that many poor supply'd;
Space for his lake, his *park's* extended bounds,
Space for his horses, equipage, and hounds.

Goldsmith.

PARK, an extent of ground enclosed with walls and palisades, and stored with beasts of chase. In their villas the ancient Romans were fond of possessing capabilities for enjoying the pleasures of the chase; to which they were greatly addicted, among other reasons, from the excellent effect produced by robust and manly exercise upon their bodies, and through that medium upon their minds likewise. For this purpose, then, parks were generally attached to their country houses. We find one represented in a painting on the ceiling of the tomb of the Pisones, near the Flaminian way. Originally hares constituted the only game placed therein, and hence they were denominated leporaria, from lepus, a hare. At length, however, other game were introduced; such as stags, wild boars, wild goats, roebucks, &c.; and the extent of the enclosures was proportionately enlarged. Fulvius Lupinus was one of the first Romans who greatly increased his domain in this way; his park stretched over forty acres. Pompey and Hortensius followed this example, the latter establishing a park of upwards of fifty acres.

Mr. Loudon, in his Treatise on Country Residences, observes that parks should be of two descriptions; those attached to small houses, wherein regard should chiefly be directed to the value of the pasture, and where the pasturing animals are sheep, horses, oxen, &c.; and, secondly, such as, belonging to splendid mansions, demand more especially grandeur of character and distribution. In the former species, the surface of the ground should receive its principal characteristic from groups of trees, or gentle walks, conducting the promenade from vista to vista, so as to produce as great a variety of effects as the nature of the scenery around, and the contracted space the artist has to work in, will possibly admit. Indeed, by circuitous paths, and skilful disposition of trees, this kind of park will often deceive the eye of the spectator with respect to its actual extent. A level and monotonous surface, such as we frequently are compelled to notice, containing a walk round, and dotted with sophisticated-looking clumps, at regular distances, can, it will be obvious, never appear larger than it really is; but a very few acres, laid out in the manner hinted at by us above, may even be made to appear almost boundless; every step presenting a novel combi-

nation, arising from the judiciously planted masses of trees, and the sight of the cattle caught by the eye at different points through the intermediate foliage.

In the latter description of park another principle must be proposed and followed. Here that style of distribution and planting denominated the forest style is in place. Long avenues; open glades stretching out in ample proportions; broken ground, set with trees, shrubs, underwood, furze, fern, &c., is admissible, and indeed desirable. The grazing animals, in a domain of this order, should be deer or horses, intermixed with a few wild cattle. It has been suggested that, as parks form the prominent features of many capital residences, were the appearance of wildness and forest scenery just alluded to given to them, the effect would be most grand and imposing, not only as regarded the actual domain of which they formed a part, but viewed with reference to the whole surrounding country. As it is, the seats of our principal men of rank and fortune possess many very noble specimens of enclosures of this kind—among which we will enumerate, by the way, those of Blenheim, Knole, Stowe, Donnington, Bow Wood, &c. &c. Among the royal demesnes, Windsor Park stands proudly pre-eminent, and is, indeed, one of the noblest in Europe, and every way worthy to encircle the castle of an English monarch.

In the metropolis there are several attached to the crown, but which are become, by prescription, almost the common property of the nation, contributing inestimably, not merely to the amusement and relaxation, but to the health and comfort of the immense population of the capital. Caroline, the queen of George II., once enquired of the first Mr. Pitt how much it would cost her to shut the parks. He replied, 'Three crowns, your majesty,' and she took the hint. To Hyde Park, St. James's Park, and the Green Park, there has, within these few years, been most munificently added the Regent's Park. Thus a vast space, close by the metropolis, is not only preserved from the encroachment of mean buildings, but laid out with groves, lakes, and villas, with their separate pleasure grounds, while through the whole place there is a winding road, which commands at every turn some fresh features of an extensive country prospect. This is indeed a desirable appendage to so vast a town as London, more especially as the rage for building fills every pleasant outlet with bricks, mortar, rubbish, and eternal scaffold-poles, which, whether you walk east, west, north, or south, seem to be running after you.

'The noble appropriation of the district of which we are now speaking is not so much a change as a restoration. It was formerly a park, and had a royal palace in it, where, we believe, queen Elizabeth occasionally resided. It was disparked by Oliver Cromwell, who settled it on colonel Thomas Harrison's regiment of dragoons for their pay; but, at the restoration of Charles II., it passed into the hands of other possessors, from which time it has descended through different proprietors, till, at length, it has reverted to the crown, by whose public spirit a magnificent park is secured to the inhabitants of Lon-

don. The expense of its planting, &c., have been enormous; but money cannot be better laid out than on purposes of this lasting benefit and national ornament.

'The plan and size of the park are in every respect worthy of the nation. It is larger than Hyde Park, St. James's, and the Green Park together; and the trees planted in it about ten years ago are already becoming umbrageous. The water is very extensive. As you are rowed on it, the variety of views you come upon is admirable: sometimes you are in a narrow stream, closely overhung by the branches of trees; presently you open upon a wide sheet of water, like a lake, with swans sunning themselves on its bosom; by and by your boat floats near the edge of a smooth lawn fronting one of the villas; and then again you catch the perspective of a range of superb edifices, the elevation of which is contrived to have the effect of one palace. The park, in fact, is to be belted with groups of these mansions, entirely excluding all sight of the streets. Many of them are finished, and give a satisfactory earnest of the splendid spirit in which the whole is to be accomplished. There will be nothing like it in Europe. The villas in the interior of the park are planted out from the view of each other, so that the inhabitant of each seems, in his prospect, to be the sole lord of the surrounding picturesque scenery.'

No man can erect a park without license under the broad seal; for the common law does not encourage matter of pleasure which brings no profit to the commonwealth. But there may be a park in reputation erected without any lawful warrant; and the owner may bring his action against persons killing his deer. To a park, three things are required:—1. A grant thereof. 2. Enclosures by pale, wall, or hedge. 3. Beasts of a park; such as the buck, doe, &c. And, where all the deer are destroyed, it shall no more be counted a park; for a park consists of vert, venison, and enclosure: and, if it is determined in any of them, it is a total disparking. Parks, as well as chases, are subject to the common law, and are not governed by the forest law. See FOREST.

PARK OF ARTILLERY. See ARTILLERY.

PARK OF PROVISIONS, in military affairs, the place where the sutlers pitch their tent in the rear, and sell their provisions to the soldiers. Likewise that place where the bread-waggons are drawn up, and where the troops receive their ammunition-bread, being the store of the army.

PARK (Mungo), the celebrated traveller, was born at Fowlshiels, in the county of Selkirk, on the 10th of September, 1771. His father was a respectable yeoman, and held a farm under the duke of Buccleuch. At the grammar school of Selkirk, where he was educated, the son is said to have shown extraordinary application to study, and was always at the head of his class. This inspired his father with the design of educating him for the church; he himself, however, made choice of the medical profession; and, at the age of fifteen, was bound apprentice to Mr. Thomas Anderson, a surgeon of Selkirk, with whom he spent three years. In 1789 he removed to Edinburgh, and attended three successive sessions the lectures delivered

at that great seminary of medical learning. Mr. Park pursued with assiduity all the studies subservient to his profession; but his peculiar attachment was to the science of botany. For this he seems to have been in a great measure indebted to his intimacy with his brother-in-law, Mr. James Dickson, who became in London, under the patronage of Sir Joseph Banks, one of the most eminent English botanists. Park, having come to London to seek employment in his profession, found in Mr. Dickson a most valuable friend. He was at once introduced to Sir Joseph Banks, through whom he obtained the appointment of assistant surgeon to the Worcester East Indiaman, and made a voyage to Bencoolen in Sumatra, during which he collected a number of specimens in botany and natural history, an account of which is inserted in the Transactions of the Linnæan Society. On the 4th of November, 1794, he read a paper before the Society, containing a description of eight new species of fish from Sumatra. What Mr. Park's views now were does not certainly appear; but the crisis had arrived which was to give a decisive turn to his future life. The association for promoting discoveries in Africa had, in the course of a few years, made a number of important researches in the interior of that great continent; and it became at this time their main object to ascertain the course of the Niger, and the present state of the great central emporium, Tombuctoo; Sir Joseph Banks, who was one of the most active members of the association, fixed upon Park as the most proper person for entering upon this career of adventure; and he was readily accepted. On the 22d of May, 1795, he set sail from Portsmouth, on board the Endeavour, an African trader, and arrived in the Gambia on the 21st of the following month. For the results of the expedition we refer our readers to the article AFRICA. After an absence from England of two years and seven months, Mr. Park arrived at Falmouth on the 22d of December, 1797, and reached London on the morning of the 25th. In June, 1798, he went down to reside with his mother and other relations at Fowlshields, where he spent the summer and autumn in assiduous labor upon the interesting volume of Travels, which he afterwards published, and in which he was assisted by Mr. Bryan Edwards. It is needless to state how universally this volume was read. After its publication Mr. Park returned to Scotland, and formed a matrimonial connection with Miss Anderson, daughter of the gentleman with whom he had served his apprenticeship. With a character so active and adventurous, it will not appear surprising that Park should be ready to enter anew upon the career in which he had already appeared so brilliantly. On the signing of the preliminaries of peace, in 1801, he received a letter from Sir Joseph Banks, intimating that the plan of penetrating into the interior of Africa would be revived; that there were hopes of its receiving the support of government; in which case the association would not hesitate to recommend him as the proper person for conducting it. He heard nothing farther till the autumn of 1803,

when he was invited to London to receive a proposition from lord Hobart to the above effect. Although he asked a short delay, and consulted some of his friends, he never seems, in his own mind, to have hesitated a moment as to the acceptance of the offer. Owing to changes in the ministry, however, and the usual delays of office, the expedition was delayed till the beginning of 1804, when, on the 30th of January, he set sail from Portsmouth. On the 8th of March he arrived at St. Jago, one of the Cape de Verd Islands; and on the 28th arrived at Goree. Here he had received authority to enlist a detachment of the garrison, and take the command of them. The promise of double pay and discharge soon gave him the choice of the soldiery; and he engaged upwards of forty to attend him in his expedition. He seems now to have been in the highest spirits, and looked forward to success with the utmost confidence. But, notwithstanding these fair promises of success, never, in fact, was an expedition undertaken under less fortunate auspices. Park's hopes of reaching the Niger in safety depended entirely upon his doing so previous to the commencement of the rainy season, the effects of which are always fatal to Europeans. From unexpected delays, however, half his journey had not been completed when the rains began to be felt. In a few days twelve men were sick; and every day added to the distress, till the whole party felt the influence of this destructive season. One after another, either stopped at the villages, or lay down on the road, refusing to proceed; and, of forty-four men who left Goree, only nine arrived at the Niger, all sick, and several in a state of mental derangement. Nothing, however, could shake Mr. Park's resolution. He immediately began to negotiate with the king of Bumbarra, for permission to build a boat for the purpose of proceeding down the Niger. Having obtained this, he constructed the vessel chiefly with his own hands. Mr. Park accordingly set sail; but Mr. Maxwell, the governor of Goree, in vain looked for any intelligence of his progress. At length unfavorable reports began to come down to the coast; and, these continually increasing, the governor felt the duty of making enquiry respecting his fate. He happened fortunately to engage Isaaco, the guide who had followed him to the Niger. This person, in the course of his mission, fell in with Amadi Fatouma, whom Mr. Park had taken with him down the river. From him he received a narrative purporting to contain the only particulars of the death of this distinguished traveller, which have ever transpired. It appears that Park had delivered some presents to the chief of Yaour, to be transmitted to the king, who lived at a little distance. The chief, having learned that Mr. Park was not to return, conceived the treacherous design of appropriating the presents to himself. Amadi Fatouma then relates: 'I went to the king to pay my respects to him. On entering the house, I found two men who came on horseback; they were sent by the chief of Yaour. They said to the king, 'we are sent by the chief of Yaour to let you know that the white men went away without giving you or him (the chief

any thing; they have a great many things with them, and we have received nothing from them; and this Amadi Fatcuma now before you is a bad man, and has likewise made a fool of you both.' The king immediately ordered me to be put in irons; which was accordingly done; and every thing I had taken from me; some were for killing me, and some for preserving my life. The next morning early, the king sent an army to a village called Boussa, near the river side. There is before this village a rock across the whole breadth of the river. One part of the rock is very high; there is a large opening in that rock in the form of a door, which is the only passage for the water to pass through; the tide current is here very strong. This army went and took possession of the top of this opening. Mr. Park came thither after the army had posted itself; he nevertheless attempted to pass. The people began to attack him, throwing lances, pikes, arrows, and stones. Mr. Park defended himself for a long time; two of his slaves at the stern of the canoe were killed; they threw every thing they had in the canoe into the river, and kept firing; but being overpowered by numbers and fatigue, and unable to keep up the canoe against the current, and there being no probability of escaping, Mr. Park took hold of one of the white men, and jumped into the water; Martyn did the same, and they were drowned in the stream in attempting to escape. The only slave remaining in the boat, seeing the natives persist in throwing weapons at the canoe, without ceasing, stood up and said to them, 'Stop throwing now; you see nothing in the canoe, and nobody but myself; therefore cease. Take me and the canoe, but don't kill me.' They took possession of the canoe and the man, and carried them to the king. I was kept in irons three months; the king released me and gave me a slave (woman). I immediately went to the slave taken in the canoe, who told me in what manner Mr. Park and all of them had died, and what I have related above. I asked him if he was sure nothing had been found in the canoe after its capture; he said that nothing remained in the canoe but himself and a sword-belt. I asked him where the sword-belt was; he said the king took it, and had made a girth for his horse with it.' Serious doubts have been raised concerning the authenticity of this narrative; but no reasonable hope can now be entertained that Mr. Park has not, in some way or other, perished in his voyage down the Niger. An account of his second journey, so far as his own narrative extended, with a memoir of his life, by Mr. Wishaw, was published in 1815.

PARKER (Henry), lord Morley, a noble author, who flourished in the reign of Henry VIII., and wrote several works, a list of which may be seen in Mr. Walpole's Catalogue of Royal and Noble Authors, vol. i. He was one of the barons who signed the memorable letter to pope Clement VII., threatening him with the loss of his supremacy in England, unless he proceeded to despatch the king's divorce against queen Catharine.

PARKER (Matthew), the second protestant archbishop of Canterbury, was born at Norwich

in 1504, in the reign of Henry VII. His father died when he was twelve years old; but his mother, at the age of seventeen, sent him to Corpus-Christi College in Cambridge, where, in 1523; he took his degree of A. B. In 1527 he was ordained, created A. M., and chosen fellow. In 1533 or 1534 he was made chaplain to queen Anne Boleyn, who obtained for him the deanery of Stoke-Clare in Suffolk, where he founded a grammar school. After her death Henry made him his own chaplain, and in 1541 prebend of Ely. In 1544 he was elected master of Corpus-Christi College; and, in 1555, vice-chancellor of the university. In 1547 he lost the deanery of Stoke, by the dissolution of the college; and married the daughter of Robert Harlestone, a Norfolk gentleman. In 1552 he was nominated by Edward VI. dean of Lincoln, which enabled him to live in great affluence: but Mary I. was hardly seated on the throne before he was deprived of every thing, and obliged to live in obscurity, often changing his place of abode to avoid the fate of the other reformers. Queen Elizabeth succeeded in 1558; and in 1559 Dr. Parker, from indigence and obscurity, was at once raised to the see of Canterbury; an honor which he neither solicited nor desired. He was consecrated December 17th, 1559, by the four surviving reformed bishops. In this high station he acted with spirit and propriety. He visited his cathedral and diocese in 1560, 1565, 1570, and 1573. He repaired and beautified his palaces at Lambeth and Canterbury, at an expense of above £1400 sterling, which is at least equal to ten times the sum now. He founded several scholarships in Corpus-Christi College in Cambridge, and gave large presents of plate to that and other colleges in this university. He gave 100 volumes to the public library. He likewise founded a free-school at Rochdale in Lancashire. He took care to have the sees filled with pious and learned men; and, considering the great want of Bibles in many places, he, with the assistance of other learned men, improved the English translation, had it printed on a large paper, and dispersed through the kingdom. This worthy prelate died in 1575, aged seventy-two, and was buried in his own chapel at Lambeth. He was pious without affectation or austerity, cheerful and contented in the midst of adversity, and beneficent beyond example. He wrote several works; and published those of four of our best historians; Matthew of Westminster, Matthew Paris. Asser's Life of King Alfred, and Thomas Walsingham. He also translated the Psalter. This version was printed, but without a name, which led the learned Wood to attribute it to an obscure poet of the name of Keeper.

PARKER (John), an eminent lawyer of the seventeenth century, who practised at Northampton about 1640. He was educated in the Temple; and, joining the party of the parliament, was made a member of the high court of justice in 1649, where he gave sentence against the three lords, Capel, Holland, and Hamilton, who were beheaded. During Cromwell's usurpation he was made an assistant committee-man for his county. In 1630 he published a book in.

defence of the new government, as a commonwealth, without a king or house of lords. In June 1655, when Cromwell was declared protector, he was appointed a commissioner for removing obstructions at Worcester House in the Strand, and was sworn serjeant at law next day. In January 1659 he was appointed one of the barons of the exchequer by the rump parliament; but, upon a complaint, was displaced. However, he was again regularly made serjeant at law, on the recommendation of chancellor Hyde, after the Restoration.

PARKER (Samuel), D.D., an English clergyman, son of the preceding, who became bishop of Oxford. He was born September 1640, at Northampton, and educated among the puritans in Northampton; whence, being fit for the university, he was sent to Wadham College in Oxford, and admitted in 1659 under a presbyterian tutor. Here he led a strict and religious life, and took the degree of A.B. February 28th, 1660. Upon the Restoration he hesitated which party to join; but, continuing publicly to speak against episcopacy, he was discountenanced by the new warden Dr. Blandford, who had been appointed to that office upon the dawn of the Restoration in 1659. Upon this he removed to Trinity College, where, by the advice of Dr. Ralph Ruthwell, then a senior fellow of that society, he was 'rescued from the prejudices of his education,' which he publicly avowed in print. He then became a zealous Anti-puritan, and for many years acted the part of what was then called a true son of the church. In this temper, having taken the degree of M.A. in 1663, he entered into holy orders, went to London, and became chaplain to a nobleman, continuing to display his talents at the expense of his old friends the Presbyterians, Independents, &c. In 1665 he published some philosophical essays, and was elected F.R.S. These essays he dedicated to Sheldon, archbishop of Canterbury, who became his patron; and, in 1667, made him his chaplain. He now left Oxford, and resided at Lambeth with his patron; who, in 1670, made him archdeacon of Canterbury. In November 1670 he joined the train of William prince of Orange, who visited Cambridge, and had the degree of D.D. conferred upon him there. In November 1672 he was installed a prebendary of Canterbury; and was made rector of Ickham and Chatham in Kent by the archbishop. He was very obsequious to the court during the reign of Charles II.; and, upon the accession of James II., he continued the same servile complaisance; and soon reaped the fruits of it in the bishopric of Oxford, to which he was appointed by James II. in 1686, being allowed to hold the archdeaconry of Canterbury in commendam. He was likewise made a privy counsellor; and, by a royal mandamus, president of Magdalen College in Oxford. He died in Magdalen College, March 20th, 1687. He sent a Discourse to James, persuading him to embrace the Protestant religion, with a letter to the same purpose, which was printed in London in 1690, 4to.

PARKER (Richard), an English sailor, the leader of a dangerous mutiny which took place on board the squadron of lord Bridport, in the eventful

spring of 1797. He was born at Exeter about 1760, and, having received a decent education, entered into the navy, and served during the American war. On peace taking place he married a woman with some property, which he dissipated, and was imprisoned for debt at Edinburgh. Being at length released, he entered on board the royal fleet at the Nore, as a common sailor, where he soon displayed a spirit of insubordination; but acquired the confidence of the men, and, on the mutiny arising, was appointed their 'admiral.' When the revolt was suppressed, through the prudent management of lord Howe, Parker was put in confinement, and, being tried by a court martial at Sheerness, was hanged on board the Sandwich, to which ship he had belonged. His body was afterwards exposed on the coast of the isle of Sheppey. He suffered June 30th, 1795, displaying great calmness of mind.

PARKES (Samuel), a late ingenious professor of chemistry, was born at Stourbridge, in Worcestershire, in 1759, and educated under Dr. Addington at Market Harborough. In 1806 he first published his *Chemical Catechism*; of which many editions have appeared, and was long eminent as a practical chemist. This work was followed in 1808 by an *Essay on the Utility of Chemistry in the Arts and Manufactures*; and in 1809 by *Rudiments of Chemistry*, illustrated by examples; an abridgment of his first treatise, which he was induced to publish, on account of an attempt to pirate the work. His last production was, *Chemical Essays*, principally relating to the Arts and Manufactures of the British dominions, printed in 1815, in eight vols. 8vo. Mr. Parkes was a fellow of the Society of Arts, and of various other literary and philosophical associations. He died at his house in Mecklenburg Square, London, December 23d, 1815.

PARKHURST (John), a learned divine and lexicographer, born at London; and educated at Clare-Hall, Cambridge; of which he was admitted fellow in 1751, and took his degrees of B. A. and M. A. He settled at Epsom in Surry, was the intimate friend of bishop Horne, and adopted the opinions of Hutchinson. He published, 1. *A Greek and English Lexicon*, 4to.; 2. *A Hebrew and English Lexicon*, 4to.; both of which are very useful; 3. *An Answer to Dr. Priestley on the pre-existence of Christ*. He died in 1797.

PARKINSON (John), an eminent English botanist, born in 1567. He was the first who described and figured the subjects of the flower garden singly. His *Theatrum Botanicum* contained a more copious history of medicinal plants than any former publication.

PARKINSONIA, so called in honor of the above botanist; a genus of the monogynia order and decandria class of plants: natural order thirty-third, *lomentaceæ*: *CAL.* quinquefid: petals five, all oval except the lowest, which is reniform; style none; the legumen monihform. We know but one species, which is very common in the Spanish West Indies, and has lately been introduced into the English settlements, for the beauty and sweetness of its flowers. In the

countries where it grows naturally it rises to a tree of twenty or more feet high, and bears long slender bunches of yellow flowers, which have a most agreeable sweet scent.

PARLE, *n. s.* } Fr. *parler*. Conver-
PARLEY, *v. a. & n. s.* } sation; negotiation;
talk; oral treaty (obsolete): to parley is to treat or discuss a thing orally: as a substantive it is a modern word for parle.

Seek rather by *parley* to recover them than by the sword. *Sidney.*

A Turk desired the captain to send some, with whom they might more conveniently *parley*.
Knolles's History.

Of all the gentlemen,
That every day with *parle* encounter me,
In thy opinion, which is worthiest love?

Shakspeare.

Our trumpet called you to this general *parle*. *Id.*

Summon a *parley*, we will talk with him. *Id.*

The bishop, by a *parle*, is, with a show
Of combination, cunningly betrayed. *Daniel.*

Parley and holding intelligence with guilt in the most trivial things, he pronounced as treason to ourselves, as well as unto God. *Fell.*

No gentle means could be essayed;
'Twas beyond *parley* when the siege was laid.
Dryden.

Force never yet a generous heart did gain;
We yield on *parley*, but are stormed in vain. *Id.*

Why meet we thus like wrangling advocates,
To urge the justice of our cause with words?
I hate this *parle*: 'tis tame: if we must meet,
Give me my arms. *Rowe's Ambitious Step-mother.*

Yet when some better fated youth
Shall with his am'rous *parley* move thee,
Reflect one moment on his truth,
Who, dying thus, persists to love thee. *Prior.*

Let us resolve never to have any *parley* with our
lusts, but to make some considerable progress in our
repentance. *Calamy.*

He *parleys* with her awhile, as imagining she would
advise him to proceed. *Broome.*

Strange is thy form, but more thy words are
strange—

Fearful it seems to hold this *parley* with thee.
Tell me thy race and country. *Maturin.*

PARLEY, in war, is a conference with an
enemy. Hence to beat or sound a *parley*, is to
give a signal for holding such a conference by
beat of drum, or sound of trumpet.

PARLIAMENT, *n. s. & adj.* } Fr. *parle-*
PARLIAMEN'TARY. } ment; Ital. &

Span. *parlamento*; Barb. Lat. *parliamentum*; 'a
parlare la mente, says Minshew, after Coke, to
speak judiciously his mind!' A high court of
debate and appeal on public affairs; in the
United Kingdom it signifies the assembly of king,
lords, and commons, 'the court of all others the
highest, and of greatest authority': parliamentary
is, enacted by, pertaining to, or customary in,
parliament.

A member of *parliament* is originally to be tender
of his own liberty, that other men may the better
trust him with theirs. *Saville.*

The king is fled to London,
To call a present court of *parliament*.
Shakspeare.

Far be the thought of this from Henry's heart,
To make a shambles of the *parliament* house. *Id.*

The true use of *parliaments* is very excellent; and
be often called, and continued as long as is neces-
sary. *Bacon.*

To the three first titles of the two houses, or lines,
and conquest, were added two more; the authorities
parliamentary and *papal*. *Id.*

I thought the right way of *parliaments* the most
safe for my crown, as best pleasing to my people.

King Charles.

Many things, that obtain as common law, had
their original by *parliamentary* acts or constitutions,
made in writings by the king, lords, and commons.

Hale.

These are mob readers: if Virgil and Marial
stood for *parliament* men, we know who would carry
it. *Dryden.*

Credit to run ten millions in debt, without *parlia-*
mentary security, I think to be dangerous and illegal.
Swift.

We assemble *parliaments* and councils, to have the
benefit of their collected wisdom; but we necessa-
rily have, at the same time, the inconveniences of
their collected passions, prejudices, and private in-
terests. *Franklin.*

THE PARLIAMENT is the grand assembly of
the three states of this kingdom, summoned to-
gether by the king's authority, to consider of
matters relating to the public welfare, particularly
to enact and repeal laws. The original or first
institution of parliament lies so far hidden in
the dark ages of antiquity, that the tracing of it
out is equally difficult and uncertain. The word
parliament is, comparatively, of modern date;
derived from the French *parler*, and signifying
the place where they met and spoke, or conferred
together. It was first applied to general assem-
blies of the states under Louis VII. in France,
about the middle of the twelfth century. But
it is certain that long before the Norman con-
quest all matters of importance were debated
and settled in the great councils of the realm; a
practice which seems to have been universal
among the northern nations, particularly the
Germans, and carried by them into all the
countries of Europe, which they over-ran at the
dissolution of the Roman empire. Relics of
this constitution, under various modifications
and changes, are still to be met with in the diets
of Poland, Germany, and Sweden, and formerly
in the assembly of the states in France; for what
was there lately called the parliament was only
the supreme court of justice, consisting of the
peers, certain dignified ecclesiastics, and judges;
which was neither in practice, nor supposed to
be in theory, a general council of the realm.

In England, this general council hath been
held immemorably, under the several names of
michel synoth, or great council; michel gemote,
or great meeting; and more frequently writena
gemote, or the meeting of wise men. It was also
styled in Latin, commune concilium regni, mag-
num concilium regis, curia magna, conventus
magnatum vel procerum, assisa generalis, and
sometimes communitas regni Angliæ. We have
instances of its meeting to order the affairs of
the kingdom, to make new laws, and to amend
the old; or, as Fleta expresses it, novis injuriis
emersis nova constituere remedia, so early as the
reign of Ina, king of the West Saxons; Ossa,
king of the Mercians; and Ethelbert, king of
Kent, in the several kingdoms of the heptarchy.

And after their union, the Mirror informs us that king Alfred ordained, for a perpetual usage, that these councils should meet twice in the year, or oftener, if need be, to treat of the government of God's people; how they should keep themselves from sin, should live in quiet, and should receive right.' The subsequent Saxon and Danish monarchs held frequent councils of this sort, as appears from their codes of laws; the titles whereof usually speak them to be enacted, either by the king, with the advice of his wittena gemote, as *Hæc sunt instituta, quæ Edgarus rex consilio sapientum suorum instituit*: or to be enacted by those sages with the advice of the king; as *Hæc sunt iudicia quæ sapientes, consilio regis Ethelstani, instituerunt*; or, lastly, to be enacted by them both together, as *Hæc sunt institutiones quas rex Edmundus et episcopi sui, cum sapientibus suis, instituerunt*. These great councils were also occasionally held under the first princes of the Norman line. Glanville, who wrote in the reign of Henry II., speaking of the particular amount of an amercement in the sheriff's court, says, it never yet had been ascertained by the general assize or assembly, but was left to the custom of particular counties. Here the general assize is spoken of as a meeting well known, and its statutes or decisions are put in a manifest contradistinction to custom, or the common law. And in Edward III.'s time, an act of parliament, made in the reign of William I., was pleaded in the case of the abbey of St. Edmund's Bury; and judicially allowed by the court. Hence it indisputably appears that parliaments, or general councils, are coeval with the kingdom itself. How those parliaments were constituted and composed has been matter of great dispute among our learned antiquarians; whether the commons were summoned at all; or at what period they began to form a distinct assembly. But, waiving these controversies, it is generally agreed that, in the main, the constitution of parliament, as it now stands, was marked out so long ago as the seventeenth year of king John, A.D. 1215, in the great charter granted by that prince; wherein he promises to summon all archbishops, bishops, abbots, earls, and greater barons, personally; and all other tenants in chief under the crown, by the sheriff and bailiffs; to meet at a certain place, with forty days' notice, to 'assess aids and scutages when necessary. See *MAGNA CHARTA*. And this constitution has subsisted in fact at least from 1266, 49 Henry III., there being still extant writs of that date, to summon knights, citizens, and burgesses to parliament.

We proceed, therefore, to enquire, wherein consists this constitution of parliament, as it now stands, and has stood, for at least 500 years: 1. As to the manner and time of its assembling: 2. Its constituent parts: 3. The laws and customs relating to parliament: 4. The methods of proceeding; and of making statutes, in both houses; and, 5. The manner of the parliament's adjournment, prorogation, and dissolution.

I. The parliament is regularly *summoned* by the king's writ or letter, issued out of chancery by advice of the privy council, at least forty days before it begins to sit. It is a branch of the

royal prerogative that no parliament can be convened by its own authority, or by the authority of any, except the king alone. And this prerogative is founded upon very good reason. For, supposing it had a right to meet spontaneously, without being called together, it is impossible to conceive that all the members of each of the houses would agree unanimously upon the proper time and place of meeting; and if half of the members met, and half absented themselves, who shall determine which is really the legislative body, the part assembled, or that which stays away? It is therefore necessary that the parliament should be called together at a determinate time and place; and highly becoming its dignity and independence that it should be called together by none but one of its own constituent parts: and, of the three constituent parts, this office can only appertain to the king; as he is a single person, whose will may be uniform and steady; the first person in the nation being superior to both houses in dignity, and the only branch of the legislature that has a separate existence, and is capable of performing any act at a time when no parliament is in being. Nor is it any exception to this rule that, by some modern statutes, on the demise of a king or queen, if there be then no parliament in being, the last parliament revives, and is to sit again for six months, unless dissolved by the successor; for this revived parliament must have been originally summoned by the crown. It is true that the convention parliament which restored King Charles II. met above a month before his return; the lords by their own authority, and the commons in pursuance of writs issued in the name of the keepers of the liberty of England by authority of parliament; and that the said parliament sat till the 29th of December, full seven months after the Restoration, and enacted many laws, several of which are still in force. But this was for the necessity of the thing, which supersedes all law; for, if they had not so met, it was morally impossible that the kingdom should have been settled in peace. And the first thing done after the king's return was to pass an act declaring this to be a good parliament, notwithstanding the defect of the king's writ: so that, as the royal prerogative was chiefly wounded by their so meeting, and as the king himself, who alone had a right to object, consented to waive the objection, this cannot be drawn into an example in prejudice of the rights of the crown. Besides, it was at that time a great doubt among the lawyers, whether even this healing act made it a good parliament, and held by very many in the negative; though it seems to have been too nice a scruple. And yet, out of abundant caution, it was thought necessary to confirm its acts in the next parliament by stat. 13 Car. II. c. 7 and c. 14. It is likewise true, at the time of the Revolution, A.D. 1688, the lords and commons, by their own authority, and upon the summons of the prince of Orange (afterwards king William III.), met in a convention, and therein disposed of the crown and kingdom. But this assembling was upon a like principle of necessity as at the Restoration; that is, upon a full conviction that king James II. had abdicated the

government, and that the throne was thereby vacant: which supposition of the individual members was confirmed by their concurrent resolution, when they actually came together. And, in such a case as the palpable vacancy of a throne, it follows, *ex necessitate rei*, that the form of the royal writs must be laid aside, otherwise no parliament can ever meet again. For let us put another possible case, and suppose, for the sake of argument, that the whole royal line should at any time fail, and become extinct, which would indisputably vacate the throne: in this situation it seems reasonable to presume that the body of the nation, consisting of lords and commons, would have a right to meet and settle the government; otherwise there must be no government at all. And upon this and no other principle did the convention in 1688 assemble. The vacancy of the throne was precedent to their meeting without any royal summons, not a consequence of it. They did not assemble without writ, and then make the throne vacant; but the throne being previously vacant, by the king's abdication, they assembled without writ, as they must do if they assembled at all. Had the throne been full their meeting would not have been regular; but, as it was empty, such meeting became absolutely necessary. And accordingly it is declared by statute, 1 W. & M. stat. 1. c. 1, that this convention was really the two houses of parliament, notwithstanding the want of writs, or other defects of form. So that, notwithstanding these two capital exceptions, which were justifiable only on a principle of necessity (and each of which, by the way, induced a revolution in the government), the rule laid down is in general certain, that the king only can convoke a parliament. And this, by the ancient statutes of the realm, he is bound to do 'every year, or oftener if need be.' Not that he is, or ever was, obliged by these statutes to call a new parliament every year; but only to permit a parliament annually for the redress of grievances, and despatch of business, if need be. These last words are so loose and vague, that such of our monarchs as were inclined to govern without parliaments neglected the convoking them, sometimes for a very considerable period, under pretence that there was no need of them. But, to remedy this, by stat. 16 Car. II. c. 1, it is enacted, that the sitting and holding of parliaments shall not be intermitted above three years at the most. And by stat. 1 W. & M., stat. 2, c. 2, it is declared to be one of the rights of the people, that for redress of all grievances, and for the amending, strengthening, and preserving the laws, parliaments ought to be held frequently. And this indefinite frequency is again reduced to a certainty by stat. 6 W. & M., c. 2, which enacts, as the statute of Charles II. had done before, that the new parliament shall be called within three years after the determination of the former.

II. These are the king's majesty, sitting there in his royal political capacity, and the three estates of the realm; the lords spiritual, the lords temporal (who sit together with the king in one house); and the commons, who sit by themselves in another. And the king and these three estates

together form the great corporation or body politic of the kingdom, of which the king is said to be *caput, principium, et finis*. For upon their coming together the king meets them, either in person or by representation, without which there can be no beginning of a parliament; and he also has alone the power of dissolving them. It is highly necessary, for preserving the balance of the constitution, that the executive power should be a branch, though not the whole, of the legislature. The total union of them, we have seen, would be productive of tyranny; the total disjunction of them, for the present, would in the end produce the same effects, by causing that union against which it seems to provide. The legislature would soon become tyrannical, by making continual encroachments, and gradually assuming to itself the rights of the executive power. Thus the long parliament of Charles I. while it acted in a constitutional manner, with the royal concurrence, redressed many heavy grievances, and established many salutary laws. But when the two houses assumed the power of legislation, in exclusion of the royal authority, they soon after assumed likewise the reins of administration; and, in consequence of these united powers, overturned both church and state, and established a worse oppression than any they pretended to remedy. To hinder therefore any such encroachments, the king is himself a part of the parliament; and as this is the reason of his being so, very properly, therefore, the share of legislation which the constitution has placed in the crown consists in the power of rejecting rather than resolving; this being sufficient to answer the end proposed. For we may apply to the royal negative, in this instance, what Cicero observes of the negative of the Roman tribunes, that the crown has not any power of doing wrong, but merely of preventing wrong from being done. The crown cannot begin of itself any alterations in the present established law; but it may approve or disapprove of the alterations suggested and consented to by the two houses. The legislature, therefore, cannot abridge the executive power of any rights which it now has by law, without its own consent; since the law must perpetually stand as it now does, unless all the powers will agree to alter it. And herein, indeed, consists the true excellence of the British government, that all the parts of it form a mutual check upon each other. In the legislature, the people are a check upon the nobility, and the nobility a check upon the people, by the mutual privilege of rejecting what the other has resolved; while the king is a check upon both, which preserves the executive power from encroachments. And this very executive power is again checked and kept within due bounds by the two houses, through the privilege they have of enquiring into, impeaching, and punishing the conduct (not indeed of the king, which would destroy his constitutional independence; but which is more beneficial to the public) of his evil and pernicious counsellors. Thus every branch of our civil polity supports and is supported, regulates and is regulated, by the rest: for the two houses naturally drawing in two directions of opposite interest, and the

prerogative in another still different from them both, they mutually keep each other from exceeding their proper limits; while the whole is prevented from separation, and artificially connected together, by the mixed nature of the crown, which is a part of the legislative, and the sole executive magistrate. Like three distinct powers in mechanics, they jointly impel the machine of government in a direction different from what either, acting by itself, would have done; but at the same time in a direction partaking of each, and formed out of all; a direction which constitutes the true line of the liberty and happiness of the community.

'The power and jurisdiction of parliament,' says Sir Edward Coke, 'is so transcendant and absolute, that it cannot be confined either for causes or persons within any bounds. And of this high court he adds, it may be truly said, *Si antiquitatem spectes, est vetustissima; si dignitatem, est honoratissima; si jurisdictionem, est capacissima.* It has sovereign and uncontrollable authority in making, confirming, enlarging, restraining, abrogating, repealing, reviving, and expounding all laws, concerning matters of all possible denominations, ecclesiastical or temporal, civil, military, maritime, or criminal; this being the place where that absolute despotic power, which must in all governments reside somewhere, is entrusted by the constitution of these kingdoms. All mischiefs and grievances, operations and remedies, that transcend the ordinary course of the laws, are within the reach of this extraordinary tribunal. It can regulate or new-model the succession to the crown, as was done in the reigns of Henry VIII. and William III. It can alter the established religion of the land; as was done in a variety of instances in the reigns of king Henry VIII. and his three children. It can change and create afresh even the constitution of the kingdom and of parliaments themselves; as was done by the act of union, and the several statutes for triennial and septennial elections. It can, in short, do every thing that is not naturally impossible; and therefore some have not scrupled to call its power, by a figure rather too bold, the omnipotence of parliament. True it is, that what the parliament doth, no authority upon earth can undo. So that it is a matter most essential to the liberties of this kingdom, that such members be delegated to this important trust as are most eminent for their probity, their fortitude, and knowledge; for it was a known apophthegm of the great lord treasurer Burleigh, 'that England could never be ruined but by a parliament:' and, as Sir Matthew Hale observes, This being the highest and greatest court, over which none other can have jurisdiction in the kingdom, if by any means a misgovernment should anywise fall upon it, the subjects of this kingdom are left without all manner of remedy. Mr. Locke, and other theoretical writers, have held that 'there remains still inherent in the people a supreme power to remove or alter the legislature, when they find the legislature act contrary to the trust reposed in them; for, when such trust is abused, it is thereby forfeited, and devolves to those who gave it.' But, however just this conclusion may be in theory, we

cannot adopt it, nor argue from it, under any dispensation of government at present actually existing. For this devolution of power to the people at large includes in it a dissolution of the whole form of government established by that people; reduces all the members to their original state of equality, and, by annihilating the sovereign power, repeals all positive laws whatsoever before enacted. No human laws will, therefore, suppose a case, which at once must destroy all law, and compel men to build afresh upon a new foundation; nor will they make provision for so desperate an event as must render all legal provisions ineffectual. So long, therefore, as the English constitution lasts, we may venture to affirm, that the power of parliament is absolute, and without control. To prevent the mischiefs that might arise by placing this extensive authority in hands either incapable or improper to manage it, it is provided by the custom and law of parliament that no one shall sit or vote in either house unless he be twenty-one years of age. This is also expressly declared by stats. 7 and 8 W. III. c. 25: yet, with regard to the house of commons, doubts have arisen from some contradictory adjudications, whether or not a minor was incapacitated from sitting in that house. It is also enacted by stat. 7 Jac. I. c. 6, that no member be permitted to enter the house of commons till he has taken the oath of allegiance before the lord steward or his deputy: and by 30 Car. II. stat. 2, and 1 Geo. c. 13, that no member shall vote or sit in either house, till he has, in the presence of the house, taken the oaths of allegiance, supremacy, and abjuration, and subscribed and repeated the declaration against transubstantiation, and invocation of saints, and the sacrifice of the mass. Aliens, unless naturalised, were likewise by the law of parliament incapable to serve therein: and now it is enacted by stat. 12 and 13 W. III. c. 2 that no alien, even though he be naturalised, shall be capable of being a member of either house of parliament. And there are not only these standing incapacities, but if any person is made a peer by the king, or elected to serve in the house of commons by the people, yet may the respective houses, upon complaint of any crime in such person, and proof thereof, adjudge him disabled and incapable to sit as a member: and this by the law and custom of parliament. For as every court of justice has laws and customs for its direction, some the civil and canon, some the common law, others their own peculiar laws and customs; so the high court of parliament has also its own peculiar law called the *lex et consuetudo parliamenti*; a law which Sir Edward Coke observes is *ab omnibus querenda, a multis ignorata, a paucis cognita*. It will not therefore be expected that we should enter into the examination of this law with minuteness; since, as the same learned author assures us, it is much better to be learned out of the rolls of parliament and other records, and by precedents and continual experience, than can be expressed by any one man. The whole of the law and custom of parliament has its original from this one maxim, 'that whatever matter arises concerning either house of parliament, ought to be

examined, discussed, and adjudged in that house to which it relates, and not elsewhere.' Hence, for instance, the lords will not suffer the commons to interfere in settling the election of a peer of Scotland; the commons will not allow the lords to judge of the election of a burgess; nor will either house permit the subordinate courts of law to examine the merits of either case. But the maxims upon which they proceed, together with the method of proceeding, rest entirely in the breast of the parliament itself; and are not defined and ascertained by any particular stated laws. The privileges of parliament are likewise very large and indefinite; and therefore, when, in 31 Henry VI., the house of lords propounded a question to the judges concerning them, the chief justice, Sir John Fortescue, in the name of his brethren, declared 'that they ought not to make answer to that question; for it hath not been used aforetime, that the justices should in any wise determine the privileges of the high court of parliament; for it is so high and mighty in its nature that it may make law; and that which is law, it may make no law: and the determination and knowledge of that privilege belongs to the lords of parliament, and not to the justices.' Privilege of parliament was principally established, in order to protect its members not only from being molested by their fellow-subjects, but also more especially from being oppressed by the power of the crown. If, therefore, all the privileges of parliament were once to be set down and ascertained, and no privilege to be allowed but what was so defined and determined, it were easy for the executive power to devise some new case, not within the line of privilege, and under pretence thereof to harass any refractory member, and violate the freedom of parliament. The dignity and independence of the two houses are therefore in a great measure preserved by keeping their privileges indefinite. Some, however, of the more notorious privileges of the members of either house are, privilege of speech, of person, of their domestics, and of their lands and goods. As to the first, privilege of speech, it is declared by the statute 1 W. & M. stat. 2, c. 2, as one of the liberties of the people: 'That the freedom of speech, and debates, and proceedings in parliament, ought not to be impeached or questioned in any court or place out of parliament.' And this freedom of speech is particularly demanded of the king in person, by the speaker of the house of commons, at the opening of every new parliament. So likewise are the other privileges of person, servants, lands, and goods; which are immunities as ancient as Edward the Confessor, in whose laws we find this precept, *ad synodos venientibus, sive summoniti sint, sive per se quid agendum habuerint, sit summa pax*; and so, too, in the old Gothic constitutions, *extenditur hæc pax et securitas ad quatuordecim dies, convocato regni senatu*. This included formerly not only privilege from illegal violence, but also from legal arrests and seizures by process from the courts of law. And still to assault by violence a member of either house, or his menial servants, is a high contempt of parliament, and there punished with the utmost

severity. It has likewise peculiar penalties annexed to it in the courts of law by stat. 5 Hen. IV. c. 6, and 11 Hen. VI. c. 11. Neither can any member of either house be arrested and taken into custody without a breach of the privilege of parliament. But all other privileges which derogate from the common law are now at an end, save only as to the freedom of the member's person; which in a peer (by the privilege of peerage) is for ever sacred and inviolable; and in a commoner (by the privilege of parliament) for forty days after every prorogation, and forty days before the next appointed meeting; which is now in effect as long as the parliament subsists: it seldom being prorogued for more than eighty days at a time. As to all other privileges, which obstruct the ordinary course of justice, they were restrained by the statutes 12 W. III. c. 3; 2 and 3 Ann. c. 18; and 11 Geo. II. c. 24; and are now totally abolished by statute 10 Geo. III. c. 50; which enacts that any suit may at any time be brought against any peer or member of parliament, their servants, or any other person entitled to privilege of parliament; which shall not be impeached or delayed by pretence of any such privilege, except that the person of a member of the house of commons shall not thereby be subjected to any arrest or imprisonment. Likewise, for the benefit of commerce, it is provided, by statute 4 Geo. III. c. 43, that any trader, having privilege of parliament, may be served with legal process for any just debt (to the amount of £100): and, unless he makes satisfaction within two months, it shall be deemed an act of bankruptcy; and that commission of bankruptcy may be issued against such privileged traders in like manner as against any other. The only way by which courts of justice could anciently take cognisance of privilege of parliament was by writ of privilege, in the nature of supersedeas, to deliver the party out of custody when arrested in a civil suit. For when a letter was written by the speaker to the judges, to stay proceedings against a privileged person, they rejected it as contrary to their oath of office. But since the statute 12 W. III. c. 3, which enacts that no privileged person shall be subject to arrest or imprisonment, it has been held that such arrest is irregular *ab initio*, and that the party may be discharged upon motion. It is to be observed that there is no precedent of any such writ of privilege, but only in civil suits; and that the statute of 1 Jac. I. c. 13, and that of king William, which remedy some inconveniences arising from privilege of parliament, speak only of civil actions. And, therefore, the claim of privilege has been usually guarded with an exception as to the case of indictable crimes; or, as it has been frequently expressed, of treason, felony, and breach of the peace. Whereby it seems to have been understood that no privilege was allowable to the members, their families, or servants, in any crime whatsoever; for all crimes are treated by the law as being *contra pacem domini regis*. And instances have not been wanting, wherein privileged persons have been convicted of misdemeanors, and committed, or prosecuted to outlawry, even in the middle of a session; which proceeding has after-

wards received the sanction and approbation of parliament. To which may be added, that, about thirty years ago, the case of writing and publishing seditious libels was resolved by both houses not to be entitled to privilege; and that the reasons upon which that case proceeded extended equally to every indictable offence. So that the chief, if not the only privilege of parliament, in such cases, seems to be the right of receiving immediate information of the imprisonment or detention of any member, with the reason for which he is detained; a practice that is daily used upon the slightest military accusations, preparatory to a trial by a court-martial, and which is recognised by the several temporary statutes for suspending the habeas corpus act: whereby it is provided that no member of either house shall be detained, till the matter of which he stands suspected be first communicated to the house of which he is a member, and the consent of the said house obtained for his commitment or detaining. But yet the usage has uniformly been, ever since the Revolution, that the communication has been subsequent to the arrest. See KING, LORDS, and COMMONS.

IV. The method of *proceeding*, in enacting laws, is much the same in both houses. But for this we refer the reader to the article BILL, and shall only observe in this place that, for despatch of business, each house of parliament has its speaker. The speaker of the house of lords, whose office it is to preside there, and manage the formality of business, is the lord chancellor, or keeper of the king's great seal, or any other appointed by the king's commission; and, if none be so appointed, the house of lords, it is said, may elect. The speaker of the house of commons is chosen by the house; but must be approved by the king. And herein the usage of the two houses differs, that the speaker of the house of commons cannot give his opinion or argue any question in the house; but the speaker of the house of lords, if a lord of parliament, may. In each house the act of the majority binds the whole; and this majority is declared by votes openly and publicly given; not, as formerly, at Venice, and many other senatorial assemblies, privately, or by ballot. This latter method may be serviceable to prevent intrigues and unconstitutional combinations; but is impossible to be practised with us, at least in the house of commons, where every member's conduct is subject to the future censure of his constituents, and therefore should be openly submitted to their inspection.

V. i. An *adjournment* is no more than a continuance of the session from one day to another, as the word signifies; and this is done by the authority of each house separately every day; and sometimes for a fortnight or a month together, as at Christmas or Easter, or upon other particular occasions. But the adjournment of one house is no adjournment of the other. It has also been usual, when his majesty has signified his pleasure, that both or either of the houses should adjourn themselves to a certain day, to obey the king's pleasure so signified, and to adjourn accordingly. Otherwise, besides the indecorum of a refusal, a prorogation would as-

surely follow; which would often be very inconvenient to both public and private business. For prorogation puts an end to the session; and then such bills as are only begun, and not perfected, must be resumed de novo, if at all, in a subsequent session; whereas, after an adjournment, all things continue in the same state as at the time of adjournment made, and may be proceeded on without any fresh commencement. ii. A *prorogation* is the continuance of the parliament from one session to another; as an adjournment is a continuance of the session from day to day. This is done by the royal authority, expressed either by the lord chancellor in his majesty's presence, or by commission from the crown, or frequently by proclamation. Both houses are necessarily prorogued at the same time; it not being a prorogation of the house of lords or commons, but of the parliament. The session is never understood to be at an end until a prorogation; though, unless some act be passed, or some judgment given in parliament, it is in truth no session at all. And formerly the usage was for the king to give the royal assent to all such bills as he approved at the end of every session, and then to prorogue the parliament, though sometimes only for a day or two; after which all business then depending in the houses was not to be begun again. Which custom obtained so strongly, that it once became a question, Whether giving the royal assent to a single bill did not of course put an end to the session? And, though it was then resolved in the negative, yet the notion was so deeply rooted that the statute 1 Car. I. c. 7 was passed to declare, that the king's assent to that and some other acts should not put an end to the session; and even so late as the reign of Charles II. we find a proviso frequently tacked to a bill, that his majesty's assent thereto should not determine the session of parliament. But it now seems to be allowed that a prorogation must be expressly made, in order to determine the session. And if at the time of an actual rebellion, or imminent danger of invasion, the parliament should be separated by adjournment or prorogation, the king is empowered to call them together by proclamation, with fourteen days' notice of the time appointed for their re-assembling. iii. A *dissolution* is the civil death of the parliament; and this may be effected three ways: 1. By the king's will, expressed either in person or by representation. For, as the king has the sole right of convening the parliament, so also it is a branch of the royal prerogative, that he may (whenever he pleases) prorogue the parliament for a time, or put a final period to its existence. If nothing had a right to prorogue or dissolve a parliament but itself, it might become perpetual. And this would be extremely dangerous, if at any time it should attempt to encroach upon the executive power; as was fatally experienced by the unfortunate king Charles I.; who, having unadvisedly passed an act to continue the parliament then in being till such time as it should please to dissolve itself, at last fell a sacrifice to that inordinate power which he himself had consented to give them. It is therefore extremely necessary that the crown should be empowered to regulate the

duration of these assemblies, under the limitations which the English constitution has prescribed; so that, on the one hand, they may frequently and regularly come together for the despatch of business and redress of grievances, and may not, on the other, even with the consent of the crown, be continued to an inconvenient or unconstitutional length. 2. A parliament may be dissolved by the demise of the crown. This dissolution formerly happened immediately upon the death of the reigning sovereign: for he being considered in law as the head of the parliament (*caput, principium, et finis*), that failing, the whole body was held to be extinct. But the calling a new parliament immediately on the inauguration of the successor being found inconvenient, and dangers being apprehended from having no parliament in being in case of a disputed succession, it was enacted by the statutes 7 and 8 Will. III. c. 15, and 6 Ann. c. 7, that the parliament in being shall continue for six months after the death of any king or queen, unless sooner prorogued or dissolved by the successor; that if the parliament be at the time of the king's death, separated by adjournment or prorogation, it shall notwithstanding assemble immediately: and that, if no parliament is then in being, the members of the last parliament shall assemble, and be again a parliament. 3. Lastly, a parliament may be dissolved or expire by length of time. For if either the legislative body were perpetual, or might last for the life of the prince who convened them, as formerly, and were so to be supplied, by occasionally filling the vacancies with new representatives; in these cases, if it were once corrupted, the evil would be past all remedy; but, when different bodies succeed each other, if the people see cause to disapprove of the present, they may rectify its faults in the next. A legislative assembly also, which is sure to be separated again (whereby its members will themselves become private men, and subject to the full extent of the laws which they have enacted for others), will think themselves bound, in interest as well as duty, to make only such laws as are good. The utmost extent of time that the same parliament was allowed to sit, by the statute 6 W. & M. c. 3, was three years; after the expiration of which, reckoning from the return of the first summons, the parliament was to have no longer continuance. But by statute 1 Geo. I. st. 2, c. 38 (in order, professedly, to prevent the great and continued expences of frequent elections, and the violent heats and animosities consequent thereupon, and for the peace and security of the government then just recovering from the late rebellion), this term was prolonged to seven years; and, what alone is an instance of the vast authority of parliament, the very same house that was chosen for three years enacted its own continuance for seven. So that, as our constitution now stands, the parliament must expire, or die a natural death, at the end of every seventh year, if not sooner dissolved by the royal prerogative.

In the house of *lords*, the princes of the blood sit by themselves on the sides of the throne; at the wall, on the king's right hand, the two arch-

bishops sit by themselves on a form. Below them the bishops of London, Durham, and Winchester, and all the other bishops, sit according to the priority of their consecration. On the king's left hand the lord treasurer, lord president, and lord privy-seal, sit upon forms above all dukes, except the royal blood; then the dukes, marquesses, and earls, according to their creation. Across the room are wool-sacks, continued from an ancient custom; and the chancellor, or keeper, being of course the speaker of the house of lords, sits on the first wool-sack before the throne, with the great seal or mace lying by him; below these are forms for the viscounts and barons. On the other wool-sacks are seated the judges, masters in chancery, and king's council, who are only to give their advice in points of law: but they all stand up till the king gives them leave to sit. 2. The commons sit promiscuously; only the speaker has a chair at the upper end of the house, and the clerk and his assistant sit at the table near him. When a member of the house of commons speaks, he stands up uncovered, and directs his speech to the speaker only. If what he says be answered by another, he is not allowed to reply the same day, unless personal reflections have been cast upon him: but when the commons, in order to have a greater freedom of debate, have resolved themselves into a committee of the whole house, every member may speak to a question as often as he thinks necessary. In the house of lords they vote, beginning at the *puisne*, or lowest baron, and so up orderly to the highest, every one answering, *Content* or *Not content*. In the house of commons they vote by yeas and nays; and, if it be dubious which are the greater number, the house divides. If the question be about bringing any thing into the house, the yeas go out; but, if it be about any thing the house already has, the nays go out. In all divisions the speaker appoints four tellers, two of each opinion. In a committee of the whole house, they divide by changing sides, the yeas taking the right and the nays the left of the chair; and then there are but two tellers. If a bill pass one house, and the other demur to it, a conference is demanded in the painted chamber, where certain members are deputed from each house; and here the lords sit covered, and the commons stand bare, and debate the case. If they disagree, the affair is null; and if they agree, this, with the other bills that have passed both houses, is brought down to the king in the house of lords, who comes thither clothed in his royal robes; before him the clerk of the parliament reads the title of each bill, and, as he reads, the clerk of the crown pronounces the royal assent or dissent. If it be a public bill, the royal assent is given in these words, *Le roy le veut*, The king will have it so; if private, *Soit fait comme il est désiré*, Let the request be complied with; if the king refuses the bill, the answer is, *Le roy s'avisera*, The king will think of it; and, if it be a money bill, the answer is, *Le roy remercie ses loyaux sujets, accepte leur benevolence, et aussi le veut*; The king thanks his loyal subjects, accepts their benevolence, and therefore grants his consent.

The *High Court* of Parliament is the supreme

court in the kingdom, not only for the making, but also for the execution, of laws, by the trial of great and enormous offenders, whether lords or commoners, in the method of parliamentary impeachment. As for acts of parliament to attain particular persons of treason or felony, or to inflict pains and penalties, beyond or contrary to the common law, to serve a special purpose, we speak not of them; being to all intents and purposes new laws, made *pro re nata*, and by no means an execution of such as are already in being. But an impeachment before the lords by the commons of Great Britain, in parliament, is a prosecution of the already known and established law, and has been frequently put in practice; being a presentment to the most high and supreme court of criminal jurisdiction by the most solemn grand inquest of the whole kingdom. A commoner cannot, however, be impeached before the lords for any capital offence, but only for any high misdemeanors; a peer may be impeached for any crime. And they usually (in case of any impeachment of a peer for treason), address the crown to appoint a lord high steward, for the greater dignity and regularity of their proceedings; which high steward was formerly elected by the peers themselves, though he was generally commissioned by the king; but it has of late years been strenuously maintained that the appointment of a high steward in such cases is not indispensably necessary, but that the house may proceed without one. The articles of impeachment are a kind of bills of indictment, found by the house of commons, and afterwards tried by the lords; who are in cases of misdemeanors considered not only as their own peers, but as the peers of the whole nation. This is a custom derived to us from the constitution of the ancient Germans; who in their great councils sometimes tried capital accusations relating to the public: *Licet apud concilium accusare quoque, et discrimen opus intendere*. And it has a peculiar propriety in the English constitution; which has much improved upon the ancient model imported hither from the Continent. For, though in general the union of the legislative and judicial powers ought to be most carefully avoided, yet it may happen that a subject, entrusted with the administration of public affairs, may infringe the rights of the people, and be guilty of such crimes as the ordinary magistrate either dares not or cannot punish. Of these the representatives of the people, or house of commons, cannot properly judge; because their constituents are the parties injured, and can therefore only impeach. But before what court shall this impeachment be tried? Not before the ordinary tribunals, which would naturally be swayed by the authority of so powerful an accuser. Reason therefore will suggest that this branch of the legislature, which represents the people, must bring its charge before the other branch, which consists of the nobility, who have neither the same interests, nor the same passions, as popular assemblies. This is a vast superiority which the constitution of this island enjoys over those of the Grecian or Roman republics; where the people were at the same time both judges and

accusers. It is proper that the nobility should judge, to insure justice to the accused; as it is proper that the people should accuse, to insure justice to the commonwealth. And therefore, among other extraordinary circumstances attending the authority of this court, there is one of a very singular nature, which was insisted on by the house of commons, in the case of the earl of Danby in the reign of Charles II., and is now enacted by statute 12 and 13 Wil. III., c. 2, that no pardon under the great seal shall be pleadable to an impeachment by the commons of Great Britain in parliament.

PARLOUR, *n. s.* *Fr. parloir; Ital. parlatorio*. A room in monasteries where the religious meet to converse; a room in houses on the first floor furnished for the reception of company; one which, according to modern usage, belongs only to the middle classes of society, or to the old English farm-house.

Back again fair Alma led them right
And soon into a goodly parlour brought.

Spenser.

Can we judge it a thing seemly for a man to go about the building of an house to the God of heaven, with no other appearance than if his end were to rear up a kitchen or a parlour for his own use?

Hooker.

Roof and sides were like a parlour made
A soft recess, and a cool summer shade.

Dryden.

It would be infinitely more shameful, in the dress of the kitchen, to receive the entertainments of the parlour.

South.

The first, forgive my verse if too diffuse,
Performed the kitchen's and the parlour's use;
The second, better bolted and immured,
From wolves his out-door family secured.

Harte.

I always admitted them into the parlour after supper, when, the carpet affording their feet a firm hold, they would frisk, and bound, and play a thousand gambols.

Couper.

PAR'LOUS, *adj.* ? Perhaps from French **PAR'LOUSNESS**, *n. s.* *Fr. parler*, to speak; but Junius derives it from *perilous*, in which it answers to the Latin *improbis*. Quick of temper; sprightly; keen.

Midas durst communicate

To none but to his wife his ears of state;
One must be trusted, and he thought her fit,
As passing prudent, and a parlous wit.

Dryden.

PARMA, a duchy of the north of Italy, bounded on the north by Lombardy, on the east by Modena, and on the south and west by Tuscany. It extends from 9° 28' to 10° 46' of E. long. and from 44° 14' to 44° 59' of N. lat., and is divided into the districts of Parma, Piacenza, Borgo San Domino, and Guastalla. Its surface is partly mountainous and stony; but in the north are extensive and fertile plains: the south is traversed by several branches of the Apennines. The principal rivers are the Po, which separates it from Lombardy; the Taro, the Trebia, the Lenza, and a number of smaller streams, all having a common origin in the Apennines, and discharging themselves into the Po. The products are vines, wheat, maize; vegetables and various fruits: hemp and saffron. The pastures are fine and the cattle numerous. The famous Par-

mesan cheese, originally a product of this country, is now made chiefly in the district of Lodi. Bees and silk-worms are objects of considerable attention, and silk articles constitute the chief manufacture. Iron, copper, and vitriol, are obtained in the mountains. Population 380,000. The government is absolute, the legislative and executive powers being wholly in the hands of the reigning prince.

The religion is Catholic; the army about 2400; and the revenue of the state nearly £160,000 annually; but it is encumbered with a public debt. The inhabitants are considered as frugal and industrious, and less addicted to sensual pleasures than in some of the other states. The other chief city of this duchy is **PLACENTIA**, which see.

PARMA, the capital of these dominions, is delightfully situated on a fertile plain, and watered by a small river of the same name. Though not so well built as many of the other large towns of Italy, it has a handsome square near the centre, surrounded with arcades. Its fortifications are of little importance, but its pentagonal citadel is esteemed one of the strongest in Italy. The dome of the cathedral is noted for its paintings by Correggio; and the cupola of St. John's was painted by this artist. The other public buildings present nothing remarkable. Its university is not numerously attended. It is the see of an archbishop and the seat of ducal administration. Its manufactures are principally silk and hats. Population about 30,000.

Parma, founded by the ancient Etrurians, has ever since retained its name. After the Etrurians it came into possession of the Boii, a tribe of Gauls, and subsequently into that of the Romans. On the decline of the empire it assumed a republican form, and asserted its liberty with great firmness; but, falling a prey to faction, fell ultimately into the hands of the pope, and Paul III. gave it to his son Luigi Farnese, whose descendants continued to reign as dukes of Parma, till the extinction of the male branch. Elizabeth Farnese, in 1714, married Philip V. of Spain, and brought him the duchy as a dowry. After this her son Don Carlos, being made king of the Two Sicilies, the duchy of Parma and Piacenza was ceded to the emperor, and governed by the house of Austria till 1748, when they were ceded to Don Philip, the second son of Philip V. and Elizabeth Farnese. By the peace of Luneville (1801) the duke of Parma was raised to the throne of Tuscany, with the title of king of Etruria, and in 1805 Parma and Piacenza were united to France. On the fall of Buonaparte they were taken possession of by the Austrians, and given by the treaty of Paris in 1814 to the ex-empress Maria Louisa, devolving on her death to Austria and Sardinia; a provision modified by subsequent arrangements, the latest of which, in 1818, stipulated, that, in return for certain equivalents, this territory should finally devolve to Spain. Parma is thirty miles west of Modena, and seventy south-east of Milan.

PARMENIDES, an ancient Greek philosopher, born in Elis, about A. A. C. 505. He studied under Xenophanes, or Anaximander. He taught that there were only two elements,

fire and earth; and that the first generation of men was produced from the sun. Along with these and other absurdities, he taught some philosophical truths. He first discovered that the earth is round, but he placed it, like Ptolemy, in the centre of the solar system. He wrote his system in verse; and fragments of it were collected by Henry Stephanus, and published under the title of *De Poesi Philosophica*.

PARMENIO, a celebrated and popular general, in the army of Alexander the Great, who long enjoyed that prince's confidence, and was much attached to him. Yet in a moment of suspicion, excited by false information, Alexander ordered this faithful friend to be put to death, in his seventieth year, with his son. Plutarch remarks that Parmenio gained many victories without Alexander, but Alexander not one without Parmenio.

PARMENTIER (John), a celebrated French navigator, born at Dieppe, in 1494. He was the first pilot who conducted vessels to Brasil, and the first Frenchman who sailed as far as Sumatra. He was a good astronomer, and laid down several excellent maps. He died at Sumatra in 1530.

PARMESAN CHEESE, a sort of cheese much esteemed among the Italians; so named from the duchy of Parma where it is made, and whence it is conveyed to various parts of Europe. Of this cheese there are three sorts; the *fromaggio di forma*, about two palms in diameter, and seven or eight inches thick; and the *fromaggio di ribiole* and *di ribolini*, which are not so large. It is of a saffron color; and the best is kept three or four years.

PARMIGIANO, a celebrated painter, whose true name was Francis Mazzuoli; but named Parmigiano from Parma, where he was born in 1504. He was educated under his two uncles, and was an eminent painter when but sixteen years of age. He was celebrated all over Italy at nineteen; and at the age of twenty-three, when the general of Charles V. took Rome by storm, some of the soldiers, having, in sacking the town, broken into his apartments, found him intent upon his work, and were so struck with the beauty of his pieces that, instead of involving him in the plunder and destruction in which they were then engaged, they protected him from all manner of violence. His works are distinguished by the beauty of the coloring, invention, and drawing. His figures are spirited and graceful, particularly with respect to attitude and dresses. His paintings in oil are few, but held in high esteem, as are also his drawings and etchings. At Rome he was employed by pope Clement VII., who was highly pleased with his performances and rewarded him liberally. Parmigiano painted a circumcision, which he presented to the pope, who prized it as one of the most capital works in his palace. That picture was not only excellent for the composition, coloring, and execution, but remarkable for the introduction of three different lights, without destroying the harmony of the whole. The light diffused on the principal figure was from the irradiation of the Infant Jesus; the second was illuminated by a torch carried by

one who attended the sacrifice; the others were in the open air, enlightened by the early dawn, which showed a lovely landscape, diversified with a number of cottages and villas. In the Houghton collection of pictures, now in possession of the emperor of Russia, is one of his finest pictures, representing Christ laid in the sepulchre, for which he is said to have been knighted by the duke of Parma. The best of his performances was Moses breaking the Tables of the Law, at Parma, of which Sir Joshua Reynolds says, we are at a loss which to admire most, the correctness of drawing, or the grandeur of the conception. Parmigiano had a fine taste for music, and, if he did not invent etching, he was at least the first who practised that art in Italy. He also engraved some of his designs; but it is to be regretted that, with such talents, he should have wasted his time and property in the study of alchemy, with a view to the discovery of the philosopher's stone. He died of a fever in 1540.

PARNASSIA, grass of Parnassus. in botany, a genus of the tetragynia order, and pentandria class of plants: *CAL.* quinquepartite; petals five; nectaria five, heart-shaped, and ciliated with globular tops: *CAPS.* quadrivalved: species one, having a stalk about a foot high, angular, and often a little twisted, bearing a single white flower at top. The flowers are very beautifully streaked with yellow; so that though it is a common plant, growing naturally in moist pastures, it is frequently admitted into gardens.

PARNASSUS, in ancient geography, a mountain of Phocis, near Delphi, and the mounts Cithæron and Helicon, with two tops; the one called Cirrha, sacred to Apollo; and the other Nisa, sacred to Bacchus. It was covered with bay-trees, and originally called Larnassus, from Deucalion's larnax or ark, thither conveyed by the flood; after the flood Parnassus from Har Nahas, changing the *h* into *p*, the hill of divination or augury; the oracle of Delphi standing at its foot. Dr. Chandler, who visited it, thus describes it in his Travels in Greece:—'Parnassus was the western boundary of Phocis, and, stretching north from about Delphi toward the Etæan Mountains, separated the western Locri from those who possessed the sea-coast before Eubœa. It was a place of refuge to the Delphians in times of danger. In the deluge, which happened under Deucalion, the natives were saved on it. On the invasion of Xerxes, some transported their families to Achaia, but many concealed them in this mountain, and in Corycium, a grotto of the nymphs. All Parnassus was renowned for sanctity; but Corycium was the most noted among the hallowed caves and places.' 'On the way to the summits of Parnassus,' says Pausanias, 'sixty stadia beyond Delphi, is a brazen image; and thence the ascent to Corycium is easier for a man on foot than for mules and horses. Of all the caves in which I have been, this appeared to me the best worth seeing. On the coasts and by the sea-side are more than can be numbered; but some are very famous both in Greece and in other countries. The Corycian cave exceeds in magnitude those I have mentioned, and for the

most part may be passed without a light. The inhabitants of Parnassus esteem it sacred to the Corycian nymphs and to Pan. From the cave to reach the summit of the mountain is difficult even to a man on foot. The summits are above the clouds, and the women called Thyades madden on them in the rites of Bacchus and Apollo.' Their frantic orgies were performed yearly.

PAR'NEL, *n. s.* The diminutive of *patronella*.—Skinner. A punk; a slut. Obsolete.

PARNELL (Dr. Thomas), a celebrated divine and poet, born in Dublin in 1679. He was educated at Trinity College, and in 1700 took his degree of M. A. In 1706 he came to England, and was much respected by Gay, Swift, Arbuthnot, &c. He was archdeacon of Clogher, and the intimate friend of Pope; who published his Hermit and other works, with commendatory verses prefixed. He died in 1718, aged thirty-nine.

PARO'CHIAL, *adj.* Lat. *parochialis*, from *parochia*. Belonging to a parish.

The married state of *parochial* pastors hath given them the opportunity of setting a more exact and universal pattern of holy living to the people committed to their charge. *Atterbury.*

PAR'ODY, *n. s. & v. a.* Fr. *parodie*; Gr. *παρῳδία*. A mode of writing in which the words or thoughts of an author are taken, and by a slight change adapted to a new purpose: to parody is, to copy or change in this way.

The imitations of the ancients are added together with some of the *parodies* and allusions to the most excellent of the moderns. *Pope's Dunciad.*

I have translated, or rather *parodied*, a poem of Horace, in which I introduce you advising me. *Pope.*

Parody is an ancient flower both of ancient and modern literature. It is a species of ludicrous composition, which derives its wit from association: and never fails to produce admiration and delight, when it unites taste in selection with felicity of application. *Paroical.*

PARODY, in poetry, consists in applying the verses written on one subject, by way of ridicule to another; or in turning a serious work into a burlesque, by affecting to observe as near as possible the same rhymes, words, and cadences. The parody was first attempted by the Greeks, from whom we borrow the name. It is the same with what some writers call travesty. Thus Cato exposed the inconstant disposition of Marcus Fulvius Nobilior, by changing Nobilior into Mobilior. Another kind of parody consists in the mere application of some known verse, or part of a verse, of a writer, without making any change in it, with a view to expose it.

PARONYMOUS, *adj.* Gr. *παρωνυμῶς*; *παρὰ* near, and *ὄνομα* a name. Resembling another word.

Show your critical learning in the etymology of terms, the synonymous and the *paronymous* or kindred names. *Watts.*

PAROLE, *n. s. & adj.* Fr. *parole*, from *parler*; Ital. *parola*. Word given as an assurance; verbal promise, particularly by a prisoner not to go away: the adjective is used in law for verbal; by word of mouth.

Love's votaries enthrall each other's soul, Till both of them live but upon *parole*. *Clarendon*

Be very tender of your honour, and not fall in love; because I have a scruple whether you can keep your *parole*, if you become a prisoner to the ladies.

Swift.

PAROLE, in a military sense, the promise made by a prisoner of war, when he has leave to go any where, of returning at a time appointed, or not to take up arms, if not exchanged. Hence to put an officer on parole is to take his word, whether a prisoner of war or under arrest, that he will not exceed certain limits, and be always forthcoming when called for.

PAROLE means also a word given out every day in orders by the commanding officer, both in camp and garrison, in order to know friends from enemies.

PARONOMASIA, *n. s.* Gr. *παρωνομασία*; Lat. *agnomimatio*: a rhetorical figure, in which, by the change of a letter or syllable, several things are alluded to.

PARONYCHIA, *n. s.* Fr. *paronychie*; Gr. *παρωνυχία*. A preternatural swelling or sore under the root of the finger nail; a whitlow.

PARONYCHIA, the whitlow, in surgery, is an abscess at the end of the fingers. According as it is situated more or less deep, it is differently denominated. It begins with a slow heavy pain, attended with a slight pulsation, without swelling, redness, or heat; but soon the pain, heat, and throbbing, are intolerable; the parts grow large and red, the adjoining fingers and the whole hand swell up; in some cases a kind of red and inflated streak may be observed, which, beginning at the affected part, is continued almost to the elbow; nor is it unusual for the patient to complain of a very sharp pain under the shoulder, and sometimes the whole arm is excessively inflamed and swelled; the patient cannot sleep, the fever, &c., increasing; and sometimes delirium or convulsions follow. When it is seated in the skin or fat, in the back or the fore part of the finger, or under or near the nail, the pain is severe, but ends well. When the periosteum is inflamed or corroded the pain is tormenting. When the nervous coats of the flexor tendons of the fingers or nerves near them are seized the worst symptoms attend. If the first kind suppurates, it must be opened, and treated as abscesses in general; but the best method of treating the other two species is, on the first, or at furthest the second day, to cut the part where the pain is seated, quite to the bone; if this operation is longer deferred, a suppuration will come on; in which case suppuration should be speedily promoted, and as early a discharge given to the matter as possible. As the pain is so considerable as to occasion a fever, and sometimes convulsions, the tinct. theb. may be added, the suppurating applications, and also given in a draught at bedtime. The second kind proves very troublesome, and sometimes ends in a caries of the subjacent bone. The third is very tedious in the cure, and usually the phalanx on which it is seated is destroyed.

PAROPAMISUS, in ancient geography, a ridge of mountains and an extensive territory in the north of India, which took Alexander the Great and his army sixteen days to cross it.

PAROQUET, *n. s.* Fr. *perroquet*. A small species of parrot.

The great, red, and blue, are parrots; the middlemost, called popinjays; and the lesser, *parquets*; in all above twenty sorts.

Grew.

I would not give my *parquet*

For all the doves that ever flew.

Prior.

PAROQUET. See **PSITTACUS**.

PAROS, in ancient geography, an island of the Ægean Sea, one of the Cyclades, thirty-eight miles from Delos, anciently called Pactye and Minoa; also Demetrius, Zacynthus, Hyria, Hyllessea, and Cabarnis. It was, the country of Archilochus, the Iambic poet, and famous for its white marble, called lychnites, because dug by the light of lamps. The name of Cabarnis is derived, according to Stephanus, from one Cabarnus, who informed Ceres of the rape of her daughter Proserpine; or, according to Hesychius, from the Cabarni, the priests of Ceres, so called by the Parians. The name of Minoa is borrowed from Minos, king of Crete, who subdued this, as he did most of the other islands of the Ægean Sea. It was called Paros, which name it retains to this day, from Paros the son of Parrhasius, or of Jason the Argonaut. Paros, according to Pliny, is seven miles and a half from Naxos, and twenty-eight from Delos. It was a rich and powerful island, being reckoned the most wealthy of the Cyclades. It is provided with several capacious and safe harbours, and was anciently much resorted to by traders. It was, according to Thucydides, originally peopled by the Phœnicians, who were the first masters of the sea. Afterwards the Carians settled here. Thucydides says, the Carians were driven out by the Cretans under Minos; but Diodorus writes, that the Carians did not settle here till after the Trojan war, when they found the Cretans in the island. Stephanus thinks that the Cretans, mixed with some Arcadians, were the only people that ever possessed this island. Minos himself, Pliny says, resided some time in this island, and received here the news of the death of his son Androgeus, who was killed in Attica after he had distinguished himself at the public games. The Parians assisted Darius in his expedition against Greece with a considerable squadron; but, after the victory obtained by Miltiades at Marathon, they were reduced to great straits by that general. However, after blocking up the city for twenty-six days, he was obliged to quit the enterprize, and return to Athens with disgrace. After the battle of Salamis, Themistocles subjected Paros and most of the neighbouring islands to Athens, exacting large sums from them for having favored the Persians. It appears from the famous monument of Adulas, which Cosmos of Egypt has described with great exactness, that Paros and the other Cyclades were once subject to the Ptolemies of Egypt. However, Paros fell again under the power of the Athenians, who continued masters of it till they were driven out by Mithridates the Great. But that prince being obliged to yield to Sylla, Lucullus, and Pompey, this and the other islands of the Archipelago submitted to the Romans, who reduced them to a province with Lydia, Phrygia, and Caria. During the

war in Candia, the Venetians destroyed the olive plantations, which were still a source of prosperity to the islanders; and finally the Russians, who declared themselves the liberators of Greece, laid waste whatever the barbarous Turks and Venetians had spared. There are not more than about 2000 inhabitants in the whole island, which number certainly would not have been sufficient at one time for the single city of Paros.

This city has now only the appearance of a village; its name has been changed into that of Parecchia; but the numerous fragments of ancient sculpture employed for common purposes, and various ancient inscriptions, remind one of what it once was. Clarke has published a great number of these inscriptions; but the most important piece of sculpture, in the opinion of all, that has been found in Paros, was brought to England at the commencement of the seventeenth century by the earl of Arundel, and is now preserved in the university of Oxford, under the name of the Arundel marble. It contains a chronological table very useful in illustrating the history of Greece. At the castle of Parecchia there are several antique fragments built into the walls, among others some pieces of columns laid horizontally.

On leaving Parecchia, and crossing some olive plantations, you come to Mount Capresso, where there is a quarry, once worked by the ancients for its beautiful white marble. These ancient quarries, abandoned since the fall of Greece, are partly stopped up; the galleries, which are still open, remain in the same state in which the ancient miners left them. You may discern by the engravings, which have been made on the rock near the entrance of the quarries, the famous bas relief, or rather sketch of bas relief, representing the festival of Silenus. It appears that by a singular *lusus naturæ* the head of this grotesque companion of Bacchus was found represented on the stone, and Onyses took occasion from this to surround it with a group of figures, and thus composed a beautiful picture. Paros has a magnificent port, called Naussa, capable of containing a whole fleet. The island produces pretty good wine.

PAROTID, *adj.* } Fr. *parotide*; Gr. *παρω-*
ΠΑ'ROTIS, *n. s.* } *τις*, of *πάρα* and *ωρα*, the ears. Salivary, so named because near the ears: parotis is a tumor in the glandules behind and about the ears.

Beasts and birds, having one common use of spittle, are furnished with the *parotid* glands, which help to supply the mouth with it. *Grew.*

PAROTID GLANDS, or the **PAROTIDS**. See **ANATOMY**.

PAROXYSM, *n. s.* Fr. *paroxysme*; Gr. *παροξυσμος*. A fit; periodical exacerbation of a disease.

Amorous girls, through the fury of an hysterick *paroxysm*, are cast into a trance for an hour.

Harvey.

I fancied to myself a kind of ease, in the change of the *paroxysm*. *Dryden.*

The greater distance of time there is between the *paroxysms*, the fever is less dangerous, but more obstinate. *Arbuthnot.*

PAROXYSM, *παροξυσμος* in medicine, is the

fit, attack, or exacerbation of a disease that occurs at intervals, or has decided remissions or intermissions. It is applicable to all febrile, spasmodic, convulsive, painful, or otherwise violent diseases, whether the periods of remission be regular or irregular. Thus we speak of a paroxysm of ague, of gout, of colic, of epilepsy, of insanity, &c.

PARR (Catherine), was the eldest daughter of Sir Thomas Parr of Kendall. She was first married to John Nevil, lord Latimer; after whose death she so captivated king Henry VIII. that he raised her to the throne. The royal nuptials were solemnised at Hampton Court on the 12th of July, 1534. Being religiously disposed, she was, in the early part of her life, a zealous observer of the Romish rites and ceremonies; but, in the dawning of the Reformation, she became as zealous a promoter of the Lutheran doctrine; yet with such prudence and circumspection as her perilous situation required. In such danger was she at one time, that the king had actually signed a warrant for committing her to the tower. She had, however, art enough to restore herself to his good graces. The king died in January 1547, just three years and a half after his marriage with his third Catharine; who, in a short time, was again espoused to Sir Thomas Seymour, lord-admiral of England: but in September, 1548, she died in childbed. The historians of this period generally insinuate that she was poisoned by her husband, to make way for his marriage with the lady Elizabeth. She wrote, 1. *Queen Catharine Parr's Lamentation of a Sinner*, bewailing the ignorance of her blind life; London, 8vo. 1548, 1563; 2. *Prayers or Meditations*, wherein the mynd is stirred patiently to suffice all afflictions here, to set at nought the vain prosperities of this world, and always to long for the everlastynge felicitye. Collected out of holy workes, by the most virtuous and gracious princesse, Katharine queene of Englande, France, and Irelande. Printed by J. Wayland, 1543, 4to.,—1561, 12mo.; 3. *Other Meditations, Prayers, Letters*, &c., unpublished.

PARR (Thomas), or Old Parr, a remarkable Englishman, who lived in the reigns of ten kings and queens. He was the son of John Parr, a husbandman of Winnington, in the parish of Alderbury, Salop. Following the profession of his father, he labored hard, and lived on coarse fare. Being taken up to London by the earl of Arundel, the journey proved fatal to him. Owing to the alteration in his diet, to the change of the air, and his general mode of life, he lived but a very short time; though one Robert Samber says, in his work entitled *Long Livers*, that Parr lived sixteen years after his presentation to Charles II. He was buried in Westminster Abbey. Though he had not the use of his eyes, nor much of his memory several years before he died, yet he had his hearing and apprehension very well; and was able, even to the 130th year of his age, to do any husbandman's work, even threshing of corn. The following summary of his life is from Oldys's MS. notes on Fuller's Worthies: 'Old Parr was born 1483; lived at home until 1500, æt. seventeen, when he went

out to service. 1518, æt. thirty-five, returned home from his master. 1522, æt. thirty-nine, spent four years on the remainder of his father's lease. 1543, æt. sixty, ended the first lease he renewed of Mr. Lewis Porter. 1563, æt. eighty, married Jane, daughter of John Taylor, a maiden; by whom he had a son and a daughter, who both died very young. 1564, æt. eighty-one, ended the second lease which he renewed of Mr. John Porter. 1585, æt. 102, ended the third lease he had renewed of Mr. Hugh Porter. 1588, æt. 105, did penance in Alderbury church for lying with Katharine Milton, and getting her with child. 1595, æt. 112, he buried his wife Jane, after they had lived thirty-two years together. 1605, æt. 122, having lived ten years a widower, he married Jane, widow of Anthony Adda, daughter of John Loyd of Gilsells, in Montgomeryshire, who survived him. 1635, æt. 152 and nine months, he died; after they had lived together thirty years, and after fifty years possession of his last lease.

PARR (Samuel), LL. D., a late learned critic, was the son of an apothecary of Harrow in Middlesex, where he was born January 15th, 1747. Admitted into the school of his native place, at the age of six, he was at its head in his fourteenth year, and was soon after called upon, much against his inclination, to assist his father in his business. He was subsequently induced, however, to send him to Emmanuel College, Cambridge; but, unable to support a continuance of the expense, our young critic accepted the situation of an usher at Harrow under Dr. Sumner. In 1769 he entered into deacon's orders, and those of priest in 1777. In 1771 he was created A.M. at Cambridge, by royal mandate, for the purpose of qualifying him to succeed Dr. Sumner in the mastership of Harrow; but, not succeeding, he opened a school at Stanmore, where he was followed by no less than forty-five of his old pupils. At this time he married Miss Maulevrier, a Yorkshire lady, by whom he had three sons and three daughters. In 1776, the establishment at Stanmore failing, he became master of the grammar-school at Colchester, whence, in 1778, he removed to a similar establishment at Norwich. In 1780 he was presented to the rectory of Asterly in Lincolnshire, and in 1781 received the degree of LL. D. He obtained in 1783 the perpetual curacy of Hatton in Warwickshire, where he ever afterwards resided, and was about the same time presented by bishop Lowth to a prebend in St. Paul's. In 1802 Sir Francis Burdett presented him, unsolicited, to the valuable living of Graffham in the county of Huntingdon. The death of this distinguished scholar took place at Hatton, March 26th, 1825, in his seventy-ninth year. Dr. Parr's career as an author began in 1760, by the publication of *Two Sermons on Education*; he in the following year printed *A Discourse on the late Fast*, which excited great attention. In 1787 he assisted his friend the Rev. Henry Homer in a new edition of the learned Bellendenus, which he inscribed to Messrs. Fox, Burke, and Lord North, the character of whose oratory he drew with uncommon felicity. Having now put an end to all hopes of preferment from government,

a subscription was made for him by the Whig club, which secured him an annuity of £300 per annum. In 1789 he republished *Tracts by Warburton and a Warburtonian*, which he prefaced with severe strictures on bishop Hurd. In 1790 he was engaged in the controversy respecting the authorship of White's Bampton Lectures, from which it appeared that he had a considerable share in them. In 1791, his residence having been in danger of destruction from the Birmingham rioters, in consequence of his intimacy with Dr. Priestley, he published an eloquent tract, entitled *A Letter from Irenopolis to the Inhabitants of Eleutheropolis*. Easter Tuesday, 1800, he preached his celebrated Spital sermon, which he soon after published, with a great number of notes; and on the death of Mr. Fox his Characters of the late Right Hon. Charles James Fox, selected and in part written by Philopatrius Varvicensis. In 1819 he reprinted *Speeches by Roger Long, and John Taylor, of Cambridge, with a Critical Essay and Memoirs of the Authors*; and, towards the close of life, composed a pamphlet, which did not appear until after his death, defending bishop Halifax from the charge of having become a convert to the church of Rome. Like Dr. Johnson, Parr is said to have been astonishingly powerful in conversation, and, though possessed of much of the warmth of a political partizan, he was of disinterested and independent feelings, speaking generally: yet we cannot reconcile with strict integrity his final continuance in a church from some of whose principal doctrines he for many years dissented. Of all his family, two daughters survived him, and he left a widow, whom he married in an advanced period of life.

PARRA, in ornithology, a genus of birds belonging to the order of grallæ; the characters of which are: the bill is tapering and a little obtuse; the nostrils are oval, and situated in the middle of the bill; the forehead is covered with fleshy caruncles which are lobated; the wings are small and spinous. There are sixteen species:—

1. *P. chavaria* is about the size of a dung-hill cock, and stands a foot and a half from the ground. The bill is of a dirty white color; the upper mandible similar to that in a dung-hill cock; the nostrils are oblong, perrivous: on both sides, at the base of the bill, is a red membrane, which extends to the temples. The irides are brown. On the hind head are about twelve blackish feathers, three inches long, forming a crest, and hanging downwards. The rest of the neck is covered with a thick black down. The body is brown, and the wings and tail inclined to black. On the bend of the wings are two or three spurs half an inch long. The belly is a light black. The thighs are half bare of feathers. The legs are very long, and of a yellow-red color. The toes are so long as to entangle one another in walking. 'This species,' says Latham, 'inhabits the lakes, &c., near the river Cinu, about thirty leagues from Carthagena, in South America, and feeds on vegetables. Its gait is solemn and slow; but it flies easily and swiftly. It cannot run, unless assisted by the wings at the same time. When any part of the

skin is touched by the hand, a crackling is felt, though it is very downy beneath the feathers; and, indeed, this down adheres so closely as to enable the bird at times to swim. The voice is clear and loud, but far from agreeable. The natives, who keep poultry in great numbers, have one of these tame, which goes along with the flock about the neighbourhood to feed during the day, when this faithful shepherd defends them against birds of prey; being able, by means of the spurs on the wings, to drive off birds as big as the carrion vulture, and even that bird itself. It is so far of the greatest use, as it never deserts the charge committed to its care, bringing them all home safe at night. It is so tame as to suffer itself to be handled by a grown person, but will not permit children to attempt the same. For the above account we are indebted to Linné, who seems to be the only one who has given any account of this wonderful bird.

2. *P. Dominica*, is about the size of the lap-wing. The bill is yellow, as are also the head and upper parts; the under are of a yellowish white, bordering on rose color. The legs are also yellow. This species inhabits several of the warmer parts of America and St. Domingo.

3. *P. jacana*, the spur-winged water-hen, is about the size of the water rail. The bill is in length about an inch and a quarter, of an orange color; and on the forehead is a membranous flap, half an inch long, and nearly as broad. On each side of the head also is another of the same, about a quarter of an inch broad, and both together they surround the base of the bill. The head, throat, neck, breast, and under parts, are black; and sometimes the belly is mixed with white, &c. This species inhabit Brasil, Guiana, and Surinam; but are equally common at St. Domingo, where they frequent the marshy places, sides of ponds, and streams, and wade quite up to the thighs in the water. They are also generally seen in pairs; and, when separated, call each other continually till they join again. They are very shy, and most common in the rainy seasons in May and November. They are at all times very noisy; their cry sharp and shrill, and may be heard a great way off. This is called by the French *chirurgen*. The flesh is accounted pretty good.

4. *P. Senegalla*, is about the same size with the *Dominica*. Its bill is also yellow, tipped with black; the forehead is covered with a yellow skin; the chin and throat are black; the head and upper parts of the body and lesser wing covers the gray-brown. The lower part of the belly, and the upper and under tail coverts, are dirty white. At the bend of the wing is a black spur. It inhabits Senegal, and thence derives its name. The negroes call them *uett uett*, the French the squallers, because, when they see a man, they scream and fly off. They generally fly in pairs.

5. *P. variabilis*, the spur-winged water-hen, is about nine inches long. The bill is about fourteen inches in length, and in color orange-yellow. On the forehead is a flap of red skin; the crown of the head is brown, marked with spots of a darker color; the hind part of the neck is much

the same, but of a deeper dye. The sides of the head, throat, fore part of the neck, breast, belly, thighs, and under tail-coverts, are white, with a few red spots on the sides of the belly and base of the thighs. On the fore part of the wing is a yellow spur, &c. The legs are furnished with long toes, as in all the others, the color of which is bluish ash. Latham says that one which came under his inspection from Cayenne was rather smaller. It had the upper parts much paler; over the eye was a streak of white passing no further, and unaccompanied by a black one. The hind part of the neck was dusky black. It had only the rudiment of a spur; and the red caruncle on the forehead was less, and laid back on the forehead. From these differences, this learned ornithologist conceives it to have differed either in sex or age from the other. This species inhabits Brasil, and is said to be pretty common about Carthagena and in South America.

PARRELS, in a ship, are frames made of trunks, ribs, and ropes, which, having both their ends fastened to the yards, are so contrived as to go round about the mast, that the yards by their means may go up and down upon the mast. These also, with the breast-ropes, fasten the yards to the masts.

PARRET, or PEDRED, a river of Somersetshire, which rises in the south part of that county, on the borders of Dorsetshire. Near Langport it is joined by the Ordered, augmented by the Ivel; and, about four miles from this junction, it is joined by the Tone or Thone, a pretty large river, rising among the hills in the western parts of this county. About two miles below the junction of the Tone, the Parret receives another considerable stream; and, thus augmented, it passes by the town of Bridgewater, and falls into the Bristol Channel in Bridgewater Bay.

PARRHASIUS, a famous ancient painter of Ephesus, or, as some say, of Athens: he flourished about the time of Socrates, according to Xenophon. It is said that he was excelled by Timanthes, but excelled Zeuxis. His subjects were very licentious.

PARRHASIUS (Janus), a famous grammarian in Italy, who was born at Cosenza, in Naples, in 1470. He was intended for the law, the profession of his ancestors; but he preferred classical learning. His real name was John Paul Parisius; but, according to the humor of the grammarians of that age, he called himself Janus Parrhasius. He taught at Milan with much reputation, being admired for a graceful delivery, in which he chiefly excelled other professors. He went to Rome when Alexander VI. was pope; but left it when in danger of being involved in the misfortunes of Cajetan and Savello, with whom he had some correspondence. Soon after, he was appointed professor of rhetoric at Milan; but, presuming to censure the teachers there, they accused him of a criminal converse with his scholars, which obliged him to leave Milan. He went to Vicenza, where he obtained a larger salary; and he held this professorship till the Venetian states were laid waste by the troops of the League; upon which he returned to his native country. By the recommendation of John

Lascaurus, he was called to Rome by Leo X., who appointed him professor of polite literature. But, exhausted by his studies and labors, he became so afflicted with the gout that he was obliged to return to Calabria, where he was taken ill of a fever, and died. There are several books ascribed to him; particularly Commentaries on Horace and Ovid.

PAR'RICIDE, *n. s.* } *Fr. parricide*; Latin
PAR'RICIDICAL, *adj.* } *parricida, parricidium.*
PAR'RICIDIOUS. } One who destroys his
 father: hence one who injures his country vi-
 tally, or his patron; the murder of a father: the
 adjective corresponding.

I told him the revenging gods
 'Gainst *parricides* did all their thunder bend;
 Spoke with how manifold and strong a bond
 The child was bound to the father. *Shakespeare.*
 Although he were a prince in military virtue ap-
 proved, and likewise a good law-maker; yet his
 cruelties and *parricides* weighed down his virtues.

Bacon.
 He is now paid in his own way, the *parricidius*
 animal, and punishment of murderers is upon him.

Brown.
 Morat was always bloody, now he's base;
 And has so far in usurpation gone,
 He will by *parricide* secure the throne. *Dryden.*

PARRICIDE is the murder of one's parents or children. By the Roman law it was punished in a severer manner than any other kind of homicide. After being scourged, the delinquents were sewed up in a leathern sack, with a live dog, a cock, a viper, and an ape, and thus cast into the sea. Solon, it is true, in his laws, made none against *parricide*; apprehending it impossible that one should be guilty of so unnatural a barbarity. And the Persians, according to Herodotus, entertained the same notion, when they adjudged all persons who killed their reputed parents to be bastards. Thus the English law treats it no otherwise than as simple murder, unless the child was also the servant of the parent. For, though the breach of natural relation is unobserved, yet the breach of civil or ecclesiastic connexions, when coupled with murder, denominates it a new offence; no less than a species of treason, called *parva prodition*, or *petit treason*; which, however, is nothing else but an aggravated degree of murder; although, on account of the violation of private allegiance, it is stigmatised as an inferior species of treason. And thus, in the ancient Gothic constitution, we find the breach, both of natural and civil relations, ranked in the same class with crimes against the state and sovereign.

PARROCEL, the name of three eminent French painters, of whom Joseph was born at Brignoles, in 1648; studied at Paris, and in Italy under Bourguignon; became eminent for painting battles, though he had never seen an army; was elected a member of the academy of painting; and died in Paris in 1704. Charles, his son and pupil, became also so eminent that he was appointed to paint the conquests of Louis XV. He died in Paris in 1752, aged sixty-three. Peter, born at Avignon, nephew to Joseph, was also his pupil, and performed many beautiful works at St. Germain, &c. His chief piece is at Marseilles. He died in 1739, aged seventy-five.

PAR'ROT, *n. s.* *Fr. perroquet.* A party-colored bird, remarkable for its imitation of the human voice.

Some will evermore peep through their eyes
 And laugh like *parrots* at a bag-piper. *Shakespeare.*
 Who taught the *parrot* human notes to try?
 'Twas witty want, fierce hunger to appease.

Dryden.
PARROT. See **PSITTACUS**.
PAR'RY, *v. n.* *Fr. parer.* To fence, or put
 by thrusts.

A man of courage who cannot fence, and will put
 all upon one thrust, and not stand *parrying*, has the
 odds against a moderate fencer *Locke*

I could
 By dint of logic strike thee mute;
 With learned skill, now push, now *parry*,
 From Darii to Bocardo vary. *Prior.*

While Bigotry, with well-dissembled fears,
 His eyes shut fast, his fingers in his ears,
 Mighty to *parry* and push by God's word
 With senseless noise, his argument the sword,
 Pretends a zeal for godliness and grace,
 And spits abhorrence in the Christian's face.

Cowper.
PARRY (Richard), D.D., a learned English
 divine, educated at Oxford, where he graduated
 in 1757. He was rector of Wichampton, and
 minister of Market Harborough, where he died
 in 1780. He wrote many useful religious trea-
 tises.

PARRY (Caleb Hillier), M. D., F.R.S., an
 ingenious physician and natural historian of
 Bath, father of the celebrated captain Parry.
 Dr. Parry is known as the author of *A Treatise*
on Wool, containing the result of a series of ex-
 periments on this staple commodity to which
 his attention was originally directed by the
 circumstance of king George III. presenting two
 Merino rams to the Bath and West of England
 Society. But his principal work is the *Elements*
of Pathology, printed in 1816. He died March
 9th, 1822, having been deprived of the use of
 his faculties by palsy in 1816.

PARSE, *v. a.* *Lat. pars.* To resolve
 a sentence into its elements or parts of speech.

Let him construe the letter into English, and
parse over perfectly. *Ascham's Schoolmaster.*

Let scholars reduce the words to their original,
 to the first case of nouns, or first tense of verbs, and
 give an account of their formations and changes
 their syntax and dependencies, which is called *para-*
sing. *Watts on the Mind.*

The nature of the subject, as well as the adapta-
 tion of it to learners, requires that it should be
 divided into two parts, viz. *parsing*, as it respects
 etymology alone; and *paring*, as it respects both
 etymology and syntax. *Murray.*

PARSHORE, a town of Worcestershire,
 seven miles from Worcester, and 102 from Lon-
 don, on the north side of the Avon, near its
 junction with the Bow, being a considerable
 thoroughfare in the lower road from Worcester
 to London. A religious house was founded
 here in 604, a small part of which now remains,
 and is used as the parish church of Holy Cross,
 the whole of which contained above ten acres.
 The abbey church was 250 feet long, and 120
 broad. The parish of Parshore is of great ex-
 tent, and has within its limits many manors
 and chapelries. At present it has two parishes,

Holy Cross and St. Andrew. In Holy Cross church are several very antique monuments. Its chief manufacture is stockings. Markets on Tuesday and Saturday.

PARSIMONIOUS, *adj.* } Lat. *parsimonia*,
PARSIMONIOUSLY, *adv.* } à parco, to save.
PARSIMONIOUSNESS, *n. s.* } Frugal; saving;
PARSIMONY. } sparing: hence covetous: the adverb and noun substantive follow these senses: parsimony is frugality; disposition to save or spare; niggardliness; covetousness.

A prodigal king is nearer a tyrant, than a *parsimonious*: for store at home draweth not his contemplations abroad, but want supplieth itself of what is next.

Bacon.

The ways to enrich are many; *parsimony* is one of the best, and yet it is not innocent; for it withholdeth men from works of liberality.

Id.

Parsimonious age and rigid wisdom.

Rowe.

Extraordinary funds for one campaign may spare us the expense of many years, whereas a long *parsimonious* war will drain us of more men and money.

Addison.

These people, by their extreme *parsimony*, soon grow into wealth from the smallest beginnings.

Swift.

Our ancestors acted *parsimoniously*, because they only spent their own treasure for the good of their posterity; whereas we squandered away the treasures of our posterity.

Id.

To thrift and *parsimony* much inclined,
She yet allows herself that boy behind;
The shivering urchin bending as he goes,
With slip-shod heels, and dew-drop at his nose;
His predecessor's coat advanced to wear,
Which future pages yet are doomed to share.

Cowper.

PARSLEY, *n. s.* Fr. *persil*; Wel. *persli*; Belg. *paterselay*, of Lat. *petrostelinum* (Gr. *πετρα* a rock, and *σέλιον*), a kind of parsley growing among rocks. An herb.

A wench married in the afternoon, as she went to the garden for *parsley* to stuff a rabbit. *Shakespeare.*

Green beds of *parsley* near the river grow.

Dryden.

Sempronia dug Titus out of the *parsley*-bed, as they use to tell children, and thereby became his mother.

Locke.

PARSLEY, in botany. See *APIUM*.

PARSLEY, BASTARD. See *CAUCALIS*.

PARSLEY, FOOL'S. See *ÆTHUSA*.

PARSLEY, MOUNTAIN. See *ATHAMANTA*.

PARSNIP, *n. s.* Lat. *pastinaca*. A plant.

November is drawn in a garment of changeable green, and bunches of *parsneps* and turneps in his right hand.

Peucham.

PARSNIP, in botany. See *PASTINACA*.

PARSNIP, COW'S. See *HERACLEUM*.

PARSON, *n. s.* } From Lat. *persona*, be-
PARSONAGE. } cause the parson 'omnium *personam* in ecclesia sustinet.' The priest or clergyman of a parish; one that has a parochial charge of souls; also applied to the teachers of the Presbyterians and Dissenters; and often in banter to all these parties.

Sometimes comes she with a tithe-pig's tail,
Tickling the *parson* as he lies asleep;
Then dreams he of another benefice. *Shakespeare.*

Abbot was preferred by king James to the bishoprick of Coventry and Litchfield, before he had been *parson*, vicar, or curate of any parish church.

Clarendon.

A PARSON is one that has full possession of all the rights of a parochial church. He is called parson, persona, because by his person the church is represented; and he is in himself a body corporate, to protect and defend the rights of the church (which he personates) by a perpetual succession. He is sometimes called the rector or governor of the church; but the appellation of parson is the most legal and most honorable title that a parish priest can enjoy; because such a one (Sir Edward Coke observes) and he only, is said *vicem seu personam ecclesie gerere*. A parson has, during his life, the freehold in himself of the parsonage house, the glebe, the tithes, and other dues. But these are sometimes appropriated; that is, the benefice is perpetually annexed to some spiritual corporation, either sole or aggregate, being the patron of the living; whom the law esteems equally capable of providing for the service of the church as any single private clergyman. The appropriating corporations, or religious houses, were wont to depute one of their own body to perform divine service, and administer the sacraments in those parishes of which the society was thus the parson. This officiating minister was in reality no more than a curate, deputy, or vicegerent, of the appropriator, and therefore called vicarius, vicar. His stipend was at the discretion of the appropriator, who was, however, bound of common right to find somebody, *qui illi de temporalibus, episcopo de spiritualibus, debeat respondere*. But this was done in so scandalous a manner, and the parishes suffered so much by the neglect of the appropriators, that the legislature was forced to interpose: and accordingly it is enacted, by statute 15 Rich. II. c. 6, that in all appropriations of churches the diocesan bishop shall ordain (in proportion to the value of the church) a competent sum to be distributed among the poor parishioners annually; and that the vicarage shall be sufficiently endowed. The parish frequently suffered, not only by the want of divine service, but also by withholding those alms for which, among other purposes, the payment of tithes was originally imposed: and therefore in this act a pension is directed to be distributed among the poor parochians, as well as a sufficient stipend to the vicar. But he, being liable to be removed at the pleasure of the appropriator, was not likely to insist too rigidly on the legal sufficiency of the stipend; and therefore, by statute 4 Hen. IV. c. 12, it is ordained that the vicar shall be a secular person, not a member of any religious house; that he shall be vicar perpetual, not removeable at the caprice of the monastery; and that he should be canonically instituted and inducted, and be sufficiently endowed, at the discretion of the ordinary, for these three express purposes, to do divine service, to inform the people, and to keep hospitality. The endowments, in consequence of these statutes, have usually been by a portion of the glebe or land belonging to the parsonage, and a particular share of the tithes, which the appropriators found it most troublesome to collect, and which are therefore generally called petty or small tithes; the greater, or prædial tithes, being still reserved to their own use. But one and

the same rule was not observed in the endowment of all vicarages. Hence some are more liberally, and some more scantily endowed : and hence the tithes of many things, as wood in particular, are in some parishes rectorial, and in some vicarial tithes. The distinction, therefore, of a parson and vicar is this : the parson has for the most part the whole right to all the ecclesiastical dues in his parish ; but a vicar has generally an appropriator over him, entitled to the best part of the profits, to whom he is in effect perpetual curate, with a standing salary. Though in some places the vicarage has been considerably augmented by a large share of the great tithes ; which augmentations were greatly assisted by statute 27 Car. II. c. 8, enacted in favor of poor vicars and curates, which rendered such temporary augmentations (when made by the appropriators) perpetual. The method of becoming a parson or vicar is much the same. To both there are four requisites necessary ; holy orders, presentation, institution, and induction. By common law, a deacon, of any age, might be instituted and inducted to a parsonage or vicarage ; but it was ordained by statute 13 Eliz. c. 12, that no person under twenty-three years of age, and in deacon's orders, should be presented to any benefice with cure ; and, if he were not ordained priest within one year after his induction, he should be ipso facto deprived : and now, by statutes 13 and 14 Car. II. c. 4, no person is capable to be admitted to any benefice, unless he has been first ordained a priest ; and then he is, in the language of the law, a clerk in orders. But if he obtain orders, or a license to preach, by money or corrupt practices (which seem to be the true, though not the common, notion of simony), the person giving such orders forfeits £40, and the person receiving £10, and is incapable of any ecclesiastical preferment for seven years after. Any clerk may be presented to a parsonage or vicarage ; that is, the patron, to whom the advowson of the church belongs, may offer his clerk to the bishop of the diocese to be instituted. But, when he is presented, the bishop may refuse him upon many accounts. As, 1. If the patron is excommunicated, and remains in contempt forty days ; or, 2. If the clerk be unfit : which unfitness is of several kinds. First, with regard to his person ; as if he be a bastard, an outlaw, on excommunicate, an alien, under age, or the like. Next, with regard to his faith or morals ; as for any particular heresy, or vice that is malum in se ; but if the bishop alleges only in generals, as that he is schismaticus inverteatus, or objects a fault that is malum prohibitum merely, as haunting taverns, playing at unlawful games, or the like, it is not good cause of refusal. Or, lastly, the clerk may be unfit to discharge the pastoral office for want of learning. In any of which cases the bishop may refuse the clerk. In case the refusal is for heresy, schism, inability of learning, or other matter of ecclesiastical cognizance, there the bishop must give notice to the patron of such his cause of refusal, who, being usually a layman, is not supposed to have knowledge of it ; else he cannot present by lapse ; but, if the cause be temporal,

there he is not bound to give notice. If an action at law be brought by the patron against the bishop for refusing his clerk, the bishop must assign the cause. If the case be of a temporal nature, and the fact admitted (for instance, outlawry), the judges of the king's courts must determine its validity, or whether it be sufficient cause of refusal : but, if the fact be denied, it must be determined by a jury. If the cause be of a spiritual nature (as heresy, particularly alleged) the fact, if denied, shall also be determined by a jury : and, if the fact be admitted or found, the court, upon consultation and advice of learned divines, shall decide its sufficiency. If the cause be want of learning, the bishop need not specify in what points the clerk is deficient, but only allege that he is deficient ; for statute 9 Edw. II. st. 1, c. 13, is express, that the examination of the fitness of a person presented to a benefice belongs to the ecclesiastical judge. But because it would be nugatory in this case to demand the reason of refusal from the ordinary, if the patron were bound to abide by his determination, who has already pronounced his clerk unfit : therefore, if the bishop returns the clerk to be minus sufficiens in literatura, the court shall write to the metropolitan to re-examine him, and certify his qualifications ; which certificate of the archbishop is final. If the bishop has no objections, but admits the patron's presentation, the clerk so admitted is next to be instituted by him ; which is a kind of investiture of the spiritual part of the benefice ; for, by institution, the care of the souls of the parish is committed to the charge of the clerk. When a vicar is instituted, he (besides the usual forms) takes, if required by the bishop, an oath of perpetual residence ; for the maxim of law is, that vicarius non habet vicarium : and, as the non-residence of the appropriators was the cause of the perpetual establishment of vicarages, the law judges it very improper for them to defeat the end of their constitution, and by absence to create the very mischief which they were appointed to remedy ; especially as, if any profits are to arise from putting in a curate and living at a distance from the parish, the appropriator, who is the real parson, has undoubtedly the elder title to them. When the ordinary is also the patron, and confers the living, the presentation and institution are one and the same act, and are called a collation to a benefice. By institution or collation the church is full, so that there can be no fresh presentation till another vacancy, at least in the case of a common patron ; but the church is not full against the king till induction : nay, even, if a clerk is instituted upon the king's presentation, the crown may revoke it before induction, and present another clerk. Upon institution, also, the clerk may enter on the parsonage house and glebe, and take the tithes ; but he cannot grant or let them, or bring an action for them, till induction. See INDUCTION. For the rights of a parson or vicar, in his tithes and ecclesiastical dues, see TITHES. As to his duties, they are so numerous that it is impracticable to recite them here with any tolerable conciseness or accuracy ; but the reader who has occasion may consult B. Gibson's

Codex, Johnson's Clergyman's Vade Mecum, and Burn's Ecclesiastical Law.

A **PARSONAGE** is a rectory, or parish church, endowed with a glebe, house, lands, tithes, &c., for the maintenance of a minister, with cure of souls within such parish.

PARSONS (James), M. D. and F. R. S., a late eminent and learned physician, born at Barnstaple, Devonshire, in 1705. He was educated in Dublin, whence he went to Paris, and improved himself under Astruc, Lemery, Hunaud, Le Cat, Bouldue, and Jussieu. He graduated at Rheims in 1736, came to London, and was made F. R. S. in 1740. He was also a member of the Antiquarian, Medical, and Agricultural Societies. In 1751 he was admitted a licentiate of the College of Physicians, and appointed physician to St. Giles's infirmary. He also assisted Dr. James Douglas in anatomy. He died in 1770. He was much esteemed by the literati at home, and had an extensive correspondence with those abroad. His publications are numerous and valuable. Of these we shall only mention his *Remains of Japhet*; being *Historical Enquiries into the affinity and origin of the European Languages*. Its object is to prove the antiquity of the first inhabitants of these islands.

PARSONS (Robert), an eminent writer of the church of Rome, born at Nether Stowey, near Bridgewater, in 1546, and educated at Baliol College, Oxford, where he distinguished himself as a zealous Protestant and an acute disputant; but, being charged by the society with incontinency and embezzling the college money, he went to Flanders, and declared himself a Catholic. After travelling to several other places, he effected the establishment of the English seminary at Rome, and procured father Allen to be chosen rector of it. He himself was appointed the head of the mission to England, to dethrone queen Elizabeth, and extirpate the Protestant religion. He accordingly came over in 1580, and took some bold steps for that purpose, in which he concealed himself with great art, travelling about the country to gentlemen's houses, disguised in the habit, sometimes of a soldier, sometimes of a gentleman, and at other times like a minister or an apparitor; but, father Campion being seized and committed to prison, our author eloped, and went to Rome, where he was made rector of the English seminary. He had long entertained the most sanguine hopes of converting to the popish faith the young king of Scots, which he considered as the most effectual means of bringing over his subjects to the same religious principles; but, finding this impossible, he published in 1594 his celebrated book, under the name of Doleman, to overthrow James's title to the crown of England. He died in Rome in 1610, and was buried in the chapel of the English College. He also wrote, 1. *A Defence of the Catholic Hierarchy*; 2. *The Liturgy of the Sacrament of the Mass*; 3. *A Memorial for the Reformation*; and several other tracts.

PART, *n. s., v. a., v. n. & adv.*

PARTABLE, *adj.*

PARTAGE, *n. s.*

PARTIBLE, *adj.*

PARTLY, *adv.*

Fr. *part*;
Italian, Spanish,
and Portuguese *parte*;
Teuton. *part*;

Belg. *paert*; Heb. פֶּרֶץ. A section or division of a whole; a portion: hence, a member; particular; ingredient; quality or power; region; proportional quantity or share; concern; particular business or duty; often a character: side; interest or faction; reciprocal relation; any thing relating or belonging; action, conduct; in 'good or ill part' taken as a good or ill action: 'for the most part' means, in most instances; commonly, to part: to divide; separate; share; distribute; break or keep asunder: as a neuter verb, to take share; quit; be separated; take farewell; go away: 'to part with' is also to quit; resign; be separated from; lose: partable and partible mean, divisible; separable: partage [Fr. *partage*], separation; division; act of dividing: partly, in part, degree, or measure.

The people stood at the nether *part* of the mount.

Erodus.

Part it in pieces, and pour oil thereon.

Leviticus.

Sheba said, we have no *part* in David, neither have we inheritance in the son of Jesse. 2 *Samuel*.

Nought but death shall *part* thee and me.

Ruth.

As his *part* is, that goeth down to the battle, so shall his *part* be, that tarrieth by the stuff; they shall *part* alike.

Isaiah.

When he had gone over those *parts*, he came into Greece.

Acts xx. 2.

All that believed, sold their goods, and *parted* them to all men, as every man had need.

Acts ii.

Forasmuch as the children are partakers of flesh and blood, he also took *part* of the same.

Hebrews.

The ungodly made a covenant with death, because they are worthy to take *part* with it.

Wisdom i. 16.

Thou marble hewest, ere long to *part* with breath, And houses rearest, unmindful of thy death.

Sandys.

For Zelmene's *part* she would have been glad of the fall, which made her bear the sweet burden of Philoclea, but that she feared she might receive some hurt.

Sidney.

Who is courteous, noble, liberal, but he that hath the example before his eyes of Amphialus; where are all heroic *parts*, but in Amphialus?

Id.

Although no man was, in our *parts*, spoken of but he, for his manhood; yet, as though therein he excelled himself, he was called the courteous Amphialus.

Id.

Such licentious *parts* tend, for the most *part*, to the hurt of the English, or maintenance of their own lewd liberty.

Spenser.

God accepteth it in *good part*, at the hands of faithful men.

Hooker.

That *part*, which, since the coming of Christ, partly hath embraced, and partly shall hereafter embrace the Christian religion, we term, as by a more proper name, the church of Christ.

Id.

The citizens were for the most *part* slain or taken.

Knolles.

Helen's cheeks, but not her heart:

Atalanta's better *part*.

Shakespeare.

When I have spoken of you dispraisingly,

Hath ta'en your *part*.

Id.

That *part*.

Was aptly fitted, and naturally performed. *Id.*

Find him, my lord,

And chide him hither straight: this *part* of his Conjoins with my disease.

Id.

I conjure thee, by all the *parts* of man,
Which honour does acknowledge. *Id.*

In the narrow seas, that *part*
The French and English, there miscarried
A vessel of our country. *Id.*
He wrung Bassanio's hand, and so they *parted*. *Id.*

Ere I could
Give him that *parting* kiss, which I had set
Betwixt two charming words, comes in my father. *Id.*

For her sake I do rear up her boy;
And for her sake I will not *part* with him. *Id.*
His hot love was *partable* among three other of his
mistresses. *Camden's Remains.*

Let them be so furnished and instructed for the
military *part*, as they may defend themselves. *Bacon.*

The pneumatical *part*, which is in all tangible
bodies, and hath some affinity with the air, per-
formeth the *parts* of the air: as, when you knock
upon an empty barrel, the sound is, in *part*, created
by the air in the outside, and, in *part*, by the air in
the inside. *Id.*

This law wanted not *parts* of prudent and deep
foresight; for it took away occasion to pry into the
king's title. *Id.*

Make the mou *ds partible*, glued or cemented to-
gether, that you may open them, when you take out the
fruit. *Id.*

Let not thy divine heart
Forethink me any ill;
Destiny may take thy *part*,
And may thy fears fulfil. *Donna.*

It was so strong, that never any filled
A cup, where that was but by drops instilled,
And drunke it off; but 'twas before allaid
With twenty *parts* in water. *Chapman.*
For my *part*, I have no servile end in my labour,
which may restrain or embase the freedom of my
judgment. *Wotton.*

Henry had divided
The person of himself into four *parts*. *Daniel.*

And that he might on many props repose,
He strengths his own, and who his *part* did take. *Id.*

Store of plants, the effects of nature; and where
the people did their *part*, such increase of maize. *Heylin.*

Of a plain and honest nature, for the most *part*
they were found to be. *Id.*

God is the master of the scenes: we must not
chase which *part* we shall act; it concerns us only
to be careful that we do it well. *Taylor.*

Inquire not whether the sacraments confer grace
by their own excellency, because they, who affirm
they do, require so much duty on our *parts*, as they
also do, who attribute the effect to our moral dispo-
sition. *Id.*

An affectionate wife, when in fear of *parting* with
her beloved husband, heartily desired of God his life
or society, upon any conditions that were not sinful.
Id.

The same body, in one circumstance, is more
weighty; and, in another, is more *partible*. *Digby.*

Besides his abilities as a soldier, which were emi-
nent, he had very great *parts* of breeding, being a
very great scholar in the political *parts* of learning.
Clarendon.

Accuse not Nature, she hath done her *part*;
Do thou but thine. *Milton's Paradise Lost.*

Powerful hands will not *part*
Easily from possession won with arms. *Id.*

So *parted* they; the angel up to heaven
From the thick shade, and Adam to his bower. *Id.*

Call up their eyes, and fix them on your exam-
ple; that so natural ambition might take *part* with
reason and their interest to encourage imitation. *Glansville.*

These conclude that to happen often, which hap-
peneth but sometimes; that never, which happeneth
but seldom; and that always, which happeneth for
the most *part*. *Broune.*

Celia, for thy sake, I *part*
With all that grew so near my heart;
And, that I may successful prove,
Transform myself to what you love. *Waller.*

A brand preserved to warm some prince's heart,
And make whole kingdoms take her brother's *part*. *Id.*

Jove did both hosts survey,
And, when he pleased to thunder, *part* the fray. *Id.*

Lixivate salts, though, by piercing the bodies of
vegetables, they dispose them to *part* readily with
their tincture, yet some tinctures they do not only
draw out, but likewise alter. *Boyle.*

The Scripture tells us the terms of this covenant
of God's *part* and our's; namely, that he will be our
God, and we shall be his people. *Tillotson.*

When your judgment shall grow stronger, it will
be necessary to examine, *part* by *part*, those works
which have given reputation to the masters. *Dryden.*

Of heavenly *part*, and *part* of earthly blood;
A mortal woman mixing with a god. *Id.*

Go not without thy wife, but let me bear
My *part* of danger, with an equal share. *Id.*
All *parts* resound with tumults, plaints, and fears,
And grisly death, in sundry shapes, appears. *Id.*
All the world,

As 'twere the bus'ness of mankind to *part* us,
Is armed against my love. *Id.*

Thy father
Embraced me, *parting* for the' Etrurian land. *Id.*

Our ideas of extension and number, do they not
contain a secret relation of the *parts*? *Locke.*

This was the design of a people that were at li-
berty to *part* asunder, but desired to keep in one body. *Id.*

The ideas of hunger and warmth are some of the
first that children have, and which they scarce ever
part with. *Id.*

Men have agreed to a disproportionate and un-
equal possession of the earth, having found out a
way, how a man may fairly possess more land than
he himself can use the product of, by receiving in
exchange for the overplus, gold and silver; this
partage of things, in an equality of private posses-
sions, men have made practicable out of the bounds
of society, without compact, only by putting a value
on gold and silver, and tacitly agreeing in the use
of money. *Id.*

What! *part*, for ever *part*? unkind Ismena;
Oh! can you think that death is half so dreadful,
As it would be to live without thee? *Smith.*

They thought it reasonable to do all possible ho-
nour to their memories; *partly* that others might be
encouraged to the same patience and fortitude, and
partly that virtue, even in this world, might not lose
its reward. *Nelson.*

For my *part*, I think there is nothing so secret
that shall not be brought to light, within the world.
Burnet.

Solomon was a prince adorned with such *parts* of

mind, and exalted by such a concurrence of all prosperous events to make him magnificent.

South.

What a despicable figure must mock-patriots make, who venture to be hanged for the ruin of those civil rights which their ancestors, rather than *part with*, chose to be cut to pieces in the field of battle!

Addison's Freeholder.

The inhabitants of Naples have been always very notorious for leading a life of laziness and pleasure, which I take to arise out of the wonderful plenty of their country, that does not make labour so necessary to them, and partly out of the temper of their climate, that relaxes the fibres of their bodies, and disposes the people to such an idle indolent humour.

Id. on Italy.

The arm thus waits upon the heart,

So quick to take the bully's part;

That one, tho' warm, decides more slow

Than t'other executes the blow. *Prior.*

The liver minds his own affairs,

And *parts* and strains the vital juices. *Id.*

Many irregular and degenerate *parts*, by the defective oeconomy of nature, continue complicated with the blood. *Blackmore.*

The good things of this world so delight in, as remember, that we are to *part with* them, to exchange them for more durable enjoyments.

Atterbury.

The Indian princes discover fine *parts* and excellent endowments, without improvement. *Felton.*

Agamemnon provokes Apollo, whom he was willing to appease afterwards at the cost of Achilles, who had no *part* in his fault. *Pope.*

Jove himself no less content would be
To *part* his throne, and share his heaven with thee. *Id.*

If it pleases God to restore me to my health, I shall make a third journey; if not, we must part, as all human creatures have parted. *Swift.*

As for riches and power, our Saviour plainly determines, that the best way to make them blessings, is to *part with* them. *Id.*

Any employment of our talents, whether of our *parts*, our time, or money, that is not strictly according to the will of God, that is not for such ends as are suitable to his glory, are as great absurdities and failings. *Leve.*

Eusebia brings them up to all kinds of labour that are proper for women, as sewing, knitting, spinning, and all other *parts* of housewifery. *Id.*

May such success attend the pious plan,
May Mercury once more embellish man,
Grace him again with long forgotten arts,
Reclaim his taste, and brighten up his *parts*.

Cowper.

Friends meet to *part*; Love laughs at faith;
True foes, once met, are joined till death!

Byron.

PART, ALIQUANT, is a quantity which, being repeated any number of times, becomes always either greater or less than the whole. Thus 5 is an aliquant part of 17, and 9 an aliquant part of 10, &c. The aliquant part is resolvable into aliquot parts. Thus 15, an aliquant part of 20, is resolvable into 10 one half, and 5 a fourth part of the same.

PART, ALIQUOT, is a quantity which, being repeated any number of times, becomes equal to an integer. Thus 6 is an aliquot part of 24, and 5 an aliquot part of 30, &c.

PARTS OF SPEECH, in grammar. See **GRAMMAR** under **ENGLISH LANGUAGE**.

PARTAKE, *v. n. & v. a.* } From *part* and *PARTAKE*. } *take*. To take part

or share with or (as Mr. Locke uses it) is; to participate; have property in or claim to; be admitted to combine or conspire; as a verb active, to share; have part in; admit to part (obsolete): partaker follows all these senses, and is used with *in*, *with*, and *of*.

Thou consentedst, and hast been *partaker* with adulterers. *Psalms.*

If we had been in the days of our fathers, we would not have been *partakers* with them in the blood of the prophets. *Matthew.*

My friend, hight Philemon, I did *partake*

Of all my love, and all my privacy.

Who greatly joyous seemed for my sake. *Spenser.*

They whom earnest lets hinder from being *partakers* of the whole, have yet, through length of divine service, opportunity for access unto some reasonable part thereof. *Hooker.*

You may *partake* of any thing we say;

We speak no treason. *Shakspeare. Richard III.*

By and by, thy bosom shall *partake*

The secrets of my heart. *Shakspeare.*

Your exultation *partake* to every one. *Id.*

Didst thou

Make us *partakers* of a little gain;

That now our loss might be ten times as much? *Id.*

Wish me *partaker* in thy happiness,

When thou do'st meet good hap. *Id.*

The attorney of the dutchy of Lancaster *partakes* partly of a judge, and partly of an attorney-general. *Bacon.*

He took upon him the person of the duke of York, and drew with him complices and *partakers*. *Id.*

At season fit

Let her with thee *partake* what thou hast heard. *Milton.*

As it prevents factions and *partakings*, so it keeps the rule and administration of the laws uniform. *Hale.*

Partake and use my kingdom as your own,
And shall be yours while I command the crown. *Dryden.*

My royal father lives!

Let every one *partake* the general joy. *Id.*

How far brutes *partake* in this faculty is not easy to determine. *Locke.*

Truth and falsehood have no other trial but reason and proof, which they made use of to make themselves knowing, and so must others too that will *partake* in their knowledge. *Id.*

With such she must return at setting light,

Though not *partaker*, witness of their night. *Prior.*

His bitterest enemies were *partakers* of his kindness, and he still continued to entreat them to accept of life from him, and, with tears, bewailed their infidelity. *Calamy.*

PARTANICO, a pleasant town in the Val di Mazzara, Sicily, situated at the base of the Palermo Mountains. The neighbouring country, though fertile, is subject to the Mal-aria. From this to Palermo, a distance of twenty-four miles, there is an excellent carriage-road across the mountains, formed with great labor. Inhabitants 5000.

PARTERRE, *n. s.* Fr. *parterre*, of Lat. *par terra*. A level part or division of ground, that, for the most part, faces the best front of a house.

The vast *parterres* a thousand hands shall make;
Lo! Cobham comes, and floats them with a lake. *Pope.*

There are as many kinds of gardening as of poetry;

your makers of *parterres* and flower gardens are epigrammatists and sonneteers.

Spectator.

This civil bickering and debate

The goddess chanced to hear,

And flew to save, ere yet too late,

The pride of the *parterre*.

Couper.

PARTERRES, in gardening, are of two kinds; the plain, and *parterres* of embroidery. Plain *parterres* are most valuable in England, because of the firmness of the English grass turf, which is superior to that of any other part of the world: and the *parterres* of embroidery are cut into shell and scroll work, with alleys between them. An oblong, or long square, is accounted the most proper figure for a *parterre*; and a *parterre* should indeed be always twice as long as it is broad, because, according to the laws of perspective, a long square always sinks to a square; and an exact square always appears less than it really is. As to the breadth of a *parterre*, it is to be proportionable to the front of the house; but less than 100 feet in breadth is too little. There should be on each side the *parterre* a terrace walk raised for a view, and the flat of the *parterre* between the terraces should never be more than 300 feet at the utmost in breadth, and about 140 feet in width, with twice and a half that in length, is esteemed a very good size and proportion.

Mr. Loudon observes that in ornamental gardens, and *parterres* of every kind, the soil should be unmanured, and rather poor than otherwise; but the situation and exposure should be good, and the surface of the ground beautifully varied. The extent of them must be in proportion to the nature of the place to which they belong. In general they need not be large. In almost every kind a few trees and shrubs should be introduced, to remove from the general view the appearance of insipidity, and to break it into separate scenes; one of which alone should be seen at a time, that, the extent of vision being circumscribed, the spectator may thus be induced to examine or admire the minute beauties of single objects, or small compositions. And it is observed that, where *parterres* are intermingled with lawns, those disgusting lines of separation at the edges of walks, or round groups and dug patches of flowers or shrubs, which abound every where, should not be introduced; the gravel of the walk, and the earth at the edges of the dug patches or groups, ought to be kept nearly on a level with the grass on the lawn. Where much culture is requisite in the groups, the line of separation should be delicate and graceful; and where this is not necessary, or not much attended to, both the lines of the walk, and the lines of the dug group, or patch, should blend and harmonise, and, in a natural easy manner, glide insensibly into each other.

PARTHAON, in fabulous history, the son of Neptune, or of Agenor and Epicaste, and father of Œneus, Sterope, &c., by his wife Euryte.

PARTHENAY (John de), lord of Soubise, an eminent French commander, born in 1512. He commanded the troops in Italy in 1550; and supported the Protestant cause till his death in 1566. He left one daughter.

PARTHENAY (Catharine de), niece to the pre-

ceding, and lady of Soubise, was married in 1568 to the baron de Pons, and in 1575 to René Visc. Rohan, by whom she had the famous duke of Rohan, who so bravely defended the Protestant cause during the civil wars under Louis XIII. She published poems, comedies, and tragedies. Her daughter Catharine was eminent for virtue, and married the duke of Deux Ponts. She died in 1607, and her mother in 1631.

PARTHENIA, in literature, is the title of a curious thin folio book of lessons for the Virginal, that was engraved on copper, and published in the reign of king James I. The full title is, *Parthenia*, or the Maidenhead of the first Musicke that ever was printed for the Virginalists. Composed by three famous masters: William Byrd, Dr. John Bull, and Orlando Gibbons, Gentlemen of his Majesties most illustrious Chappel. Bird being called 'gentleman of his majesties chappel,' seems here to imply that he was living when it was published. King James died in 1525, and Bird in 1523. The first three movements in this collection, consisting of a prelude; pavana; Sir William Peder; and a galiardo; are in G minor, and may be called a suite of lessons. The fourth and fifth movements, prelude; and galiardo, Mrs. Marye Brownlo, in C; and the sixth, seventh, and eighth, pavana, the earl of Salisbury; galiardo primo; and galiardo secundo. Mrs. Marye Brownlo, in A minor, constitute what may likewise be regarded as two other suites de pieces, or sets of lessons.

PARTHENIA, or **PARTHENOS**, in mythology, an epithet of Minerva, because she is said to have preserved her virginity. When the Rhodians neglected her worship, and the cultivation of the fine arts, the Athenians began to distinguish themselves in this respect, and took her for their patroness. Accordingly they dedicated to her a magnificent temple under the name of Parthenos, the virgin. Phidias adorned it with a statue of gold and ivory, which was a master-piece; and the Athenians also celebrated to her honor a festival, which was afterwards called 'panathenaia.'

Parthenos was also a name given to Juno, from a notion that this goddess, by bathing herself every year in the fountain called Canathos, which was at Nauplia, recovered her virginity.

PARTHENII, citizens of ancient Sparta, who owed their existence to a singular circumstance. During the Messenian war the Spartans had been ten years absent from their city; and 'they had bound themselves by a solemn oath not to return till they had subdued Messenia. The magistrates as well as the women of Sparta were alarmed at the danger of such long absence depopulating the country. A law was therefore enacted, that all the young men who had not taken the oath should have free access to the unmarried women. The fruits of this promiscuous intercourse were named Παρθενιοι, Parthenii, i. e. sons of virgins. When they grew up, knowing they had no legitimate fathers, and of course no inheritance, they conspired with the Helots to massacre the other citizens, and seize their possessions. The conspiracy was discovered, but the Spartans, instead of punishing them, permitted them to emigrate to Italy, where, un-

der their leader Phalantus, they settled in Magna Græcia, and built Tarentum, A.A. C. 707. Justin, Strabo, Paus. Plut..

PARTHENIUM, in botany, bastard feverfew, or kiu-hoa of the Chinese, a genus of the pentandria order, belonging to the monœcia class of plants; and in the natural method ranking under the forty-ninth order. *compositæ*. The MALE CAL. is common and pentaphyllous; the florets of the disk monopetalous: the FEMALE has five florets of the radius, each with two male florets behind it: the intermediate female superior; the seed is naked. It has been much neglected in Europe, having on account of its smell been banished from our parterres. It is therefore indebted for its culture to the distinguished rank it holds among the Chinese flowers. The skill of the florists, and their continual care, have brought this plant to so great perfection that Europeans scarcely know it. The elegance and lightness of its branches, the beautiful indentation of its leaves, the splendor and duration of its flowers, seem indeed to justify the florimania of the Chinese for this plant. They have, by their attention to its culture, procured more than 300 species or varieties of it: every year produces a new one. Parthenium is propagated in China by seeds, and by suckers, grafts, and slips. When the florists have a fine plant, they suffer the seeds to ripen, and about the end of autumn sow them in well-prepared earth. Some keep them in this manner curing winter, others sow them in spring. Provided they are watered after the winter, they shoot forth, and grow rapidly. After the parthenium is flowered, all its branches are cut three inches from the root, the earth is hoed around, and a little dung is mixed with it; and, when the cold becomes severe, the plant is covered with straw, or an inverted pot. Those that are in vases are transported to the greenhouse, where they are uncovered and watered, and they shoot forth a number of stems; of these some florists leave only two or three, others pull up the stalk, together with the whole root, and divide it into several portions, which they transplant elsewhere. Some join two slips of different colors, in each of which, towards the bottom, they make a long notch, almost to the pith, and afterwards tie them together with packthread, that they may remain closely united: by these means they obtain beautiful flowers, variegated with whatever colors they choose. Parthenium requires a good exposure, and fresh moist air that circulates freely: when shut up closely, it soon languishes. The earth in which it is planted ought to be rich, moist, and loamy, and prepared with great care. For refreshing it, the Chinese use only rain or river water; and in spring they mix with this water the excrements of silkworms, or the dung of poultry; in summer they leave the feathers of ducks or fowls to infuse in it for several days, after having thrown into it a little saltpetre; but in autumn they mix with the water a greater or smaller quantity of dried excrement reduced to powder, according as the plant appears more or less vigorous. During the great heats of summer, they water it morning and evening; but they moisten the leaves only in the morning: they also place small fragments

of brick round its root, to prevent the water from pressing down the earth too much.

PARTHENIUS, in geography, a mountain of Arcadia, where Telephus had a temple, and on which Atalantis was exposed. Paus. viii. 54. *Ælian* 13.

PARTHENON, Παρθενος, a virgin, in ancient architecture, the appellation given to the celebrated Grecian temple of Minerva, who was often herself designated Παρθενος, or virgin, and worshipped with the most profound adoration in the citadel of Athens. The temple thus called was built during the splendid era of Pericles; and the expenses of its erection were estimated at 6000 talents. It was built upon a spot elevated on all sides above the town and citadel; of the Doric order; constructed of Pentelican marble; and from its breadth (100 Greek feet) was denominated by the ancients Hecatompedon.

The Parthenon was 220 Greek feet in length, and about sixty-nine in height. Its portico was double at the two fronts, and single at the sides. On the exterior façade of the nave was represented a procession in honor of Minerva. The two architects employed by Pericles in the building of this superb and elegant edifice were Callicrates and Ictinus. This magnificent temple had resisted all the outrages of time; had been in turn converted into a Christian church and a Turkish mosque; but still subsisted entire when Spon and Wheeler visited Attica in 1676. It was in the year 1687 that the Venetians besieged the citadel of Athens under the command of General Kœnigsmarck. A bomb fell most unluckily on the devoted Parthenon, set fire to the powder which the Turks had shut up therein, and thus the roof was entirely destroyed, and the whole building almost reduced to ruin. The Venetian general, being afterwards desirous of carrying off the statue of Minerva which had adorned the pediment, had it removed, thereby assisting in the defacement of the place without any good result to himself—for the group fell to the ground and was shattered to pieces. Since this period every man of taste must have deplored the demolition of this noble structure, and the enlightened travellers who have visited the spot have successively published engravings of its remains. One of the first of these was Le Roy, in his *Ruins of Greece*; after him came Stuart, who, possessing greater pecuniary means, surpassed his predecessor in producing a beautiful and interesting work on the Athenian Antiquities. Chandler, and other travellers in Greece, have also described what came under their eye of the remains of the Parthenon, of which many models have likewise been executed. M. Cassas (says Millin) has a very fine one in his valuable cabinet of models of antique temples and other monuments. There is another in the Galerie d'Architecture au Palais des Arts, at Paris, &c. &c.

But, not content with these artistical labors and publications, more recent travellers have enriched their country and themselves with the actual spoils of the Parthenon. The foremost of these is our fellow-countryman lord Elgin, who, about the year 1800, removed a variety of the matchless friezes, statues, &c., which were pur-

chased of him by parliament on the part of the nation, and now form the most valuable and interesting portion of the British Museum. See **ELGIN MARBLES**. A part of his lordship's precious treasure was, however, to the regret of all lovers of the fine arts, lost in the passage to England.

PARTHIA, a celebrated empire of antiquity, bounded on the west by Media, north by Hyrcania, east by Aria, south by Carmania the desert; surrounded on every side by mountains, which still serve as a boundary, though its name is now changed to Eyrac or Irac; and, to distinguish it from Chaldea, to that of Irac Agemi. By Ptolemy it is divided into five districts, viz. Caminsine or Gamisene, Rarhyene, Choroane, Atticene, and Tabiene. The ancient geographers enumerate many cities in this country. Ptolemy reckons twenty-five large cities; and it certainly must have been very populous, since we have accounts of 2000 villages, besides a number of cities in this district being destroyed by earthquakes. Its capital was named Hecatompolis, from the circumstance of its having 100 gates. It was a noble and magnificent place; and, according to some, it still remains under the name of Ispahan, the capital of the present Persian empire.

Parthia is by some supposed to have been first peopled by the Phetri or Pathri, often mentioned in Scripture, and will have the Parthians to be descended from Pathrusim the son of Misraim. But however true this may be with regard to the ancient inhabitants, yet it is certain that those Parthians who were so famous in history descended from the Scythians, though from what tribe we are not informed. The history of the ancient Parthians is totally lost. *All we know is, that they were first subject to the Medes, afterwards to the Persians, and lastly to Alexander the Great. After his death the province fell to Seleucus Nicator, and was held by him and his successors till the reign of Antiochus Theos, about A. A. C. 250. At this time the Parthians revolted, and chose one Arsaces for their king. The immediate cause of this revolt was the lewdness of Agathocles, to whom Antiochus had committed the care of all the provinces beyond the Euphrates. This man made an infamous attempt on Tiridates, a youth of great beauty; which so enraged his brother Arsaces that he excited his countrymen to revolt; and, before Antiochus had leisure to attend to the rebellion, it became too powerful to be crushed. Seleucus Callinicus, the successor of Antiochus Theos, attempted to reduce Arsaces; but the latter, having had so much time to strengthen himself, defeated and drove him out of the country. Seleucus soon after undertook another expedition against Arsaces, but was still more unfortunate; being not only defeated in a great battle, but taken prisoner; and he died in captivity. The day on which Arsaces gained this victory was ever after observed among the Parthians as an extraordinary festival. Arsaces being thus fully established in his new kingdom, reduced Hyrcania and some other provinces under his power; and was at last killed in a battle against Ariarathes IV. king of Cappadocia.

Arsaces I. was succeeded by his son Arsaces
VOL. XVI.

II., who, entering Media, made himself master of that country, while Antiochus the Great was engaged in a war with Antiochus Euergetes king of Egypt. Antiochus, however, was no sooner disengaged from that war than he marched with all his forces against Arsaces, and at first drove him quite out of Media. But he soon returned with an army of 100,000 foot and 20,000 horse, with which he put a stop to the further progress of Antiochus; and a treaty was soon after concluded, in which it was agreed that Arsaces should remain master of Parthia and Hyrcania, upon condition of his assisting him in his wars with other nations. Arsaces II. was succeeded by his son Priapatus, who reigned fifteen years, and left three sons, Phrahates, Mithridates, and Artabanus. Phrahates, the eldest, succeeded to the throne, and reduced under his subjection the Mardi, who had never been conquered by any but Alexander the Great. After him, his brother Mithridates was invested with the regal dignity. He reduced the Bactrians, Medes, Persians, Elymeans, and over-ran all the east, penetrating beyond the boundaries of Alexander's conquests. Demetrius Nicator, who then reigned in Syria, endeavoured to recover these provinces, but his army was entirely destroyed, and himself taken prisoner, and kept captive till his death; after which Mithridates made himself master of Babylonia and Mesopotamia, so that he now commanded all the provinces between the Euphrates and the Ganges. Mithridates died in the thirty-seventh year of his reign, and left the throne to his son Phrahates II. who was scarcely settled in his kingdom when Antiochus Zidetes marched against him at the head of a numerous army, under pretence of delivering his brother Demetrius, who was still in captivity. Phrahates was defeated in three pitched battles; in consequence of which he lost all the countries conquered by his father, and was reduced within the limits of the ancient Parthian kingdom. Antiochus did not, however, long enjoy his good fortune; for his army, on account of their number, amounting to no fewer than 400,000, being obliged to separate to such distances as prevented them, in case of any sudden attack, from joining together, the inhabitants, whom they had most cruelly oppressed, taking advantage of this separation, conspired with the Parthians to destroy them. This was accordingly executed; and the vast army of Antiochus, with the monarch himself, were slaughtered in one day, scarcely a single person escaping to carry the news to Syria.

Elated with his success, Phrahates now proposed to invade Syria; but in the mean time, happening to quarrel with the Scythians, he was by them cut off with his whole army, and was succeeded by his uncle Artabanus; who enjoyed his dignity but a very short time, being, a few days after his accession, killed in another battle with the Scythians. He was succeeded by Pacorus I., who entered into an alliance with the Romans; and he by Phrahates III. This monarch took under his protection Tigranes the son of Tigranes the Great, king of Armenia, gave him his daughter in marriage, and invaded the kingdom with a design to place the son on the throne of Armenia; but, on the approach of

Pompey, he retired, and soon after renewed the treaty with the Romans. Phraates was murdered by his sons Mithridates and Orodes; and soon after the former was put to death by his brother, who thus became sole master of the Parthian empire. In his reign happened the memorable war with the Romans under Crassus. This was occasioned, not by any breach of treaty on the side of the Parthians, but through the shameful avarice of Crassus. The whole Roman empire had been divided between Cæsar, Pompey, and Crassus; and the eastern provinces had fallen to the lot of Crassus. No sooner was he invested with this dignity than he resolved to carry the war into Parthia, to enrich himself with the spoils of that people, who were then very wealthy. Some of the tribunes opposed him, as the Parthians had religiously observed the treaty; but Crassus having, by the assistance of Pompey, carried every thing before him, left Rome in the year 55 B. C., and pursued his march to Brundisium, where he immediately embarked his troops, though the wind blew very high; and after a difficult passage, where he lost many of his ships, he reached the ports of Galatia. From Galatia Crassus hastened to Syria, and, passing through Judea, plundered the temple at Jerusalem. He then marched with great expedition to the Euphrates, which he crossed on a bridge of boats; and, entering the Parthian dominions, began hostilities. As the enemy had not expected an invasion they were quite unprepared for resistance; and therefore Crassus overran all Mesopotamia; and, if he had taken advantage of the consternation which the Parthians were in, might have also reduced Babylonian. But instead of this, early in autumn, he repassed the Euphrates, leaving only 7000 foot and 1000 horse to garrison the places he had reduced; and, putting his army into winter quarters in Syria, gave himself totally up to his favorite passion of amassing money. Early in spring he drew his forces out of their winter quarters, in order to pursue the war with vigor; but, during the winter, Orodes had collected a very numerous army, and was well prepared to oppose him. Before he entered upon action, however, the Parthian monarch sent ambassadors to Crassus to expostulate with him on his injustice in attacking an ally of the Roman empire; but Crassus only returned for answer that 'they should have his answer at Seleucia.' Orodes, finding that a war was not to be avoided, divided his army into two bodies. One he commanded in person, and marched towards Armenia, in order to oppose the king of that country, who had raised a considerable army to assist the Romans. The other he sent into Mesopotamia, under Surenas, a most experienced general, by whose conduct all the cities which Crassus had reduced were quickly retaken. On this some Roman soldiers, who made their escape, and fled to the camp of Crassus, filled the minds of his army with terror at the accounts of the number, power, and strength of the enemy. They told their fellow-soldiers that the Parthians were very numerous, brave, and well disciplined; that it was impossible to overtake them when they fled, or escape when they pursued; that their defensive weapons were

proof against the Roman darts, and their offensive weapons so sharp that no buckler was proof against them, &c. Crassus looked upon all this only as the effects of cowardice; but the soldiers, and even many of the officers, were so disheartened, that Cassius, the same who afterwards conspired against Cæsar, and most of the legionary tribunes, advised Crassus to suspend his march, and consider better of the enterprise before he proceeded farther in it. But Crassus obstinately persisted in his former resolution, being encouraged by the arrival of Artabazus king of Armenia, who brought with him 6000 horse, and promised to send 10,000 cuirassiers and 30,000 foot whenever he should stand in need of them. At the same time he advised him not to march his army through the plains of Mesopotamia, but to take his route over the mountains of Armenia, as in every respect much safer. This salutary advice, however, was rejected, and Crassus entered Mesopotamia with an army of about 40,000 men. The Romans had no sooner crossed the Euphrates than Cassius advised Crassus to advance to some of those towns in which the garrisons yet remained, to halt and refresh his troops; or to march along the Euphrates to Seleucia; and thus to prevent the Parthians from surrounding him, at the same time that he would be plentifully supplied with provisions. Of this advice Crassus approved, but was dissuaded by Abgarus king of Edessa, whom the Romans took for an ally, but who was in reality a traitor sent by Surenas to bring about their destruction. Under this faithless guide the Romans entered a vast green plain divided by many rivulets. Their march proved at first very easy, but the farther they advanced the worse the roads became, inasmuch that they were at last obliged to climb up rocky mountains, which brought them to a dry and sandy plain, where they could neither find food nor water. Abgarus then began to be suspected by the tribunes and other officers, who earnestly intreated Crassus not to follow him any longer, but to retreat to the mountains; at the same time an express arrived from Artabazus, acquainting the Roman general that Orodes had invaded his dominions with a great army, and that he was obliged to keep his troops at home, to defend his own dominions. The same messenger advised Crassus to avoid by all means the barren plains, where his army would certainly perish with hunger and fatigue, and to approach Armenia, that they might join their forces against the common enemy. But Crassus, instead of hearkening either to the advice of the king or his own officers, first flew into a violent passion with the messengers of Artabazus, and then told his troops that they were not to expect the delights of Campania in the most remote parts of the world. Thus they continued their march across a desert, the very sight of which was sufficient to throw them into despair; for they could not perceive the least tree, plant, or brook, not so much as a single blade of grass; nothing all around them but huge heaps of burning sand. The Romans had scarcely got through this desert when word was brought them by their scouts that a numerous army of Parthians was advancing full speed to attack them; for Abgarus, under

pretence of going out on parties, had often conferred with Surenas, and concerted measures with him for destroying the Roman army. Upon this advice, which occasioned great confusion in the camp, the Romans being quite exhausted with their long march, Crassus drew up his men in battalia, following at first the advice of Cassius, who was for extending the infantry as wide as possible, that they might take up the more ground, and thus prevent the enemy from surrounding them; but, Abgarus assuring the proconsul that the Parthian forces were not so numerous as was represented, he changed this disposition, and drew up his troops in a square, which faced every way, and had on each side twelve cohorts in front. Near each cohort he placed a troop of horse to support them, that they might charge with the greater security and boldness. Thus the whole army looked more like one phalanx than troops drawn up in manipuli, with spaces between them, after the Roman manner. The general himself commanded in the centre, his son in the left wing, and Cassius in the right. In this order they advanced to the banks of the Balissus, the sight of which was very pleasing to the soldiers, who were much harassed with drought and heat. Most of the officers were for encamping on the banks of this river, to give the troops time to refresh themselves; but Crassus, hurried on by the inconsiderate ardor of his son, only allowed the legions to take a meal standing, and, before this could be done by all, he ordered them to advance, not slowly, and halting now and then after the Roman manner, but as fast as they could move, till they came in sight of the enemy, who, contrary to their expectation, did not appear either so numerous or so terrible as they had been represented; but this was a stratagem of Surenas, who had concealed his men in convenient places, ordering them to cover their arms, lest their brightness should betray them, and starting up at the first signal to attack the enemy on all sides. The stratagem had the desired effect; for Surenas no sooner gave the signal than the Parthians, rising as it were out of the ground with dreadful cries and a most frightful noise, advanced against the Romans, who were greatly surprised and dismayed at that sight; and much more so when the Parthians, throwing off the covering of their arms, appeared in shining cuirasses, and helmets of burnished steel, finely mounted on horses covered all over with armour of the same metal. At their head appeared young Surenas, in a rich dress, who was the first who charged the enemy, endeavouring with his pikemen to break through the first ranks of the Roman army; but finding it too close and impetenable, the cohorts supporting each other, he fell back, and retired in a seeming confusion; but the Romans were much surprised when they saw themselves suddenly surrounded on all sides, and galled with continual showers of arrows. Crassus ordered his light-armed foot and archers to advance, and charge the enemy; but they were soon repulsed, and forced to cover themselves behind the heavy armed foot. Then the Parthian horse, advancing near the Romans, discharged showers of arrows upon them, which

did great execution, the legionaries being drawn up in such close order that it was impossible for the enemy to miss their aim. As their arrows were of an extraordinary weight, and discharged with incredible force and impetuosity, nothing was proof against them. The two wings advanced in good order to repulse them, but to no effect; for the Parthians shot their arrows with as great dexterity when their backs were turned as when they faced the enemy; so that the Romans, whether they kept their ground or pursued the flying enemy, were equally annoyed with their fatal arrows. The Romans, as long as they had any hopes that the Parthians, after having spent their arrows, would either betake themselves to flight, or engage them hand to hand, stood their ground with great resolution and intrepidity; but when they observed that there were many camels in their rear loaded with arrows, and that those who emptied their quivers wheeled about to fill them anew, they began to lose courage, and to complain of their general for suffering them thus to stand still, and serve only as a butt to the enemy's arrows. Hereupon Crassus ordered his son to advance, and to attack the enemy with 1300 horse, 500 archers, and eight cohorts. But the Parthians no sooner saw this choice body (for it was the flower of the army) marching up against them, than they wheeled about, and betook themselves, according to their custom, to flight. Hereupon young Crassus, crying out, *They fly before us, pushed on full speed after them, not doubting but he should gain a complete victory*; but when he was at a great distance from the main body of the Roman army, he perceived his mistake; for those who before had fled, facing about, charged him with incredible fury. Young Crassus ordered his troops to halt, hoping that the enemy, upon seeing their small number, would not be afraid to come to a close fight: but herein he was likewise greatly disappointed; for the Parthians, contenting themselves to oppose his front with their heavy armed horse, surrounded him on all sides, and, keeping at a distance, discharged incessant showers of arrows upon the unfortunate Romans, thus surrounded and pent up. The Parthian cavalry, in wheeling about, raised so thick a dust that the Romans could scarcely see one another, far less the enemy. In a short time the place where they stood was covered with dead bodies. Some of the unhappy Romans finding their entrails torn, and many overcome by the exquisite torments they suffered, rolled themselves in the sand and expired. Others endeavouring to tear out by force the bearded points of the arrows, only increased their pain. Most of them died in this manner; and those who outlived their companions were no more in a condition to act; for when young Crassus exhorted them to march up to the enemy, some showed him their wounded bodies, others their hands nailed to their bucklers, and some their feet pierced through and pinned to the ground; so that it was equally impossible for them to attack the enemy or defend themselves. The young commander, therefore, leaving his infantry to the mercy of the enemy, advanced at the head of the cavalry against their heavy armed horse. The thousand Gauls whom he had brought with him

from the west charged the enemy with incredible boldness and vigor; but their lances did little execution on men armed with cuirasses, and horses covered with tried armour: however they behaved with great resolution; for some of them taking hold of the enemy's spears, and closing with them, threw them off their horses on the ground, where they lay without being able to stir by the great weight of their armor; others, dismounting, crept under the enemy's horses, and, thrusting their swords into their bellies, made them throw their riders. Thus the brave Gauls fought, though greatly harassed with heat and thirst, which they were not accustomed to bear, till most of their horses were killed, and their commander dangerously wounded. They then thought it advisable to retire to their infantry, which they no sooner joined than the Parthians invested them anew, making a most dreadful havoc of them with their arrows. In this desperate condition Crassus, spying a rising ground at a small distance, led the remains of his detachment thither, with a design to defend himself in the best manner he could, till succours should be sent him from his father. The Parthians pursued him; and, having surrounded him in his new post, continued showering arrows upon his men, till most of them were either killed or disabled, without being able to make use of their arms, or give the enemy proofs of their valor. Young Crassus had two Greeks with him, who had settled in the city of Carrhæ. These, touched with compassion at seeing so brave a man reduced to such straits, pressed him to retire with them to the city of Ischnes, which had declared for the Romans; but the young Roman rejected their proposal, saying that he would rather die a thousand times than abandon so many valiant men, who sacrificed their lives for his sake. He then embraced and dismissed them, giving them leave to retire and shift for themselves. As for himself, having now lost all hopes of being relieved, and seeing most of his men and friends killed around him, he gave way to his grief; and, not being able to make use of his arm, which was shot through with a large barbed arrow, he presented his side to one of his attendants, and ordered him to put an end to his unhappy life. His example was followed by Censorius a senator, by Megabaccus an experienced and brave officer, and by most of the nobility who served under him: 500 soldiers were taken prisoners, and the rest cut in pieces.

The Parthians, having thus cut off or taken the whole detachment commanded by young Crassus, marched without delay against his father, who, upon the first advice that the enemy fled before his son, and were closely pursued by him, had taken heart, the more because those who had remained to make head against him seemed to abate much of their ardor, the greater part of them having marched with the rest against his son. Wherefore, having encouraged his troops, he had retired to a small hill in his rear, to wait there till his son returned from the pursuit. Young Crassus had despatched frequent expresses to his father, to acquaint him with the danger he was in; but they had fallen into the enemy's hands, and been by them put to the sword:

only the last, who had escaped with great difficulty, arrived safe, and informed him that his son was lost if he did not send him an immediate and powerful reinforcement. This news threw Crassus into the utmost consternation; but the desire he had of saving his son and so many brave Romans who were under his command, made him immediately decamp, and march to their assistance. He was not gone far before he was met by the Parthians, who, with loud shouts, and songs of victory, gave, at a distance, the unhappy father notice of his misfortune. They had cut off young Crassus's head, and, having fixed it on the point of a lance, were advancing full speed to fall on the father. As they drew near Crassus was struck with the dismal sight, but behaved like a hero; for he had the presence of mind to stifle his grief, and to cry out to his dismayed troops, 'This misfortune is entirely mine; the loss of one man cannot affect the victory: Let us charge, let us fight like Romans: If you have any compassion for a father who has lost a son whose valor you admired, let it appear in your rage and resentment against these insulting barbarians.' Thus Crassus strove to reanimate his troops; but their courage was quite sunk, as appeared from the faint and languishing shout which they raised, according to custom, before the action. When the signal was given, the Parthians, keeping to their old way of fighting, discharged clouds of arrows on the legionaries, without drawing near them; which did such dreadful execution that many of the Romans, to avoid the arrows, which occasioned a long and painful death, threw themselves in despair on the enemy's heavily-armed horse, seeking from their spears a more speedy death. Thus the Parthians continued plying them incessantly with their arrows till night, when they left the field of battle, crying out that they would allow the father one night to lament the death of his son. This was a melancholy night for the Romans. Crassus kept himself concealed from the soldiers, lying not in the general's tent, but in the open air, and on the bare ground, with his head wrapped up in his military cloak; and was, in that forlorn condition, says Plutarch, a great example to the vulgar of the instability of fortune; to the wise, a still greater, of the pernicious effects of avarice, temerity, and ambition. Octavius, one of his lieutenants, and Cassius, endeavoured to raise him up and console him: but seeing him quite sunk under his affliction, and deaf to all comfort, they summoned a council of war, composed of all the chief officers; in which it was unanimously resolved that they should decamp before day-break, and retire to Carrhæ, which was held by a Roman garrison. Agreeably to this resolution they began to march as soon as the council broke up; which produced dreadful outcries among the sick and wounded, who, perceiving that they were to be abandoned to the mercy of the enemy, filled the camp with their complaints and lamentations: but their cries did not stop the march of the others, which indeed was very slow to give the stragglers time to come up. There were only 300 light horse, under the command of one Ægnatius, who pursued their march

without stopping. These arriving at Carrhæ about midnight, *Ægnatius* calling to the sentinels on the walls, desired them to acquaint *Coponius*, governor of the place, that *Crassus* had fought a great battle with the Parthians; and, without letting them know who he was, continued his march to the bridge of Zeugma, which he passed, and thus saved his troops; but was much blamed for abandoning his general. However, the message he sent to *Coponius* was of some temporary service to *Crassus*; for that commander, wisely conjecturing, from the manner in which the unknown person had given him that intelligence, that some misfortune had befallen *Crassus*, immediately ordered his garrison to stand to their arms, and, marching out, met *Crassus*, and conducted him and his army to the city; for the Parthians, though informed of his flight, did not offer to pursue him; but when it was day they entered the Roman camp, and having put all the wounded, to the number of 4000, to the sword, dispersed their cavalry all over the plain, in pursuit of the fugitives. One of *Crassus's* lieutenants, named *Vargunteius*, having separated in the night from the main body of the army, with four cohorts, missed his way, and was overtaken by the enemy; at whose approach he withdrew to a neighbouring hill, where he defended himself with great valor, till all his men were killed except twenty, who made their way through the enemy, sword in hand, and got safe to Carrhæ: but *Vargunteius* himself was killed. In the mean time *Surenas*, not knowing whether *Crassus* and *Cassius* had retired to Carrhæ, or chosen a different route, in order to be informed of the truth, despatched a messenger, who spoke the Roman language, to the city of Carrhæ, enjoining him to approach the walls, and acquaint *Crassus* himself, or *Cassius*, that the Parthian general was inclined to enter into a treaty with them, and demanded a conference. Both the proconsul and his quæstor *Cassius* spoke from the walls with the messenger; and, accepting the proposal with great joy, desired that the time and place for an interview might be immediately agreed upon. The messenger withdrew, promising to return quickly with an answer from *Surenas*: but that general no sooner understood that *Crassus* and *Cassius* were in Carrhæ, than he marched thither with his whole army; and, having invested the place, acquainted the Romans that, if they expected any favorable terms, they must deliver up *Crassus* and *Cassius* to him in chains. Hereupon, a council of the chief officers being summoned, it was thought expedient to retire from Carrhæ that very night, and seek for another asylum. It was of the utmost importance that none of the inhabitants of Carrhæ should be acquainted with their design till its execution; but *Crassus*, whose conduct was infatuated, imparted the whole matter in confidence to one *Andromachus*, choosing him for his guide, and relying on the fidelity of a man whom he scarcely knew. *Andromachus* immediately acquainted *Surenas* with the design of the Romans; promising at the same time, as the Parthians did not engage in the night, to manage matters so that they should not get out of his reach before day-break. Pursuant to

his promise, he led them through many windings and turnings till he brought them into deep marshy grounds, where the infantry were up to the knees in mire. Then *Cassius*, suspecting that their guide had led them into those bogs with no good design, refused to follow him any longer; and, returning to Carrhæ, took his route towards Syria, which he reached with 500 horse. *Octavius*, with 5000 men under his command, being conducted by trusty guides, gained the mountains called by *Plutarch* and *Appian* *Sinnaci*, and there intrenched himself before break of day. As for *Crassus*, he was still entangled in the marshes, when *Surenas*, at the rising of the sun, overtook him and invested him with his cavalry. The proconsul had with him four cohorts, and a small body of horse; and with these he gained, in spite of all opposition, the summit of another hill within twelve furlongs of *Octavius*; who, seeing the danger that threatened his general, flew to his assistance, first with a small number of his men, but was soon followed by all the rest, who quitted their post, though very safe, and, charging the Parthians with great fury, disengaged *Crassus*, and obliged the enemy to abandon the hill. Upon the retreat of the enemy, they formed themselves into a hollow square; and, placing *Crassus* in the middle, made a kind of rampart round him with their bucklers, resolutely protesting, that none of the enemy's arrows should touch their general's body till they were all killed fighting in his defence. *Surenas*, loth to let so fine a prey escape, surrounded the hill, as if he designed to make a new attack: but finding his Parthians very backward, and not doubting but the Romans, when night came on, would pursue their march, and get out of his reach, he had recourse again to artifice; and declared before some prisoners, whom he soon after set at liberty, that he was inclined to treat with the proconsul of a peace; and that it was better to come to reconciliation with Rome, than to sow the seed of an eternal war, by shedding the blood of one of her generals. Agreeably to this declaration, *Surenas* advanced towards the hill where the Romans were posted, attended only by some of his officers, and, with his bow unbent, and open arms, invited *Crassus* to an interview. So sudden a change seemed very suspicious to the proconsul; who therefore declined the interview, till he was forced, by his own soldiers, to entrust his life with an enemy whose treachery they had all experienced; for the legionaries, flocking round him, not only abused him in an outrageous manner, but even menaced him if he did not accept of the proposals made him by the Parthian general. Seeing, therefore, that his troops were ready to mutiny, he began to advance without arms or guards, towards the enemy, after having called the gods and his officers to witness the violence his troops offered him; and entreated all who were present, but especially *Octavius* and *Petronius*, two of the chief commanders, for the honor of Rome, their common mother, not to mention, after his death, the shameful behaviour of the Roman legionaries. *Octavius* and *Petronius* could not resolve to let him go alone; but attended him down the hill, as did likewise some legionaries, keeping at a

distance. Crassus was met at the foot of the hill by two Greeks; who, dismounting from their horses, saluted him with great respect; and desired him, in the Greek tongue, to send some of his attendants, who might satisfy him, that Surenas, and those who were with him, came without arms. Hereupon Crassus sent two brothers of the Rœscian family; but Surenas, having caused them to be seized, advanced to the foot of the hill, mounted on a fine horse, and attended by the chief officers of the army. Crassus, who waited for the return of his two messengers, was surprised to see himself prevented by Surenas in person, when he least expected it. The Parthian general, perceiving, as he approached Crassus, that he was on foot, cried out in a seeming surprise, 'What do I see? a Roman general on foot, and we on horseback! Let a horse be brought for him immediately. You need not be surprised,' replied Crassus, 'we are come only to an interview, each after the custom of his country.' 'Very well,' answered Surenas, 'there shall be henceforth a lasting peace between king Orodes and the people of Rome: but we must sign the articles of it on the banks of the Euphrates; for you Romans do not always remember your conventions.' Crassus would have sent for a horse: but a very stately one, with a golden bit, and richly caparisoned, was brought to him by a Parthian; which Surenas presenting to him, 'Accept this horse from my hands,' said he, 'which I give you in the name of my master king Orodes.' He had scarce uttered these words, when some of the king's officers, taking Crassus by the middle, set him upon the horse, which they began to whip with great violence before them in order to make him quicken his pace. Octavius, offended at this insult, took the horse by the bridle; Petronius, and the few Romans who were present, seconded him, and flocking all around Crassus stopped his horse. The Parthians endeavoured to repulse them, and clear the way for the consul; whereupon they began to jostle and push one another with great tumult and disorder. At last, Octavius, drawing his sword, killed one of the king's grooms; but at the same time another, coming behind Octavius with a blow laid him dead at his feet. Both parties fought with great resolution, the Parthians striving to carry off Crassus, and the Romans to rescue him out of their hands. In this scuffle most of the Romans who came to the conference were killed; and among the rest Crassus himself, but whether by a Roman or a Parthian is uncertain. Upon his death, the rest of the army either surrendered to the enemy, or, dispersing in the night, were pursued, and put to the sword. The Romans lost in this campaign at least 30,000 men; of whom 20,000 were killed, and 10,000 taken prisoners.

When the battle of Carrhæ was fought, king Orodes was in Armenia, where he had made peace with Artabazus. While the two kings were solemnising their new alliance with expensive and public feasts, Syllaces, a Parthian officer, whom Surenas had sent with the news of his late victory, and the head of Crassus as a proof of it, arrived in the capital of Armenia. The transports of joy which Orodes felt at this sight, and

these news are not to be expressed; and the lords of both kingdoms, who attended their sovereigns, raised loud and repeated shouts of joy. Syllaces was ordered to give a more particular and distinct account of that memorable action; which when he had done, Orodes commanded melted gold to be poured into Crassus's mouth; reproaching him thereby with avarice, which had been always his predominant passion. Surenas did not long enjoy the pleasure of his victory; for Orodes, jealous of his power and authority among the Parthians, soon after caused him to be put to death. Pacorus, the king's favorite son, was put at the head of the army; and, agreeably to his father's directions, invaded Syria; but he was driven out with great loss by Cicero and Cassius, the only general who survived the death of Crassus. After this we find no mention of the Parthians, till the time of the civil war between Cæsar and Pompey, when the latter sent ambassadors to solicit succor against his rival. This Orodes was willing to grant, upon condition that Syria was delivered up to him; but, as Pompey would not consent to such a proposal, the succors were not only denied, but, after the battle of Pharsalia, he put Lucius Hirtius in irons, whom Pompey had again sent to ask assistance, or at least to desire leave to shelter himself in the Parthian dominions. Cæsar is said to have meditated a war against the Parthians, which in all probability would have proved fatal to them. His death delivered them from this danger. But, not long after, the eastern provinces, being grievously oppressed by Marc Antony, rose up in arms; and, having killed the tax-gatherers, invited the Parthians to join them, and drive out the Romans. They very readily accepted the invitation, and crossed the Euphrates with a powerful army, under the command of Pacorus, and Labienus a Roman general of Pompey's party. At first they met with great success, over-ran all Asia Minor, and reduced all the countries as far as the Hellespont and Ægean Sea, subduing likewise Phœnicia, Syria, and even Judea. They did not, however, long enjoy their new conquests: for being elated with their victories, and despising the enemy, they engaged Ventidius, Antony's lieutenant, before Labienus had time to join them, and were utterly defeated. This so disheartened Labienus's army that they all abandoned him; and he himself, being thus obliged to wander from place to place in disguise, was at last taken and put to death at Cyprus. Ventidius, pursuing his advantage, gained several other victories; and at last entirely defeated the Parthian army under Pacorus, cutting almost the whole of them in pieces, and the prince himself among the rest. He did not, however, pursue this last victory as he might have done; being afraid of giving umbrage to Antony, who had already become jealous of the great honor gained by his lieutenant. He therefore contented himself with reducing those places in Syria and Phœnicia which the Parthians had taken in the beginning of the war, until Antony arrived to take the command of the army upon himself. Orodes was almost distracted with grief, on receiving the dreadful news of the loss of his army and the death of his favorite

son. However, when time had restored the use of his faculties, he appointed Phrahates, the eldest, but the most wicked, of all his children, to succeed him in the kingdom, admitting him at the same time to a share of the sovereign authority with himself. The consequence of this was, that Phrahates very soon attempted to poison his father with hemlock. But this, contrary to expectation, proving a cure for the dropsy, which an excess of grief had brought upon the king, the unnatural son had him stifled in bed; and soon after not only murdered all his own brethren, who were thirty in number, but cut off all the rest of the royal family, not sparing even his own eldest son, lest the discontented Parthians should place him, as he was already of age, on the throne.

Many of the chief lords of Parthia, being intimidated by the cruelty of Phrahates, retired into foreign countries; and among these was one Moneses, a person of great distinction, as well as skill and experience in war. This man, having fled to Antony, soon gained his confidence, and was by him easily prevailed upon to engage in a war against his countrymen. But Phrahates, justly dreading the consequences of such a person's defection, sent a solemn embassy to invite him home on such terms as he should think fit to accept: which greatly provoked Antony; though he did not hinder him from returning, lest others should thereby be discouraged from coming over to him. He therefore dismissed him with great civility, sending ambassadors at the same time to Phrahates to treat of a peace. Thus he hoped to divert the Parthian monarch's attention from making the necessary preparations for war, and that he should be able to fall upon him in the spring when he was in no condition to make resistance. But herein he was greatly disappointed; for on his arrival at the Euphrates, which he intended to pass, and enter the Parthian dominions on that side, he found all the passes so well guarded that he thought proper to enter Media, with a design first to reduce that country, and then to enter Parthia. This plan had been suggested to him by Artabazus king of Armenia, who in the end betrayed him; for instead of conducting the army the straight way from Zeugma on the Euphrates to the Araxes, which parted Media from Armenia, and which was about 500 miles distant from the place whence he first set out, Artabazus led them over rocks and mountains so far about that the army marched above 1000 miles before they reached the borders of Media, where they intended to begin the war. Thus they were not only greatly fatigued, but had not sufficient time, the year being far spent, to put in execution the design on which they had come. However, as Antony was impatient to get back to Cleopatra, he left behind him most of the baggage of the army, and 300 waggons loaded with battering rams and other military engines for sieges; appointing Statianus, one of his lieutenants, with a body of 10,000 men, to guard them, and to bring them, by slower marches, after the army. With the rest of the forces he marched more than 300 miles before the rest, without allowing his men any respite till he arrived at Praaspa or Phrahata, the ca-

pital of Media, which he immediately invested. But the Parthians, well knowing that he could not make any progress without his military machines, passed by his army, in order to attack Statianus: which they did with such success that the body commanded by him were all to a man cut off, and all their military engines taken, among which was a battering ram eighty feet long. Antony, notwithstanding this disaster, continued the siege of Praaspa; but was daily harassed by sallies of the garrison from within, and the enemy's army without. At last he began to think of a retreat, when his provisions were almost exhausted, finding it impossible to become master of the city. But, as he was to march 300 miles through the enemy's country, he thought proper first to send ambassadors to the Parthian monarch, acquainting him that the Romans were willing to allow him a peace, provided he would restore the standards and prisoners taken at Carrhæ. Phrahates received the ambassadors, sitting on a golden throne; and, after having bitterly inveighed against the avarice and unbounded ambition of the Romans, told them that he would not part with the standards and prisoners; but, that if Antony would immediately raise the siege of Praaspa, he would suffer him to retire unmolested. Antony, who was reduced to great straits, no sooner received this answer than he broke up the siege, and marched towards Armenia. However, Phrahates was not so good as his word; for the Romans were attacked by the enemy no fewer than eighteen times on their march, and were thrice in the utmost danger of being cut off. A famine also raged in the Roman army; upon which they began to desert to the enemy; and indeed Antony would probably have been left by himself, had not the Parthians, in a very cruel as well as impolitic manner, murdered all those who fled to them in sight of the rest. At last, after having lost 32,000 men, and being reduced to such despair that he was with difficulty prevented from laying violent hands on himself, he reached the river Araxes; when his men, finding themselves out of the reach of the enemy, fell on the ground, and kissed it with tears of joy.

Antony was no sooner gone than the kings of Media and Parthia quarrelled about the booty they had taken; and, after various contests, Phrahates reduced all Media and Armenia. After this, being elated with his conquests, he oppressed his subjects in such a cruel and tyrannical manner that a civil war took place; in which the competitors were alternately driven out and restored, till A. D. 50, when one Vologeses, the son of Gortazes, a former king, became peaceable possessor of the throne. He carried on some wars with the Romans, but with very indifferent success, and at last gladly consented to a renewal of the ancient treaties with that powerful people. From this time the Parthian history affords nothing remarkable till the reign of the emperor Trajan; when the Parthian king, Cosroes, infringed the treaty with Rome, by driving out the king of Armenia. Upon this Trajan, who was glad of any pretence to quarrel with the Parthians, immediately hastened into Armenia. His arrival there was so sudden and unexpected that

he reduced almost the whole country without opposition; and took prisoner Parthamasiris, the king whom the Parthians had set up. After this he entered Mesopotamia, took the city of Nisibis, and reduced to a Roman province the whole of that wealthy country. Early in the spring of the following year, Trajan, who had kept his winter quarters in Syria, took the field again but was warmly opposed by Cosroes. He found him encamped on the banks of the Euphrates, with a design to dispute his passage; which he did with such vigor that the emperor, after having several times attempted to ford that river, and been always repulsed with great slaughter, was obliged to cause boats to be built on the neighbouring mountains, which he privately conveyed from thence on carriages to the water side; and having, in the night time, formed a bridge with them, he passed his army the next day; but not without great loss and danger, the Parthians harassing his men the whole time with incessant showers of arrows, which did great execution. Having gained the opposite bank, he advanced boldly into Assyria, the Parthians flying every where before him, and made himself master of Arbela. Thence he pursued his march; subduing, with incredible rapidity, countries where the Roman standard had never been displayed before. Babylonia voluntarily submitted to him. The city of Babylon was, after a vigorous resistance, taken by storm; by which means he became master of all Chaldea and Assyria, the two richest provinces of the Parthian empire. From Babylon he marched to Ctesiphon, the metropolis of the Parthian monarchy; which he besieged and at last reduced. But as to the particulars of these great conquests we are quite in the dark: this expedition, however glorious to the Roman name, being rather hinted at than described, by the writers of those times.

While Trajan was thus making war in the heart of the enemy's country, Cosroes, having recruited his army, marched into Mesopotamia, with a design to recover that country, and cut off all communication between the Roman army and Syria. On his arrival in that province the inhabitants flocked to him from all parts; and most of the cities, driving out the garrisons left by Trajan, opened their gates to him. Hereupon the emperor detached Lucius and Maximus, two of his chief commanders, into Mesopotamia, to keep such cities in awe as had not revolted, and to open a communication with Syria. Maximus was met by Cosroes; and, having ventured a battle, his army was entirely defeated, and himself killed. But Lucius being joined by Euricius and Clarius, two other commanders sent by Trajan with fresh supplies, gained considerable advantages over the enemy, and retook the cities of Nisibis and Seleucia, which had revolted. And now Trajan seeing himself possessed of all the best and most fruitful provinces of the Parthian empire, but at the same time being well apprised that he could not without a vast expense maintain his conquests, nor keep in subjection so fierce and warlike a people, at such a distance from Italy, resolved to set over them a king of his own choosing, who should hold the crown of him and his successors, and acknowledge them

as his lords and sovereigns. With this view he repaired to Ctesiphon; and, having there assembled the chief men of the nation, he crowned one of the royal family, named Parthaspates, king of Parthia, obliging all who were present to pay him their allegiance. He chose Parthaspates, because that prince had joined him at his first entering the Parthian dominions, conducted himself with great fidelity, and shown on all occasions an extraordinary attachment to the Romans. Thus the Parthians were at last subdued, and their kingdom made tributary to Rome.

The Parthians did not long continue in this state of subjection: for they no sooner heard of Trajan's death, than, taking up arms, they drove Parthaspates from the throne; and recalling Cosroes, who had retired into the country of the Hyrcanians, openly revolted from Rome. Adrian, who was then commander-in-chief of all the forces in the east, and soon after acknowledged emperor by the army, did not care, though he was at that time in Syria with a numerous army, to engage in a new war with the Parthians; but contented himself with preserving the ancient limits of the empire, without any ambitious prospects of further conquests. Therefore, in the beginning of his reign, he abandoned those provinces beyond the Euphrates which Trajan had conquered; withdrew the Roman garrisons from Mesopotamia; and, for the greater safety of other places, made the Euphrates the boundary of and barrier in those parts, posting his legions along the banks of the river. Cosroes died after a long reign, and was succeeded by his eldest son Vologeses II.: in whose reign the Alani breaking into Media, then subject to the Parthians, committed there great devastations; but were prevailed upon, with rich presents sent them by Vologeses, to abandon that kingdom, and return home. Upon their retreat, Vologeses, having no enemy to contend with at home, fell unexpectedly upon Armenia; surprised the legions there; and, having cut them all in pieces to a man, entered Syria; defeated with great slaughter Atilius Cornelianus, governor of that province; and advanced without opposition to the neighbourhood of Antioch; putting every where the Romans and those who favored them to the sword. Hereupon the emperor Verus, by the advice of his colleague Antoninus surnamed the philosopher, leaving Rome, hastened into Syria; and, having driven the Parthians out of that province, ordered Statius Priscus to invade Armenia, and Cassius, and Martius Verus, to enter the Parthian territories, and carry the war into the enemy's country. Priscus made himself master of Artaxata; and in one campaign drove the Parthians, though not without great loss on his side, quite out of Armenia. Cassius, on the other hand, having in several encounters defeated Vologeses, though he had an army of 400,000 men under his command, reduced, in four years time, all those provinces which had formerly submitted to Trajan, took Seleucia, burnt and plundered the famous cities of Babylon and Ctesiphon, with the stately palaces of the Parthian monarchs, and struck terror into the most remote provinces of that great empire. On his return, he lost above half the number of

his forces by sickness and famine; so that, after all, the Romans, as Spartianus observes, had no great reason to boast of their victories and conquests.

Verus, however, who had never stirred during the whole time of the war from Antioch and Daphne, took upon him the lofty titles of Parthicus and Armenicus, as if he had acquired them in the midst of his pleasures and debaucheries. After the revolt and death of Cassius, Antoninus the Philosopher repaired into Syria to settle the affairs of that province. On his arrival there, he was met by ambassadors from Vologeses; who, having recovered most of the provinces subdued by Cassius, and being unwilling either to part with them or engage in a new war, solicited the emperor to confirm him in the possession of them, promising to hold them of him, and to acknowledge the sovereignty of Rome. To these terms Antoninus readily agreed, and a peace was accordingly concluded between the two empires; which Vologeses did not long enjoy, being soon after carried off by a distemper, and not murdered by his own subjects, as we read in Constantinus Manasses, who calls him Beleges. Upon his death, Vologeses III., the son of his brother Sanatruces, and grandson of Cosroes, was raised to the throne. He sided with Niger against the emperor Severus: who, thereupon having settled matters at home, marched with all his forces against him; and advancing to the city of Ctesiphon, whither he had retired, laid close siege to that metropolis. Vologeses made a most gallant defence; but the city, after a long siege, and much bloodshed on both sides, was at length taken by assault. The king's treasures, with his wives and children, fell into the emperor's hands: but Vologeses himself had the good luck to make his escape; which was a great disappointment to Severus, who immediately despatched an express to acquaint the senate with the success that had attended him in his expedition against the only nation that was then so formidable to Rome.

He had no sooner crossed the Euphrates than Vologeses recovered all the provinces, except Mesopotamia, which he had reduced. These expeditions were chargeable to the Romans, and cost them much blood, without reaping any advantages from them; for, as they had not sufficient forces to keep in awe the provinces they had subdued, the inhabitants, greatly attached to the family of Arsaces, never failed to return to their ancient obedience as soon as the Roman armies were withdrawn. Vologeses was soon after engaged in a war still more troublesome and destructive, with his brother Artabanus, who, encouraged by some of the discontented nobles, attempted to rob him of the crown, and place it on his own head. Vologeses gained several victories over his brother and rebellious subjects; but died before he could restore the empire to its former tranquillity. Artabanus, who had a numerous army at his devotion, did not meet with any opposition in seizing the throne, vacant by the death of his brother, though Tiridates had a better title to it, as being his eldest brother. He had scarce settled the affairs of the kingdom, when the emperor Caracalla, desirous to signalise himself, as several

of his predecessors had done, by some memorable exploit against the Parthians, sent a solemn embassy to him, desiring his daughter in marriage. Artabanus, overjoyed at this proposal, which he thought would be attended with a lasting peace between the two empires, received the ambassadors with all possible marks of honor, and readily complied with their request. Soon after Caracalla sent a second embassy to acquaint the king that he was coming to solemnise the nuptials; whereupon Artabanus went to meet him, attended by the chief of his nobility and his best troops, all unarmed and in most pompous habits: but this peaceable train no sooner approached the Roman army than the soldiers, on a signal given them, falling upon the king's retinue, made a most terrible slaughter of the unarmed multitude, Artabanus himself escaping with great difficulty. The treacherous Caracalla, having gained by this exploit great booty, and, as he thought, no less glory, wrote a long and boasting letter to the senate; and assumed the title of Parthicus, for this piece of treachery, as he had before that of Germanicus, for murdering, in like manner, some of the German nobility. Artabanus, resolving to make the Romans pay dear for their inhuman and barbarous treachery, raised the most numerous army that had ever been known in Parthia, crossed the Euphrates, and entered Syria, putting all to fire and sword. But, Caracalla being murdered before this invasion, Macrinus, who had succeeded him, met the Parthians at the head of a mighty army, composed of many legions, and all the auxiliaries of the states of Asia. The two armies no sooner came in sight of each other than they engaged with the utmost fury. The battle continued two days, both the Romans and Parthians fighting so obstinately that night only parted them, without any apparent advantage on either side; though both retired, when night had put an end to the contest, crying, Victory! Victory! The field of battle was covered all over with dead bodies, there being already above 40,000 killed, including both Romans and Parthians: nevertheless Artabanus was heard to say that the battle was only begun, and that he would continue it till either the Parthians or Romans were all to a man cut in pieces. But Macrinus, being well apprised that the king came highly enraged against Caracalla in particular, and dreading the consequences which would attend the destruction of his army, sent a herald to Artabanus, acquainting him with the death of Caracalla, and proposing an alliance between the two empires. The king, understanding that his great enemy was dead, readily embraced the proposals of peace and amity, upon condition that all the prisoners who had been taken by the treachery of Caracalla should be immediately restored, and a large sum of money paid him to defray the expenses of the war. These being performed, without delay, Artabanus returned into Parthia, and Macrinus to Antioch. As Artabanus lost on this occasion the flower of his army, Artaxerxes, a Persian of mean descent, but of great courage and experience in war, revolting from the Parthians, prevailed on his countrymen to join him and attempt the recovery

of the sovereign power, of which he said they had been unjustly deprived, first by the Macedonians and afterwards by the Parthians their vassals. Artabanus, upon the news of this revolt, marched with the whole strength of his kingdom to suppress it; but being met by Artaxerxes, at the head of a no less powerful army, a bloody battle ensued, which is said to have lasted three days. At length the Parthians, though they behaved with the utmost bravery and fought like men in despair, were forced to yield to the Persians, who were commanded by a more experienced leader. Most of their troops were cut off in the flight; and the king himself was taken prisoner, and soon after put to death by Artaxerxes's order. The Parthians, having lost in this fatal engagement both their king and their army, were forced to submit to the conqueror, and become vassals to a nation which had been subject to them for 475 years.

PARTHICUS, a title absurdly assumed by the emperors Verus and Caracalla, upon their pretended conquest of Parthia. See **PARTHIA**.

PARTI, **PARTIE**, **PARTY**, or **PARTED**, in heraldry, is applied to a shield or escutcheon, denoting it divided or marked out into partitions. Thus,

1. **PARTI PER BEND DEXTER** is when the division comes from the upper corner of the shield on the right hand, and descends obliquely to the opposite lower corner.

2. **PARTI PER BEND SINISTER** is when the division, coming from the upper left corner, descends across to the opposite lower one.

3. **PARTI PER FESS** is when the division is across the middle from side to side.

4. **PARTI PER PALE** is when the shield is divided perpendicularly into two halves. All these partitions, according to M. de la Colom-biere, have their origin from the cuts and bruises that have appeared on shields after engagements; and, being proofs of the dangers to which the bearers had been exposed, they were transmitted to posterity, and became arms and marks of honor to their future families. See **HERALDRY**.

PARTIAL, *adj.* } Fr. *partial*. Inclined to
PARTIAL'ITY, *n. s.* } one part or party; dis-
PARTIALIZE, *v. a.* } posed to favor without
PARTIALLY, *adv.* } reason; affecting one part;
not total or general: partiality is, bias of judgment to one side; prejudice in favor of a party: to partialize (used by Shakespeare, after the Fr. *partialiser*) is, to make partial: partially follows the senses of partial.

Ye have not kept my ways, but have been *partial* in the law. *Malachi* ii. 9.

Then would the Irish party cry out *partiality*, and complain he is not used as a subject, he is not suffered to have the free benefit of the law. *Spenser*.

Such neighbour-ness to our sacred blood

Should nothing privilege him, nor *partialize*

The' unstooping firmness of my upright soul.

Shakespeare.

That stole into a total verity, which was but *partially* true in its covert sense. *Browne*.

Self-love will make men *partial* to themselves and friends, and ill-nature, passion, and revenge, will carry them too far in punishing others; and hence God hath appointed governments to restrain the *partiality* and violence of men *Locke*.

Thus Kings heretofore who showed themselves *partial* to a party, had the service only of the worst part of their people. *Davenant*.

If we compare these *partial* dissolutions of the earth, with an universal dissolution, we may as easily conceive an universal deluge from an universal dissolution, as a *partial* deluge from a *partial*.

Burnet's Theory.

That which weakens religion, will at length destroy it; for the weakening of a thing is only a *partial* destruction of it. *South*.

Partiality is properly the understanding's judging according to the inclination of the will and affections, and not according to the exact truth of things, or the merits of the cause. *Id. Sermons.*

The message he brought opened a clear prospect of eternal salvation, which had been but obscurely and *partially* figured in the shadows of the law.

Rogers.

Authors are *partial* to their wit, 'tis true, But are not crickus to their judgment too?

Pope.

All discord, harmony, not understood;

All *partial* evil, universal good. *Id.*

Nor any *partial*, private end,

Such reverence to the public bears;

Nor any passion, Virtue's friend,

So like the virtue's self appears. *Athenis.*

PARTICIPABLE, *adj.*

PARTICIPANT, *n. s.*

PARTICIPATE, *v. n. & v. a.*

PARTICIPATION.

Fr. *participer*;
Latin, *participo*.
Divisible; such as may be shared:

participant is, having a share or part of: participate, to partake; have share; have part of more things than one; have a reciprocated part; taking of, in, and with: as an active verb, to partake; share; receive part of: participation is, the act or state of participating: also (in an obsolete sense) division or distribution into parts.

As Christ's incarnation and passion can be available to no man's good, which is not made partaker of Christ, neither can we *participate* him without his presence. *Hooker*.

Civil society doth more content the nature of man, than any private kind of solitary living; because, in society, this good of mutual *participation* is so much larger. *Id.*

The' other instruments

Did see, and hear, devise, instruct, walk, feel;

And mutually *participate*. *Shakespeare.*

Their spirits are so married in conjunction, with the *participation* of society, that they flock together in consent, like so many wild geese. *Id.*

It sufficeth not, that the country hath wherewith to sustain even more than live upon it, if means be wanting whereby to drive convenient *participation* of the general store into a great number of well-servers. *Raleigh*.

The French seldom atchieved any honourable acts without Scottish hands, who therefore are to *participate* the glory with them. *Camden*.

During the parliament, he published his proclamation, offering pardon to all such as had taken arms, or been *participant* of any attempts against him; so as they submitted themselves. *Bacon*.

The species of audibles seem to *participate* more with local motion, like percussions made upon the air. *Id.*

Few creatures *participate* of the nature of plants and metals both. *Id.*

A joint coronation of himself and his queen might give any countenance of *participation* of title. *Id.*

An aged citizen brought forth all his provisions,

and said, that as he did communicate unto them his store, so would he *participate* of their wants.

Hayward.

The prince saw he should confer with one *participate* of more than monkish speculations. *Wotton.*

God, when heaven and earth he did create,
Formed man, who should of both *participate*.

Denham.

His delivery, and thy joy thereon,

In both which we, as next, *participate*.

Milton.

Fellowship,

Such as I seek, fit to *participate*

All rational delight! wherein the brute

Cannot be human consort.

Id.

If any part of my body be so mortified, as it becomes like a rotten branch of a tree, it putrefies, and is not *participate* of influence derived from my soul, because it is now no longer in it to quicken it.

Hale.

Those deities are so by *participation*, and subordinate to the supreme.

Stillington.

Those bodies, which are under a light, which is extended and distributed equally through all, should *participate* of each others' colours.

Dryden.

Plato, by his ideas, means only the divine essence with this connotation, as it is variously imitable or *participable* by created beings.

Norris's Miscellanies.

What an honour, that God should admit us into such a blessed *participation* of himself!

Atterbury.

Convince them that brutes have the least *participation* of thought, and they retract.

Bentley.

Your genius should mount above that mist, in which its *participation* and neighbourhood with earth long involved it.

Pope.

PARTICIPLE, n. s. } Lat. *participium*. A
PARTICIPIAL, *adj.* } word partaking of the
PARTICIPIALITY, *adv.* } qualities both of a noun
and verb: participial, and participially, corresponding.

The *participles* or confiners between plants and living creatures, are such as are fixed, though they have a motion in their parts: such as oysters and cockles.

Bacon.

A *participle* is a particular sort of adjective, formed from a verb, and, together with its signification of action, passion, or some other manner of existence, signifying the time thereof.

Clarke.

As the perfect *participle*, and the imperfect tense, are sometimes different in their form, care must be taken that they be not indiscriminately used.

Murray.

PARTICLE, n. s. Lat. *particula*. A diminutive of part; an indivisible part; hence a word unvaried by inflexions.

Till Arianism had made it a matter of sharpness and subtlety of wit to be a sound believing Christian, men were not curious what syllables or *particles* of speech they used.

Hooker.

From any of the other unreasonable demands, the houses had not given their commissioners authority in the least *particle* to recede.

Clarendon.

With *particles* of heavenly fire,

The God of nature did his soul inspire.

Dryden.

There is not one grain in the universe, either too much or too little, nothing to be added, nothing to be spared: nor so much as any one *particle* of it, that mankind may not be either the better or the worse for, according as 'tis applied.

L'Estrange.

In the Hebrew tongue there is a *particle* consisting but of one single letter, of which there are reckoned up above fifty several significations.

Locke.

Particles are the words whereby the mind signifies what connection it gives to the several affirmations and negations that it unites in one continued reasoning or narration.

Id.

It is not impossible but that microscopes may at length be improved to the discovery of the *particles* of bodies, on which their colours depend.

Newton's Opticks.

Curious wits,

With rapture, with astonishment, reflect

On the small size of atoms, which unite

To make the smallest *particle* of light.

Blackmore.

Blest with more *particles* of heavenly flame.

Granville.

A **PARTICLE**, in physiology, is the minute part of a body, an assemblage of which constitutes all natural bodies. Particle is often used in the same sense as atom in the ancient Epicurean philosophy. Some writers, however, distinguish them; making particle an assemblage or composition of two or more primitive and physically indivisible corpuscles or atoms; and corpuscle or little body, an assemblage or mass of secondary particles or secondary corpuscles. The distinction, however, is of little moment. Particles are then the elements of bodies; it is the various arrangement and texture of these, with the difference of the cohesion, &c., that constitute the various kinds of bodies, hard, soft, liquid, dry, heavy, light, &c. The smallest particles or corpuscles cohere with the strongest attractions, and always compose larger particles of weaker cohesion; and many of these cohering compose larger particles whose vigor is still weaker; and thus on for divers successions, till the progression ends in the largest particles, whereon the operations in chemistry, and the colors of natural bodies depend, and which, by cohering, compose bodies of sensible bulks. The cohesion of the particles of matter, according to the Epicureans, was effected by hooked atoms; the Aristotelians thought it managed by rest, that is, by nothing. But Sir Isaac Newton maintains it to be by means of a certain power, whereby the particles mutually attract or tend towards each other, which is still, perhaps, giving a fact without the cause. By this attraction of the particles, he shows that most of the phenomena of the lesser bodies are affected, as those of the heavenly bodies are by the attraction of gravity. See **ATTRACTION** and **COHESION**.

PARTICLE, in grammar, is a denomination for all those words that unite or disjoin others; or that express the modes or manners of words or things. It comprehends all those parts of speech divided by grammarians into articles, adverbs, prepositions, interjections, and conjunctions.

PARTICLE, in theology, is used in the Latin church for the crumbs, or small pieces of consecrated bread, called in the Greek church *μεσίδες*. The Greeks have a particular ceremony, called *των μεσίδων*, of the particles, wherein certain crumbs of bread, not consecrated, are offered up in honor of the Virgin, St. John the Baptist, and several other saints. They also give them the name of *προσφορά*, oblation. Gabriel, archbishop of Philadelphia, wrote a treatise express *των μεσίδων*, wherein he endeavours to show the

antiquity of this ceremony, in that it is mentioned in the liturgies of St. Chrysostom and Basil. There has been much controversy on this head between the reformed and catholic divines. Auberton and Blondel explain a passage in the theory of Germanus, patriarch of Constantinople, where he mentions the ceremony of the particles as in use in his time, in favor of the former; Messieurs de Port Royal contest the explanation; but M. Simon, in his notes on Gabriel of Philadelphia, endeavours to show that the passage itself is an interpolation, not being found in the ancient copies of Germanus, and consequently that the dispute is very ill grounded.

PARTICULAR, *adj.* } Fr. *particulier*; Sp. *particular*; and Port. *particular*;
PARTICULARITY, *n. s.* }
PARTICULARIZE, *v. a.* } Ital. *particolare*; Lat. *particularis*, à pars, a
PARTICULARLY, *adv.* } part. Relating to a
PARTICULATE, *v. a.* } part. Relating to a
 part or to a single thing; individual; odd; attention to distinct or minute things: as a noun substantive, a single instance; a detail of single things or items; interest or state of an individual; single self; 'in particular' means peculiarly; distinctly: particularity is distinct notice or account; individuality; petty or detailed account; something belonging to a single person, thing, or occasion; something peculiar; oddity; scrupulousness: to particularise, or particulate (the latter obsolete), means to mention or narrate in detail; show minutely: particularly is, singly; distinctly; extraordinarily.

He, as well with general orations as *particular* dealing with men of most credit, made them see how necessary it was. *Sidney.*

Rather performing his general commandment, which had ever been, to embrace virtue, than any new *particular*, sprung out of passion, and contrary to the former. *Id.*

So did the boldness of their affirmation accompany the greatness of what they did affirm, even descending to *particularities*, what kingdoms he should overcome. *Id.*

As well for *particular* application to special occasions, as also in other manifold respects, infinite treasures of wisdom are abundantly to be found in the holy scripture. *Hooker.*

Our wisdom must be such, as doth not propose to itself *re ides* our own *particular*, the partial and immoderate desire whereof poisoneth wheresoever it taketh place; but the scope and mark, which we are to aim at, is the publick and common good. *Id.*

Knowledge imprinted in the minds of all men, whereby both general principles for directing of human actions are comprehended, and conclusions derived from them, upon which conclusions growth, in *particularity*, the choice of good and evil. *Id.*

His general loved him

In a most dear *particular*. *Shakspeare.*
 For his *particular*, I'll receive him gladly;
 But not one follower. *Id.*

Let the general trumpet blow in
Particularities, and petty sounds

To cease. *Id. Henry VI.*

The leanness that afflicts us, is an inventory to *particularize* their abundance. *Id. Coriolanus.*

I may not *particulate* of Alexander Hales, the irrefragable doctor. *C Camden's Remains.*

Wheresoever one plant draweth such a *particular* juice out of the earth, as it qualifieth the earth, so as that juice which remaineth is fit for the other plant, there the neighbourhood doth good. *Bacon.*

Of this prince there is little *particular* memory; only that he was very studious and learned. *Id.*

I must reserve some *particulars*, which it is not lawful for me to reveal. *Id.*

Artists, who propose only the imitation of such a *particular* person, without election of ideas, have often been reproached for that omission. *Dryden.*

Invention is called a muse; authors ascribe to each of them in *particular* the sciences which they have invented. *Id.*

This exact propriety of Virgil I *particularly* regarded as a great part of his character. *Id.*

It is the greatest interest of *particulars* to advance the good of the community. *L'Estrange.*

I have been *particular* in examining the reason of children's inheriting the property of their fathers, because it will give us farther light in the inheritance of power. *Locke.*

Having the idea of an elephant or an angle in my mind, the first and natural enquiry is, whether such a thing does exist? and this knowledge is only of *particulars*. *Id.*

This is true of actions considered in their general nature or kind, but not considered in their *particular* individual instances. *South.*

Those notions are universal, and what is universal must needs proceed from some universal constant principle; the same in all *particulars*, which can be nothing else but human nature. *Id.*

Providence, that universally casts its eye over all the creation, is yet pleased more *particularly* to fasten it upon some. *Id. Sermons.*

The reader has a *particular* of the books, wherein this law was written. *Ayliffe's Parergon.*

We are likewise to give thanks for temporal blessings, whether such as concern the publick, as the prosperity of the church, or nation, and all remarkable deliverances afforded to either; or else such as concern our *particular*. *Duty of Man.*

The master could hardly sit on his horse for laughing, all the while he was giving me the *particulars* of this story. *Addison.*

To see the titles that were most agreeable to such an emperor, the flatteries that he lay most open to, with the like *particularities* only to be met with on medals, are certainly not a little pleasing. *Id.*

It is in the power of more *particular* persons in this kingdom, than in any other, to distress the government, when they are disobliged. *Id. Freeholder.*

This in *particular* happens to the lungs. *Blackmore.*

He not only boasts of his parentage as an Israelite, but *particularizes* his descent from Benjamin. *Atterbury.*

Vespasian he resembled in many *particulars*. *Swift.*

Adversity has ever been considered as the state in which a man most easily becomes acquainted with himself, *particularly* being free from flatterers. *Johannson.*

PARTING, in chemistry, an operation by which gold and silver are separated from each other. As these two metals resist equally well the action of fire and of lead, they must therefore be separated by other methods. This separation could not be effected if they were not soluble by different menstruums. Nitrous acid, marine acid, and sulphur, which cannot dissolve gold, attack silver very easily; and therefore these three agents furnish methods of separating silver from gold, or of the operation called parting.

Although parting by aquafortis be easy, it cannot be very exact, unless we attend to some es-

several circumstances. I. The gold and silver must be in a proper proportion : for, if the gold be in too great quantity, the silver will be covered and guarded by it from the action of the acid. Therefore, when the essayers do not know the proportion of these two metals in the mass to be operated upon, they discover it by the following method :—They have a certain number of needles composed of gold and silver alloyed together in graduated proportions, and the alloy of each needle is known by a mark upon it. These are called proof needles. When essayers want to know early the proportion of gold and silver in a mass, they rub this mass upon a touchstone, so as to leave a mark upon it. They then make marks upon the touchstone with some of the needles, the color of which they think comes nearest to that of the mass. By comparing the marks of these needles with the mark of the mass, they discover nearly the proportion of the gold and silver in the mass. If this trial shows that in any given mass the silver is not to the gold as three to one, this mass is improper for the operation of parting by aquafortis. In this case, the quantity of silver necessary to make an alloy of that proportion must be added. This operation is called quartation, probably because it reduces the gold to a fourth part of the whole mass. II. That the parting may be exact, the nitrous acid or aquafortis employed must be very pure, and especially free from mixture of vitriolic and marine acids. For, if this be not attended to, a quantity of silver proportionable to these two foreign acids will be separated during the solution; and this portion of silver, reduced by these acids to vitriol of silver and to luna cornea, will remain mingled with the gold, which consequently will not be entirely purified by the operation. When the metallic mass is properly alloyed, it is to be reduced to plates, rolled up spirally, called cornets; or to grains. These are to be put into a matrass, and upon them a quantity of aquafortis is to be poured, the weight of which is to that of the silver as three to two: and, as the nitrous acid employed for this operation is rather weak, the solution is assisted, especially at first, by the heat of a sand bath, in which the matrass is to be placed. When, notwithstanding the heat, no further mark of solution appears, the aquafortis charged with silver is to be decanted. Fresh nitrous acid is to be poured into the matrass, stronger than the former, and in less quantity, which must be boiled on the residuous mass and decanted as the former. Aquafortis must even be boiled a third time on the remaining gold, that all the silver may be certainly dissolved. The gold is then to be washed with boiling water. This gold is very pure if the operation has been performed with due attention. It is called gold of parting. See ASSAYING. The gold and silver thus operated upon ought to have been previously refined by lead, and freed from all alloy of other metallic matters, so that the gold which remains should be as pure as is possible.

Concentrated parting is performed by cementation, and may be used when the quantity of gold is so great in proportion to the silver that it cannot be separated by aquafortis. A cement

must be first prepared, composed of four parts of bricks powdered and sifted, of one part of green vitriol calcined till it becomes red, and of one part of common salt. The whole is very accurately mixed together, and a firm paste is made of it by moistening it with a little water or uripe. The gold to be cemented is to be reduced to thin plates, as thin as small pieces of money. At the bottom of the crucible or cementing pot, a stratum of cement, of the thickness of a finger, is to be put, which is to be covered with plates of gold; upon these another stratum of cement is to be laid, and then more plates of gold, till the crucible is filled with these alternate strata of cement and of gold. The whole is then to be covered with a lid, which is to be luted with a mixture of clay and sand. This pot is to be placed in a furnace or oven, and heated by degrees till it is moderately red, which heat is to be continued during twenty-four hours. The heat must not be so great as to melt the gold. The pot is then left to cool, and the gold is to be carefully separated from the cement, and boiled at different times in a large quantity of pure water. This gold is to be assayed upon a touchstone or otherwise; and, if it be found not sufficiently purified, it is to be cemented a second time in the same manner. The sulphuric acid of the bricks and of the calcined vitriol disengages the muriatic acid of the common salt during this cementation; and this last acid dissolves the silver alloyed with the gold, and separates it by that means. Instead of sea-salt, nitre may be used with equal success; because the nitrous acid is then put in a state to attack the silver, notwithstanding the quantity of gold which covers it.

Parting by fusion, or dry parting, is performed by sulphur, which has the property of uniting easily with silver, while it does not attack gold. This method of separating these two metals would be the cheapest, the most expeditious, and convenient of any, if the sulphur could dissolve the silver, and separate it from the gold as well and as easily as nitrous acid does: but, on the contrary, we are obliged to employ a particular treatment, and a kind of concentration, to begin the union of the sulphur alloyed with gold. The most advantageous method of separating a small portion of gold from a large one of silver appears to be by sulphur, which unites with and scorifies the silver without affecting the gold; but as sulphuretted silver does not flow thin enough to suffer the small particles of gold diffused through it to reunite and settle at the bottom, some addition is necessary for collecting and carrying them down. In order to the commixture with the sulphur, fifty or sixty pounds of the mixed metal, or as much as a large crucible will receive, are melted at once, and reduced into grains, by taking out the fluid matter with a small crucible made red hot, and pouring it into cold water stirred with a rapid circular motion. From one-fifth to one-eighth of the granulated metal, according as it is richer or poorer in gold, is reserved, and the rest well mingled with one-eighth of powdered sulphur. The grains enveloped with the sulphur are again put into the crucible, and the fire kept gentle for some time, that the silver, before it melts may be

thoroughly penetrated by the sulphur: If the fire be hastily urged, great part of the sulphur will be dissipated, without acting upon the metal. If to sulphureted silver infusion pure silver be added, the latter falls to the bottom, and forms there a distinct fluid not miscible to the other. The particles of gold, having no affinity with the sulphureted silver, join themselves with the pure silver, wherever they come in contact with it, and are thus transferred from the former into the latter, more or less perfectly, according as the pure silver was more or less thoroughly diffused through the mixed. It is for this use that a part of the granulated metal was reserved. The sulphureted mass being brought into perfect fusion and kept melted for near an hour in a close covered crucible, one-third of the reversed grains is thrown in; and, as soon as this is melted, the whole is well stirred, that the fresh silver may be distributed through the mixed to collect the gold from it. The stirring is performed with a wooden rod; an iron one would be corroded by the sulphur, so as to deprive the mixed of its due quantity of sulphur, and likewise render the subsequent purification of the silver more troublesome. The fusion being continued an hour longer, another third of the unsulphureted grains is added, and an hour after this the remainder; after which the fusion is further continued for some time, the matter being stirred at least every half hour from the beginning to the end, and the crucible kept closely covered in the intervals. The sulphureted silver appears in fusion of a dark brown color; after it has been kept melted for a certain time, a part of the sulphur having escaped from the top, the surface becomes white, and some bright drops of silver, about the size of peas, are perceived on it. When this happens, which is commonly in about three hours after the last addition of the reserved grains, sooner or later, according as the crucible has been more or less closely covered, the process is discontinued; for otherwise more and more of the silver, thus losing its sulphur, would subside, and mingle with the part at the bottom in which the gold is collected; the whole is poured out into an iron mortar greased and duly heated; or, if the quantity is too large to be safely lifted at once, a part is first taken out from the top with a small crucible, and the rest poured into the mortar. The gold, diffused at first through the whole mass is now found collected into a part of it at the bottom, amounting only to about as much as was reserved unsulphureted. This part may be separated from the sulphureted silver above it by a chisel and hammer; or, more perfectly, the surface of the lower mass being generally rugged and unequal, by placing the whole mass with its bottom upwards in a crucible: the sulphureted part quickly melts, leaving unmelted that which contains the gold, which may thus be completely separated from the other. The sulphureted silver is assayed by keeping a portion of it in fusion in an open crucible till the sulphur is dissipated, and then dissolving it in aquafortis. If it should still be found to contain any gold, it is to be melted again; as much more unsulphureted silver is to be added as was employed in each of the former injections, and the

fusion continued about an hour and a half. The gold thus collected into a part of the silver may be further concentrated into a smaller part, by granulating the mass and repeating the whole process. The operation may be again and again repeated, till so much of the silver is separated that the remainder may be parted without much expense.

PARTING GLASSES. Glass vessels used for parting gold and silver. They have the form of truncated cones, the bottom being commonly about seven inches wide, the aperture about one or two inches wide, and the height about twelve inches. These vessels ought to have been well annealed, and chosen free from flaws; as one of the chief inconveniences attending the operation is, that the glasses are apt to crack by exposure to cold, and even when touched by the hand. Some operators secure their glasses by a coating. For this purpose they spread a mixture of quick lime, slaked with beer and whites of eggs, upon linen cloth, which they wrap round the lower part of the vessel, leaving the upper part uncovered, that they may see the progress of the operation; and over this cloth they apply a composition of clay and hair. Schlutter advises to put the parting glasses into copper vessels, containing some water, and supported by trevets, with fire under them. When the heat communicated by the water is too great, it may be diminished by adding cold water; which must be done very carefully by pouring against the sides of the pan, to prevent too sudden an application of cold to the parting glass. The intention of this contrivance is, that the contents of the glasses, if these should break, may be received by the copper vessel. Into a glass fifteen inches high, and ten or twelve inches wide at bottom, placed in a copper pan twelve inches wide at bottom, fifteen inches wide at top, and ten inches high, he usually put about eighty ounces of metal, with twice as much aquafortis.

PARTISAN, n. s. Fr. *partisan*; Ital. *partisano*. An adherent to or head of a party; also (Fr. *partisane*) a kind of pike or halbert.

Let us
Find out the prettiest dazied plot we can,
And make him with our pikes and *partisans*
A grave. *Shakespeare. Hamlet.*

Some of these *partisans* concluded, the government had hired men to be bound and pinioned.

Addison.

I would be glad any *partisan* would help me to a tolerable reason, that, because Clodius and Curio agree with me in a few singular notions, I must blindly follow them in all. *Swift.*

PARTITION, n. s. & v. a. From **PART**. Division; the act of dividing or division made; that by which a whole is separated into parts; the point or time of separation.

For he is our peace, who hath made both one; and hath broken down the middle wall of *partition* between us. *Ephes. ii. 14.*

It doth not follow, that God, without respect, doth teach us to erect between us and them a *partition* wall of difference, in such things indifferent as have been disputed of. *Hooker.*

We grew together,
Like to a double cherry, seeming parted,
But yet an union in partition. *Shakespeare.*

Can we not
Partition make with spectacles so precious
Twixt fair and foul? *Id. Cymbeline.*

Make partitions of wood in a hogshead, with heels
in them, and mark the difference of their sound
from that of an hogshead without such partitions.

Bacon.
The sides are uniform without, though severally
partitioned within. *Id.*

Enclosures our factions have made in the church,
become a great partition wall to keep others out of it.
Decay of Piety.

Partition firm and sure,
The waters underneath from those above
Dividing. *Milton's Paradise Lost.*

Lodged in a small partition; and the rest
Ordained for uses to his Lord best known.

Milton.
The day, month, and year, measured by them, are
used as standard measures, as likely others arbitra-
rily deduced from them by partition or collection.

Holder on Time.
The mound was newly made, no sight could pass
Betwixt the nice partitions of the grass,
The wall united sods so closely lay. *Dryden.*

At one end of it is a great partition, designed for
an opera. *Addison.*

The partition between good and evil is broken
down; where one sin has entered legions will force
their way. *Rogers.*

PARTLET, *n. s.* Ital. *pareta* and *lattucca*
(a nurse's dress). A ruff for the neck; hence a
hen with a natural ruff on the neck.

Thou dotard, thou art woman tired; unroosted
By thy dame partlet here. *Shakespeare.*

Tired with pinned ruffs, and fans, and partlet
strips. *Hall.*

Dame partlet was the sovereign of his heart;
He feathered her. *Dryden's Fables.*

PARTNER, *n. s. & v. a.* } From **PART**. He
PARTNERSHIP. } who shares or par-
takes with another; particularly a joint sharer
in a business or trade; one who dances with
another: to join in partnership: partnership is,
joint interest or property; union for such in-
terest. See below.

My noble partner
You greet with present grace. *Shakespeare. Macbeth.*

Lead in your ladies every one; sweet partner,
I must not yet forsake you. *Id. Henry VIII.*

A lady who
So fair, and fastened to an empery,
Would make the greatest king double to be part-
nered.

With tomboys, hired with self-exhibition,
Which your own coffers yield. *Shakespeare.*

Sapor, king of Persia, had an heaven of glass,
which sitting in his estate, he trod upon, calling
himself brother to the sun and moon, and partner
with the stars. *Peucham.*

Those of the race of Sem were no partners in the
unbelieving work of the tower. *Raleigh's History.*

To undergo
Myself the total crime; or to accuse
My other self, the partner of my life. *Milton.*

He does possession keep
And is too wise to hazard partnership. *Dryden.*

'Tis a necessary rule in alliances, partnerships,
and all manner of civil dealings, to have a strict re-
gard to the disposition of those we have to do withal.

L'Estrange.
The soul continues in her action, till her partner
is again qualified to bear her company. *Addison.*

An admission made by one of the two partners,
after the dissolution of the partnership, is competent
evidence to charge the other partner.

Taunton's Reports.
PARTNERSHIP, in English law. The law on this
important subject we purpose to arrange under
the following heads:—1. The nature and forma-
tion of a partnership. 2. The rights and powers
of partners amongst themselves. 3. Their lia-
bilities to third persons. 4. The exceptions to
such liability. 5. The means of dissolution.

SECT. I.—OF THE NATURE OF A PARTNERSHIP AND ITS FORMATION.

In order to constitute a partnership it is es-
sential that there should be a communion of
profit and loss. This is the criterion by which
to determine the question whether persons are
partners or not. An agent who is paid by a
proportion of the profits of an adventure does
not thereby become a partner in the property,
though it may render him liable as a partner to
third persons. 5 Taunt. 74. 2 Barn. 401.

If a person make himself responsible to the
vendor for a purchase, upon an agreement with
the purchaser, that if any profit arise from the
sale he shall have one-half for his trouble; this
does not constitute a partnership between the
parties. 4 East 141. A partnership may be
limited to a particular concern, without extend-
ing to all the concerns in which another member
of the firm is engaged, 4 Esp. 182. It was
ruled by lord Ellenborough that, if there be a
partnership as to third persons, the presumption
of law is that there is a partnership between the
parties. 2 Camp 45.

The cases in which the courts have determined
what particular circumstances constitute a part-
nership will best explain the legal definition of
its nature. We proceed therefore to state some
of the principal decisions on this point. A,
having neither money nor credit, offers to B,
that, if he will order with him certain goods to
be shipped upon an adventure, if any profit
should arise from them B should have half for
his trouble. B having lent his credit on this
contract and ordered the goods on their joint
account, which were furnished accordingly, and
afterwards paid for by Balone: held that he was
entitled to recover back such payment in as-
sumpsit against A, who had not accounted to
him for the profits, such contract not constituting
a partnership as between themselves, but only
an agreement for a compensation for trouble and
credit, though B were liable as a partner to third
persons, creditors. 4 East 144.

A and B, general partners in trade, being in-
debted to C for advances paid by him on the
joint account of the three in the purchase of
tobacco which had been sent out on a special
joint adventure to Spain, with a view to liquidate
that balance, C agreed with A and B to join
with them in another adventure to Lisbon, of
which he was to have one moiety; and it was

agreed that A and B should purchase goods for the adventure, to be shipped on board a certain vessel, and pay for them, and the returns of such adventure were to be made to C to go in liquidation of his demand on them; but C was to bear his proportion of the loss if any; and also to receive his share of the profits if any after reimbursing himself out of the returns the amount of his advances previously made to A and B. The court of king's bench held that this agreement constituted a partnership between the three in the adventure, at and from the time of the purchase of the goods for the adventure by A and B, although C did not go with them to make the purchase nor authorize them to purchase on the joint account, but A and B alone, in fact, made the purchase; and although C also purchased in his own name, and paid for goods to be sent out at the same time in which B was to share the profit or loss, and these goods were consigned for sales and returns to the same persons who went out as supercargo on the joint account of the three. 12 East 421.

SECT. II.—OF THE RIGHTS AND POWER OF PARTNERS AMONG THEMSELVES.

If there is no express stipulation as to the management of partnership property, the majority must decide as to the disposition and management of the partnership concerns. One partner cannot bind the other partners by deed, except in bankruptcy. 7 Term Rep. 207. But he may by drawing or accepting bills of exchange. 7 Term Rep. 210. And, it is said that, if the partners agree that one member of the firm may bind it by deed, such agreement is valid. 7 T. R. 207. So if one partner in the presence of the other, and by his authority, execute a deed for both of them in a transaction in which they are both interested, it is a valid execution by both, although there is but one seal. 4 T. R. 313. And it is undoubted that the execution of a deed is valid, as the separate act of the person by whom it is actually executed. 2 B and B 338. So if a partnership, indebted on simple contract, intend that a bond shall be given, and by mistake it is executed by the senior partner only in the partnership firm, the creditor is entitled to rank as a special creditor against the estate of any of the partners. 3 Vesey, 73.

If the partners' life effects are taken and sold under an execution against one partner only, the sheriff is to pay over to the other partners a share of the produce proportioned to their shares in the partnership effects. As a general rule one partner cannot sue another in a court of law; but must seek relief in equity. Thus a number of persons agreeing to subscribe sums of money for the purpose of obtaining a bill in parliament to make a railway are partners in the undertaking; and, therefore, a subscriber who acted as their surveyor cannot maintain an action for work done by him in that character, on account of his partnership, against all or any of the other subscribers. 1 Barn. and Cress. 74. So also, the partners in one house of trade cannot maintain an action against the partners in another house of trade, of which one of the partners in the

plaintiff's house is also a member, for transactions which took place while he was partner in both houses; and that whether the action be brought in the life time of the common partner or after his decease: but after his decease the surviving partners of the one house may sue the surviving partners of the other house upon transactions subsequent to the decease of the common partner. 6 W. P. Taunt. 597.

To this general rule, that one partner cannot maintain an action at law against his co-partner, there are however several exceptions. For instance, if partners covenant to account, and a balance is struck, and the indebted partner promises to pay, an action of assumpsit may be maintained. 2 T. Rep. 483. And, if two persons agree to share in profit or loss upon goods bought by one of them on joint account, an action will lie against the other for the payment of his share. 13 East 7. So one partner may maintain an action against the other for money received to the separate use of the former and wrongfully carried to the partnership account. 2 Term Rep. 476.

The following cases are also explanatory of the principle which regulates this exception to the general rule. The defendant agreed in writing to take one half share of certain goods bought by the plaintiff on their joint account, half in the profit or loss, and to furnish the plaintiff with half the amount in time for the payment thereof, the goods being to be paid for by bills. The court of king's bench held, that the plaintiff having paid the whole price of the goods which were to constitute the partnership stock to which both parties were to contribute equally, an action lay against the defendant for his moiety of the price which was to be furnished by him in the first instance, although there might be an account to be taken between them as partners upon the subsequent disposal of the joint stock. 13 East 7. Where money is owing to two partners, and after the death of one it is paid to a third person, the surviving partner may maintain an action for money had and received in his own right and not as survivor. 2 Term Rep. 140.

On the subject of the expenses of conducting a partnership concern, the following case may be material:—If, after two partners have lived in the same house where the business is carried on, one of them take and live in a separate house for his dwelling, and the remaining partner manage the whole business, and is at considerable expense in treating the customers, and such treating is necessary and usual, but not universal in the trade; and a balance of profits and expenses is struck every year without any demand for the expenses of such treating; and it is usual for articles of partnership to contain a covenant for such expenses, the remaining partner is not entitled to an allowance for such expenses. 1 Ans. 94. In some respects an individual partner, or a particular partnership consisting of two or more such persons as are partners in some larger partnership, may be considered as third persons in transactions in which the general partnership may happen to be engaged with a correspondent. Per Eyre C. J. 1 Bos. and Pull. 546, 547. If partners by deed assign all

their partnership effects, &c., to trustees for the benefit of their creditors, and some of the separate creditors of one partner do not assent to it, the assignment is fraudulent and void. 8 Term Rep. 140. An admission by one of the two partners, after the dissolution of the partnership, is competent evidence to charge the other partner. 1 W. P. Taunt. 104. If the names of two partners in trade appear (among others) on the certificate of registry as owners of a ship, the registry acts do not prevent the showing how and in what proportions the several owners are respectively entitled, and the partners may derive title under different conveyances; yet if their shares were purchased with the partnership funds and treated by them as partnership property, and the partners become bankrupt, these shares will be considered as the joint property. Term Rep. Hil. 56 Geo. III. To prevent the ends of justice from being defeated in criminal prosecutions by the difficulty of ascertaining the names of every owner of property, the 7th George IV. cap. 64, sec. 14, enacts that, 'in any indictment or information for felony or misdemeanor, when it shall be necessary to state the ownership of property, it shall be sufficient to name one owner;' and this extends to all partners in trade, joint tenants, parceners, or tenants in common as well as to trustees and joint stock companies.

SECT. III.—OF THE LIABILITIES OF PARTNERS TO THIRD PERSONS.

Where there is a share of profits there shall also be a share of losses; for whoever takes a part of the capital, or of the profits of it, takes a part of that fund to which the public have given credit, and to which they look for payment. Dormant partners are liable when discovered, because they would otherwise receive usurious interest and without a risk. Another, and perhaps a better, reason is, that the act of the partner binds all his co-partners, on account of the communion of profit and loss. The following cases will explain the nature of the liabilities incurred by the several persons who compose a partnership.

Where the consignee of goods (to whom the bill of lading was indorsed in blank) assigned it over as a security for acceptance given by the assignee not amounting to the value of the goods, and afterwards they became partners in the goods by an agreement between them that the profits and loss should be equally divided, but the first was to stand guarantee to the other for the solidity of the factors by whom the goods were to be sold; and it appeared by the agreement that the consignor had not been paid for the goods; the assignee of the bill of lading cannot maintain trover against the consignor if he stop the goods in transitu on the insolvency of the consignee; for one partner cannot recover those goods which the other could not. 2 Term. Rep. 674. An action cannot be maintained by several partners for goods sold by one of them living in Guernsey, and packed by him in a particular manner for the purpose of smuggling, though the other partners who resided in England knew nothing of the sale; for the act of one is, in this respect, the act of all; and as it is a contract by

subjects of this country, made in contravention of the laws, this case must be considered in the same light as if all the partners resided in England. 3 Term. Rep. 454. 5 Term Rep. 599. 4 Term Rep. 466. If one partner draw or indorse a bill in the partnership firm, it will prima facie bind the firm, although passed by the one partner to a separate creditor in discharge of his own debt, unless there be evidence of covin between such separate debtor and creditor, or at least of the want of authority either express or implied in the debtor partner to give the joint security of the firm for his separate debt. But the court of king's bench held that no sufficient circumstance appeared in this case to raise any presumption adverse to the separate creditor taking such joint security in a case where the bill appeared to have been drawn in the name of the firm to their own order, eighteen days before the delivery of it to the separate creditor, and to have been accepted and indorsed before such delivery, and to have been drawn for a larger amount than the particular debt, and where, though the indorsement was in fact made by the hand of the debtor partner, yet it did not appear that that fact was known to the separate creditor at the time, and this too in a case where direct evidence might have been given of the covin or want of authority if it existed. 13 East 175.

A and B, ship agents at different ports, enter into an agreement to share in certain proportions the profits of their respective commissions, and the discount on tradesmen's bills employed by them in repairing the ships consigned to them, &c. By this agreement they were held to become liable as agent: though the agreement provided that neither should be answerable for the acts or losses of the other, but each for his own. 2 H. Blacks. 235. Where A, B, and C, were engaged in a cotton trade under the firm of A and B (C not being known to the world as a partner), and A and B traded under the same firm as grocers, and a bill given to them in the cotton business was indorsed in the firm common to partnerships, and given in payment by A and C for goods received in their grocery business; the court of king's bench held that C was liable to pay the bill to the holders, although the indorsement was unknown to C, of whom the indorsee had no knowledge at the time of the indorsement. 7 East 209. One of two partners applied trust money in the trade with the privity of the other partners; afterward they separated, and the partnership effects were assigned over to the first who took on him the debts; this was held to be no payment in discharge of the other partner, but both were liable to make good the trust money. 5 Term Rep. 601. A contract made by two partners to pay a certain sum of money to a third person equally out of their own private cash is a joint contract, and they must be jointly sued upon it. 1 H. Blacks. 236.

If three partners (two of whom reside abroad and one in England) be sued for a partnership debt, and the partner resident in England appear to the action, but refuses to appear for the partners resident abroad, the sheriff under a distringas against the two partners may take partnership

effects, though paid for by the partner resident in England alone, to whom the partnership was legally indebted; and the court will not relieve him against such distress. 3 Bos. and Pull. 254. In assumpsit against one of several partners for not delivering goods, with account for money had and received, to which defendant pleaded that the promises were jointly made with A and B, made the contract individually though in the name of the partnership, and for the sale of partnership property; and that in fraud of his partners he received the money to his own use: though the bill drawn by him for the money was in the partnership name. Held that plaintiff might recover the money so received under the common court. Term Rep. Hil. 56. Geo. III.

Where one of three partners, after a dissolution of partnership, undertook by deed to pay a particular partnership debt on two bills of exchange, and that was communicated to the holder, who consented to take the separate notes of the one partner for the amount, strictly reserving his right against all three, and retained possession of the original bills. Held that the separate notes having proved unproductive he might still resort to his remedy against the other partners, and that the taking under these circumstances the separate notes, and even afterwards renewing them several times successively, did not amount to satisfaction of the joint debt Term Rep. Mich. 53, Geo. III.

It has been said (but it does not appear conclusively settled) that if one partner sign a letter of credit or guarantee in the name of all the partners, it binds the firm. But that there is a material difference between one partner pledging the guarantee of the firm for his separate debt, and his negotiating bills in the partnership firm. 1 East 48. After a general partnership between two conveyancers in the country; if money be received partly by one of the firm, and partly by the other, to be laid out upon a mortgage, which is forged by one of the partners without the knowledge of the other, the innocent partner is liable to repay the money. 2 Cowp. 814.

It is sometimes the case that although no contract of partnership has been actually entered into between persons acting or dealing together, so as to bind each other among themselves, yet a partnership is held to be subsisting, and a consequent liability to be incurred to third persons. So also a previous partnership, which has ceased as between the partners, may be held to continue as regards the world. Thus if a person suffer his name to be used as a partner he is liable to third persons.

If an outgoing partner is to receive an annuity and a per centage upon all sales to his old customers, and to new customers by him recommended, it seems that the partnership as to third persons continues. 2 H. Blackst. 242. It has been said that the liability of the outgoing partner is to be determined by considering whether the payment is certain and defined, or depending upon the casualties of trade. So, also, the liability is said to depend upon his agreeing to share the profits, or only relying upon the profits as a fund for payment. 2 Blackst. 998.

In partnerships not incorporated, the indivi-

dual partners are liable for the debts of the joint trade without limitation. The members of incorporated societies are liable for their respective shares, or, according to 6 Geo. IV. cap. 91, in such other degree as the charter of incorporation may prescribe.

SECT. IV.—OF THE EXCEPTIONS TO THE LIABILITY OF PARTNERS.

A joint purchase without any communion or profit does not constitute a liability to third persons. Thus, if a purchase be made upon an agreement that one of the parties shall be ostensible buyer, and each party have a distinct share of the whole; and the ostensible purchaser is the only party known to the vendor, the other parties are not liable for payment. 1 H. Blackst. 37. A communion of subsequent profits, without any joint interest at the time of the purchase, does not constitute a joint liability. 4 T. R. 724. As a general rule, it may be observed, that the liability of one partner for the acts of another extends only to debts contracted in the course of the partnership concern.

A dormant partner is not responsible for a bill of exchange, accepted by the acting partners in their names, unless such bill relate to the business of the partnership—the sleeping partner having no privity of interest in the bill. 2 Car. and Pay. 138. A member of a firm who retires from the partnership, is not liable on account of the remaining members continuing his name without his consent. And if the remaining partners continue the trade in the style of the old firm, after due notice of the dissolution, it seems that there is not any necessity for the protection of the outgoing partner that he should apply to a court of equity to restrain the remaining partners from the use of the style of the old firm. 2 Camp. 617. This, however, supposes that all the measures of precaution by advertisement, notice, &c., have been adopted.

An agreement by the remaining members of a firm to pay to an outgoing partner an annuity for his interest at the time of the dissolution in the profits and good will does not constitute a liability as partners to third persons. A share in a ship or other specific object does not constitute a general partnership; and therefore the responsibility is limited to that particular object.

If the proprietor of cattle agree with the owner of land that the cattle shall be pastured upon the land, and that the profit after they are fatted above a certain sum at which the cattle are estimated, shall be equally divided between the proprietor of the cattle and the owner of the land; this is merely a mode of paying for the pasture, and does not constitute a joint liability. 1 Camp. 331, in notes.

If the contract is for an antecedent debt, due from the partner to the contracting party, the presumption seems to be that the firm is not liable. 1 East. 48.

If there be any speculation of which one of the partners should disapprove, he may avoid responsibility by giving notice, to those with whom the other partners are about to contract, that he will not be concerned in it. Two (of three) partners who had contracted a debt prior to the

admission of the third partner into the firm cannot bind him, without he assent by accepting a bill drawn by the creditor in their joint names; but such security is fraudulent and void as against the third partner, and cannot be recovered in an action against the three, wherein one only of the original partners plead to the action. 1 East. 48, 49. Where A and C had entered into an agreement to purchase goods in the name of A only, and to take aliquot shares of the purchase, but it did not appear that they were jointly to resell the goods, the court of common pleas (Wilson J. Diss.) held that on failure of A, the ostensible buyer, B and C were not answerable as partners with him. 1 H. Blackst. 37.

Acts subsequent to the time of delivering goods on a contract may be admitted as evidence to show that the goods were delivered on a partnership account, if it were doubtful at the time of the contract; but, if it clearly appear that no partnership existed at the time of the contract, no subsequent act, by any person who may afterwards become a partner (not even an acknowledgment that he is liable on his accepting a bill of exchange drawn on them as partners for the very goods), will make him liable in an action for goods sold and delivered, though he will be liable in an action on the bill of exchange. 4 Term Rep. 720. On the dissolution of a partnership between A, B, and C, a power given to A, to receive all debts owing to, and to pay all those owing from the late partnership, does not authorise him to indorse a bill of exchange in the name of the partnership, though drawn by him in that name and accepted by a debtor to the partnership after the dissolution. The person therefore to whom he so indorses it cannot maintain an action on it against A, B, and C, as partners. 1 H. Blackst. 155. Neither can such indorsee maintain an action against A, B, and C, for money paid to the use of the partnership, though in fact the money advanced by him in discounting the bill be applied by A to the payment of a debt due from the partnership. 1 H. Blackst. 155.

The authority of one partner to bind another, by signing bills of exchange and promissory notes in their joint names, is only an implied authority, and may be rebutted by express previous notice to the party taking such security from one of them, that the other would not be liable for it; and this though it were represented to the holder, by the partner signing such security, that the money advanced on it was raised for the purpose of being applied to the payment of partnership debts and though the greater part of it were in fact so applied. Nor can he recover against the other partner to the amount of the sums so applied to the payment of the partnership debts against such notice. 10 East. 264. If several persons horse, with horses their several property, the several stages of a coach in the general profits of which they are partners, they are not jointly liable for goods furnished to one partner for the use of the horses drawing the coach along his part of the road. 2 W. P. Taunt. 49. In an action on the case, upon a delivery of goods to several joint owners of a ship to be carried to A for freight alleging a

deviation if the plaintiff fail in proving all the defendants to be owners he cannot recover, even against those whom he proves to be owners. 2 New Rep. C. P. 454.

A bond was given to the several persons constituting the firm of a banking house, conditioned for the repayment of the balance of an account, and of such further sums as the bankers might advance to the obligor; one of the partners dies, and a new partner is taken into the firm: at that time a considerable balance is due from the obligor to the firm, advances are afterwards made by the bankers, and payments made to them on account by the obligor; the latter is credited by the new firm with the several payments, and charged with the original debt and subsequent advances, as constituting items in one entire account, and the balance due at the time of the partner's death is considerably reduced; and that reduced balance, by order of the obligor, is transferred by the bankers to the account of another customer, who, with his assent, is charged with the then debt of the obligor. The person so charged having become insolvent, the surviving partners of the original firm brought their action upon the bond. Held that as they had not originally treated it as a distinct account, but had blended it in the general account with other transactions, they were not at liberty so to treat it at a subsequent period, and, having received in different payments a sum more than sufficient to discharge the debt due upon the bond, was to be considered as paid. Term. Rep. Mich. 59 Geo. III.

SECT. V.—OF THE DISSOLUTION OF PARTNERSHIPS.

A general partnership, entered into for an unlimited time, may be put an end to, at any time, by either of the parties, so that he does not break off with some sinister view. It may be dissolved also by the award of arbitrators, by the insanity of one of the firm, or by the gross misconduct of a partner; on which a court of equity may annul the contract.

The death of one partner dissolves the partnership, unless there be an express agreement to transmit the interest in the business to the family of the deceased partner, or his executor, or administrator. It is dissolved also by the bankruptcy, outlawry, or attain for treason or felony of either partner.

If a partnership for a limited time, with a right to dissolve upon giving a year's notice, be continued, without any new agreement after the expiration of the limited time, such new partnership is dissoluble at the will of either party. 17 Vesey 298. The taking, by a partnership, of a lease which is unexpired, or their entering into contracts which are unexecuted, does not deprive either party of his right to dissolve at will. Ibid. If a partnership be formed for carrying into effect a new invention, which, after repeated trials, is found impracticable, it seems that the partnership is dissoluble. Baring, v. Dix, at the Rolls, 1786.

A firm may be bound, after the dissolution of the partnership, by a contract, made by one partner in the name of the firm, with a person who con-

tracted on the fait of the partnership, and had not notice of the dissolution. 1 Esp. 371. It seems that an advertisement in the Gazette is sufficient notice to all persons who had not previous dealings with the house. 3 Esp. 248. But it is necessary, as to all persons with whom the firm had dealings, to send to each notice of the dissolution.

PARTRIDGE, *n. s.* Fr. *perdre*; Wel. *pertris*; Lat. *perdis*; Gr. *περδύς*. A well known species of game bird.

The king is come out to seek a flea, as when one doth hunt a *partridge* in the mountains.

1 Samuel xxvi. 20.

Enough for me

To boast the gentle spar-hawk on my fist,
Or fly the *partridge* from the bristly field,
Relieve the covey with my busy train,
Or with my soaring hobby dare the lark.

Somerville.

This may lead to the right interpretation of Ecclesiasticus xi. 30, which we render 'like as a *partridge* taken (or kept) in a cage, so is the heart of the proud,' but should be 'like a decoy *partridge* in a cage.'

Dr. Shaw.

PARTRIDGE, in ornithology. See **TETRAO**. The places partridges delight in most are corn fields, especially whilst the corn grows; for under that cover they shelter and breed; and they are frequented by them when the corn is cut down, for the grain. In the furrows, amongst the clods, branches, and long grass, they hide both themselves and coveys, which are sometimes twenty in number, nay thirty in a covey. When winter is arrived, and the stubble fields are ploughed up, or over-soiled with cattle, partridges resort into the upland meadows, and lodge in the dead-grass, or fog under hedges, amongst mole-hills, or under the roots of trees; sometimes they resort to coppices and under-woods, especially if any corn-fields are adjacent, or where there is grown broom, brakes, fern, &c. In harvest, when every field is full of men and cattle, in the day they are found in fallow fields adjoining to corn-fields, where they lie lurking till evening or morning, and feed among the sheaves of corn. This bird contributes so much to the pleasures of the table that many experiments were formerly in use to take them alive. Having deceived the timid creatures by a happy imitation of their notes, it was easy to entice them into the snare; but their destruction is now almost entirely reserved for the shot of the sportsman, or the net of the poacher. The partridges of Abyssinia are said to be as large as capons.

PARTURITION, *n. s.* } Lat. *parturio*. The
PARTURIENT, *adj.* } state of being about to bring forth.

Conformation of parts is required, not only under the previous conditions of birth, but also under the *parturition* or very birth.

Browne.

PARTURITION. See **MIDWIFERY**.

PARTY, *n. s.*

PARTY-COLORED, *adj.* } Fr. *partie*. Or from
PARTY-JURY, *n. s.* } PART. An individual
or distinct person; a
side; hence a faction;

a number of persons combined; or the adherents to a cause taken collectively; a military detachment; a select assembly: party-colored means, having various colors: party-jury, a jury half

foreigners and half natives: party-wall, a partition wall between two houses.

The cause of both parties shall come before the judges.

Easday.

As she paced on, she was stopped with a number of tees, so thickly placed together that she was afraid she should, with rushing through, stop the speech of the lamentable party, which she was so desirous to understand.

Sidney.

Men in a party have liberty only for their motto; in reality they are greater slaves than any body else would care to make them.

Beville.

The minister of justice may, for public example, virtuously will the execution of that party, whose pardon another, for compassion's sake, as virtuously may desire.

Hooker.

When you are hearing a matter between party and party, if pinched with the cholic, you make faces like mummers, and dismiss the controversy more entangled by your hearing: all the peace you make in their cause is calling both parties knaves.

Shakespeare.

How shall this be compast? canst thou bring me to the party?

Id. Tempest.

The fulsome ewes,

Then conceiving, did, in yearning time

Fall party-coloured lambs.

Shakespeare.

The child was prisoner to the womb, and is

Freed and enfranchised; not a party to

The anger of the king, nor guilty of

The trespass of the queen.

Id.

The imagination of the party to be cured is not needful to concur; for it may be done without the knowledge of the party wounded.

Bacon.

If the jury found that the party slain was of English race, it had been adjudged felony.

Devies.

The smoke received into the nostril causes the party to lie as if he were drunk.

Abbot.

He that confesses his sin, and prays for pardon, hath punished his fault: and then there is nothing left to be done by the offended party, but to return to charity.

Taylor.

When princes idly lead about,

Those of their party follow suit,

Till others tramp upon their play,

And turn the cards another way.

Butler.

The peace, both parties want, is like to last.

Dryden.

Ægle came in, to make their party good.

Id.

Constrained him in a bird, and made him fly

With party-coloured plumes a chattering pie.

Id.

The leopard was valuing himself upon the lustre of his party-coloured skin.

L' Estrange.

When any of these combatants strips his terms of ambiguity I shall think him a champion for truth, and not the slave of vain glory and a party.

Locke.

'Tis an ill custom among bricklayers to work up a whole story of the party-walls, before they work up the fronts.

Mason.

As he never leads the conversation into the violence and rage of party disputes, I listened to him with pleasure.

Tatler.

Party writers are so sensible of the secret virtue of an innuendo, that they never mention the *q*—a at length.

Spectator.

I looked with as much pleasure upon the little party-coloured assembly, as upon a bed of tulips.

Addison's Spectator.

This account of party patches will appear improper to those who live at a distance from the fashionable world.

Addison.

There is nothing so bad for a face as party zeal. It gives an ill-natured cast to the eyes, and a dis-

agreeable sourness to the look : besides that it makes the hues too strong, and flushes them worse than brandy. *Id.*

If a bishop be a *party* to a suit, and excommunicates his adversary ; such excommunication shall not bar his adversary from his action. *Ayliffe.*

Though there is a real difference between one man and another, yet the *party* who has the advantage usually magnifies the inequality. *Collier.*

Nor is it hard to beautify each month
With files of *party-coloured* fruits. *Philips.*

Let me extol a cat on oysters fed,
I'll have a *party* at the Bedford-head. *Pope.*

Four knaves in garb succinct, a trusty band,
And *party-coloured* troops, a shining train,
Draw forth to combat on the velvet plain. *Id.*

Division between those of the same *party* exposes them to their enemies. *Id.*

There never was any *party*, faction, seat, or cabal whatsoever, in which the most ignorant were not the most violent ; for a bee is not a busier animal than a blockhead. *Id.*

If the clergy would a little study the arts of conversation, they might be welcome at every *party*, where there was the least regard for politeness or good sense. *Swift.*

The most violent *party* men are such, as, in the conduct of their lives, have discovered least sense of religion or morality. *Id.*

PARVIS, *n. s.* Fr. *parvis*. A church or church-porch : applied to the mootings or law-disputes among young students in the inns of courts, and also to that disputation at Oxford called disputation in *parvis*.

PARVITUDE, or } Lat. *parvus*. Little-
PARVITY, *n. s.* } ness ; minuteness. Not used.

The little ones of *parvitude* cannot reach to the same field with them. *Glanville.*

What are these for fineness and *parvity*, to those minute animalcula discovered in pepper-water ? *Rag.*

PARULIDES, in surgery, tumors and inflammations of the gums, commonly called gum-boils. They are to be treated with discutients like other inflammatory tumors.

PARUS, the titmouse, in ornithology, a genus belonging to the order of passeress. The bill is very entire, covered at the basis with hairs ; the tongue is truncated and hairy. There are fourteen species, of which the most remarkable are these :—

1. *P. biarmicus*, the bearded titmouse, has a short, strong, and very convex bill, of box color ; the head of a fine gray ; the chin and throat white ; the middle of the breast flesh-colored ; the sides and thighs of a pale orange ; the hind part of the neck and back of orange bay ; the tail is two inches and three quarters long ; the legs of a deep shining black. The female wants the flesh-color on the breast, and a triangular tuft of black feathers on each side the bill which adorn the male. They are found in marshy places.

2. *P. ceruleus*, the blue titmouse, is a very beautiful bird. The bill is short and dusky ; the crown of the head a fine blue, from the bill to the eyes is a black line ; the forehead and cheek white ; the back of a yellowish green ; the lower side of the body yellow ; the wings and tail blue, the former marked transversely with a

white bar ; the legs of a lead color. They frequent gardens ; and do great injury to fruit trees, by bruising the tender buds in search of the insects which lie under them. They breed in holes of walls, and lay twelve or fourteen eggs.

3. *P. caudatus*, the long-tailed titmouse, is about five inches and a quarter long, and seven inches broad. The bill is black, very thick, and convex, differing from all others of this genus. The top of the head, from the bill to the hind part, is white, mixed with a few dark gray feathers : this bed of white is entirely surrounded with a broad stroke of black ; which, rising on each side of the upper mandible, passes over each eye, unites at the hind part of the head, and continues along the middle of the back to the rump. The feathers on each side of this black stroke are of a purplish red, as are those immediately incumbent on the tail. The tail is the longest, in proportion to the bulk, of any British bird, being in length three inches, the form not unlike that of a magpie, consisting of twelve feathers of unequal lengths, the middle-most the longest, those on each side growing gradually shorter. These birds are often seen passing through our gardens, going from one tree to another, as if in their road to some other place, never making any halt. They make their nests with great elegance, of an oval shape, and about eight inches deep, having near the upper end a hole for admission. The external materials are mosses and lichens curiously interwoven with wool. On the inside it is very warmly lined with a thick bed of feathers. The female lays from ten to seventeen eggs. The young follow their parents the whole winter ; and from the slenderness of their bodies, and great length of tail, appear, while flying, like darts cutting the air.

4. *P. cristatus*, the crested titmouse, weighs thirteen pennyweights ; the bill is black, with a spot of the same color above it ; all the upper part of the body gray ; the neck and under parts are white, with a faint tincture of red, which is deepest just below the wings. The legs are of a lead color. It erects its crown feathers into a crest. They inhabit the warm parts of North America ; and frequent forest-trees, feeding upon insects.

5. *P. major*, the great titmouse, has the head and throat black, the cheeks white, the back green ; the belly yellowish green, divided in the middle by a line of black which extends to the vent ; the rump a bluish gray, the legs of a lead color, the toes divided to the very origin, and the back too very large and strong. This species sometimes visit our gardens ; but for the most part inhabit woods, where they build in hollow trees, laying about ten eggs. They feed on insects, which they find in the bark of trees. In spring, they do a great deal of mischief by picking off the tender buds of the fruit trees. Like woodpeckers, they are perpetually running up and down the bodies of trees in quest of food. These birds have three cheerful notes which they begin to utter in February.

6. *P. pendulinus*, the remiz, or small titmouse. It is often found in Lithuania. Mr. Coxe, in his Travels through Poland, gives the following

account of this little animal:—'They are the smallest species of titmice. The head is of a pale bluish ash color; the fore part of the neck and the breast tinged with red; the belly white; wings black; back and rump of a yellowish rust color; quill feathers cinereous, with the exterior sides white; the tail rust-colored. The male is singularly distinguished from the female by a pair of black pointed whiskers. Its nest is in the shape of a long purse, which it forms with amazing art, by interweaving down, gossamer, and minute fibres, in a close and compact manner, and then lining the inside with down alone, so as to make a snug and warm lodge for its young brood. The entrance is at the side, small, and round, with its edge more strongly marked than the rest of this curious fabric: the bird, attentive to the preservation of its eggs or little ones from noxious animals, suspends it at the lesser end to the extremity of the slender twigs of a willow, or some other tree, over a river. Contrary to the custom of titmice, it lays only four or five eggs: possibly Providence has ordained this scantiness of eggs to the remiz, because, by the singular instinct imparted to it, it is enabled to secure its young much more effectually from destruction than the other species, which are very prolific.'

PARUTA (Paul), a noble Venetian, born in 1540; distinguished for his learning, and knowledge as a statesman. He filled several high offices; was sent on several embassies; was appointed governor of Brescia, and procurator of St. Mark: in all which stations he showed great talent and probity. He wrote, *Notes upon Tacitus*; *Political Discourses*; *A Treatise of the Perfection of the Political Life*; *A History of Venice*, from 1513 to 1572, with the War of Cyprus; all in Italian. He died in 1598.

PARYSATIS, an infamous Persian queen, wife of Darius Nothus, and mother of Artaxerxes Mnemon and Cyrus the younger. Her partiality for Cyrus led her to commit the greatest injustice and barbarities; and she poisoned Statira, the wife of Artaxerxes. See **PERSIA**.

PAS, *n. s.* *Fr. pas*. Precedence; right of going foremost; a Gallicism.

In her poor circumstances, she still preserved the mien of a gentlewoman; when she came into any full assembly, she would not yield the *pas* to the best of them. *Arbuthnot.*

PASARGADA, a town of Persia, near Carmania, founded by Cyrus the Great, on the spot where he conquered Astyages. The kings of Persia were afterwards crowned in it.

PASCAL (Stephen), a French gentleman of an ancient family, born in 1588. He was president of the court of aids in Auvergne; he was a very learned man, an able mathematician, and a friend of Descartes. In 1631 he quitted his office in his province, and went and settled at Paris, that he might be quite at leisure for the instruction of his only son.

PASCAL (Blaise), one of the finest mathematicians France has produced. He was born at Clermont in Auvergne in 1623. His father had kept all mathematical books out of his way, lest they should interrupt his study of the languages; but nevertheless he advanced considerably in

the knowledge of mathematics, without ever hearing a single term. He understood Euclid's Elements as soon as he cast his eyes upon them. At sixteen years of age he wrote *A Treatise on Conic Sections*; and, at nineteen, contrived an admirable arithmetical machine, which would have done credit to any man versed in science. About this time his health became impaired, and he was in consequence obliged to suspend his labors for four years. In his twenty-third year, having seen Torricelli's experiment respecting a vacuum and the weight of the air, he turned his attention towards these objects; and he published the result of a variety of experiments, in two small treatises, the one entitled *A Dissertation on the Equilibrium of Liquors*; and the other, *An Essay on the Weight of the Atmosphere*. These labors procured him so much reputation, that the greatest mathematicians and philosophers of the age consulted him about such difficulties as they could not solve. But his career, though brilliant, was ordained to be but short. His health declined so rapidly that he renounced all severe study, and, in mistaken devotion, inflicted on himself the most severe tortures. He died in Paris 1662, aged thirty-nine years. Besides the works above-mentioned, he wrote *Lettres Provinciales*, satirising the Jesuits, and some religious pieces. His works were collected by Bossu, in 5 vols. 8vo.

PASCHE, *n. s.* } *Fr. pascal*; *Lat. paschalis*.
PAS'CHAL, *adj.* } The passover: relating to the passover: hence relating to Easter.

Neither would God have cast the Christian Easter upon the just time of the Jewish *Pasch*, and their Whitsuntide upon the Jewish Pentecost. *Bp. Hall.*

PAS-DE-CALAIS, DEPARTMENT OF THE, France, is formed out of the former province of Artois, and takes its name from its situation, being near the strait that separates France from England, called the Pas-de-Calais, and by the English the Straits of Dover. The principal place of this prefecture is Arras; it is divided into six arrondissements: Arras, containing 165,864 inhabitants, Bethune 123,247, Boulogne 85,141, Montreuil 75,983, St. Omer 98,274, and St. Pol 78,075; being a total population of 626,584 souls, on an area of 2932 square miles, yielding a territorial revenue of 32,305,000 francs. It is subdivided into forty three cantons and 953 communes, forming part of the sixteenth military division, having a royal court at Douay and a bishopric at Arras, and consisting of four electoral arrondissements which send seven members to the chamber of deputies. This department is bounded on the north-east and east by that of the North, on the south by that of the Somme, and on the west by the ocean.

The surface presents a very flat country, gradually declining from the side of Belgium; there is, however, a chain of small mountains, which, stretching from Abbeville beyond Boulogne, contains the sources of several rivers. The sea-coast is bordered by sandy hills, called the Downs, which are yet uncultivated. The soil is very fruitful, and produces in abundance all sorts of grain, vegetables and fruit for cyder. The artificial meadows are very numerous. The low country presents but little running

water; there are marshes, fens, and some fine meadows, fat pastures, fruitful fields, and turpits. Cattle of all kinds are fed here, and horses of excellent quality. There are but few thickets, and not one forest of any size, on which account the people burn chiefly turf and coal. The vine is not cultivated here; the climate is very variable. The soil is chiefly cultivated with horses, and yields more than sufficient for its inhabitants, producing on an average forty-six francs forty-three centimes from every hectare of arable land. There is much small game; also fresh and salt water fish, asses, milch cows, merino sheep, pigs, and great quantities of poultry. There are quarries of marble, gray paving-stone, flint, lime-stone, pipe-clay, potter's-clay, and sand. At Arras and at Courset there are botanical gardens, and mineral waters of a chalybeate quality at Boulogne.

The manufactures of this department consist of common cloths, caps of thread, cotton and wool, cotton velvet, lace, soap, bright iron goods, plate-iron, candles, gingerbread, fishing-nets, and baskets. There are linen and cotton spinning-factories, numerous oil-mills, sugar and salt refining-houses, brandy and hollands distilleries, forges, powder-mills, bleaching grounds, starch manufactories, paper-mills, bark-mills, and considerable tan-yards. A great trade is carried on in grain, wine, brandy, oil, honey, salt, cattle, linen, lace, thread, leather, earthenware for the colonies, coal, &c. There are also cod, herring, and mackerel fisheries, and a coasting trade. This country is watered by the Lys, the Scarpe, the Canche, the Aa, the Auty, the Lave, and other rivers and rivulets; the canals of Calais, St. Omer, Ardres, and Marck, intersect it, and it is crossed by the great roads of Mons, Lille, Dunkirk, Montreuil, Abbeville, and St. Quentin.

PASH, *n. s.* Span. *paz*, a kiss; Scot. *push*, the head. A face.

Thou want'st a rough *push*, and the shoots that I have,

To be full like me. *Shakespeare. Winter's Tale.*

PASH, *v. a.* Lat. *pango*. To strike; crush.

With my armed fist

I'll *push* him o'er the face. *Shakespeare.*

Thy cunning engines have with labour raised

My heavy hanger, like a mighty weight,

To fall and *push* thee dead. *Dryden.*

PASIPHAE, in fabulous history, daughter of Apollo, by Perseis, and wife of Minos, king of Crete, and mother of the Minotaur. See **DÆDALUS**, **MINOS**, and **MINOTAUR**.

PASOR (Matthias), a learned German divine of the seventeenth century, born at Herborne, in Westphalia. He became professor of divinity at Groningen, and afterwards of mathematics at Heidelberg. On the invasion of the Palatinate he came over to England, and read lectures at Oxford on Hebrew and mathematics; and was afterwards appointed professor of oriental languages in that university. He died in 1658.

PASQUIER (Stephen), a learned French lawyer, poet, and historian, born in Paris in 1528. He became an advocate in parliament, afterwards counsellor, and at last advocate general, under Henry III., all of which stations he

filled with ability and reputation. His works, which were published together, consist of Letters, Enquiries, Poems, Portraits, Epigrams, Epitaphs, &c. His poem entitled *Puce*, occasioned by his observing a flea on the breast of the learned Catharine De Roches, excited considerable attention. He died in Paris, August 31st, 1615, aged eighty-seven.

PASQUIL, *n. s.* } From Ital. *pasquino*, a
PASQUIN, } statue at Rome, to which
PASQUINADE. } they affix any lampoon or
satirical paper. A lampoon.

He never valued any *pasquils* that were dropped up and down, to think them worthy of his revenge.

Howel.

The *pasquils*, lampoons, and libels, we meet with now-a-days, are a sort of playing with the four-and-twenty letters, without sense, truth, or wit. *Tatler.*

PASQUIN (*pasquino*, Italian). By this name is designated a group, or rather a torso, in white marble, now in a corner of the Ursini palace in Rome, and which has been regarded by some as the figure of a wrestler, by others as that of Mars, or some earthly warrior, by others again as a gladiator, &c. M. de Ramdohr, in considering the merits of this relic of ancient art, observes that its very mutilated state prevents the connoisseur from arriving at any satisfactory conclusion respecting them. He himself seems to be of opinion that it is the representation of a warrior carrying from the scene of battle his wounded comrade.

The history of this sculpture is remarkable enough. It derives its present name from an Italian cobbler, so called, who lived in Rome, and was notorious for the bitterness of his gibes and the raciness of his jokes. His shop became, consequently, the rendezvous for a quantity of splenetic and idle persons, who diverted themselves by bantering all the passers by.

After Pasquin's decease, in digging the pavement up in front of his shop or stall, the fragments of a statue were exhumed, well chiseled; but, as has been already observed, maimed and half spoiled.

To this statue, by common consent, was affixed the name of the jocular cobbler, in the neighbourhood of whose nest it was discovered, and immediately set up on the same spot; and from that time and circumstance arose the well known term of *pasquinade*, all lampoons and satires having been, in Rome, ascribed to this figure, being put in its mouth or pasted against it as if the bonâ fide lucubrations of Pasquin rediivus. The usual method is, to make Pasquin address himself to Marforio (another statue in the same town) or the latter to Pasquin, who never fails to make reply, the one being often made to assist the other, when either is assailed.

PASS, *v. n., v. a. & n. s.* } Fr. *passer*; Ital.
PASSABLE, *adj.* } *passare*; Span. and
PASSAGE, *n. s.* } Port. *passar*; of
PASSER, } Lat. *passus*, a step.
PASSENGER, *n. s.* } To move progres-
PASSIBLE, *adj.* } sively or from step
PASSIBLENESS, *n. s.* } to step; go; change
PASSING, *part. & adj.* } by regular grada-
PASSING-BELL. } tion; go through
regular stages or vessels of the body; go away;

omit; vanish; die; be lost; be spent; be at an end or crisis: progress to or beyond the final stage: hence to be enacted, as a bill in parliament; be effected; be determined; be supremely excellent; become current; be practised shrewdly or artfully; occur; heed or regard (obsolete); thrust; be in a tolerable state: taking 'away' (intens.) when it signifies to be completely lost; vanish or glide off: as an active verb, to go beyond or through; hence surpass or excel; spend; live through; carry over; transfer; strain (a liquid); pronounce; admit or allow; enact; impose or practise upon: 'to pass away' is, to spend or waste: 'pass by, excuse or forgive; also neglect; disregard: 'to pass over' is, to omit; leave unregarded: a pass is an entrance or avenue; road; order or permission to travel or to go from place to place; a push or thrust; state arrived at; condition or disposition: passable is, that can be passed or travelled through or over; tolerable; popular: passible is, impassible: passage, the act or course of passing; journey; voyage; road or way; avenue; state of decay; occurrence or hap (obsolete in both these last senses); aptness to pass; unsettled state; incident; conduct; single part or plan of a book or writing: a passer is, he who passes, or is upon a road: passenger, a traveller; wayfarer; one who passes: passing is, supreme; eminent; exceeding: passing-bell, a bell rung to obtain prayers for a passing or dying soul; also the bell rung immediately after a death.

If I have found favour in thy sight, *pass not away* from thy servant.

This heap and this pillar be witness, that I will not *pass over* to thee, and that thou shalt not *pass over* it and this pillar unto me for harm.

While my glory *passeth by*, I will put thee in a cleft of the rock, and will cover thee, while I *pass by*.

Ecclesiastes xxxiii. 22.

The money of every one that *passeth* the account, let the priests take.

2 Kings xii. 4.

Why sayest thou, My way is hid from the Lord, and my judgment is *passed over* from my God?

Isaiah xl. 27.

Whom do'st thou *pass* in beauty?

Ezekiel.

Thus will I cut off him that *passeth out*, and him that returneth.

Id. xxxv. 7.

The father waketh for the daughter, lest she *pass away* the flower of her age.

Ecclesiastes xlii. 9.

Antiochus departed in all haste, weening in his pride to make the land navigable, and the sea *passable* by foot.

2 Maccabees.

To what a *pass* are our minds brought, that from the right line of virtue, are wryed to these crooked shifts?

Sidney.

The diligent pilot in a dangerous tempest doth attend the unskilful words of a *passenger*.

Id.

She, more sweet than any bird on bough,

Would oftentimes amongst them bear a part,

And strive to *pass*, as she could well enough,

Their native music by her skilful art.

Spenser.

They shall protect all that come in, and send them to the lord deputy, with their safe-conduct or *pass*, to be at his disposition.

Id. on Ireland.

I have heard it enquired, how it might be brought to *pass* that the church should every where have able preachers to instruct the people.

Hooker.

Theodoret disputeth with great earnestness, that God cannot be said to suffer; but he thereby meaneth Christ's divine nature against Apollinarius, which held even deity itself *passible*.

Id.

It drew after it the bareness of the *passibility* of the deity; the deity of Christ was become, in their conceits, the same nature with the humanity that was *possible*.

Everaard.

The pangs of death do make him grin;

Disturb him not, let him *pass* peaceably.

Shakespeare.

Why this *passes*, Mr. Ford:—you are not to go loose any longer, you must be pinioned.

Id.

Tell him his long trouble in *passing*

Out of this world.

Id. Henry VIII.

This practice hath most shrewdly *pass* upon thee; But, when we know the grounds and authors of it, Thou shalt be both the plaintiff and the judge.

Shakespeare.

As for these silken-coated slaves, I *pass* not,

It is to you, good people, that I speak,

O'er whom, in time to come, I *hope* to reign.

Id.

Though well we may not *pass* upon his life,

Without the form of justice; yet our power

Shall do a court'sy to our wrath.

Id.

This night

We'll *pass* the business privately and well.

Id.

To see thee fight, to see thee *pass* thy puncto.

Id.

Let me o'erleap that custom; for I cannot Put on the gown, stand naked, and entreat them; Please you that I may *pass* this doing.

Id.

We bid this be done,

When evil deeds have their permissive *pass*,

And not the punishment.

Id.

'Tis dangerous when the baser nature comes

Between the *pass* and fell incensed points

Of mighty opposites.

Id. Hamlet.

The king hath laid, that in a dozen *passes* between you and him, he shall not exceed you three hits.

Shakespeare.

His body is a *passable* carcase, if he be not hurt.

It is a thoroughfare for steel.

What, are my doors opposed against my *passage*?

Id.

Would some part of my young years

Might but redeem the *passage* of your age!

Id.

It is no act of common *passage*, but

A strain of rareness.

Id.

Thou do'st in thy *passages* of life

Make me believe that thou art only marked

For the hot vengeance of heaven.

Id.

What hollowing, and what stir is this?

These are my mates that make their wills their law,

Have some unhappy *passenger* in chase.

Id.

Oberon is *passing* fell and wroth.

Id.

The Tyrians had no *pass* to the Red Sea, but through the territory of Solomon, and by his sufferance.

Raleigh.

The story of such a *passage* was true, and Jason, with the rest, went indeed to rob Colchos, to which they might arrive by boat.

Raleigh's History.

When the case required dissimulation, if they used it, it came to *pass* that the former opinion of their good faith made them almost invisible.

Beacon.

They speak of severing wine from water, *passing* it through ivy wood.

Id. Natural History.

How far ought this enterprize to wait upon these other matters, to be mingled with them, or to *pass by* them, and give law to them, as inferior unto itself?

Beacon.

Where there is no eminent odds in sufficiency, it is better to take with the more *passable*, than with the more able.

Id.

Human actions are so uncertain, as that seemeth the best course which hath most *passages* out of it.

Id.

The land enterprize of Panama was grounded upon a false account, that the *passages* towards it were no better fortified than Drake had left them. *Id.*

After king Henry united the roses, they laboured to reduce both English and Irish, which work, to what *pass* and perfection it was brought in queen Elizabeth's reign, hath been declared.

Davies's State of Ireland.

Upon consideration of the conduct and *passage* of affairs in former times, the state of England ought to be cleared of an imputation cast upon it. *Davies.*

As it is advantageable to a physician to be called to the cure of a declining disease, so it is for a commander to suppress a sedition which has *passed* the height; for, in both, the noxious humour doth first weaken, and afterwards waste to nothing.

Hayward.

This business, as it is a very high *passage* of state, so it is worthy of serious consideration. *Id.*

Those loving papers

Thicken on you now, as prayers ascend
To heaven in troops at a good man's *passing* bell.

Donne.

No strength of arms shall win this noble fort,
Or shake this puissant wall, such *passing* might
Have spells and charms, if they be said aright.

Fairfax.

My friends remembered me of home; and said,
If ever fate would signe my *pass*, delay
It should be now no more. *Chapman.*

In my feare of hospitable Jove,

Thou did'st to this *pass* my affections move. *Id.*

You shall furnish me

With cloake, and coate, and make my *passage* free
For loved Dulichia. *Id.*

Passing many know it; and so many,

That of all nations there abides not any,
From where the morning rises, and the sun,
To where even and night their courses run! *Id.*

Martial, thou gavest far nobler epigrams
To thy Domitian, than I can my James;
But in my royal subject I *pass* thee,
Thou flatter'dst thine, mine cannot flattered be.

Ben Jonson.

Under you ride the home and foreign shipping in
so near a distance, that, without troubling the *passer*,
or borrowing Stentor's voice, you may confer with
any in the town. *Carew.*

He that will *pass* his land,

As I have mine, may set his hand
And heart unto this deed, when he hath read;
And make the purchase spread. *Herbert.*

The last doubt, touching the *possibility* of the matter
of the heavens, is drawn from the eclipses of the
sun and moon. *Hakewill.*

A talk of tumult, and a breath,

Would serve him as his *passing* bell to death.

Daniel.

I would render this treatise intelligible to every
rational man, however little versed in scholastick
learning, among whom I expect it will have a fairer
passage than among those deeply imbued with other
principles. *Digby.*

It conduces much to our content, if we *pass* by
those things which happen to our trouble, and con-
sider that which is prosperous; that, by the repre-
sentation of the better, the worse may be blotted out.

Taylor's Holy Living.

Zeal may be let loose in matters of direct duty, as
in prayers, provided that no indirect act *pass* upon
them to defile them. *Taylor.*

They are crafty, and of a *passable* reach of under-
standing. *Howel.*

Many of the nobility spoke in parliament against
those things which were most grateful to his majesty,

and which still *passed*, notwithstanding their contra-
diction. *Clarendon.*

Many of the lords, and some of the commons,
passed some compliments to the two lords. *Id.*

Waller *passed* over five thousand horse and foot by
Newbridge. *Id.*

It would be easy to defend the *passes* into the
whole country, that the king's army should never be
able to enter. *Id.*

A gentleman had a *pass* to go beyond the seas.

Id.

So shalt thou best prepared endure

Thy mortal *passage* when it comes. *Milton.*

Against which opened from beneath

A *passage* down to the earth, a *passage* wide. *Id.*

The nodding horror of whose shady brows

Threats the forlorn and wandering *passenger*. *Id.*

Many in each region *passing* fair

As the noon sky; more like to goddesses

Than mortal creatures. *Id. Paradise Lost.*

That trick, said she, will not *pass* twice.

Hudibras.

All have liberty to take fish, which they do by
standing in the water by the holes, and so intercept-
ing their *passage* take great plenty of them, which
otherwise would follow the water under ground.

Browne's Travels.

To bleed to death was one of the most desirable
passages out of this world. *Fell.*

However God may *pass* by single sinners in this
world, yet, when a nation combines against him,
the wicked shall not go unpunished. *Tillotson.*

Others, dissatisfied with what they have, and not
trusting to those innocent ways of getting more, fall
to others, and *pass* from just to unjust. *Temple.*

Traders in Ireland are but factors; the cause must
be rather an ill opinion of security than of gain: the
last intices the poorer traders, young beginners, or
those of *passage*; but, without the first, the rich will
never settle in the country. *Id.*

When the *passage* is open, land will be turned
most to great cattle; when shut, to sheep. *Id.*

Her face, her hands were torn

With *passing* through the brakes. *Dryden.*

Trust not too much to that enchanting face;
Beauty's a charm, but soon the charm will *pass*.

Id.

Their excellencies will not *pass* for such in the
opinion of the learned, but only as things which
have less of error in them. *Id.*

Both advance

Against each other, and with sword and lance
They lash; they foin, they *pass*, they strive to bore
Their corslets. *Id.*

You know in what deluding joys we *pass*

The night that was by heaven decreed our last.

Id.

I *pass* their warlike pomp, their proud array. *Id.*

Among the laws that *passed*, it was decreed,
That conquered Thebes from bondage should be
freed. *Id.*

Better to *pass* him o'er, than to relate

The cause I have your mighty sire to hate. *Id.*

Pity tempts the *pass*;

But the tough metal of my heart resists. *Id.*

Lay by Virgil, my version will appear a *passable*
beauty when the original muse is absent. *Id.*

The *passage* made by many a winding way,
Reached e'en the room in which the tyrant lay.

Id.

Apelles, when he had finished any work, exposed
it to the sight of all *passengers*, and concealed himself
to hear the censure of his faults. *Id.*

She was not only *passing* fair,

But was withal discreet and debonnaire. *Id.*

Though frauds may pass upon men, they are as open as the light to him that searcheth the heart.

L'Estrange.

A middling sort of man was left well enough to pass by his father, but could never think he had enough, so long as any had more.

Id.

He passed his promise, and was as good as his word.

Id.

Time lays open frauds, and after that discovery there is no passing the same trick upon the mice.

Id.

I could see plate, hangings, and paintings about my house till you had the ordering of me, but I am now brought to such pass, that I can see nothing at all.

Id.

In counterfeits, it is with men as with false money; one piece is more or less passable than another.

Id.

An idea of motion not passing on, is not better than idea of motion at rest.

Locke.

We see, that one who fixes his thoughts very intently on one thing, so as to take but little notice of the succession of ideas that pass in his mind, whilst he is taken up with that earnest contemplation, lets slip out of his account a good part of that duration, and thinks that time shorter than it is.

Id.

Defining the soul to be a substance that always thinks, can serve but to make many men suspect that they have no souls at all, since they find a good part of their lives pass away without thinking.

Id.

They did pass those bounds, and did return since that time.

Burnet's Theory of the Earth.

Certain passages of Scripture we cannot, without injury to truth, pass by here in silence.

Burnet.

How does that man know, but the decree may be already passed against him, and his allowance of mercy spent?

South.

Truth is a strong hold fortified by God and nature, and diligence is properly the understanding's laying siege to it; so that it must be perpetually observing all the avenues and passes to it, and accordingly making its approaches.

Id.

Matters have been brought to this pass, that if one among a man's sons had any blemish, he laid him aside for the ministry, and such an one was presently approved.

Id.

The Persian army had advanced into the straight passages of Cilicia, by which means Alexander with his small army was able to fight and conquer them.

Id.

Have we so soon forgot,

When, like a matron, butchered by her sons,
And cast beside some common way a spectacle
Of horror and affright to passers by,
Our groaning country bled at every vein? *Rouse.*

The people, free from cares serene and gay,
Pass all their mild untroubled hours away.

Addison.

I had only time to pass my eye over the medals, which are great in number.

Id. on Italy.

I wish for the wings of an eagle, to fly away to those happy seats; but the genius told me there was no passage to them, except through the gates of death.

Addison.

A critick who has no taste nor learning seldom ventures to praise any passage in an author who has not been before received by the publick.

Id.

He affirmed that no good law passed since king William's accession, except the act for preserving the game.

Id.

Full soon by bonfire and by bell,
We learnt our liege was passing well.

Gay.

Full piteous seems young Alma's case,
As in a luckless gamester's place,
She would not play, yet must not pass.

Prior.

Were I not assured he was removed to advantage, I should pass my time extremely ill without him.

Collier.

These stage advocates are not only without truth, but without colour; could they have made the slander passable, we should have heard farther.

Id.

He rejected the authority of councils, and so do all the reformed; so that this wont pass for a fault in him, till 'tis proved one in us.

Atterbury.

Live like those who look upon themselves as being only on their passage through this state, but as belonging to that which is to come.

Id.

Inflammations are translated from other parts to the lungs; a pleurisy easily passeth into a peripneumony.

Arbutnot.

Substances hard cannot be dissolved, but they will pass; but such, whose tenacity exceeds the powers of digestion, will neither pass, nor be converted into aliment.

Id.

When the gravel is separated from the kidney, oily substances relax the passages.

Id.

Dr. Thurston thinks the principal use of inspiration to be, to move, or pass the blood, from the right to the left ventricle of the heart.

Derham.

If the cause be visible, we stop at the instrument, and seldom pass on to him that directed it.

Wake's Preparation for Death.

Though the passage be troublesome, yet it is secure, and shall in a little time bring us ease and peace at the last.

Wake.

False eloquence passeth only where true is not understood, and no body will commend bad writers, that is acquainted with good.

Felton on the Classics.

Heedless of those cares, with anguish stung,
He felt their fleeces as they passed along.

Pope.

In man the judgment shoots at flying game;
A bird of passage! lost as soon as found;
Now in the moon perhaps, now under ground.

Id.

As to the cantos, all the passages are as fabulous as the vision at the beginning.

Id.

Neither of these bills have yet passed the house of commons, and some think they may be rejected.

Swift.

The grossest suppositions pass upon them, that the wild Irish were taken in toys; but that, in some time, they would grow tame.

Id.

Could the same parliament, which addressed with so much zeal and earnestness against this evil, pass it into a law?

Id.

Before the passing-bell begun,

The news through half the town has run.

Id.

The queen asked him, who he was; but he passes over this without any reply, and reserves the greatest part of his story to a time of more leisure.

Broom.

If we would judge of the nature of spirits, we must have recourse to our own consciousness of what passes within our own mind.

Watts.

How many thousands take upon them to pass their censures on the personal actions of others, and pronounce boldly on the affairs of the publick?

Id.

It does not belong to this place to have that point debated, nor will it hinder our pursuit to pass it over in silence.

Id.

How commentators each dark passage shun,
And hold their farthing candle to the sun.

Young.

In souls prepared, the passage is a breath
From time to eternity, from life to death.

Harte.

Sir Hudibras's passing worth,
The manner how he sallied forth.

Underwood.

Green as the bay tree, ever green,
With its new foliage on,

The gay, the thoughtless, have I seen,
I passed—and they were gone.

Cowper.

Time moveth not!—our being 'tis that moves:
And we, swift gliding down life's rapid stream,
Dream of swift ages and revolving years,
Ordn'd to chronicle our passing days.

Kirke White.

PASSADE, in the manege, is a turn or course of a horse backwards or forwards on the same spot of ground. Hence there are several sorts of passades, according to the different ways of turning, in order to part or return upon the same tread, which is called closing the passade; as the passade of one time, the passade of five times, and the raised or high passades, into which the demivolts are made into curvets.

PASSA'DO, *n. s.* Italian. A push; a thrust.

A duellist, a gentleman of the very first house;
ah! the immortal *passade*.
Shakespeare.

PASSADO, **PASS**, or **PASSADE**, in fencing, an advance or leap forward upon the enemy. Of these there are several kinds; as passes within, above, beneath, to the right, the left, and passes under the line, &c. The measure of the pass is when the swords are so near as that they may touch one another.

PASSAGE, **RIGHT OF**, in commerce, is a duty exacted by some princes, either by land or sea, in certain close and narrow places in their territories, on all vessels and carriages, and even sometimes on persons or passengers, coming in or going out of ports, &c. The most celebrated passage of this kind in Europe is the Sound; The dues for passing which strait belong to the king of Denmark, and are paid at Elsinore or Cronenburg.

PASSAIC, a river of New Jersey, which flows south into Newark Bay. It is navigable ten miles for small vessels. At Paterson this river has a fall of sixty or seventy feet: perpendicular, presenting a scene of singular beauty and grandeur. It is much visited as a natural curiosity.

PASSAMAQUODDY BAY, a bay of North America, which forms a part of the boundary between Maine and New Brunswick. It is about six miles from north to south, and twelve from east to west. It contains a number of islands, as Campo Bello, Deer, Mouse, Dudley, Frederick, &c.

PASSAMAN, a province in the north of the island of Sumatra, formerly part of the kingdom of Achin. It is subdivided into other provinces, and was once a place of great trade in gold and pepper. It is nearly under the equinoctial line.

PASSANT, in heraldry, a term applied to a lion or other animal in a shield, appearing to walk leisurely; for most beasts, except lions, the trippant is frequently used instead of passant.

PASSARON, in ancient geography, a town of Epirus, where, after sacrificing to Jupiter, the kings swore to govern according to law, and the people to obey and defend the country.

PASSAU, a considerable town of Bavaria, at the confluence of the Inn and Danube, was formerly the capital of a bishopric, and is still a bishop's see, and the chief town of the circle of the Lower Danube. The Inn here is full as large, if not larger than the Danube, and the

two rivers divide the town into three parts, Passau Proper, situated on the peninsula between them; the Innstadt, standing on the south side of the Inn; and the Ilzstadt, on the north side of the Danube. The three parts are connected by two long wooden bridges. The fortifications are of considerable strength, and include three large forts. Passau Proper contains several fine public edifices, such as the cathedral, the bishop's palace, and the gymnasium, originally the Jesuits' College. The Ilzstadt is inhabited chiefly by fishermen and laborers. The Innstadt is somewhat better. Passau has a tobacco manufactory, some large breweries, and, from its command of river navigation, a tolerable general trade. Here was concluded, in 1552, the famous peace of Passau, considered by the German Protestants as the charter of their liberties: in 1652 the greatest part of the town was burnt down; and in 1800, 1805, and 1809, it suffered greatly from military contributions, and the passage of troops. Population of the whole place 10,000. Eighty-six miles E. N. E. of Munich, and 138 west by north of Vienna.

The bishopric of Passau formerly comprised a track of country between Bavaria, Bohemia, and Upper Austria, of 470 square miles superficial extent; population 60,000. It was secularised in 1803; and since 1815 the part lying west of the Inn belongs to Bavaria, and the rest to Austria.

PASSERAT (John), a celebrated professor of eloquence in the royal college of Paris, and one of the most elegant writers of his time, was born at Troyes, in Champagne, in 1534. He studied the law under the famous Cujacius at Bourges, where he became professor of eloquence in 1572. He was an indefatigable student, and gained the esteem of Charles IX., Henry III., and all the men of wit and learning in his time. He died in 1602, and left several admired works behind him.

PASSERES, in ornithology, the sixth order of birds according to the Linnæan system, are distinguished by a conical and pointed bill; the nostrils are oval, pervious, and naked; the legs are formed for hopping; the toes are slender, and divided; the bodies of those that feed on grain are pure, but of those that feed on insects impure; the nest is formed with much art. They live chiefly in trees and hedges, are monogamous, and feed their young by thrusting the food down their throats. This order includes all the singing birds; the males are the songsters. They are divided into four sections, see **ORNITHOLOGIST**, and include the following genera.

Sect. I.

Colius.
Emberiza.
Fringilla.
Loxia.
Phytotoma.

Sect. III.

Ampelis.
Muscicapa.
Tanagra.
Turdus.

Sect. II.

Caprimulgus.
Pipra.
Hirundo.

Sect. IV.

Alauda.
Columba.
Motacilla.
Parus.
Sturnus.

PASSERI (John Baptist), a learned antiquary and philologist, born at Gubio in Urbino, in 1694. Having entered into orders he became apostolic protonotary and vicar general of Pesara. He published many books, particularly *Picture Etruscorum in Vasculis, nunc primum in unum collectæ, explicationibus et dissertationibus illustratæ*, Rome, 1767, 3 tom. fol. Being overturned in his carriage, he received a bruise of which he died in 1780.

PASSERI (John Baptist), a painter and poet of Italy, born in 1609. He was a disciple of Dominichino, but had more merit as an author than as a painter. He wrote the *Lives of the Painters, Sculptors, and Architects*, of his own time. He died at Rome in 1679, aged seventy.

PASSIENUS (Paulus), a Roman knight, nephew of the poet Propertius, whose elegiac poetry he imitated. He also attempted Lyric poetry with success.

PASSIFLORA, the passion-flower; a genus of the pentandria order and gynandria class of plants; natural order thirty-fourth, cucurbitaceæ: CAL. pentaphyllous; petals five; the nectarium a crown; the berry is pedicellated. There are nearly thirty different species; all natives of warm foreign countries, only one of which is sufficiently hardy to succeed well in the open ground here; all the others requiring the shelter of a green-house or stove, but chiefly the latter. The most remarkable are:—

1. *P. cærulea*, the blue-rayed common palmated passion-flower, has long, slender, shrubby, purplish-green stalks, branchy, and ascending, upon support by their claspers, thirty or forty feet high; with one large palmated leaf at each joint, and at the axillas large spreading flowers, with whitish-green petals, and a blue radiated nectarium; succeeded by a large, oval, yellowish fruit. It flowers from July until October; the flowers are very large, conspicuous, and their composition is exceedingly curious and beautiful. They come out at the axillas on pedunculi about three inches long, which they terminate, each flower having, just close under the calyx, a three-lobed involucre-like appendage; a five-lobed calyx, and a five-petalous corolla, the size, figure, and color of the calyx, &c., the petals arranging alternately with the calycinal lobes; and within the corolla is the nectarium, composed of a multitude of thread-like fibres, of a blue and purple color, disposed in circular rays round the column of the fructification; the outer ray is the longest, flat, and spreading on the petals: the inner is short, erect, and narrows towards the centre; in the middle is an erect cylindric club-shaped column or pillar, crowned with the roundish germen, having at its base five horizontal spreading filaments, crowned with incumbent yellow antheræ, and that move about every way; and from the side of the germen arise three slender spreading styles, terminated by headed stigmas; the green afterwards gradually becomes a large oval fleshy fruit, ripening to a yellowish color. These wonderful flowers are only of one day's duration, generally opening about 11 or 12 o'clock, and frequently in hot sunny weather burst open with elasticity, and continue fully expanded all that day; and the

next they gradually close, assuming a decayed-like appearance, and never open any more; the evening puts a period to their existence, but they are succeeded by new ones daily on the same plant. This plant and flowers are held in great veneration in some foreign Catholic countries, where the religious make the leaves, tendrils, and different parts of the flower, to represent the instruments of our blessed Saviour's passion; hence the name *passiflora*.

2. *P. incarnata*, the incarnated, or flesh-colored Italian passion flower, has a strong perennial root; slender, herbaceous stalks, rising, upon support, four or five feet high; leaves composed of three sawed lobes, each leaf attended by a twining tendril; and at the axillas long slender pedunculi, terminated each by one whitish flower, having a greenish calyx, and a reddish or purple radiated nectarium, surrounding the column of the fructification, which succeed to a large, round, fleshy fruit, ripening to a beautiful orange-color. The flowers of this species are also very beautiful, though of short duration, opening in the morning and night puts a period to their beauty; but they are succeeded by a daily supply of new ones. The fruit of this sort is also very ornamental, as ripening to a fine reddish orange-color; but these rarely attain perfection here, unless the plants are placed in the stove; therefore, when there is such accommodation, it highly merits that indulgence, where it will exhibit both flowers and green and ripe fruit; all at the same time in a beautiful manner.

3. *P. vespertilio*, the bat's wing passion-flower, has slender, striated, branchy stalks; large, bilobate, or two-lobed leaves, the base roundish and glandular, the lobes acute, widely divaricated like a bat's wings, and dotted underneath; the axillary flowers having white petals and rays. The leaves of this species have a singular appearance, the two lobes being expanded six or seven inches, resembling the wings of a bat upon flight; hence the name *vespertilio*. All the species in this country are of a tender quality, except the first, which succeeds very well in the full ground, in a warm situation; only their young branches are sometimes killed in very severe winters; but plenty of new ones generally rise again in spring following: the others denominated stove kinds, must always be retained in that repository.

PASSINELLI (Laurence), an eminent historical painter, born in 1629, at Bologna; in which city there are some of his best pieces. He died in 1700, aged seventy-one.

PAS'SION, *n. s. & v. n.* } Fr. and Span. *pas-*
PAS'SIONATE, *adj. & v. a.* } sion; Ital. *passione*;
PAS'SIONATELY, *adv.* } Lat. *passio*. An ef-
PAS'SIONATENESS, *n. s.* } fect produced by ex-
PAS'SION-WEEK. } ternal agency; suscep-

tibility of such effect, particularly mental susceptibility; emotion or commotion of mind; eagerness; a particular kind of mental emotion, as anger, zeal, &c. Used emphatically, in theology, for the last sufferings of the Redeemer of mankind: hence the compound, *passion-week*, the week in which his sufferings have been commemorated: to passion is used by Shakespeare

for to be agitated extremely: passionate is, moved, or apt to be moved, by passion; soon angry: to passionate, to affect with or to express passion: passionately and passionateness follow the senses of passionate.

He shewed himself alive after his *passion*, by many infallible proofs. *Acts i. 3.*

Great pleasure, mixed with pitiful regard,
That godly king and queen did *passionate*,
Whilst they his pitiful adventures heard,
That oft they did lament his luckless state.

Spenser.

My whole endeavour is to resolve the conscience, and to shew what, in this controversy, the heart is to think, if it will follow the light of sound and sincere judgment, without either cloud of prejudice or mist of *passionate* affection. *Hooker.*

All the other *passions* fleet to air,
As doubtful thoughts and rash embraced despair.

Shakespeare.

I am doubtful, lest
You break into some merry *passion*,
And so offend him:
If you should smile, he grows impatient. *Id.*

'Twas Ariadne *passioning*
For Theseus' perjury and unjust fight. *Id.*

Thy niece and I want hands,
And cannot *passionate* our tenfold grief
With folded arms. *Id. Titus Andronicus.*

The differences of mouldable and not mouldable, scissible and not scissible, and many other *passions* of matter, are plebeian notions, applied to the instruments men ordinarily practise. *Bacon.*

Envy is a gadding *passion*, and walketh the streets, and doth not keep at home. *Id.*

Thucydides observes that men are much more *passionate* for injustice than for violence; because the one, coming as from an equal, seems rapine; when the other, proceeding from one stronger, is but the effect of necessity. *Clarendon.*

In his prayers, as his attention was firm and steady, so was it inflamed with *passionate* fervors. *Fell.*

To love with some *passionateness* the person you would marry is not only allowable but expedient. *Boyle.*

Passion's too fierce to be in fetters bound,
And nature flies him like enchanted ground.

Dryden.

I made Meleaginda, in opposition to Nourmahal, a woman *passionately* loving of her husband, patient of injuries and contempt, and constant in her kindness. *Id.*

For your love,
You killed her father: you confessed you drew
A mighty argument to prove your *passion* for the daughter. *Id. and Lee's Oedipus.*

Whoever *passionately* covets any thing he has not, has lost his hold. *L'Etrange.*

A body at rest affords us no idea of any active power to move, and, when set in motion, it is rather a *passion* than an action in it. *Locke.*

They lay the blame on the poor little ones sometimes *passionately* enough, to divert it from themselves. *Id.*

Good angels looked upon this ship of Noah's with a *passionate* concern for its safety. *Burnat.*

If sorrow expresses itself never so loudly and *passionately*, and discharges itself in never so many tears, yet it will no more purge a man's heart, than the washing of his hands can cleanse the rottenness of his bones. *South's Sermons.*

He, to grate me more,
Publickly owned his *passion* for Amestris.

Race.

Where statesmen are ruled by faction and interest, they can have no *passion* for the glory of their country, nor any concern for the figure it will make.

Addison on Medals.

Homer's Achilles is haughty and *passionate*, impatient of any restraint by laws, and arrogant in arms. *Prior.*

Men, upon the near approach of death, have been roused up into such a lively sense of their guilt, such a *passionate* degree of concern and remorse, that, if ten thousand ghosts had appeared to them, they scarce could have had a fuller conviction of their danger. *Atterbury.*

Survey yourself, and then forgive your slave,
Think what a *passion* such a form must have.

Grenville.

Abate a little of that violent *passion* for fine cloaths, so predominant in your sex. *Swift.*

The word *passion* signifies the receiving any action, in a large philosophical sense; in a more limited philosophical sense, it signifies any of the affections of human nature; as love, fear, joy, sorrow: but the common people confine it only to anger. *Watts.*

Would a man know himself, he must study his natural temper; his constitutional inclinations and favourite *passions*. *Mason.*

Self-knowledge will be a good ballast to the mind under any accidental hurry or disorder of the *passions*. *Id.*

O Liberty! the prisoner's pleasing dream,
The poet's Muse, his *passion*, and his theme;
Genius is thine, and thou art Fancy's nurse.

Cowper.

Hence all that is in man, pride, *passion*, art,
Powers of the mind, and feelings of the heart,
Insenible of Truth's almighty charms,
Starts at her first approach, and sounds to arms!

Id.

But from his visage little could we guess,
So unrepentant, dark, and *passionless*,
Save that when struggling nearer to his last,
Upon that page his eye was kindly cast. *Byron.*

PASSION is a word of which, as Dr. Reid observes, the meaning is not precisely ascertained, either in common discourse or in the writings of philosophers. In its original import it denotes every feeling of the mind occasioned by an extrinsic cause; but it is generally used to signify some agitation of mind, opposed to that state of tranquillity in which a man is most master of himself. That it was thus used by the Greeks and Romans is evident from Cicero's rendering *παθος*, the word by which the philosophers of Greece expressed it, by *perturbatio* in Latin. In this sense of the word, *passion* cannot be itself a distinct and independent principle of action; but only an occasional degree of vehemence given to those dispositions, desires, and affections, which are at all times present to the mind of man; and that this is its proper sense, we need no other proof, than that *passion* has always been conceived to bear analogy to a storm at sea, or to a tempest in the air. With respect to the number of *passions* of which the mind is susceptible, different opinions have been held by different authors. Le Brun, a French writer on painting, justly considering the expression of the *passions* as a very important as well as difficult branch of his art, has enumerated no fewer than twenty, of which the signs may be expressed by the pencil on canvas. That there are so many different states of

mind producing different effects which are visible on the features and the gestures, and that those features and gestures ought to be diligently studied by the artist, are truths which cannot be denied; but it is absurd to consider all these different states of mind as passions, since tranquillity is one of them, which is the reverse of passion.

A question of considerable importance in the philosophy of the human mind has been discussed at no small length, by several eminent authors, whether the different passions be each a degree of an original and innate disposition, distinct from those dispositions which are respectively the foundations of the other passions, or only different modifications of one or two general dispositions common to the whole race? The former opinion is held by all who build their system of metaphysics upon a number of distinct internal senses; and the latter by those, who, with Locke and Hartley, resolve what is commonly called instinct into an early association of ideas. See *INSTINCT* and *METAPHYSICS*. This question also involves in it the arguments respecting the disinterestedness of our most benevolent passions. But as it would swell this article beyond all due bounds to give even an abridged view of the arguments on both sides, we shall refer the reader to the writings of Messrs. Locke and Hartley, lord Kames, Reid's *Enquiry into the Human Mind*, and Dr. Sayer's *Disquisitions Metaphysical and Literary*, where they will find the question amply discussed.

PASSIONEI (Dominic), an Italian ecclesiastic, born at Fossombrone, in Urbino, in 1682, studied in the Clementine College at Rome, after which he went to Paris with Gualterio, the papal nuncio. In 1708 he was employed as secret agent of the court of Rome in Holland, and subsequently in Switzerland. Innocent XIII. made him titular archbishop of Ephesus, and Clement XII. a cardinal and secretary of the briefs. Finally he became keeper of the Vatican library, where he was distinguished by the encouragement he gave to the collation of MSS. of the Old Testament, for the use of Dr. Kennicott, &c. He died in 1761. He published an account of his negotiations in Switzerland, under the title of *Acta Legationis Helveticæ*, folio; and formed a library at the Clementine College. Benedict Passionei, his nephew, published a collection of ancient inscriptions, with annotations, folio, 1763.

PASSIR, a town and district of the south-east coasts of Borneo. The town is situated about fifty miles from the mouth of the river of this name, near the bottom of a large bay; it has sixteen reaches, and five other rivers joining it. Near the town it is very rapid: the tide rises nine feet, and ascends above the town. Over a bar at the mouth of the river is two fathoms water, with a muddy bottom.

The town consists of 300 wood houses, situated on the north side of the river, most of them inhabited by Buggess merchants. The house or palace of the sultan is on the south side, a short distance from the river. The neighbourhood, though flat and unhealthy, produces rice in great abundance; musk, benzoin, aloes, pepper, cassia,

and long nutmegs; also mastic and other gums, particularly dragon's blood; honey, gold dust, camphor, and various fruits. The imports are similar to those of the other Malay ports. The inhabitants are fraudulent, and have cut off many ships by treachery. This was formerly a place of considerable trade. The East India Company about 1772 attempted to settle a factory here for the sale of opium, piece-goods, &c., and for the purchase of the many valuable articles brought thither by the Buggesses from Celebes, Sooloo, &c. But the plan was frustrated by a commotion amongst the natives, at which the English commander took an alarm, and quitted the country, much against the wishes of the principal inhabitants. Since that period Passir has been seldom visited by Europeans. A few Chinese are settled here, who are in possession of the chief trade.

PASSIVE, *adj.* } *Fr. passif; Lat. passiv.*
PASSIVELY, *adv.* } *Pass.* This is, strictly, the
PASSIVENESS, *n. s.* } adjective of passion in its
PASSIVITY. } first sense, and means

receptive of impressions from an external agent; suffering without resistance; in grammar, a particular form of the verb: passively and passiveness correspond with these senses: passivity is an innovation of Cheyne's, see below; and passiveness is sometimes used to express calmness; patience of suffering.

We shall lose our *passiveness* with our being, and be as incapable of suffering as heaven can make us.

Decay of Piety.

High above the ground

Their march was, and the *passive* air upbore
 Their nimble tread. *Milton's Paradise Lost.*

Gravity and *passiveness* in children is not from discretion but phlegme. *Fell.*

A man may not only *passively* and involuntarily be rejected, but also may, by an act of his own, cast out or reject himself. *Pearson.*

Though some are *passively* inclined,
 The greater part degenerate from their kind.

Dryden.

As the mind is wholly *passive* in the reception of all its simple ideas, so it exerts several acts of its own, whereby out of its simple idea the other is formed. *Locke.*

The active information of the intellect, filling the *passive* reception of the will, like form closing with matter, grew actuate into a third and distinct perfection of practice. *South.*

The vis inertiae is a *passive* principle by which bodies persist in their motion or rest, receive motion in proportion to the force impressing it, and resist as much as they are resisted: by this principle alone there never could have been any motion in the world.

Newton's Opticks.

A verb *passive* is that which signifies passion or the effect of action: as doceor, I am taught.

Clarke's Latin Grammar.

There being no mean between penetrability and impenetrability, between *passivity* and activity, these being contrary and opposite, the infinite rarefaction of the one quality is the position of its contrary.

Cheyne's Philosophical Principles.

Not those alone, who *passive* own her laws,
 But who, weak rebels, more advance her cause.

Pope.

It will almost always produce a *passive* compliance with the wickedness of others, and there are few who

do not learn by degrees to practise those crimes which they cease to censure. *Johnson.*

PASS'OVER, n. s. Pass and over. A feast instituted among the Jews in commemoration of the time when God, smiting the first born of the Egyptians, passed over the habitations of the Hebrews; the sacrifice killed at this time.

Take a lamb, and kill the *pasover*.

Exodus.

The Jews *pasover* was at hand, and Jesus went up.

John ii. 13.

The lamb was the remembrance of the *passover*, as the blessed eucharist is of the death of Christ.

Jer. Taylor.

The Lord's *passover*, commonly called Easter, was ordered by the common law to be celebrated every year on a Sunday.

Ayliffe.

The *Passover* was called *pascha* by the old Greeks and Romans; not we presume from *pascha*, I suffer, as Chrysostom, Irenæus, and Tertullian, suppose, but from the Hebrew word *פסח*, passage, leap. The institution of this solemn festival, the reason of it, the alteration of the Hebrew calendar, and its other consequences, with all the peculiar ceremonies observed in the celebration of it, are particularly related in the twelfth chapter of *Exodus*. The obligation of keeping the *passover* was so strict that whosoever neglected to do it was condemned to death. Numb. ix. 13. But those who had any lawful impediment, as a journey, sickness, or any uncleanness, voluntary or involuntary: those that had been present at a funeral, or by any other accident had been defiled, were to defer the celebration of the *passover* till the second month of the ecclesiastical year, or to the 14th day of the month Jiar, which answers to April and May. See 2 Chron. xxx. 1, 2, &c. The modern Jews observe in general the same ceremonies that were practised by their ancestors, in the celebration of the *passover*; but add thereto very many superstitious observances. See Whitby's Dissertation in an appendix to the fourteenth chapter of St. Mark.

PASSPORT, n. s. Fr. *passport*. Permission of passage; a public certificate of leave to travel.

Under that pretext, fain she would have given a secret *passport* to her affection. *Sidney.*

Giving his reason *passport* for to pass.

Whither it would, so it would let him die. *Id.*

Let him depart; his *passport* shall be made,

And crowns for convoy put into his purse.

Shakespeare.

Having used extreme caution in granting *passports* to Ireland, he conceived that paper not to have been delivered. *Clarendon.*

Admitted in the shining throng

He shows the *passport* which he brought along;

His *passport* is his innocence and grace,

Well known to all the natives of the place.

Dryden.

At our meeting in another world;

For thou hast drunk thy *passport* out of this. *Id.*

The gospel has then only a free admission into the assent of the understanding, when it brings a *passport* from a rightly disposed will, as being the faculty of dominion, that commands all, that shuts out, and lets in, what objects it pleases. *South.*

Dame nature gave him comeliness and health,
And fortune, for a *passport* gave him wealth.

Harte.

A **PASSPORT, or Pass**, is a license or writing obtained from a government granting permission and a safe conduct to pass through the country without molestation: also a permission granted by any state to navigate in some particular sea, without molestation. It contains the name of the vessel, and that of the master, together with her tonnage, and the number of her crew, certifying that she belongs to the subjects of a particular state, and requiring all persons at peace with that state to suffer her to proceed on her voyage without interruption. The violation of *passports* expressly granted by the king, or by his ambassadors, to the subjects of a foreign power in time of mutual war, or committing acts of hostility against such as are in amity, league, or truce with us, who are here under a general implied safe conduct, are breaches of the public faith, without which there can be no intercourse or commerce between one nation and another; and such offences may, according to the writers upon the law of nations, be a proper ground of a national war. Balzac mentions a very honorable *passport* given by an emperor to a philosopher in these terms: 'If there be any one on land or sea hardy enough to molest Potamon, let him consider whether he be strong enough to wage war with Cæsar.'

PASSPORT is used likewise for a license granted by a prince for the importing or exporting merchandises, moveables, &c., without paying the duties. Merchants procure such *passports* for certain kinds of commodities; and they are always given to ambassadors and ministers for their baggage, equipage, &c.

PASSPORT is also a license obtained for the importing or exporting of merchandises deemed contraband, and declared such by tariffs, &c., as gold, silver, precious stones, ammunition of war, horses, corn, wool, &c., upon paying duties.

PASSUMAIL, a district of Sumatra, on the south-west coast, bordering south on Rejang, and north by Lamatang. It is governed by four nearly independent chiefs, and is part of the territory of the sultan of Palembang.

PASSUS, among the ancient Romans, a measure of length, being about four feet ten inches, or the 1000th part of a Roman mile. The word properly signifies the space betwixt the feet of a man walking at an ordinary rate. See **MEASURE**.

PAST, adj. (part.), n. s., & prep. From **PASS**. Gone over; gone through or spent; undergone; not present nor to come: as a noun substantive, the past time: as a preposition, beyond in point of time; out of reach; above or more than; incapable of.

We will go by the king's highway, until we be past thy borders. *Numbers xxi. 22.*

Sarah was delivered of a child, when she was past age. *Hebrews xi. 11.*

The northern Irish Scots have bows not past three quarters of a yard long, with a string of wreathed hemp, and their arrows not much above an ell.

Spenser on Ireland.

Past, and to come, seem best; things present worst. *Shakespeare.*

We must not

Prostitute our past cure malady

To empiricks.

Id. All's Well That Ends Well.

What's gone, and what's *past* help,
Should be *past* grief. *Id. Winter's Tale.*
The same inundation was not deep, not *past* forty
foot from the ground. *Bacon.*
That France and Spain were taught the use of
shipping by the Greeks and Phœnicians is a thing
past questioning. *Heylin.*
Past hope of conquest, 'twas his latest care
Like falling Cæsar decently to die. *Druden.*
Her life she might have had; but the despair
Of saving his had put it *past* her care. *Id.*

But lights the present, and shall warm the last.
Pope.
A life of glorious labours *past*. *Id.*
For several months *past* papers have been written
upon the best publick principle, the love of our
country. *Swift.*

PASTE, *n. s. & v. a.* } Fr. *paste, paster*;
PASTEBOARD, *n. s. & adj.* } Ital. *pasta*; Lat.
pastum. A thin cement of flour and water;
dough; an artificial mixture in imitation of
precious stones: to fasten or spread with paste:
pasteboard is, a kind of paper board made by
past together layers of paper, or the macerated
and coarser materials of paper.

Except you could bray Christendom in a mortar,
and mould it in a new *paste*, there is no possibility
of an holy war. *Bacon.*

With particles of heavenly fire
The God of nature did his soul inspire;
Which wise Prometheus tempered into *paste*,
And mixt with living streams, the godlike image
cast. *Dryden.*

When the gods moulded up the *paste* of man,
Some of their dough was left upon their hands. *Id.*

Tintoret made chambers of board and *pasteboard*,
proportioned to his models, with doors and windows,
through which he distributed on his figures artificial
lights. *Id.*

By *past*ing the vowels and consonants on the sides
of dice, his eldest son played himself into spelling.
Locke.

Put silk worms on whited brown paper in a *paste-*
board box. *Mortimer.*

He has the whitest hand that ever you saw, and
raises *paste* better than any woman.

Addison's Spectator.
I would not make myself merry even with a piece
of *pasteboard*, that is invested with a publick charac-
ter. *Addison.*

Young creatures have learned their letters and syl-
lables by having them *past*ed upon little flat tablets.
Watts.

PASTE is likewise used for a preparation of
wheaten flour, boiled up and incorporated with
water, used by various artificers, as upholsterers,
saddlers, bookbinders, &c., instead of glue or
size; to fasten or cement their cloth, leathers,
papers, &c. When paste is used by bookbinders,
or for paper hangings to rooms, they mix a
fourth, fifth, or sixth of the weight of the flour
of powdered resin; and, where it is wanted still
more tenacious, gum arabic or any kind of size
may be added. Paste may be preserved from
vermin by dissolving a little sublimate, in the
proportion of a drachm to a quart, in the water
employed for making it, which will prevent them
from preying upon it.

PASTES used in the imitation or counterfeiting
of gems in glass. Gems made of pastes are no
way inferior to the native stones, when carefully
made and well polished, in brightness or trans-
parency, but want their hardness.

To make pastes of extreme hardness, and ca-
pable of taking the colors of the gems. Take of
prepared crystal 10 lbs., salt of pulverine 6 lbs.,
sulphur of lead 2 lbs.; mix all these well into a
fine powder: make the whole with common
water in a hard paste, and make this paste into
small cakes of about 3 oz. each, with a hole in
their middle; dry them in the sun, and after-
wards calcine them in the straitest part of a
potter's furnace. After this, powder them, and
levigate them to a perfect fineness on a porphyry
stone, and set this powder in pots in a glass
furnace to purify for three days; then cast the
whole into water, and afterwards return it into the
furnace, where let it stand fifteen days, in which
time all foulness and blisters will disappear, and
the paste will greatly resemble the natural jewels.
To give this the color of the emerald, add to it
brass thrice calcined; for a sea-green, brass
simply calcined to a redness; for a sapphire,
add zaffer, with manganese; and for a topaz,
manganese and tartar. The color of the coun-
terfeit gems may be made deeper or lighter ac-
cording to the work for which the stones are
designed; and small stones for rings, &c., re-
quire a deeper color, and large ones a paler.
Besides the colors made from manganese, verdi-
gris, and zaffer, which are the ingredients com-
monly used, there are other very fine ones which
care and skill may prepare. A very fine red
may be made from gold, and one not much in-
ferior to that from iron; a very fine green from
brass or copper; a sky-color from silver, and a
much finer one from the garnets of Bohemia.
Another way of making the paste to imitate the
colored gems is this: Take a quantity of sugar
of lead; set it in sand, in a glass body well luted
from the neck downwards; leave the mouth of
the glass open, and continue the fire twenty-four
hours; then take out the salt, and, if it be not red
but yellowish, powder it fine, and return it into
the vessel, and keep it in the sand heat twenty-
four hours more, till it becomes as red as cinna-
bar. The fire must not be made so strong as to
melt it; for then all the process is spoiled. Pour
distilled vinegar on this calcined salt, and sepa-
rate the solution from the dregs; let the decanted
liquor stand six days in an earthen vessel, to
give time for the finer sediment to subside

filter this liquor and evaporate it in a glass body, and there will remain a most pure salt of lead; dry this well, then dissolve it in fair water; let the solution stand six days in a glazed pan; let it subside, then filter the clear solution, and evaporate it to a yet more pure white and sweet salt; repeat this operation three times; put the now perfectly pure salt into a glass vessel, set it in a sand heat for several days, and it will be calcined to a fine impalpable powder of a lively red. Take all the ingredients as in the common composition of the pastes of the several colors, only, instead of red lead, use this powder; and the produce will well reward the trouble of the operation. A paste proper for receiving colors may be readily made by pounding and mixing 6 lbs. of white sand cleansed, 3 lbs. of red lead, 2 lbs. of purified pearl-ashes, and 1 lb. of nitre. A softer paste may be made in the same manner, of 6 lbs. of white sand cleansed; red lead, and purified pearl-ashes, of each 3 lbs; 1 lb. of nitre, half a pound of borax, and 3 ozs. of arsenic. For common use, 1 lb. of common salt may be substituted for the borax. This glass will be very soft, and will not bear much wear if employed for rings, buckles, or such imitations of stones as are exposed to much rubbing; but for ear-rings, ornaments worn on the breast, and those little used, it may last a considerable time. See GLASS-MAKING.

To make doublet pastes, let the crystal or glass be first cut by the lapidaries in the manner of a brilliant, except that, in this case, the figure must be composed from two separate stones, or parts of stones, formed in the manner of the upper and under parts of a brilliant, if it was divided in a horizontal direction, a little lower than the middle. After the two plates of the intended stone are thus cut, and fitted so exactly that no division can appear when they are laid together, the upper part must be polished ready for setting; and then the color must be put betwixt the two plates by this method. Take of Venice or Cyprus turpentine two scruples; and add to it one scruple of the grains of mastich chosen perfectly pure, free from foulness, and previously powdered. Melt them together in a small silver or brass spoon ladle, or other vessel, and put to them gradually any of the colored substances below mentioned, being first well powdered; stirring them together as the color is put in that they may be thoroughly commixed. Warm then the doublets to the same degree of heat as the melted mixture; and paint the upper surface of the lower part, and put the upper one instantly upon it, pressing them to each other, but taking care that they may be conjoined in the most perfectly even manner. When the cement or paint is quite cold and set, the redundant part of it, which has been pressed out of the joint of the two pieces, should be gently scraped off the side, till there be no appearance of any color on the outside of the doublets: and they should then be skilfully set; observing to carry the mounting over the joint, that the upper piece may be well secured from separating from the under one. The color of the ruby may be best imitated, by mixing a fourth part of carmine with some of the finest crimson

lake that can be procured. The sapphire may be counterfeited by very bright Prussian blue, mixed with a little of the above mentioned crimson lake, to give it a cast of the purple. The Prussian blue should not be very deep-colored, or but little of it should be used: for otherwise it will give a black shade that will be injurious to the lustre of the doublets. The emerald may be counterfeited by distilled verdigris, with a little powdered aloes. But the mixture should not be strongly heated, nor kept long over the fire after the verdigris is added: for the color will be soon impaired by it. The resemblance of the garnet may be made by dragon's blood; which, if it cannot be procured of sufficient brightness, may be improved by a very small quantity of carmine. The amethyst may be imitated by the mixture of some Prussian blue with the crimson lake; but the proportions can only be well regulated by direction, as different parcels of the lake and Prussian blue vary extremely in the degree of strength of the color. The yellow topazes may be counterfeited by mixing the powdered aloes with a little dragon's blood, or by good Spanish anotto; but the color must be very sparingly used, or the tinge will be too strong for the appearance of that stone. The chrysolite, hyacinth, vinegar garnet, eagle marine, and other such weaker or more diluted colors, may be formed in the same manner, by lessening the proportions of the colors; or by compounding them together correspondently to the hue of the stone to be imitated; to which end it is proper to have an original stone, or an exact imitation of one, at hand when the mixture is made, in order to the more certain adapting the colors to the effect desired: and when these precautions are taken, and the operation well conducted, it is practicable to bring the doublets to so near a resemblance of the true stones, that even the best judges cannot distinguish them, when well set, without inspecting them betwixt the eye and light, in such position that the light may pass through the upper part and corners of the stone; when it will easily be perceived that there is no color in the body of the stone.

M. Fontaineu, of the Royal Academy of Sciences at Paris, proposed the following processes for imitation pastes, which were approved: Although the different calces of lead are all adapted to produce the same effect in vitrification; yet M. Fontaineu prefers lead in scales, and next to that minium, as being the most constantly pure. Sift through a silk sieve the preparations of lead to be used in the vitrification, to separate the grosser parts; as also the lead in a metallic state when white lead in scales is employed. The base of factitious gems is calx of lead and rock-crystal. Pure sand, flint, and the transparent pebbles of rivers, are substances equally fit to make glass; but as it is first necessary to break masses of crystal, stones, or pebbles, into smaller parts; so by this operation particles of iron or copper are frequently introduced, and to these dust or greasy matters are also apt to adhere. Our author therefore begins by putting the pounded crystal or pebbles into a crucible, which he places in a degree of heat ca-

pable of making the mass red hot; he then pours it into a wooden bowl filled with very clear water; and, shaking the bowl from time to time, the small portions of coals furnished by the extraneous bodies swim on the surface of the water, and the vitrifiable earth, with the iron, &c., rests on the bottom. He then decants the water; and, having dried the mass, pounds it, sifts the powder through the finest silk sieve; then digests the powder four or five hours with muriatic acid, shaking the mixture every hour. After having decanted the acid from the vitrifiable earth, he washes the latter until the water no longer reddens the tincture of turnsol. The earth, being dried, is passed through a silk sieve, and is then fit for use. Nitre, salt of tartar, and borax, are the three species of salts that enter with quartz and the calces of lead into M. Fontaineu's vitrifications. The success depends much on the accurate proportion of the substances made use of to form the crystal which serves as a base. After having tried a great variety of receipts, our author recommends the following: 1. Take two parts and a half of lead in scales, one part and a half of rock crystal or prepared flints, half a pint of nitre, as much borax, and a quarter part of glass of arsenic. These, being well pulverised and mixed together, are put into a Hessian crucible and submitted to the fire. When the mixture is well melted, pour it into cold water; then melt it again a second and a third time, taking care after each melting to throw it into fresh cold water, and to separate from it the lead that may be revived. The same crucible should not be used a second time, as the glass of lead is apt to penetrate it, and lose the contents. Cover the crucible well, to prevent any coals getting into it, which would spoil the composition. 2. Take two parts and a half of white ceruse, one part of prepared flints, half a part of salt of tartar, and a quarter part of calcined borax: melt the mixture in a Hessian crucible, and then pour it into cold water; then melt it again and wash it a second and a third time, the same precautions being observed. 3. Take two parts minium, one part rock-crystal, half a part of nitre, and as much salt of tartar: this mixture, being melted, must be treated as the former. 4. Take three parts of calcined borax, one part of prepared rock-crystal, and one part of salt of tartar; these, being well mixed and melted together, must be poured into warm water; the water being decanted, and the mass dried, an equal quantity of minium must be added to it; it is then to be melted and washed several times as directed above. 5. That called by our author the Mayence base, and which he considers as one of the finest crystalline compositions hitherto known, is thus composed: Take three parts of fixed alkali of tartar, one part of rock-crystal or flint pulverised: the mixture to be well baked together, and then left to cool. It is afterwards poured into a crucible of hot water to dissolve the fritt; the solution of the fritt is then received into a stone-ware pan, and aquafortis added gradually till it no longer effervesces: this water being decanted, the fritt must be washed in warm water till it has no longer any taste: the fritt is then dried, and mixed with one part

and a half of fine ceruse or white lead in scales; and this mixture must be well levigated with a little distilled water. To one part and a half of this powder dried add an ounce of calcined borax: let the whole be well mixed in a marble mortar, then melted and poured into cold water. These fusions and washings having been repeated, and the mixture dried and powdered, a twelfth part of nitre must be added, and then melted for the last time; when a very fine crystal will be found in the crucible. 6. For very fine white stones: take 8 ozs. of ceruse, 3 ozs. of rock-crystal pulverised, 2 ozs. of borax finely powdered, and half a grain of manganese; having melted and washed this mixture as above, it produces a very fine white crystal.

There are three degrees of heat proper for pastes very different in their energy. The fire kept up in the wind-furnaces in the laboratories of chemists is less active than that whose effect is accelerated by the means of bellows; and a fire supported by wood, and kept up during sixty hours without interruption, produces singular effect in vitrification, and renders the glass finer and less alterable. When recourse is had to the forge, in order to operate a vitrification, it is necessary to turn about the crucible from time to time, that the mass may melt equally. Some coal also should be replaced, in proportion as it consumes towards the nozzle of the bellows; for, without this precaution, we should run the risk of cooling the crucible opposite to the flame, and probably of cracking it, when all the melted mass, running among the coals, would be totally lost. Though this is the readiest way of melting, it should not be employed out of choice; for the crucible often breaks, or coals get into it, and reduce the calx of lead to a metallic state. The wind-furnace is either square or round. A small cake of baked clay or brick, of the thickness of an inch, is placed upon the grate; and upon this cake is placed the crucible, surrounded with coals.

The following are some of the receipts recommended by M. Fontaineu:—1. For the white diamond:—Take the base of Mayence. This crystal is very pure and has no color. 2. For the yellow diamond:—To an ounce of the fourth base, add for color 25 grains of luna cornea, or 10 grains of glass of antimony. 3. For the emerald:—1. To 15 ozs. of either of the bases, add for color 1 dr. of mountain-blue and 6 grs. of glass of antimony; or, 2. To 1 oz. of the second base add 20 grs. of glass of antimony, and 3 grs. of calx of cobalt. 4. For the sapphire:—To 24 ozs. of the Mayence base add 2 drs. 64 grs. of the calx of cobalt. 5. For the amethyst:—To 24 ozs. of the Mayence base add 4 drs. of prepared manganese and 4 grs. of precipitate of cassius. 6. For the beryl:—To 24 ozs. of the third base add 96 grs. of glass of antimony, and 4 grs. of calx of cobalt. 7. For the black agate:—To 24 ozs. of either of the bases add 2 ozs. of the mixture directed above in par. f. 8. For the opal:—To 1 oz. of the third base add 10 grs. of luna cornea, 2 grs. of magnet, and 26 grs. of absorbent earth. 9. For the oriental topaz:—To 24 ozs. of the first or third base add 5 drs. of glass of antimony. 10. For the topaz of Saxony:—To 24

ozs. of the same base, add 6 drs. of the glass of antimony. 11. For the topaz of Brazil:—To 24 ozs. of the second or third base, add 1 oz. 24 grs. of the glass of antimony, and 8 grs. of precipitate of cassius. 12. For the hyacinth:—To 24 ozs. of the base made with rock-crystal add 2 drs. 48 grs. of glass of antimony. 13. For the oriental ruby:—1. To 16 ozs. of the Mayence base, add a mixture of 2 drs. 48 grs. of the precipitate of cassius, the same quantity of crocus Martis prepared in aquafortis, the same of golden sulphur of antimony and of fusible manganese, with 2 ozs. of mineral crystal; or, 2. To 20 ozs. of the base made with flint, add half an ounce of fusible manganese, and 2 ozs. of mineral crystal. 14. For the balass ruby:—1. To 16 ozs. of the Mayence base, add the above coloring powder, but diminished one-fourth part; or, 2. To 20 ozs. of the base made with flints, add the same coloring powder, but with one-fourth less of the manganese. The factitious gems are easily distinguished from the natural, by their softness and fusibility; by their solubility in acids; by their causing only a single refraction of the rays of light; and, in many cases, by their specific gravity, which exceeds 2.76 in all precious gems of the first order, as the diamond, ruby, sapphire, &c.

A prize having been offered by the Society for the Encouragement of the Arts in France for the best memoir on the fabrication of imitation stones, it was decreed to M. D. Wieland.

The base of all these imitations is Strass, or white crystal. The materials employed are melted in Hessian crucibles, and a porcelain furnace; or, what is preferable, a potter's furnace is afterwards used. The more tranquil and prolonged that the fusion is, the more hardness and beauty does the strass acquire.

Strass.—The following three mixtures give a very fine strass:—

| | | | |
|-------------------|-------|--------|-------|
| Rock crystal | 0.318 | 0.3170 | 0.300 |
| Minium | 0.490 | 0.4855 | 0.565 |
| Potassa, pure | 0.170 | 0.1770 | 0.105 |
| Borax | 0.021 | 0.0200 | 0.030 |
| Arsenic, oxide of | 0.001 | 0.0005 | |
| | 1.000 | 1.0000 | 1.000 |

M. Lançon recommends the following mixture for a pure strass:—

| | |
|-------------------------|-------|
| Litharge | 0.540 |
| White lead | 0.406 |
| White tartar, or potash | 0.054 |

Topaz.—The imitation of topaz is difficult. It passes from the white of strass to sulphur yellow, violet and red purple, according to circumstances which are not determined. The following are two of M. Wieland's recipes:—

| | | |
|-------------------|---------|------|
| White strass | 0.95816 | 0.99 |
| Glass of antimony | 0.04089 | |
| Purple of cassius | 0.00095 | |
| Oxide of iron | | 0.01 |
| | 1.00000 | 1.00 |

These mixtures sometimes yield an opaque mass, translucent at the edges, and of a red color in thin plates. By mixing it with eight times

its weight of strass, and keeping the mixture in fusion for thirty hours in a potter's furnace, the result is a fine yellowish crystal. This crystal, re-melted by the blow-pipe, produces the finest imitation of eastern ruby.

Ruby.—A ruby less beautiful, and of a different tint, may be made thus:—

| | |
|--------------------|--------|
| Strass | 0.9755 |
| Oxide of manganese | 0.0245 |

1.0000

Sapphire.—The composition for this paste is—

| | |
|----------------------------|--------|
| Strass, very white | 0.9855 |
| Oxide of cobalt, very pure | 0.0145 |

1.0000

This mixture must be put into a Hessian crucible, carefully luted, and remain thirty hours in the fire. If the process is well conducted, the result will be a very hard glass.

Amethyst.—Very deep amethyst may be obtained from—

| | |
|--------------------|--------|
| Strass | 0.9870 |
| Oxide of manganese | 0.0078 |
| Oxide of cobalt | 0.0050 |
| Purple of cassius | 0.0002 |

1.0000

M. Lançon uses—

| | |
|--------------------|--------|
| Strass | 0.9977 |
| Oxide of manganese | 0.0022 |
| Oxide of cobalt | 0.0001 |

1.0000

Beryl, or aquamarine, is made with—

| | |
|-------------------|--------|
| Strass | 0.9926 |
| Glass of antimony | 0.0070 |
| Oxide of cobalt | 0.0004 |

1.0000

The following is M. Lançon's recipe for emerald:—

| | |
|-------------------|--------|
| Strass | 0.9904 |
| Acetate of copper | 0.0080 |
| Peroxide of iron | 0.0016 |

1.0000

Peridot.—By augmenting the proportion of oxide of chrome and oxide of copper in the first composition of emerald, and adding oxide of iron, we may vary the green shades, and imitate the peridot and deep-colored emerald.

There has been at different times a method practised by particular persons of taking the impressions and figures of antique gems, with their engravings, in glass of the color of the original gem. This has always been esteemed a very valuable art, and greatly preferable to the ordinary method of doing it on sealing-wax or brimstone; but being a secret in the hands of particular persons, who obtained their bread by it, it died with them, and every new artist was obliged to re-invent the method; till at length M. Homberg, having carried it to great perfection, gave the whole process to the world. M. Homberg was favored in his attempts with all the engraved gems of the king's cabinet; and took such

elegant impressions, and made such exact resemblances of the originals, and that in glasses so artfully tinged to the color of the gems themselves, that the nicest judges were deceived in them, and often took them for the true antique stones. The chief care in the operation is to take that impression of the gem in a very fine earth, and to press down upon this a piece of proper glass, softened or half melted at the fire, so that the figures of the impression made in the earth may be nicely and perfectly expressed upon the glass. All earths run more or less easily in the fire as they are more or less mixed with saline particles. As all salts make earths run into glass, and as it is necessary to use an earth on this occasion for the making a mould, it being also necessary, to the perfection of the experiment, that this earth should not melt or run, some earth must be got which naturally contains very little salt. Of all the earths which M. Homberg examined, none proved so fit for the purpose as the common Tripoli, used to polish glass and stones. Of this earth there are two common kinds: the one reddish, and composed of several flakes or strata; the other yellowish, and of a simple structure. The yellowish kind, commonly called Venetian tripoli, is the best. It receives the impressions very beautifully; and never mixes with the glass in the operation, which the red kind sometimes does. When the tripolis are separately powdered, the red kind must be mixed with so much water as will bring it to the consistence of paste, so that it may be moulded like a lump of dough between the fingers; this paste must be put into a small crucible of a flat shape, and about half an inch or a little more in depth, and of such a breadth at the surface as is a little more than that of the stone whose impression is to be taken. The crucible is to be nicely filled with this paste lightly pressed down into it, and the surface of the paste must be strewed thickly over with the fine powder of the yellow tripoli not wetted. When this is done, the stone, of which the impression is to be taken, must be laid upon the surface, and pressed evenly down into the paste with a finger and thumb, so as to make it give a strong and perfect impression; the tripoli is then to be pressed nicely even to its sides with the fingers, or with an ivory knife. The stone must be thus left a few moments, for the humidity of the paste to moisten the dry powder of the yellow tripoli which is strewed over it: then the stone is to be carefully raised by the point of a needle fixed in a handle of wood; and, the crucible being then turned bottom upwards, it will fall out, and the impression will remain very beautifully on the tripoli. If the sides of the cavity have been injured in the falling out of the stone, they may be repaired; and the crucible must then be set, for the paste to dry, in a place where it will not be incommoded by the dust. The red tripoli, being the more common and the cheaper kind, is here made to fill the crucible only to save the other, which alone is the substance fit for taking the impression. When the stone is taken out, it must be examined, to see whether any thing be lodged in any part of the engraving, because if there be any of the tripoli left there, there will certainly be so much want-

ing in the impression. When the crucible and paste are dry, a piece of glass must be chosen of a proper color, and cut to a size proper for the figure; this must be laid over the mould, but in such a manner that it does not touch the figures, otherwise it would spoil them. The crucible is then to be brought near the furnace by degrees, and gradually heated till it cannot be touched without burning the fingers; then it is to be placed in the furnace under a muffle, surrounded with charcoal. Several of these small crucibles may be placed under one muffle; and, when they are properly disposed, the aperture of the muffle should have a large piece of burning charcoal put to it, and then the operator is to watch the process, and see when the glass begins to look bright: this is the signal of its being fit to receive the impression. The crucible is then to be taken out of the fire; and the hot glass must be pressed down upon the mould with an iron instrument, to make it receive the regular impression: as soon as this is done, the crucible is to be set at the side of the furnace out of the way of the wind, that it may cool gradually without breaking. When it is cold, the glass is to be taken out, and its edges should be grated round with pincers, which will prevent its flying afterwards, which is an accident that sometimes happens when this caution has been omitted, especially when the glass is naturally brittle. The different colored glasses are of different degrees of hardness, according to their composition; but the hardest to melt are always the best for this purpose, and this is known by a few trials. If it be desired to copy a stone in relief which is naturally in creux, or to take one in creux which is naturally in relief, there needs no more than to take an impression first in wax or sulphur, and to mould that upon the paste of tripoli instead of the stone itself: then, proceeding in the manner before directed, the process will have the desired success. The application of paste to multiply and preserve the impressions of caméos and intaglios is an object very interesting to artists and to antiquaries, as well as to men of learning and taste in the fine arts. This art, though not long restored to any degree of perfection, is of very considerable antiquity. The great prices which the ancients paid for the elegant gems engraved by the celebrated Greek artists, could not but suggest to them the idea of multiplying their numbers, by taking off their impressions in wax, in sulphur, in plaster, or in clay; but more particularly in colored glass, or that vitrified substance commonly called paste. As the impressions on paste are durable, and imitate the colors and brilliancy of the original stones, they mostly serve the same purposes as the gems themselves. This art was therefore practised, not only by the Greeks, but by all the nations who cultivated Grecian taste. Many of the finest gems of antiquity are now lost, and their impressions are to be found only on ancient pastes. Numerous collections of them have been formed by the curious. Instances of this are found in the Florentine Museum, in Stosch's work on ancient gems with inscriptions, and in Winckelman's description of Stosch's cabinet. The art of taking impressions of gems seems not

to have been altogether lost even in the Gothic ages; for Heraclius, who probably lived in the ninth century, and wrote a book *De coloribus et artibus Romanorum*, teaches in very plain terms how to make them. Indeed, some of the few who then possessed this art, taking advantage of the ignorance of the times, sold pastes for the original gems. Thus the famous emerald of the abbey of Reichnaw near Constance, although a present made by Charlemagne, is now found to be a piece of glass. And thus the celebrated emerald vase in the cathedral of Genoa is likewise found to be a paste. The Genoese received this vase at the taking of Cesare, in 1101, as an equivalent for a large sum of money; nor was any imposition then suspected, for in 1319 they pawned it for 1200 marcs of gold. But this ingenious art, revived indeed in Italy, in the time of Laurence De Medicis, and Pope Leo X., was not cultivated in an extensive manner till the beginning of the eighteenth century, when M. Homberk restored it. In this he is said to have been greatly assisted and encouraged by the then duke of Orleans regent of France, who amused himself with that celebrated chemist, in taking off impressions in paste for the king of France's, his own, and other collections of gems. According to the French Encyclopedists, M. Clachant the elder, an engraver of some note, who died in Paris in 1781, learned this art from his royal highness, to whose household, his father or he, seems to have belonged. Mad. Feloux next cultivated this art. She had been taught by her father, who, in quality of *garçon de chambre* to the regent, had often assisted in the laboratory of his master, where he acquired this knowledge. Baron Stosch, a Prussian, who travelled over Europe in quest of original engraved stones and impressions of ancient gems, for the elegant work which he published and Picart engraved, entitled *Gemmæ antiquæ coloratæ*, was well acquainted with this art. He had taught it to his servant Christian Dehn, who settled in Rome, where he made and sold his well known sulphur impressions and pastes. The difficulties in taking off the cameos arising from their size and form, and from the various nature of the different sorts of glass, which do not well unite into different strata, are very numerous: nor could the completest success in the chemical and mechanical branch of the art produce a tolerable cameo. Impressions or imitations, if unassisted by the tool of the engraver, do not succeed: because the undercutting and deep work of most of the originals require to be filled up with clay or wax, that the moulds may come off safe without injuring them. Hence the impressions from these moulds come off hard, and destitute of delicacy, sharpness, and precision of outline, till the underworking of the moulder is cut away. But Mr. Reiffenstein of Rome, by perseverance, and the assistance of able artists, overcame most of these difficulties; and had the satisfaction of producing variegated cameos which can hardly be distinguished from the originals. But, of all the artists who have taken impressions of engraved gems in sulphur and in paste, no one seems to have carried that art to greater perfection than Mr. James Tasse, a

native of Glasgow, who resided in London. The great demand for his pastes was perhaps owing in the beginning to the London jewellers, who introduced them into fashion, by setting them in rings, seals, bracelets, necklaces, and other trinkets. The reputation of these impressions having reached the empress Catharine II. of Russia, she ordered a complete set; which, being accordingly executed in the best and most durable manner, were arranged in elegant cabinets, and placed in the apartments of her superb palace at Czarsko Zelo. The impressions were taken in a beautiful white enamel composition, which is not subject to shrink or form air-bladders; which emits fire when struck with steel, and takes a fine polish; and which shows every stroke and touch of the artist in higher perfection than any other substance. It was the learned Mr. Raspe who arranged this great collection, and made out the descriptive catalogue, from which this account is taken.

PASTES for fishing are variously compounded, almost according to the angler's own fancy; but there should always be a little cotton wool, shaved lint, or fine flax, to keep the parts of it together, that it may not fall off the hook. White bread and honey will make a proper paste for carp or tench. Fine white bread alone, with a little water, will serve for roach and dace; and mutton suet and soft new cheese for barbel. Strong cheese with a little butter, and colored yellow with saffron, will make a good winter paste for a chub.

But, among all the variety of pastes, there is none so often used as the simple and plain one made with white bread and milk, which requires only clean hands.

In September, and all the winter months, when you angle for chub, carp, and bream, with paste, let the bait be as big as a large hazle nut: but for roach and dace, the bigness of an ordinary bean is sufficient.

PASTER, *n. s.* Fr. *pasturon*; Ital. *passatoia*, from Lat. *passus*. That part of the leg of a horse between the fetlock and the hoof.

I will not change my horse with any that treads on four *pasterns*. *Shakspeare. Henry V.*

The colt that for a stallion is designed,
Upright he walks on *pasterns* firm and straight,
His motions easy, prancing in his gait. *Dryden.*

Being heavy, he should not tread stiff, but have a *pastern* made him to break the force of his weight: his body thus hangs on the hoof, as a coach doth by the leathers. *Grew.*

PASTIL, *n. s.* Fr. *pastille*; Ital. *pastiglia*; Lat. *pastillus*. A roll of paste.

To draw with dry colors, make long *pastils*, by grinding red lead with strong wort, and so roll them up like pencils drying them in the sun.

Peacham on Drawing.

PASTIL, in pharmacy, is a dry composition of sweet-smelling resins, aromatic woods, &c. sometimes burnt to clear and scent the air of a chamber.

PASTIME, *n. s.* Pass and time. Sport; amusement; something to pass time away; diversion.

It was more requisite for Zelmane's hurt to rest, than sit up at those *pastimes*; but she that felt no

wound but one, earnestly ceas'd to have the pasto-
rals.

Sidney.

I'll be as patient as a gentle stream,
And make a *pastime* of each weary step,
Till the last step has brought me to my love.

Shakespeare.

With these

Find *pastime*, and bear rule; thy realm is large.

Milton.

A man much addicted to luxury, recreation, and
pastime, should never pretend to devote himself en-
tirely to the sciences, unless his soul be so refined
that he can taste these entertainments eminently in
his closet.

Watts.

While many a *pastime* circled in the shade,
The young contending as the old surveyed;
And many a gambol frolicked o'er the ground,
And slights of art, and feats of strength went round.

Goldsmith.

Even in his *pastimes* he requires a friend,
To warn, and teach him safely to unbend,
'O'er all his pleasures gently to preside,
Watch his emotions, and control their tide.

Cowper.

PASTIMES, ANCIENT BRITISH. Most of the
recreations of our ancestors are resolvable into
the public defence of the state against the attacks
of a foreign enemy. 'Every Friday in Lent,'
says Fitz-Stephen, 'a company of young men
comes into the field on horseback, attended and
conducted by the best horsemen: then march
forth the sons of the citizens, and other young
men with disarmed lances and shields; and there
practise feats of war. Many courtiers likewise,
when the king is near the spot, and attendants
upon noblemen, do repair to these exercises;
and, while the hope of victory does inflame their
minds, they show by good proof how serviceable
they would be in martial affairs.' This evidently
is of Roman descent, and brings to our recollection
the Ludus Trojæ, supposed to be the inven-
tion, as it was the common exercise, of Asca-
nius. In the vacant intervals of industry and
labor, commonly called the holy-days, indolence
and inactivity, which now mark this portion of
time, were found only in those who were dis-
tempered with age or infirmity. Fitz-Stephen
says, 'In Easter holidays they fight battles upon
the water. A shield is hanged upon a pole,
fixed in the middle of the stream. A boat is
prepared without oars, to be borne along by the
violence of the water; and in the forepart
thereof standeth a young man, ready to give
charge upon the shield with his lance. If so be
that he break his lance against the shield, and
doth not fall, he is thought to have performed a
worthy deed. If without breaking his lance he
runs strongly against the shield, down he falleth
into the water; for the boat is violently forced
with the tide: but on each side of the shield ride
two boats, furnished with young men, who re-
cover him who falleth soon as they may. In the
holidays all the summer the youths are exercised
in leaping, dancing, shooting, wrestling, casting
the stone, and practising their shields; and the
maidens trip with their timbrels, and dance as
long as they can well see. In winter, every
holiday before dinner, the boars prepared for
brawn are set to fight, or else bulls or bears are
baited.' Such were the pursuits to which leisure
was devoted by our forefathers so far back as

1130. Their immediate successors breathed the
same spirit. In 1222, the sixth year of Henry
III., certain masters in exercises of this kind
made a public profession of their instructions
and discipline, which they imparted to those who
were desirous of attaining excellence and victory
in these honorable achievements. About this
period, persons of rank and family introduced
the game of Tennis; and erected courts or ob-
long edifices for the performance of it. In the
reign of Henry III. the Quintain was a sport
much in fashion in almost every part of the king-
dom. This contrivance consisted of an upright
post firmly fixed in the ground, upon the top of
which was a cross piece of wood, moveable upon
a spindle; one end of which was broad like
the flat part of a halberd, while at the other end
was hung a bag of sand. The exercise was per-
formed on horseback. The masterly performance
was, when, upon the broad part being struck
with a lance, which sometimes broke it, the as-
sailant rode swiftly on, so as to avoid being
struck on the back by the bag of sand, which
turned round instantly upon the stroke given,
with a very swift motion. He who executed
this feat in the most dexterous manner was de-
clared victor. But if, upon the aim taken, the
contender miscarried in striking at the broad-
side, his want of skill became the ridicule and
contempt of the spectators. Dr. Plott, in his
Natural History of Oxfordshire, tells us, that
this *pastime* was in practice in his time at Ded-
dington. He and Matthew Paris give similar
accounts. But all the manly *pastimes* seem to
have given place to one indeed no less manly,
which was Archery. This continued till the
reign of Charles I. It appears from 33 Hen.
VIII. that, by the intrusion of other pernicious
games, archery had been for a long time dis-
used; to revive which a statute was made, to-
wards the beginning of James I.'s reign. He,
to gratify the importunity of the common people,
published a book of sports, in which the people
had been some time before indulged on Sunday
evenings, but which had been lately prohibited.
These sports consisted of dancing, singing,
wrestling, church ales, and other profanations of
that day. Charles, his successor, in the very
entrance of his reign, abolished these sports.

PASTINACA, the parsnep, a genus of the
digynia order and pentandria class of plants;
natural order forty-fifth, umbellatæ: fruit an el-
liptical compressed plane; petals involuted and
entire; species three.

1. *P. panax*: the root is perennial, thick,
fleshy, tapering like the garden parsnep; the
stalk is strong, branched, rough towards the bot-
tom, and rises seven or eight feet in height; the
leaves are pinnated, consisting of several pairs of
pinne, which are oblong, serrated, veined, and
towards the base appear unformed on the upper
side: the flowers are small, of a yellowish color,
and terminate the stem and branches in flat um-
bels; the general and partial umbels are com-
posed of many radii; the general and partial
involucra are commonly both wanting; all the
florets are fertile, and have a uniform appear-
ance; the petals are five, lance-shaped, and
curled inwards; the five filaments are spreading,

curved, longer than the petals, and furnished with roundish anthers; the germen is placed below the corolla, supporting two reflexed styles, which are supplied with blunt stigmata; the fruit is elliptical, compressed, divided into two parts, containing two flat seeds, encompassed with a narrow border. It is a native of the south of Europe, and flowers in June and July. It bears the cold of our climate very well, and commonly matures its seeds; and its juice here manifests some of those qualities which are discovered in the officinal opoponax; but it is only in the warm regions of the east, and where this plant is a native, that its juice concretes into this gummy resinous drug. Opoponax is obtained by means of incisions made at the bottom of the stalk of the plant, whence the juice gradually exudes; and by undergoing spontaneous concretion, assumes the appearance under which we have it imported from Turkey and the East Indies. It readily mingles with water, by triture, into a milky liquor, which, on standing, deposits a portion of resinous matter, and becomes yellowish: to rectified spirit it yields a gold-colored tincture, which tastes and smells strongly of opoponax. Water distilled from it is impregnated with its smell, but no essential oil is obtained on committing moderate quantities to the operation. See OPOPONAX.

2. *P. sativa*, garden parsnep, is an exceedingly fine esculent root. It is propagated by seeds sown in February or March, in a rich mellow soil, which must be deep dug, that the roots may be able to run deep without hindrance. It is common to sow carrots at the same time, upon the same ground with the parsneps; and, if the carrots are designed to be drawn young, there is no harm in it. The parsneps, when they are grown up a little, must be thinned to a foot distant, and kept clear of weeds. They are finest tasted just at the season when the leaves are decayed: and such as are desirous to eat them in spring should have them taken up in autumn, and preserved in sand. When the seeds are to be saved, some very strong and fine plants should be left four feet distant; and towards the end of August, or beginning of September, the seeds will be ripe: they must then be gathered, and dried on a coarse cloth. They should always be sown the spring following; for they do not keep well. Hints have been given, and experiments made, by agricultural societies, respecting parsneps, to raise them for winter food to cattle. It has long been a custom in some parts of Brittany to sow parsneps in the open field for the food of cattle. Hogs have no other food in all that season, and bullocks and oxen thrive well upon it. Cows fed with parsneps give more milk than with any other winter fodder, and that milk yields better butter than the milk of cows nourished with any other substance. Cattle eat these roots raw, at first sliced lengthwise; and when they begin to tire of them they are cut in pieces, put into a large copper, pressed down there, and boiled with only so much water as fills up the chasms between them. They then eat them very greedily, and continue to like them.

PASTOPHORI. Gr. *πατος*, a couch, and

πεπος, to bring or bear. In archæology, priests of an inferior order among the ancients, who, in solemn processions, carried the statues of the gods. Pocock speaks of two antique monuments extracted from the ruins of Thebes, on one of which are represented twelve pastophori, carrying on their shoulders a vessel, in the middle of which is a little chapel, closed: on the other eight priests of a similar order, bearing in like manner, a ship wherein a god, in human guise, appears seated upon a kind of shrine. It is to be regretted that this traveller cites from memory only, having neglected to procure a drawing of the figures.

Sometimes, also, these pastophori bore in their hands the images of the gods. Caylus has given a drawing of a priest bearing the idol of a divinity enclosed in a sort of little tabernacle.

Clemens Alexandrinus, describing the temples of the Egyptians, says, that, after having passed through magnificent courts, you are conducted to a temple, which is at the farther end of these courts, and then a pastophorus gravely lifts up the veil, which is the door, to show you the deity within; which is nothing but a dog or a cat, or some other animal. Apuleius speaks of the pastophori that carried the Syrian goddess. The Greeks had a college of priests of this description in the time of Sylla. Some antiquaries have affirmed that the name of pastophori was applied to this class by the Greeks from the circumstance of their wearing long mantles, or from the couch or bed (*πατος*) of Venus, which was carried by them in certain ceremonies, or, again, from the veil which covered the divinities, and which was lifted up by the pastophori, to exhibit them to the view of the people.

PASTOPHORIA, the cells or apartments near the temples, where the pastophori lived. There were several lodging rooms for the priests of a similar kind in the temple of Jerusalem.

PASTOR, *n. s.* } Fr. *pasteur*, *pastor*.
PASTORAL, *adj. & n. s.* } *toral*; Latin *pastor*, *pastoralis*. A shepherd; hence the settled minister of a spiritual flock: pastoral is, shepherd-like; rural; relating to the care of souls: as a noun substantive, a poem representing a country or rural life; a bucolic.

Woe be unto the *pastors* that destroy and scatter the sheep of my pasture, saith the Lord.

Jer. xxiii. 1.

In those *pastoral* pastimes, a great many days were spent to follow their flying predecessors.

Sidney

All bishops are *pastors* of the common flock.

Leasey.

The *pastor* maketh suits of the people, and they with one voice testify a general assent thereunto, or he joyfully beginneth, and they with like alacrity follow, dividing between them the sentences wherewith they strive which shall most shew his own, and stir up others zeal to the glory of God.

Hooker.

Their lord and master taught concerning the *pastoral* care he had over his own flock.

Id

The best actors in the world, for tragedy, comedy, history, *pastoral*.

Shakspeare. Hamlet.

Receive this present by the muses made,
The pipe on which the Ascræan *pastor* played.

Dryden

The bishop of Salisbury recommendeth the tenth satire of Juvenal, in his *pastoral* letter, to the serious perusal of the divines of his diocese. *Id.*

There ought to be the same difference between *pastorals* and elegies as between the life of the country and the court; the latter should be smooth, clean, tender, and passionate: the thoughts may be bold, more gay, and more elevated than in *pastoral*. *Walsh.*

The first branch of the great work belonging to a *pastor* of the church was to *catechize*. *South.*

Pastoral is an imitation of the action of a shepherd; the form of this imitation is dramatick or narrative, or mixed of both, the fable simple, the manners not too polite nor too rustick. *Pope.*

A breach in the general form of worship was reckoned too unpopular to be attempted, neither was the expedient then found out of maintaining separate *pastors* out of private purses. *Swift.*

'Tis now become a history little known,
That once we called the *pastoral* house our own. *Cowper.*

PASTRY, *n. s.* } Fr. *pastisserie*, from *paste*.
PASTRY-COOK. } Baked paste; paste designed to be baked: pastry-cook is, one whose trade is to make and sell things baked in paste.

Remember
The seed cake, the *pastories*, and the fermenty pot. *Tusser.*

They call for dates and quinces in the *pastry*. *Shakespeare.*

Beasts of chase, or fowls of game,
In *pastry* built, or from the spit, or boiled,
Gris amber steamed.

Milton's Paradise Regained.

Let never fresh machines your *pastry* try,
Unless grantees or magistrates are by,
Then you may put a dwarf into a pie. *King.*
I wish you knew what my husband has paid to the *pastrycooks* and confectioners. *Arbuthnot.*

PASTURE, *n. s., v. a., & v. n.* } Fr. *pasture*,
PASTURABLE, *adj.* } *pasturage*.
PASTURAGE, *n. s.* } Food for
cattle; food of any kind; culture of the mind:
to pasture is, both to place in, and graze on pasture ground: *pasturable*, fit for pasture: *pasturage*, the art of using or managing pastures; lands grazed by cattle.

He maketh me to lie down in green *pastures*: he leadeth me beside the still waters. *Psa. xxiii. 2.*

I wish there were ordinances, that whosoever keepeth twenty kine, should keep a plough going; for otherwise all men would fall to *pasturage*, and none to husbandry. *Spenser.*

A careless herd
Full of the *pasture* jumps along by him,
And never stays.

Shakespeare. As You Like it.

The inhabitants each *pasture* and each plain
Destroyed have, each field to waste is laid;
In fenced towers bestowed is their grain,
Before thou camest this kingdom to invade.

Fairfax.

The cattle in the fields and meadows green,
Those rare and solitary; these in flocks
Pasturing at once, and in broad herds up sprung.

Milton.

Unto the conservation is required a solid *pasture*, and a food congenious unto nature. *Broune.*

From the first *pastures* of our infant age,
To elder cares and man's severer page
We lash the pupil. *Dryden.*

When there was not room for their herds to feed together, they, by consent, separated and enlarged their *pasture* where it best liked them. *Locke.*

France has a sheep by her to show that the riches of the country consisted chiefly, in flocks and *pasturage*. *Addison.*

Cattle fatted by good *pasturage*, after violent motion, die suddenly. *Arbuthnot on Aliments.*

The *pastures* smile in green array;
There lambs and larger cattle play. *Watts.*
The new tribes look abroad

On nature's common, far as they can see
Or wing their range and *pasture*.

Thomson's Spring.

PASTURE, or PASTURE LAND, is that reserved for feeding cattle. Pasture land is of such advantage to husbandry that many prefer its cultivation even to corn land, because of the small hazard and labor that attend it, and as it lays the foundation for most of the profit that is expected from arable land, because of the manure afforded by the cattle which are fed upon it. Pasture ground is of two sorts; the one is meadow land, which is often overflowed; and the other upland, which lies high and dry. The first of these will produce a much greater quantity of hay than the latter, and will not require manuring or dressing so often: but then the hay produced on the upland is much preferable to the other; as is also the meat which is fed in the upland more valued than that which is fatted in rich meadows; though the latter will make the fatter and larger cattle, as is seen by those which are brought from the low rich lands in Lincolnshire. But, where people are nice in their meat, they will give a much larger price for such as has been fed on the downs, or in short upland pasture, than for the other, which is much larger. Besides this, dry pastures have an advantage over the meadows, that they may be fed all the winter, and are not so subject to be boggy in wet weather; nor will there be so many weeds produced; which are great advantages, and in a great measure recompense for the smallness of the crop. We shall here only mention some methods for improving upland pasture.

The first improvement of upland pasture is by fencing it, and dividing it into small fields of four, five, six, eight, or ten, acres each, planting timber trees in the hedge rows, which will screen the grass from the dry pinching winds of March, which will prevent the grass from growing in large open lands; so that if April proves a dry month, the land produces very little hay; whereas, in the sheltered fields, the grass will begin to grow early in March, and will cover the ground, and prevent the sun from parching the roots of the grass, whereby it will keep growing, so as to afford a tolerable crop, if the spring should prove dry. But in fencing land the enclosure must not be made too small, especially where the hedge-rows are planted with trees; because, when the trees are advanced to a considerable height, they will spread over the land: and, where they are close, will render the grass sour; so that, instead of being of an advantage, it will greatly injure the pasture. The next improvement of upland pasture is to make turf good, where, either from the badness of the soil or want of proper care, the grass has been destroyed by rushes,

bushes, or mole-hills. Where the surface of the land is clayey and cold, it may be improved by paring it off, and burning it; but if it is a hot sandy land, then chalk, lime, marl, or clay, are very proper manures to lay upon it; but this should be laid in pretty good quantities, otherwise it will be of little service to the land. If the ground is over-run with bushes or rushes, it will be of great advantage to the land to grub them up towards the latter part of summer, and, after they are dried, to burn them, and spread the ashes over the ground just before the autumnal rains; at which time the surface of the land should be levelled, and sown with grass-seed, which will come up in a short time, and make good grass the following spring. So, also, when the land is full of mole-hills, these should be pared off, and either burnt for the ashes, or spread immediately on the ground where they are pared off, observing to sow the bare patches with grass-seed just as the autumnal rains begin. Where the land has been thus managed, it will be of great service to roll the turf in the months of February and March with a heavy wood roller; always observing to do it in moist weather, that the roller may make an impression; this will render the surface level, and make it much easier to mow the grass than when the ground lies in hills; and will also cause the turf to thicken, so as to have what the people usually term a good bottom. The grass likewise will be the sweeter for this husbandry, and it will be a great help to destroy weeds. Another improvement of upland pastures is the feeding of them; for, where this is not practised, the land must be manured at least every third year; and, where a farmer has much arable land in his possession, he will not care to part with his manure to the pasture. Therefore every farmer should endeavour to proportion his pasture to his arable land, especially where manure is scarce, otherwise he will soon find his error; for the pasture is the foundation of all the profit which may arise from the arable land. Whenever the upland pastures are mended by manure, there should be a regard had to the nature of the soil, and a proper sort of manure applied: as, for instance, all hot sandy land should have a cold manure; neat's dung and swine's dung are very proper for such lands; but, for cold lands, horse dung, ashes, and other warm manures, are proper. And, when these are applied, it should be done in autumn, before the rains have soaked the ground, and rendered it too soft to cart on; and it should be carefully spread, breaking all the clods as small as possible, and then harrowed with bushes, to let it down to the roots of the grass. When the manure is laid on at this season, the rains in winter will wash down the salts, so that the following spring the grass will receive the advantage of it. There should also be great care taken to destroy the weeds in the pasture every spring and autumn: for, where this is not practised, the weeds will ripen their seeds, which will spread over the ground, and thereby fill it with such a crop of weeds as will soon overbear the grass, and destroy it; and it will be very difficult to root them out afterwards; especially ragwort, and such other weeds as have

down adhering to their seeds. The grasses sown in these upland pastures seldom degenerate, if the land is tolerably good: whereas the low meadows, which are overflowed in winter, in a few years turn to a harsh rushy grass, though the upland will continue a fine sweet grass for many years without renewing. There is no part of husbandry of which the farmers are in general more ignorant than that of the pasture: most of them suppose that, when old pasture is ploughed up, it can never be brought to have a good sward again; so their common method of managing their land after ploughing is to sow with their crop of barley some grass seeds as they call them; that is, either the red clover, which they intend to stand two years after the corn is taken off the ground, or rye-grass mixed with trefoil; but as all these are at most but biennial plants, whose roots decay soon after their seeds are perfected, so the ground, having no crop upon it, is again ploughed for corn; and this is the constant round which the lands are employed in by the better sort of farmers. But, whatever may have been the practice of these people, it is certainly possible to lay down lands which have been in tillage with grass, in such a manner as that the sward shall be as good, if not better, than any natural grass, and of as long duration. But this is never to be expected in the common method of sowing a crop of corn with the grass seeds; for, wherever this has been practised, if the corn has succeeded well, the grass has been very poor and weak; so that, if the land has not been very good, the grass has scarcely been worth saving; for the following year it has produced but little hay, and the year after the crop is worth little, either to mow or feed. Nor can it be expected to be otherwise; for the ground cannot nourish two crops; and if there were no deficiency in the land, yet the corn, being the first and most vigorous of growth, will keep the grass from making any considerable progress; so that the plants will be extremely weak, and but very thin, many of them which come up in the spring being destroyed by the corn; for, whenever there are roots of corn, it cannot be expected there should be any grass. Therefore the grass must be thin; and if the land is not in good heart to supply the grass with nourishment, that the roots may branch out after the corn is gone, there cannot be any considerable crop of clover; and, as their roots are biennial, many of the strongest plants will perish soon after they are cut; and the weak plants, which had made but little progress before, will be the principal part of the crop for the succeeding year; which is many times not worth standing. Therefore, when ground is laid down for grass, there should be no crop of any kind sown with the seeds; or at least the crop should be sown very thin, and the land should be well ploughed and cleaned from weeds, otherwise the weeds will come up first, and grow so strong as to overbear the grass, and, if they are not pulled up, will entirely spoil it. The best season to sow the grass seeds upon dry land, when no other crop is sown with them, is about the middle of September, or sooner if there is an appearance of rain: for the ground being then warm, if there happen some good

showers of rain after the seed is sown, the grass will soon make its appearance, and get sufficient rooting in the ground before winter: so will not be in danger of having the roots turned out of the ground by frost especially if the ground is well rolled before the frost comes on, which will press it down, and fix the earth close to the roots. Where this has not been practised, the frost has often loosened the ground so much as to let in the air to the roots of the grass, and done it great damage; and this has been brought as an objection to the autumnal sowing of grass; but it will be found to have no weight if the above direction is practised: nor is there any hazard of sowing the grass at this season, but that of dry weather after the seeds are sown; for if the grass comes up well, and the ground is well rolled in the end of October, or the beginning of November, and repeated again the beginning of March, the sward will be closely joined at bottom, and a good crop of hay may be expected the same summer. But where the ground cannot be prepared for sowing at that season, it may be performed in the middle or end of March, according as the season is early or late; for, in backward springs, and in cold land, we have often sowed the grass in the middle of April with success; but there is danger, in sowing late, of dry weather, and especially if the land is light and dry; for we have seen many times the whole surface of the ground removed by strong winds at that season; so that the seeds have been driven in heaps to one side of the field. Therefore, whenever the seeds are sown late in the spring, it will be proper to roll the ground well soon after the seeds are sown, to settle the surface, and prevent its being removed. The sorts of seeds which are the best for this purpose, are, the best sort of upland hay seeds, taken from the cleanest pastures, where there are no bad weeds; if this seed is sifted, to clean it from rubbish, three bushels will be sufficient to sow an acre of land. The other sort is the trifolium pratense album, commonly called white Dutch clover, or white honeysuckle grass. Of this seed eight pounds will be enough for one acre. The grass seed should be sown first, and then the Dutch clover seed may be afterwards sown; but they should not be mixed, because the clover-seeds being the heaviest will fall to the bottom, and consequently the ground will be unequally sown. When the seeds are come up, if the land should produce many weeds, these should be drawn out before they grow so tall as to overbear the grass; for where this has been neglected, the weeds have taken such possession of the ground as to keep down the grass, and starve it; and, when these weeds have been suffered to remain until they have shed their seeds, the land has been so plentifully stocked with them as entirely to destroy the grass; therefore it is a principal care in husbandry never to suffer weeds to grow on the land. If the ground is rolled two or three times at proper distances after the grass is up, it will press down the grass, and cause it to make a thicker bottom: for, as the Dutch clover will put out roots from every joint of the branches which are near the ground, so, by pressing down of the stalks, the roots will mat so closely together as to form a sward

so thick as to cover the whole surface of the ground, and form a green carpet, and will better resist the drought. For if we examine the common pastures in summer, in most of which there are patches of this white honeysuckle grass growing naturally, we shall find these patches to be the only verdure remaining in the fields. And this the farmers in general acknowledge is the sweetest feed for all sorts of cattle; yet they never thought of propagating it by seeds, nor has this been long practised in England. As the white clover is an abiding plant, so it is certainly the very best sort to sow, where pastures are laid down to remain; for as the hay-seeds which are taken from the best pastures will be composed of various sorts of grass, some of which may be but annual, and others biennial; so, when these go off, there will be many and large patches of ground left bare and naked, if there is not a sufficient quantity of the white clover to spread over and cover the land. Therefore a good sward can never be expected where this is not sown; for in most of the natural pastures we find this plant makes no small share of the sward; and it is equally good for wet and dry land, growing naturally upon gravel and clay in most parts of England: which is a plain indication how easily this plant may be cultivated to great advantage in most sorts of land throughout this kingdom. Therefore the true cause why the land which has been in tillage is not brought to a good turf again, in the usual method of husbandry, is, from the farmers not distinguishing which grasses are annual from those which are perennial; for, if annual or biennial grasses are sown, these will of course soon decay; so that, unless where some of their seeds may have ripened and fallen, nothing can be expected on the land but what will naturally come up. Therefore this, with the covetous method of laying down the ground with a crop of corn, has occasioned the general failure of increasing the pasture in many parts of Britain, where it is now much more valuable than any arable land. After the ground has been sown in the manner before directed, and brought to a good sward, the way to preserve it good is, by constantly rolling the ground with a heavy roller, every spring and autumn, as has been before directed. This piece of husbandry is rarely practised by farmers; but those who do, find their account in it, for it is of great benefit to the grass. Another thing should also be carefully performed, which is, to cut up docks, dandelion, knapweed, and all such weeds, by their roots, every spring and autumn; this will increase the quantity of good grass, and preserve the pastures in beauty. Dressing of these pastures every third year is also a good piece of husbandry; for otherwise it cannot be expected the ground should continue to produce good crops. Besides this, it will be necessary to change the seasons of mowing, and not to mow the same ground every year, but to mow one season and feed the next: for, where the ground is every year mown, it must be constantly dressed, as are most of the grass grounds in the environs of London, otherwise the ground will be soon exhausted.

PASTY, *n. s.* Fr. *paste*. A pie of crust without a dish.

Of the paste a coffin will I rear,
And make two *pasties* of your shameful heads.

Shakspeare.

I will confess what I know; if ye pinch me like a *pasty* I can say no more.

Id.

If you'd fright an alderman and mayor,
Within a *pasty* lodge a living hare.

King.

A man of sober life,

Not quite a madman though a *pasty* fell.

And much too wise to walk into a well. *Pope.*

What say you—a *pasty*, it shall, and it must,
And my wife little Kitty is famous for crust.

Goldsmith.

PAT, *adj., n. s., & v. a.* } Belg. *pas*. (Skinner.)

PATLY, *adv.* } Dr. Johnson says Fr.

patte, is a foot, and thence pat may be a blow with the foot. Smart; fit; convenient; suited: hence a smart, quick blow; a tap: to strike lightly or smartly: patly is, suitably, with exact fitness.

Pat, pat; and here's a marvellous convenient place for our rehearsal.

Shakspeare. Midsummer Night's Dream.

Now I might do it *pat*, now he is praying.

Shakspeare.

Children prove, whether they can rub upon the breast with one hand, and *pat* upon the forehead with another, and straightways they *pat* with both.

Bacon's Natural History.

They never saw two things so *pat*,

In all respects as this and that.

Hadibras.

If we do search about for a case to that which we do now commemorate, we should, perhaps, hardly find one more *patly* such, than is that which is implied in this psalm.

Barrow.

The least noise is enough to disturb the operation of his brain; the *pat* of a shuttlecock, or the creaking of a jack will do.

Collier.

Zuinglius dreamed of a text, which he found very *pat* to his doctrine of the Eucharist. *Atterbury.*

Gay *pats* my shoulder, and you vanish quite.

Pope.

He was sorely *put* to it at the end of a verse,
Because he could find no word to come *pat* in.

Swift.

PATÆCI, in mythology, images of gods which the Phœnicians carried on the prows of their galleys. Herodotus, lib. iv., calls them *πατῆρες*. The word is Phœnician, and derived from *pethica*, i. e. titulus, a title, or mark of dignity. See Bochart's Chanaan, lib. ii. cap. 3. But Scaliger derives it from Heb. *patach*, to engrave. Morin derives it from *μῆνec*, monkey, this animal having been an object of worship among the Egyptians, and hence might have been honored by their neighbours. Mr. Elsner has observed, that Herodotus does not call the *patæci* gods, but that they obtained this dignity from the liberality of Hesychius and Suidas, and other ancient lexicographers, who place them at the stern of ships; whereas Herodotus placed them at the prow. Scaliger, Bochart, and Selden, have taken some pains about this subject. Mr. Morin has also given us a learned dissertation on this head in the *Memoires de l'Acad. des Inscript. et Belles Lettres*, tom. i.

PATAGONIA, a name given to that part of South America which extends from Chili and Paraguay to the extremity of this continent south-west, that is, from 35° almost to 54° of

latitude: being surrounded by Chili, Paraguay, the South and North Seas, and the Straits of Magellan, which separate it from Terra del Fuego, and extend about 116 leagues in length from sea to sea, but only from half a league to three or four in breadth. This country had the name of Terra Magellanica, from Magellan. The lofty mountains of Andes, which are covered with snow a great part of the year, crossing the country from north to south, the air is much colder than in the north, under the same latitude. Towards the north it is covered with wood, but on the south not a single tree fit for any mechanical purpose is to be seen; yet there is good pasture, and incredible numbers of wild horned cattle and horses. The east coast is mostly low land, with few or no good harbours; one of the best is Port St. Julian. Patagonia is inhabited by a variety of Indian tribes, as the Patagons, from which the country takes its name; the Pampas, the Cossares, &c., of whom we know very little. From the accounts of commodore Byron and his crew, and the testimonies of other navigators, some of them were long said to be of a gigantic stature, and clothed with skins; others to go almost quite naked, notwithstanding the inclemency of the climate. Some of them who live about the Straits are perfect savages: but those with whom Byron and his people conversed were gentle and humane. They live on fish and game, and what the earth produces spontaneously. On the coasts of Patagonia lie a great number of islands. A vast deal has been said respecting the stature of the Patagians, by people of different nations, and on various occasions. Mr. Charles Clarke, who was on board Byron's ship in 1764, says that some of them are certainly nine feet, if they do not exceed it. Captain Wallis, on the other hand, who went out to the Straits of Magellan after Byron's return, found that the tallest man among them measured only six feet seven inches high; and several were within an inch or two as tall; but the ordinary size was from five feet ten inches to six feet.

Bougainville, who sailed along the coast in 1767, says, 'the natives have a good shape, of those we saw, as to broadness of their shoulders, the size of their head, and the thickness of their limbs; they are robust and well-fed; their nerves are braced, and their muscles are strong and sufficiently hard. They are men left entirely to nature, and supplied with food abounding in nutritive juice, by which means they are come to the full growth they are capable of. Their figure is not coarse or disagreeable; on the contrary, many of them are handsome. Their face is round, and somewhat flatfish; their eyes are very fiery; their teeth white, and are somewhat too large. At Paris they have long black hair, tied up on the top of their heads. I have seen some of them with long but thin whiskers. Their color is bronzed, as it is in all the Americans without exception, both in those who inhabit the torrid zone, and those who are born in the temperate and frigid zones. Some of them had their cheeks painted red. Their language seemed very delicate; and nothing gave us reason to fear any ferocity from them. The dress of these Patagians is very nearly the

same with that of the Indians of Rio de la Plata. They have merely a piece of leather which covers their natural parts, and a great cloak of guanaco, or sorillos skins, which is fastened round the body with a girdle. This cloak hangs down to their heels, and they generally suffer that part which is intended to cover the shoulders to fall back; so that, notwithstanding the rigor of the climate, they are almost always naked from the girdle upward. Habit has certainly made them insensible to cold; for, though we were here in summer, Reaumur's thermometer was only one day risen to 10° above the freezing point. These men have a kind of half-boots, of horse-leather, open behind; and two or three of them had on the thigh a copper ring about two inches broad. Some of my officers likewise observed that two of the youngest among them had such beads as are employed for making necklaces. The only arms which we observed among them are two round pebbles fastened to the two ends of a twisted gut, like those which are made use of in all this part of America. They had likewise little iron knives, of which the blade was about an inch and a half broad; these knives were of an English manufacture, and were certainly given to them by Mr. Byron. Their horses, which are small and very lean, were bridled and saddled in the same manner as those belonging to the inhabitants of Rio de la Plata. One of the Patagonians had at his saddle gilt nails, wooden stirrups, covered with plates of copper, a bridle of twisted leather, and a white Spanish harness. The principal food of the Patagonians seems to be the marrow and flesh of guanacos and vicuñas; many of them had quarters of this flesh fastened on their horses, and we saw them eat pieces of it quite raw. They had likewise little nasty dogs with them, which, like their horses, drink sea-water; it being a very scarce thing to get fresh water on this coast, or even in the country. None of them had any apparent superiority over the rest; nor did they show any kind of esteem for two or three old men who were in the troop. It is remarkable that several of them pronounced the Spanish words *manano*, *muchacha*, *bueno*, *chico*, *capitan*. I believe this nation leads the life of Tartars. Besides rambling through the immense plains of South America, men, women, and children, being constantly on horseback pursuing the game or the wild beasts with which those plains abound, dressing and covering themselves with skins, they bear probably yet this resemblance with the Tartars, that they pillage the caravans of travellers. I shall conclude this article by adding, that we have once since found a nation in the South Pacific Ocean, which is taller than the Patagonians. The soil in the place we landed at is very dry, and in that particular bears great resemblance with that of the Malouines. The botanists have likewise found almost all the same plants in both places. The sea shore was surrounded with the same sea-weed, and covered with small shells. Here are no woods, but only some shrubs.

These tribes have been described by Falkner, a South American missionary, who represents the Puelches as divided into three or four tribes,

the most southern of which are the Tehuels, who extend on the east to the strait, as the Huilliches do on the west. The Tehuels are the proper Patagonians, who are a warlike tribe, but courteous and humane. According to this writer, their complexion is a copper-color, like the other American Indians. Their hair is straight, black, and coarse, and tied back with a string; but neither sex wear any covering on their heads. They are well made, robust, bony, and very strong; though their hands and feet are small in proportion to their size. They are generally clad in the skins of the guanaco, sewed together into pieces of about six feet long and five broad, which are wrapped round their bodies with the hairy side inwards, and which forms a kind of cloak, fastened round the waist with a girdle. Some of them wear the *puncho*, which is made of the wool of the guanaco, and all have a kind of tight drawers, with buskins that reach from the middle of the leg to the instep, and pass under the heel, while the rest of the foot is uncovered. 'This cloak hangs down to their heels, and they generally suffer that part which is intended to cover the shoulders to fall back; so that, notwithstanding the rigor of the climate, they are always naked from the girdle upward. Habit has certainly made them insensible to cold; for, though we were here in summer, Reaumur's thermometer was only 10° above the freezing point.'

PATAGONULA, in botany, a genus of the monogynia order, and pentandria class of plants: natural order forty-first, *asperifoliae*. The characters are these: the cup is an extremely small perianth, divided into five segments, and remains after the flower is fallen; the flower consists of a single petal, with almost no tube, the margin of which is divided into five acute oval segments; the stamina are five filaments of the length of the flower; the anthers simple; the germen of the pistil is oval and pointed; the style is slender and slightly bifid, its ramifications are also bifid; this is of the same length with the stamina, and remain when the flower is fallen; the stigmata are simple; the fruit is an oval and pointed capsule standing on a large cup, made up of five long segments emarginated or rimmed round their edges; the seeds of this plant are yet unknown; but the construction of the cup, in which the capsule stands, is alone a sufficient distinction for this genus. There is but one species.

PATAN, a town of Hindostan, in the district of Harowty, Ajmeer. It is situated on the south side of the Chambul, and is the capital of a district of thirty-two villages, belonging to the Mahrattas. It contains a handsome temple, dedicated to Vishnu, and a palace belonging to the rajah. Long. 75° 50' E., lat. 25° 17' N.

PATANY, a port on the eastern coast of the peninsula of Malacca, near the mouth of the gulf of Siam. It is situated about six miles up a river falling into a good roadstead. The English established a factory here in 1610, where they imported Surat and Coromandel cloths, to the value of 10,000 dollars; but they withdrew it in 1623. The trade is now in the hands of the Chinese. European goods are received from

Batavia; the exports consist of gold dust, canes, rattans, dragon's blood, &c. Long. 101° 40' E., lat. 6° 50' N.

PATAPSCO, a river of Maryland, which runs south-east into Chesapeake Bay, between North Point and Bodkin's Point. It is navigable to Fell's Point, in Baltimore, fourteen miles, for ships drawing eighteen feet water.

PATARA, the capital of Lycia, east of the mouth of the Xanthus; famous for a temple and oracle of Apollo. Livy, Mela. For the six winter months, Apollo gave answers at Patara; and for the six summer at Delos (Virgil, Servius); these are the Lyciæ Sortes of Virgil. The town was situated in a peninsula, called Lyciorum Chersonesus. Stephanus. There is still a place on the sea-coast of Caramania, the supposed Patara of history. The theatre contains thirty-four rows of marble seats entire, and is distinguished also by the superior preservation of its proscenium. The circuit of the walls may be traced, and temples, altars, pedestals, and fragments of sculpture, are in profusion. It is almost deserted, however, as a habitation of men.

PATAVINITY, among critics, a peculiarity of Livy's diction; from Patavium, the place of his nativity; but wherein this patavinity consists they are by no means agreed. In all probability it is one of those delicacies that are lost in a dead language.

PATAVIUM, a town of Gallia Transpadana, on the left or north bank of the Medoacus Minor; founded by Antenor the Trojan Mela, Virgil, Seneca. Now called Padua.

PATCH, *v. n. & n. s.* } Ital. *pezza*; Span. }
 PATCHER, *n. s.* } *pieza*, or, as Minsheu }
 PATCH'ERY, } suggests, more probably }
 PATCH'WORK. } a corruption of Borch, }
 which see. To mend or cover with new pieces; hence make up of different pieces or shreds; mend clumsily; as the ladies formerly endeavoured to do with respect to their faces, by decorating them with small spots of black silk: a patch is, a piece sewed on or inverted with a view to mending or variegating a portion of work; a small spot of black silk stuck on the face; a small piece of ground: a patcher, he or she who patches: patchery, botchery; bungling work; forgery: patchwork is work made by inserting pieces of different colors or patterns in the same design.

Any thing mended is but *patched*. *Shakespeare.*

Patches set upon a little breach,
 Discredit more in hiding of the flaw,
 Than did the flaw before it was so *patched*. *Id.*

We go to gain a little *patch* of ground,
 That hath in it no profit but the name. *Id.*

What a pied ninny's this? thou scurvy *patch*! *Id.*

You hear him cogg, see him dissemble,
 Know his gross *patchery*, love him, and feed him,
 Yet remain assured that he's a made-up villain. *Id.*

If we seek to judge of those times, which the scriptures set us down without error, by the reigns of the Assyrian princes, we shall but *patch* up the story at adventure, and leave it in confusion.

Raleigh's History.

If to every common funeral,
 By your eyes martyred, such grace were allowed,
 Your face would wear not *patches*, but a cloud.

How! providence! and yet a Scottish crew!
 Then madam Nature wears black *patches* too. *Suckling.*

Physick can but mend our crazy state,
Patch an old building, not a new create. *Cleveland.*

His glorious end was a *patched* work of fate,
 Ill sorted with a soft effeminate life. *Dryden.*

If the shoe be ript, or *patches* put;
 He's wounded! see the plaster on his foot. *Id.*

They suffer their minds to appear in a pie-bald
 livery of coarse *patches* and borrowed shreds, such as
 the common opinion of those they converse with
 clothe them in. *Loeke.*

Broken limbs, common prudence sends us to the
 surgeons to piece and *patch* up. *L'Estrange.*

In the middle boxes were several ladies who
patched both sides of their faces. *Addison's Spectator.*

They were *patched* differently, and cast hostile
 glances upon one another, and their *patches* were
 placed in different situations, as party signals, to
 distinguish friends from foes. *Addison.*

Enlarging an author's sense, and building fancies
 of our own upon his foundation, we may call para-
 phrasing; but more properly changing, adding,
patching, piecing. *Felton.*

There is that visible symmetry in a human body,
 as gives an intrinsick evidence that it was not formed
 successively and *patched* up by piece-meal. *Bentley.*

This the morning omens seemed to tell:
 Thrice from my trembling hand the *patch*-box fell. *Pope.*

Foreign her air, her robe's discordant pride
 In *patchwork* fluttering. *Id.*

We begged her but to *patch* her face,
 She never hit one proper place. *Swift.*

Whoever only reads to transcribe shining remarks,
 without entering into the genius and spirit of the
 author, will be apt to be misled out of the regular
 way of thinking; and all the product of all this will
 be found a manifest incoherent piece of *patchwork*. *Id.*

To *patchwork* learned quotations are allied,
 Both strive to make our poverty our pride. *Young.*

Vain hope! in *patch-work* of terrestrial grain,
 To be received into the courts above!
 As vain, as towards yonder suns to soar,
 On wing of waxen plumage, melting soon. *Pollak.*

PATCHOW ISLANDS, a group of islands on the coast of China, the eastern extremity of which is formed by Typinsan, a large island, having on its north side a reef, on which the Providence, captain Broughton, was wrecked in 1797, in long. 125° 11' E., lat. 25° 6' N. These islands are tributary to the great Liquejo.

PATE, *n. s.* Derived by Skinner from Fr. *tête*, more probably from the Ital. or Span. *patena*, a skull. The head. Now commonly used in contempt or ridicule; but anciently in serious language.

Behold the despaire,
 By custome and covetous *pates*,
 By gaps and opening of gates. *Tusser.*
 'Senseless man, that himself doth hate,
 To love another;
 Here take thy lover's token on thy *pate*. *Spenser.*

He is a traitor, let him to the tower,
And crop away that factious *pate* of his.
Shakespeare.

That sly devil,
That broker that still breaks the *pate* of faith,
That daily breakvow. *Id.*

Thank you gentler fate,
That, for a bruised or broken *pate*,
Has freed you from those knobs that grow
Much harder on the married brow. *Hudibras.*
If only scorn attends men for asserting the church's
dignity, many will rather chuse to neglect their duty,
than to get a broken *pate* in the church's service.
South.

No; not a single thought like that
Employs his philosophic *pate*,
Or troubles it at all. *Cowper.*

PATELLA, in anatomy (from *patina*, a dish, so named from its shape). *Rotula*. The kneepan. A small flat-bone, somewhat resembling the common figure of the heart, with its point downwards, and which is placed at the fore-part of the joint of the knee. Anteriorly it is a little convex, and rough for the insertion of muscles and ligaments; posteriorly it is smooth, covered with cartilage, and divided by a middle longitudinal ridge into two slightly concave surfaces, of which the external one is the largest and deepest. It is thus exactly adapted to the pulley of the *os femoris*. The edges of this posterior surface are rough and prominent where the capsular ligament is attached, and below is a roughness at the point of the bone, where the upper extremity of a strong tendinous ligament is fixed, which joins this bone to the tuberosity at the upper end of the tibia. This ligament is of considerable thickness, about an inch in breadth, and upwards of two inches in length. See **ANATOMY**.

PATELLA, in zoology, the limpet, a genus belonging to the order of *vermes testacea*; the animal is of the snail kind. The shells are of that class which is called *univalves*; they have no contour, and are in the form of little pointed cones. They are always attached to some hard body. Their summit is sometimes acute, sometimes obtuse, flattened, turned back, or perforated. The rock, or other hard body to which they are always found adhering, serves as a kind of second or under shell to preserve them from injury; and for this reason *Aldrovandus* and *Rondelet* have classed them among the bivalves; but in this they have not been followed. There are very many species of this genus, which are principally distinguished by peculiarities in their shells. Dr. Rees gives 250 in his *Cyclopædia*.

PATELLA, in entomology, is also a name given by Lister and others to a little husk or shell, found on the bark of the cherry, plum, rose, and other trees, containing an animal within, and useful in coloring. These *patellæ* are of the form of globes, except when they adhere to the tree, and are for the most part of a shining chestnut color. The husk itself strikes a very fine crimson color on paper, and within it is found a white maggot which is of no value: this, in time, hatches into a very small but beautiful bee. The size of this bee is about half that of an ant. They have a sting like bees,

and three spots in a triangle on the forehead, supposed to be eyes. They are black, and have a large round whitish or pale yellow spot on the back. The upper pair of wings are shaded and spotted, but the under pair are clear. It might be worth while to try whether the color they yield might not be useful. The deepest colored husks afford the finest and deepest purple; they must be used while the animal in them is in the maggot form; for when it is changed into the bee state the shell is dry and colorless. Lister, who first observed these *patellæ*, went so far on comparing them with the common *kermes* as to assert that they were of the same nature with that production; but his account of their being the workmanship of a bee, to preserve her young maggot in, is not agreeable to the true history of the *kermes*; for that is an insect of a very peculiar kind. It is possible that these *patellæ* may be the same genus of animals with the *kermes*, but then it produces its young within this shell or husk, which is no other than the skin of the body of the mother animal; but as there are many flies whose worms or maggots are lodged in the bodies of other animals, perhaps this little bee may lay its egg in the body of the proper insect, and the maggot hatched from that egg may eat up the proper progeny, and, undergoing its own natural changes there, issue out at length in form of the bee. This may have been the case in some few which Dr. Lister examined and he may have been misled by this to suppose it the natural change of the insect.

PATEN, *n. s.* Lat. *patina*. A plate. Not in use.

The floor of heaven
Is thick inlaid with *patens* of bright gold;
There's not the smallest orb which thou behold'st,
But in his motion like an angel sings. *Shakespeare.*

PATENT, *adj. & n. s.* } Fr. *patent*; Lat. *pa-*
PATENTE, *n. s.* } *tens* (opened). Open
to all; as letters patent: hence a writ or order conferring a privilege or exclusive right: *patentee* is one who is possessed of such right by public law or orders.

In Ireland, where the king disposes of bishopricks merely by his letters *patent*, without any *Comte d'Elire*, which is still kept up in England; though to no other purpose than to shew the ancient right of the church to elect her own bishops. *Lecky.*

If you are so fond over her iniquity, give her *patent* to offend: if it touch not you, it comes near *no* body. *Shakespeare.*

So will I grow, so live, so die,
Ere I will yield my virgin *patent* up
Unto his lordship.

Id. Midsummer Night's Dream.
If his tenant and *patentee* dispose of his gift, without his kingly consent, the lands shall revert to the king. *Bacon.*

Madder is esteemed a commodity that will turn to good profit; so that, in king Charles the first's time, it was made a *patent* commodity. *Mortimer.*

We are censured as obstinate, in not complying with a royal *patent*. *Swift.*

In the *patent* granted to lord Dartmouth the securities obliged the *patentes* to receive his money back upon every demand. *Id.*

PATER (Paul), a learned Hungarian, born at Menersdorf, in 1659; and driven from his

country, when young, on account of his being a Protestant. The duke of Wolfenbutter made him his librarian, and he became professor of mathematics in the college of Dantzic; where he died in 1724. He published many works on literature and philosophy.

PATER PATRATUS, the first and principal person in the ancient college of heralds called *Feciales*. Some say he was a constant officer and perpetual chief of that body; and others suppose him to have been a temporary minister, elected upon account of making peace or denouncing war, which were both done by him. See *FECIALES*.

PATERA, in antiquity (from *pateo*, Lat. to be open), a large open goblet or vessel, used by the Romans in their sacrifices; wherein they offered their consecrated meats to the gods, and wherewith they made libations. On medals the patera is seen in the hands of several deities; and often in those of princes, to mark the sacerdotal authority joined with the imperial, &c. F. Joubert observes that, besides the patera, there is frequently an altar upon which the patera seems to be pouring its contents. The patera was of gold, silver, marble, brass, glass, or earth; and they used to enclose it in urns with the ashes of the deceased, after it had served for the libation of the wine and liquors at the funeral. The patera is an ornament in architecture, frequently seen in the Doric frieze, and the tympan of arches; and they are sometimes used by themselves to ornament a space. In this case it is common to hang a string of husks or drapery over them; sometimes they are much enriched with foliage, and have a mask or a head in the centre. In the Royal Cabinet of Antiquities in Paris is a most magnificent one in gold, of which Millin has given a description (together with a drawing) in his *Monumens Antiques Inédits*. This elegant monument of art is nine inches and upwards in diameter. The subject represented on it is a contest between Hercules and Bacchus as to which could drink most. The contesting deities have drained all their drinking cups except the last, which Bacchus is about to empty at one draught. He holds the vase with a firm hand, and looks scornfully on his vanquished rival, who appears to be sinking down from the effects of intoxication. This beautiful vase was discovered at Rennes, in Brittany, on the 26th of March, 1774, by some masons who were at work in pulling down a chapter house.

PATERCULUS (Caius Velleius), an ancient Roman historian, who flourished in the reign of Tiberius Cæsar, was born A. U. C. 735. His grandfather espoused the party of Tiberius Nero, the emperor's father; but, being old and infirm, and not being able to accompany Nero when he retired from Naples, he killed himself. His father was a soldier of rank, and Paterculus was a military tribune when Caius Cæsar, a grandson of Augustus, had an interview with the king of the Parthians, in an island of the Euphrates, in 753. He commanded the cavalry in Germany under Tiberius, and accompanied that prince for nine years' successively in all his expeditions. He received honorable rewards from

him; but was preferred to no higher dignity than the prætorship. The praises he bestows upon Sejanus make it probable that he was a friend of this favorite, and was involved in his ruin. He died A. U. C. 784, when in his fiftieth year. He wrote an Abridgment of the Roman History in two books, in which many particulars are related that are nowhere else to be found. It was first published from the MS. of Morhauc, by Rhenanus, at Basil, in 1520; afterwards by Lipsius at Leyden in 1581; by Gerard Vossius in 1639; by Boeclerus at Strasburg in 1642; by Thysius and others; and lastly, by Peter Burman at Leyden, 1719, in 8vo. To the Oxford edition in 1693, 8vo., were prefixed the *Annales Velleiani* of Mr. Dodwell, which show a great knowledge of antiquity. Lipsius censures him severely for his praise of Tiberius.

PATERNAL, *adj.* } *Fr. paternel*; *Lat. pater-nity*, *n. s.* } *ternus*. Like a father; having the relation of, pertaining to, or received from a father: *paternity*, is the relation or quality of a father.

I disclaim all my *paternal* care,
Propinquity and property of blood,
And as a stranger to my heart and me
Hold thee. *Shakespeare. King Lear.*

The world, while it had scarcity of people, underwent no other dominion than *paternity* and eldership. *Ruleigh.*

Grace signifies the *paternal* favour of God to his elect children. *Hammond.*

Admonitions fraternal or *paternal* of his fellow Christians or governors of the church. *Id.*

They spend their days in joy unblamed; and dwell

Long time in peace, by families and tribes,
Under *paternal* rule. *Milton's Paradise Lost.*

Men plough with oxen of their own
Their small *paternal* field of corn. *Dryden.*

Retreat betimes
To thy *paternal* seat, the Sabine field,
Where the great Cato toiled with his own hands. *Addison.*

A young heir kept short by his father, might be known by his countenance; in this case, the *paternity* and filiation leave very sensible impressions. *Arbushnot.*

This origination in the divine *paternity*, as bishop Pearson speaks, hath anciently been looked upon as the assertion of the unity. *Waterland.*

PATERSON (Samuel), was born in 1725. His father died when he was very young, and, his guardian failing, he lost his fortune. Being lame, and not having been brought up to any profession, he chose that of a bookseller, in which he was unsuccessful. He then commenced auctioneer, and, after struggling with much distress, was appointed librarian to the marquís of Lansdown. He died 29th of October, 1802. He wrote and published, 1. A dissertation on the equestrian figure of the George and Garter; by Dr. Pertingall, 1753. 2. The Travels of Caiat Junior, 1767. 3. Janeriana, or a Book of Scraps. 4. The Templar, a weekly paper; and 5. Speculations on Law and Lawyers. But what rendered him chiefly famous was his talent at drawing up catalogues. The catalogues which he made of many valuable libraries sell at high prices.

PATH, *n. s.* } *Sax. paþ; Wel. paith.*
PATHLESS, *adj.* } Way: road; track, particu-
PATHWAY, *n. s.* } larly a foot road or track;
 passage: pathless is, untrodden; unmarked by
 paths; desert; path-way, a road particularly
 for foot passengers; any passage.

For darkness, where is the place thereof? that thou
 shouldst know the *paths* to the house thereof.

Job xxxviii. 20.

In the way of righteousness is life, and in the
pathway thereof there is no death. *Prov. xii. 28.*

Ask thou the citizens of *pathless* woods;
 What cut the air with wings, what swim in floods?

Sandys.

Alas, that love, whose view is muffled still,
 Should without eyes see *pathways* to his ill.

Shakespeare.

Like one that had been led astray
 Through the heaven's wide *pathless* way.

Milton.

In fortunes's empire blindly thus we go,
 And wander after *pathless* destiny,
 Whose dark resorts since prudence cannot know,
 In vain it would provide. *Dryden.*

On the glad earth, the golden age renew,
 And thy great father's *path* to heaven pursue.

Id.

The dewy *paths* of meadows we will tread. *Id.*
 There is but one road by which to climb up, and
 they have a very severe law against any that enters
 the town by another *path*, lest any new one should
 be worn on the mountain. *Addison on Italy.*

Through mists obscure she wings her tedious way,
 Now wanders dazzled with too bright a day;
 And from the summit of a *pathless* coast
 Sees infinite, and in that sight is lost. *Prior.*

When in the middle *pathway* basks the snake;
 O lead me, guard me from the sultry hours. *Gay.*

The *path* prescribed inviolably kept,
 Upbraids the lawless sallies of mankind.

Young.

PATHETIC, *adj.* } *Fr. pathétique; Greek*
PATHETICAL, } *πάθητικός. Affecting the*
PATHETICALLY, } passions; passionate;
PATHETICALNESS, } moving: the adjective
 and noun substantive correspond.

His page that handful of wit;
 'Tis most *pathetical*. *Shakespeare.*

These reasons so *pathetically* urged and so admi-
 rably raised by the prosopopeia of nature, speaking
 to her children with so much authority, deserve the
 pains I have taken. *Dryden.*

How *pathetick* is that expostulation of Job, when,
 for the trial of his patience, he was made to look
 upon himself in this deplorable condition!

Spectator.

While thus *pathetick* to the prince he spoke,
 From the brave youth the streaming passion broke.

Pope.

Tully considered the dispositions of a sincere and
 less mercurial nation, by dwelling on the *pathetick*
 part. *Swift.*

PATHOGNOMONICK, *adj.* *Gr. παθογ-
 νομονικός, παθος, and γινωσκω, to know. Such*
 signs of a disease as are inseparable, or indicate
 the essence or real nature of it; not symptoma-
 tic.

He has the true *pathognomonick* sign of love, jea-
 lousy; for nobody will suffer his mistress to be
 treated so. *Arbutnot.*

PATHOLOGY. See **MEDICINE**.

PATHROS, a city and canton of Egypt, which
 the prophets Jeremiah and Ezekiel mention;

Jer. xlv. 1, 15. Ezek. xxix. 14, xxx. 14. We
 are uncertain of its situation. Pliry and Pto-
 lemy call it Phaturis; and it appears to have
 been in Upper Egypt. Isaiah (x. 2) calls it
 Pathros; and it is the country of the Pathrusim,
 the posterity of Mizraim, mentioned by Moses,
Gen. x. 14. Ezekiel threatens them with an
 entire ruin. The Jews retired thither, notwith-
 standing the remonstrances of Jeremiah; but
 Isaiah foretold their return.

PATIENT, *adj., n. s. & v. a.* } *Fr. patient;*
PATIENTLY. } *Ital. pazienza;*

Lat. patiens. Enduring; with of before the
 thing endured; calm; meek; the adjective cor-
 responding.

Have *patience* with me, and I will pay thee all.
Matthew.

Warn them that are unruly, support the weak, be
patient toward all men. *1 Thes. v. 14.*

Necessary *patience* in seeking the Lord is better
 than he that leadeth his life without a guide.

Eccles. x. 32.

You deal with me like a physician, that, seeing
 his *patient* in a pestilent fever, should chide instead
 of administering help, and bid him be sick no more.

Sidney.

Through ignorance of the disease, through unrea-
 sonableness of the time, instead of good he worketh
 hurt, and out of one evil throweth the *patient* into
 many miseries. *Spenser.*

By their *patience* be it spoken, the apostles preached
 as well when they wrote, as when they spake the
 gospel. *Hooker.*

That which they grant, we gladly accept at their
 hands, and wish that *patiently* they would examine
 how little cause they have to deny that which as yet
 they grant not. *Id.*

The king-becoming graces,
 Devotion, *patience*, courage, fortitude;
 I have no relish of them. *Shakespeare. Macbeth.*
 Be *patient*, and I will stay. *Id. Henry VI.*
 To proper *patients* he kind agents brings,
 In various leagues binds disagreeing things. *Creech.*

Lament not, Eve, but *patiently* resign
 What justly thou hast lost.

Milton's Paradise Lost.

To this outward structure was joined strength of
 constitution, *patient* of severest toil and hardship.

Fell.

Grieved, but unmoved, and *patients* of your scorn,
 I die. *Dryden's Theocritus.*

Nor will the raging fever's fire abate
 With golden canopies or beds of state;
 But the poor *patient* will as soon be found
 On the hard matress or the mother ground. *Dryden.*

Wheat, which is the best sort of grain, of which
 the purest bread is made, is *patient* of heat and cold.

Ray.

Patience, an herb, makes a good boiled sallad.

Mortimer.

Christian fortitude and *patience* have their oppor-
 tunity in times of affliction and persecution.

Spriet.

Cato, lend me for a while thy *patience*,
 And condescend to hear a young man speak.

Addison.

A physician uses various methods for the recovery
 of sick persons; and, though all of them are dis-
 agreeable, his *patients* are never angry. *Id.*

Malice is a passion so impetuous and precipitate,
 that it often involves the agent and the *patient*.

Government of the Tongue.

Frequent debauch to habitude prevails,
Patience of toil and love of virtue fails. *Prior.*

Too industrious to be great,
 Not *patient* to expect the turns of fate,
 They opened camps deformed by civil fight. *Id.*
 Whatever I have done is due to *patient* thought.

Newton.

It is wonderful to observe how inapprehensive these *patients* are of their disease, and backward to believe their case is dangerous.

Blackmore.

Could men but once be persuaded *patiently* to attend to the dictates of their own minds, religion would gain more proselytes. *Calamy's Sermons.*

Ned is in the 'gout,

Lies racked with pain, and you without,

How *patiently* you hear him groan!

How glad the case is not your own! *Swift.*

Action and passion are modes which belong to substances: when a smith with a hammer strikes a piece of iron, the hammer and the smith are both agents or subjects of action; the one supreme, and the other subordinate: the iron is the *patient* or the subject of passion, in a philosophical sense, because it receives the operation of the agent. *Watts.*

He learnt with *patience*, and with meekness taught;
 His life was but the comment of his thought.

Harte.

But once enslaved, farewell! I could endure
 Chains no where *patiently*: and chains at home,
 Where I am free by birthright, not at all. *Cowper.*

PATIGUMQ (a corruption of the words *pate de guimauve*), a sort of lozenge much used on the continent, as an agreeable and useful remedy for catarrhal defluxions, and supposed by Dr. Percival to consist of gum arabic combined with sugar and the whites of eggs. But it is said that the powdered substance of the marshmallow is the chief ingredient of the composition.

PATIN (Charles), M. D., a celebrated French author who excelled in the knowledge of medals. He was born in Paris in 1633. He studied physic, took his degrees, and practised with great success. In 1676 he was appointed professor of physic in Padua; and in 1679 was created a knight of St. Mark. He died in that city in 1694. His works are numerous. See **NUMISMATOLOGY**.

PATIN, or **PATINA**, ærugo, or the green rust of copper, so much valued by antiquarians, as an evidence of the genuineness of ancient copper coins. Instead of corroding the metal, as the rust of iron does, patina is the best preservative of ancient copper coins. This rust is sometimes counterfeited, and a false patina substituted for that which is true. The false varnish is black, greasy, and shining, and is besides very tender when touched with a burin or needle. The ancient, on the contrary, has none of these qualities, and is as hard as the coin itself. Mr. Pinkerton observes, that sometimes a light green, oally-like varnish is produced, spotted with a kind of iron marks. This is made of sulphur, verdigris, and vinegar; and is to be often distinguished, among other marks, by hair strokes of the brush with which it was laid on. The following hints are given by Vico, whom Pinkerton cites, respecting false patina. He describes it as green, black, russet or brown, gray, and iron color. The green is made with verdigris; the black is smoke of sulphur; the

Vol. XVI.

gray is formed of chalk steeped in urina, in which the coin is left for some days. The russet most nearly approaches the natural patina, being a kind of froth formed by the fire from ancient coins; but when false it is too shining. The large brass coins of the Ptolemies are often employed in producing it, since they are frequently corroded: these are made red hot, and, the metals being put in them, a fine rust adheres. Vico does not explain the process of iron color. Sometimes, he says, they take an old defaced coin, covered with real ancient patina, and stamp it afresh; but the patina is then too bright in the cavities and too dull in the protuberances. It may be observed, in conclusion, that the trial of brass coins with the tongue is often serviceable; for, if modern, the patina tastes pungent or bitter; while, if ancient, it is perfectly tasteless.

PATIZITHES, one of the Persian Magi, whose brother having a strong resemblance to Smerdis, the second son of Cyrus the Great, he raised him to the throne on the death of Cambyses, pretending that he was prince Smerdis. See **PERSIA**.

PATKUL (John Reinhold, Count), a brave and accomplished nobleman, born in Livonia. He was employed to represent the grievances of that province to Charles XI. of Sweden; which he did with intrepidity and freedom. For this the king caused him to be prosecuted for high treason; when he was condemned to lose his head. Patkul, however, escaped, and entered into the service of Peter the Great; but, while acting as the czar's ambassador to Augustus, king of Poland, whom he had formerly served, he was most ungratefully delivered up a prisoner, by that monarch, to Charles XII.; who caused him to be broken alive on the wheel, with every circumstance of ignominy and aggravated cruelty, on the 30th of September, 1707.

PATMOS, an island of the Grecian archipelago, situated in N. lat. 37° 20', E. long. 26° 35', consists of two portions of an island united by an isthmus. It is encompassed with porphyry rocks, black and porous, full of crystals of feldspar. On a hill at the junction of the two parts of the island the Greeks once built a fort, the remains of which are still visible; they consist of walls flanked with towers, of very solid masonry and of the porphyry found in the country. On a mountain elevated above the rest is the monastery of St. John the Evangelist; it was in a grotto excavated in the rock that the apostle, banished into Patmos, is said to have written the book of the Revelation. From this height an extensive and delightful view all round strikes the eye; few spectacles in nature have equal beauty. The monastery on the summit, which is fortified like a castle, is the residence of a hermit, renowned for his devotions and pretended revelations; and the island is filled with little churches and chapels, which here occupy the place of houses; there are about 240 of these churches, while the houses do not exceed 600. The monastery itself contains about 500 monks, and has a revenue of 200 purses. The caloyers or priests are very ignorant; M. de Choiseul found only three who

2 X

could read tolerably; and neither he nor Sonini thought they had any library; later travellers have found some books and MSS. here. The priests, however, did not appear to make use of them; and Dr. Clarke persuaded them without much difficulty to sell him their most valuable MSS., which are yet to be seen in the university library at Cambridge. One traveller, who visited the monastery of St. John in 1817, found a monk who was acquainted with the ancient Greek, and who had a library with a few MSS. There is a hermitage built on the grotto, where John received his revelations.

The disastrous effects of monachism are imprinted on the very soil of Patmos; there is no agriculture, no industry, no population. The Caloyers are the most considerable inhabitants in the island, there is but one town, or rather village, built on the side of the mountain on which the convent stands. The land is overgrown with weeds and in many places bare and very wild in its appearance; misery indeed weighs heavily on this island; the soil is naturally fruitful and needs only the cultivation of the hand of man; but he has chosen rather to cover it with churches than harvests. The little agriculture that is attended to is the work of the women; the men, during the fine season, go to seek their living elsewhere, especially by transporting the productions of one island of the Archipelago, or of one sea port of the Levant, to another. They go as far as the Black Sea for the corn they want. Notwithstanding the hard labor that they undergo, the women of Patmos excite the attention of foreigners by their beauty; in the time of Tournefort they used to load themselves with heavy burdens, without being sensible that it affected their shape; but they now carry lighter loads and with much more address. At that time they thought every foreigner who accosted them was looking for a woman, because a Marseillaise had married one for her beauty; but foreigners so often abused their easy access, that after some time the women fled at their approach to hide themselves in the deserts, especially when their husbands were absent. With the very fine red and shining cotton thread, cultivated in Scio, and spun in the convents, the women of this island, as well as those of Seripho, make caps, net-work, purses, stockings, &c. A German author supposes this silky cotton is the byssus, so much esteemed in ancient times as one of the most precious articles for luxurious clothing. Great neatness prevails in their dwellings, and they have a peculiar custom of raising their beds to the height of ten feet above the ground.

PATNA, PADMAVATI. A large city of Hindostan, the capital of the province of Bahar, and standing in lat. $25^{\circ} 37' N.$, long. $85^{\circ} 15' E.$ It is situated on the south side of the Ganges, which is here five miles wide during the rainy season. The town is one continued street for many miles along the river; the houses of the natives being generally of mud; but those of the Europeans of brick, and of handsome appearance. There are also several large old buildings of brick. It was formerly fortified after the native manner, with a wall and small citadel. The

surrounding country is perfectly flat. This town is prosperous and populous; but the number of inhabitants has never been correctly ascertained; they cannot, however, be estimated, says Mr. Hamilton, at less than 150,000. Every article of food is remarkably cheap.

Chintzes and dimities are manufactured here, and also cloths resembling diaper and damask linen. In the vicinity flannels well wove, but ill fulled, are made, and also a sort of canvas from cotton. A large quantity of salt-petre is annually despatched to Calcutta.

Patna is a city of great antiquity, and supposed by some to be the site of the ancient Palibothra. By the modern Mahometans it is named Azimabad, and by the Hindoos Sri Nagur. Many years since the East India Company erected a dépôt here to contain rice. It is a building of stone in the shape of a bee-hive, with two winding staircases on the outside, which have been ascended on horseback. The grain is poured in at the top, there being a small door at the bottom to take it out. The walls at the bottom, although twenty-one feet thick, have given way—a circumstance of very little consequence, as were it filled (which it never was) it would not contain one day's consumption for the inhabitants of the province. It originally cost 120,000 rupees. Here are also the remains of the British factory, where the massacre of 200 prisoners was perpetrated in 1763 by a German adventurer, Somro (Summers), in the service of Meer-Cossim; immediately after which the city was captured by the British troops under major Adams, and has ever since remained in our possession. A monument, but without inscription, is erected to the memory of the sufferers. In Bankipoor, one of the suburbs of Patna, the East India Company's civil servants reside. The provincial court of appeal and circuit, its registers and clerks, the district and city court, with the commercial resident, collector, and other agents of the Company, compose a numerous establishment. The Patna division of the court of circuit comprehends the following districts, viz. 1. Ramgur; 2. Bahar; 3. Tirhoot; 4. Sarum; 5. Shahabad; 6. The city of Patna. Travelling distance from Patna to Calcutta, by Moorshedabad, 400 miles; by Birmboom 340; from Benares, by Buxar, 155; from Delhi 661; from Agra 544; and from Lucknow 316 miles.

PATRÆ, a city of Achaia, at the north-west of the Peloponnesus, which assisted the Ætolians when invaded by the Gauls under Brennus. It was afterwards reduced to extreme poverty, till Augustus reunited the scattered citizens, and made it a Roman colony, settling a portion of the troops which obtained the victory of Actium, with other inhabitants from the adjacent places. Patræ refLOURISHED and enjoyed dominion over Naupactus, Ceanthea, and several cities of Achaia. In the time of Pausanias it was adorned with temples and porticoes, a theatre, and an odéum which was superior to any in Greece, but that of Atticus Herodes at Athens. In the lower part of the city was a temple of Bacchus *Æsymmetes*, in which was an image preserved in a chest, and conveyed from Troy by

Eurypylus. By the port were temples; and by the sea, one of Ceres, with a pleasant grove and a prophetic fountain of unerring veracity in determining the event of any illness. After supplicating the goddess with incense, the sick person appeared, dead or living, in a mirror suspended so as to touch the surface of the water. In the citadel of Patræ was a temple of Diana Laphria, with her statue in the habit of a huntress, of ivory and gold, given by Augustus Cæsar, when he laid waste Calydon and the cities of Ætolia to people Nicopolis. The Patrensians honored her with a yearly festival, which is described by Pausanias who was a spectator. They formed a circle round the altar with pieces of green wood, each sixteen cubits long, and within heaped dry fuel. The solemnity began with a most magnificent procession, which was closed by the virgin priestess in a chariot drawn by stags. On the following day, the city and private persons offered at the altar fruits, and birds, and all kinds of victims, wild boars, stags, deer, young wolves, and beasts full grown; after which the fire was kindled. It was not remembered that any wound had ever been received at this ceremony, though the spectacle and sacrifice were as dangerous as savage. The number of women at Patræ was double that of the men. They were employed chiefly in a manufacture of flax which grew in Elis, weaving garments, and attire for the head.

For the state of the modern town of PATRAS, see our article GREECE, Vol. X. p. 630.

PATRIARCH, *n. s.*

PATRIARCHAL, *adj.*

PATRIARCHATE, *n. s.*

PATRIARCHSHIP

PATRIARCHY.

Fr. *patriarche*; Lat.

patriarcha; Greek,

πατριάρχης. The

father and ruler of a

family; one who

governs by a paternal right; applied to ecclesiastical superiors: patriarchal is the corresponding adjective: and patriarchate, patriarchship, and patriarchy, all express the state or quality of a patriarch.

Calabria pertained to the *patriarch* of Constantinople, as appeareth in the novel of Leo Sophus, touching the precedence of metropolitans belonging to that *patriarchy*. *Brerewood.*

The *patriarchs* for an hundred years had been of one house, to the prejudice of the church, and there yet remained one bishop of the same kindred. *Raleigh.*

The good *Patriarch* was the same in Potiphar's dungeon, and on Pharaoh's bench. *Hall.*

Between ecclesiastical, the questions are as ancient as the differences between Rome and any other of the old *patriarchates*. *Selden.*

So spake the *patriarch* of mankind; but Eve Persisted, yet submits. *Milton's Paradise Lost.*

The monarch oak, the *patriarch* of the trees, Shoots rising up, and spreads by slow degrees, Three centuries he grows, and three he stays Supreme in state; and in three more decays. *Dryden.*

Nimrod enjoyed this *patriarchal* power; but he against right enlarged his empire, by seizing violently on the rights of other lords. *Locke.*

Such drowsy sedentary souls have they,

Who would to *patriarchal* years live on,

Fixed to hereditary clay,

And know no climate but their own. *Norris.*

Where secular primates were heretofore given, the ecclesiastical laws have ordered *patriarchs* and ecclesiastical primates to be placed. *Ayliffe's Patergon.*

Archbishops or metropolitans in France are immediately subject to the pope's jurisdiction; and in other places they are immediately subject to the *patriarchal* sees. *Ayliffe.*

Prelacies may be termed the greater benefices; as that of the pontificate, a *patriarchship* and archbishoprick. *Id.*

PATRIARCHS, the name given to those fathers who lived towards the beginning of the world, and who became famous by their long lines of descendants. Abraham, Isaac, and Jacob, and his twelve sons, are the patriarchs of the Old Testament; Adam, Seth, Enoch, &c., were antediluvian patriarchs. The authority of patriarchal government existed in the fathers of families, and their first-born after them, exercising all kinds of ecclesiastical and civil authority in their respective households; and to this government, which lasted till the time of the Israelites dwelling in Egypt, some have ascribed an absolute and despotic power, extending even to the punishment by death.

PATRIARCHS, CHRISTIAN, are ecclesiastical dignitaries, or bishops, so called from their paternal authority in the church. The power of patriarchs was not the same in all, but differed according to the customs of countries, or the pleasure of kings and councils. Thus the patriarch of Constantinople became in course of time patriarch over the patriarchs of Ephesus and Cæsarea, and was called the œcumenical and universal patriarch; and the patriarch of Alexandria had some prerogatives which no other patriarch but himself enjoyed, such as the right of consecrating and approving every single bishop under his jurisdiction. The patriarchate has ever been esteemed the highest dignity in the church: the bishop had only under him the territory of the city of which he was bishop: the metropolitan superintended a province, and had for suffragans the bishop of his province; the primate was the chief of what was then called a diocese, and had several metropolitans under him; and the patriarch had under him several dioceses, composing one exarchate, and the primates themselves were under him. Usher, Pagi, De Marca, and Morinus, attribute the establishment of the grand patriarchates to the apostles themselves; who, say they, chose the three principal cities in the three parts of the known world; viz. Rome in Europe, Antioch in Asia, and Alexandria in Africa: and thus formed a trinity of patriarchs. Others maintain that the name of patriarch was unknown at the time of the council of Nice; and that long afterwards patriarch and primates were confounded together, as being all equally chiefs of dioceses, and superior to metropolitans, who were only chiefs of provinces. Hence Socrates gives the title patriarch to all the chiefs of dioceses, and reckons ten of them. It does not appear that the dignity of patriarch was appropriated to the five grand sees of Rome, Constantinople, Alexandria, Antioch, and Jerusalem, till after the council of Chalcedon in 451; for when the council of Nice regulated the limits and prerogatives of the three patriarchs of Rome, Antioch, and Alexandria, it did not give them the title of patriarchs, though it allowed them the pre-eminence and privileges.

thereof. Nor is the term patriarch found in the decree of the council of Chalcedon, whereby the fifth place is assigned to the bishop of Jerusalem; nor did these five patriarchs govern all the churches. There were besides many independent chiefs of dioceses, who, far from owning the jurisdiction of the grand patriarchs, called themselves patriarchs; such as that of Aquileia; nor was Carthage ever subject to the patriarch of Alexandria. Mosheim imagines that the bishops, who enjoyed a certain degree of pre-eminence over the rest of their order, were distinguished by the Jewish title of patriarchs in the fourth century. The authority of the patriarchs gradually increased, till, about the close of the fifth century, all affairs of moment within their patriarchate came before them. They consecrated bishops; assembled yearly in council the clergy of their respective districts; pronounced a decisive judgment in those cases where accusations were brought against bishops; and appointed vicars or deputies, clothed with their authority, for the preservation of order in the remote provinces. In short, nothing was done without consulting them; and their decrees were executed with the same respect as those of the princes. But the authority of the patriarchs was not acknowledged through all the provinces. Several districts, both in the eastern and western empires, were exempted from their jurisdiction. The Latin church had no patriarchs till the sixth century; and the churches of Gaul, Britain, &c., were never subject to the authority of any patriarch. There was no primacy, no archate nor patriarchate, owned here; but the bishops, with the metropolitans, governed the church in common. Du Cange says that some abbots have borne the title of patriarchs.

PATRIARCHS, JEWISH, a dignity respecting the origin of which there is a variety of opinions. The learned authors of the Universal History think, that the first appearance and institution of those patriarchs happened under Nerva the successor of Domitian. It seems probable that the patriarchs were of the Aaronic or Levitical race; the tribe of Judah being at that time too much depressed, and too obnoxious to the Romans, to be able to assume any external power. But, of whatever tribe they were, their authority came to be very considerable. Their principal business was to instruct the people; and for this purpose they instituted schools in several cities. And by this means having gained great reputation for their learning, zeal, and piety, they ventured at length to levy a kind of tribute from their brethren, to defray the charges of their dignity, and of the apostoli, or legati, under them, whose business it was to carry their orders and decisions through the other provinces of their dispersion, and to see them punctually executed by all, that some shadow of union might be kept up among the western Jews. They likewise nominated the doctors who were to preside over their schools and academies; and these were in process of time styled chiefs and princes, in order to raise the credit of that dignity, or to imply the great regard which their disciples were to pay to them. These chiefs became at length rivals of the patriarchs; and some of them possessed both dignities at once; a usurpation which

caused not only great confusion amongst them but oftentimes violent and bloody contests. However, the Jewish rabbis have contended for a much older era for this patriarchal dignity, and have given us a succession of them down to the fifth century, in which it was abolished. According to them, the first patriarch was Hillel, surnamed the Babylonian, because he was sent for from Babylon to Jerusalem, about 100 years before the ruin of their capital, or thirty before the birth of Christ, to decide a dispute about keeping the Passover, which on that year fell out on the Sabbath day; and it was on account of his wise decision that he was raised to that dignity, which continued in his family till the fifth century. He was likewise looked upon as a second Moses, because he lived like him forty years in obscurity, forty more in great reputation for learning and sanctity, and forty more in possession of this patriarchal dignity. They make him little inferior to that lawgiver in other of his excellencies, as well as in the great authority he gained over the whole Jewish nation. The wonder is, how Herod the Great, who was so jealous of his power, could suffer a stranger to be raised to such a height of it, barely for having decided a dispute of little importance. Hillel was succeeded by his son Simeon, whom many Christians pretend to have been the venerable old person of that name, who received the divine infant in his arms. The Jews give him but a very obscure patriarchate; though the Christian authors make him chief of the sanhedrim; and Epiphanius says, that the priestly tribe hated him so much, for giving so ample a testimony to the divine child, that they denied him common burial. But it is hardly credible that St. Luke should have so carelessly passed over his two-fold dignity, if he had been really possessed of them. He was succeeded by Jochanan, not in right of descent, but of his extraordinary merit, which the rabbis describe in terms of the most extravagant hyperboles. He enjoyed his dignity but two years, or at most five years, and is said to have foretold to Titus that he was ordained to destroy the temple; on which account they pretend that general gave him leave to remove the sanhedrim to Japhne. The Jewish writers add that he erected an academy there, which subsisted till the death of Akiba; was the seat of the patriarch; and consisted of 300 schools; and another at Lydda, near Japhne, and where the famed St. George is buried. He lived 120 years; and, being asked what he had done to prolong his life? he gave this answer: I have taken care to celebrate all festivals: and my mother even sold my head ornaments to buy wine to make me merry on such days; and left me at her death 300 hogsheads of it, to sanctify the sabbath! The doctors that flourished in his time were no less considerable, particularly the famed rabbi Chanina of whom the Bath Col was heard to say, that the world was preserved for the sake of him; and R. Nicodemus, who, they pretend, stopped the course of the sun, like Joshua. He was succeeded by Gamaliel, a man of insufferable pride; and yet of so universal authority over all the Jews, not only in the west but over the whole world, that the very monarchs suffered his laws to be obeyed in their dominions. In his days

flourished Samuel the Less, who composed a prayer full of the bitterest curses against heretics, by which they mean the Christians; and which are still in use. Gamaliel was no less an enemy to them; and yet both have been challenged, the former as the celebrated master of our great apostle, the other as his disciple in his unconverted state. Simon II., his son and successor, died during the siege of Jerusalem. The people so regretted his death that an order was given, instead of ten bumpers of wine, which were usually drank at the funeral of a saint, to drink thirteen at his. These are the patriarchs who, the rabbis tell us, preceded the destruction of the temple; and we need no farther confutation of this pretended dignity than the silence of the sacred historians, who not only make not the least mention of it, but assure us all along that the high-priests presided in the sanhedrim; before whom all cases relating to the Jewish religion were brought and decided. It was the high-priest who condemned our Saviour and St. Stephen; who forbade the apostles to preach in Christ's name; and who sat as judge on St. Paul. The same may be urged from Josephus, who must have known and mentioned this pretended dignity, if any such there had been; and yet is so far from taking the least notice of it, that he places the pontiffs alone at the head of all the Jewish affairs; and names the high-priest Ananus as having the care and direction of the war against the Romans; which is an evident proof that there were then no such patriarchs in being. If there had been any such remarkable succession, the Talmudists would have preserved it; whereas, neither they, nor any of the ancient authors of the Jewish church, make any mention of it; but only some of their doctors, who have written a considerable time after them, to whom little credit can be given, as there are such insurmountable contradictions between them, as no authors either Jewish or Christian have been able to reconcile. Their succession, according to those rabbies, stands as follows: 1. Hillel the Babylonian. 2. Simeon, the son of Hillel. 3. Gamaliel, the son of Simeon. 4. Simeon II., the son of Gamaliel. 5. Gamaliel II., the son of Simeon II. 6. Simeon III., the son of Gamaliel II. 7. Judah, the son of Simeon III. 8. Gamaliel III., the son of Judah. 9. Judah II., the son of Gamaliel III. 10. Hillel II., son of Judah II. 11. Judah III., son of Hillel II. 12. Hillel III., son of Judah III. 13. Gamaliel IV., son of Hillel III. But Gants Tremach David has reduced them to ten. On the whole, it cannot be doubted but that their first rise was in Nerva's time, however much Jewish pride may have prompted them to assert their origin to have been more ancient than it really was. In time, however, they certainly imposed upon the people; and what power they did possess (which the Romans only allowed to be in religious matters, or in such as were connected with religion) they exercised with great rigor. Their pecuniary demands became very exorbitant; and were the cause of their suppression in the year 429.

PATRIARCHAL CROSS, in heraldry, is that where the shaft is twice crossed; the lower arms being lower than the upper ones.

PATRICIAN, *adj.* & *n. s.* *Fr.* *patricien*;

Lat. patricius. Senatorial; noble; not plebeian: a nobleman, or man of high rank.

Noble *patricians*, patrons of my right,
Defend the justice of my cause with arms.

Shakespeare.

You'll find Gracchus, from *patrician* grown
A fencer and the scandal of the town. *Dryden.*

I see

The insulting tyrant prancing o'er the field,
His horse's hoofs wet with *patrician* blood. *Addison.*

Your daughters are all married to wealthy *patricians*. *Swift.*

PATRICIAN was a title given, among the ancient Romans, to the descendants of the 100 or 200 first senators chosen by Romulus; and by him called *patres*, fathers. Romulus established this order after the example of the Athenians; who were divided into two classes, viz. the *εὐγενεῖς*, *patricios*, and *δημογενοὺς*, *populares*. *Patricians*, therefore, were originally the nobility; in opposition to the *plebeians*. They were the only persons whom Romulus allowed to aspire to the magistracy; and they exercised all the functions of the priesthood till A.U.C. 495. But the cognizance and character of these ancient families being almost lost by a long course of years, and frequent changes in the empire, a new kind of *patricians* were afterwards set on foot, who had no pretensions from birth, but whose title depended entirely on the emperor's favor. This new *patriciate*, Zozimus tells us, was erected by Constantine, who conferred the quality on his counsellors, not because they were descended from the ancient fathers of the senate, but because they were the fathers of the republic or of the empire. This dignity in time became the highest of the empire. Justinian calls it *summam dignitatem*.

PATRICIAN was also a title of honor often conferred on men of the first quality in England, in the time of the Anglo-Saxon kings. See **THANE**.

PATRICIAN DEITIES, **PATRICII DEI**, in mythology, were Janus, Saturn, the Genius, Pluto, Bacchus, the sun, the moon, and the earth.

PATRICIANS, in ecclesiastical writers, were ancient sectaries, who disturbed the peace of the church in the beginning of the third century: thus called from their founder *Patricius*, preceptor of a Marcionite called *Symmachus*. His distinguishing tenet was, that the substance of the flesh is not the work of God, but that of the devil; on which account his adherents bore an implacable hatred to their own flesh; which sometimes carried them so far as to kill themselves. They were also called *Tatianites*, and made a branch of the *Encratitæ*.

PATRICK (Peter), a native of Thessalonica, who was sent by the emperor Justinian I. ambassador to Amalasuntha, queen of the Goths, A.D. 534; and in 550 to Chosroes, king of Persia, to conclude a peace. On his return he was appointed mayor of the palace. He wrote a work, entitled *The History of Ambassadors*, part of which is extant, and was published in the *Collection of Byzantine Historians*; in 1648, folio.

PATRICK (Simon), D.D., a learned English bishop, born at Gainsborough in Lincolnshire in 1626. In 1644 he was admitted into Queen's College, Cambridge, and entered into holy orders. After being for some time chaplain to Sir Walter

St. John, and vicar of Battersea, in Surry, he was made rector of St. Paul's, Covent Garden, London. In 1678 he was made dean of Peterborough where he was much beloved. During the reign of king James II. he boldly preached and wrote against the church of Rome. In 1689 he was appointed bishop of Chichester, and was employed with others of the new bishops to settle the affairs of the church in Ireland. In 1691 he was translated to the see of Ely. He died in 1707, after having published various works; among which the most distinguished are *Paraphrases and Commentaries on the Holy Scriptures*, 3 vols. folio. 2. *Tracts against Popery*; 3. *Sermons*; 4. *History of the Church of Peterborough*.

PATRICK (St.), commonly styled the apostle of Ireland, and second bishop of that country. He was born A. D. 373, at Kirk-Patrick, near Dumbarton, now in Scotland, but then comprehended under Britain. His baptismal name, *Suceath*, signifies, in the British language, valiant in war. On some inroad of certain exiles from Ireland, he was taken prisoner, and carried into that kingdom, where he continued six years in the service of Milcho, who had bought him, when Patrick acquired the new name of Cothraig, or Ceathur-Tigh, i. e. four families. In this time he made himself master of the Irish language, and at last made his escape, and returned home on board a ship. About two years after he formed a design of converting the Irish. To qualify himself for this, he travelled to the continent, where he continued thirty-five years, pursuing his studies under his mother's uncle, St. Martin, bishop of Tours, who had ordained him deacon; and after his death with St. Germain, bishop of Auxerre, who ordained him priest, and gave him his third name, Mawn or Maginim. Pope Celestine consecrated him bishop, and gave him his most familiar name, Patricius, expressive of his honorable descent, and to give lustre and weight to the commission which he now charged him with to convert the Irish. Patrick landed in the country of the Evoiein, or at Wicklow, A. D. 441. His first convert was Sinell, the eighth in descent from Cormac king of Leinster. He then proceeded to Dublin, and thence to Ulster, where he founded a church (afterwards the famous abbey of Saul, in the county of Down), remarkable for its position, and being made out of a barn. After laboring seven years indefatigably in his great work, he returned to Britain, which he is said to have delivered from the heresies of Pelagius and Arius; engaged several eminent persons to assist him; visited the Isle of Man, which he converted in 440, when the bishopric was founded; and, A. D. 448, returned to the see of Armagh, which he had founded in 445; and in thirteen years more completed the conversion of the whole island. After giving an account of his commission at Rome, he once more returned to Ireland, and spent the remainder of his life between the monasteries of Armagh and Saul, superintending and enforcing the doctrine and discipline which he had established. After having established schools, he died at Saul abbey, aged 120, March 17, A. D. 493, and was afterwards buried at Down, in the same grave with St. Bridget and St.

Columb. His genuine works were collected and printed by Sir James Ware, 1656. His immediate successor in this see was St. Binen or Begnus.

PATRICK, ST., ORDER OF, an institution which took place in Ireland in 1783. On the 5th of February, 1783, the king ordered letters patent to be passed under the great seal of the kingdom of Ireland, for creating a society or brotherhood, to be called knights of the illustrious order of St. Patrick, of which his majesty, his heirs, and successors, shall perpetually be sovereigns, and his majesty's lieutenant-general and general governor of Ireland, &c., for the time being, shall officiate as grand-masters; and also for appointing prince Edward, and several of the chief nobility of Ireland, knights companions of the said illustrious order.

PATRICK, a county of Virginia, bounded north by Franklin county, east by Henry county, south by North Carolina, and north-west by Grayson and Montgomery county.

PATRIMONIO DI S. PIETRO, the name of a province in the west of Italy, belonging to the Papal states. It lies to the north-west of Rome, and is in length about forty-five miles; in breadth thirty-five. Its chief towns are Civita Vecchia on the coast; Viterbo in the interior; and Bolsena towards its northern limit. It is in general fertile, and was the earliest possession of the bishop of Rome, the grant of it having been originally made by the emperor Constantine.

PATRIMONY, *n. s.* Fr. *patrimoine*; Lat. *patrimonium*. An estate possessed by inheritance.

Inclosures they would not forbid, for that had been to forbid the improvement of the *patrimony* of the kingdom. *Bacon.*

So might the heir, whose father hath, in play,
Wasted a thousand pounds of ancient rent,

By painful earning of one groat a day,
Hope to restore the *patrimony* spent. *Davies.*

In me all
Posterity stands cursed! fair *patrimony*
That I must leave ye, sons.

Milton's Paradise Lost.

For his redemption, all my *patrimony*

I am ready to forego, and quit. *Id. Agonistes.*

The expense of the duke of Ormond's own great *patrimonial* estate, that came over at that time, is of no small consideration in the stock of this kingdom. *Temple.*

Their *patrimonial* sloth the Spaniards keep,
And Philip first taught Philip how to sleep. *Dryden.*

Their ships like wasted *patrimonies* shew;
Where the thin scattering trees admit the light
And shun each other's shadows as they grow. *Id.*

The shepherd last appears,
And with him all his *patrimony* bears;
His house, and household gods the trade of war,
His bow and quiver, and his trusty cur. *Id.*

Good princes have not only made a distinction between what was their own *patrimonially*, as the civil law books term it, and what the state had an interest in. *Dowdant.*

PATRIMONY has been also applied to church estates or revenues; in which sense authors say, the *patrimony* of the church of Rimini, Milan, &c. The church of Rome had *patrimonies* in

France, Africa, Sicily, and many other countries. To create the greater respect to the estates belonging to the church, it was usual to give their patrimonies the names of the saints they held in the highest veneration: thus the estate of the church of Ravenna was called the patrimony of St. Apollinaris; that of Milan the patrimony of St. Ambrose; and the estates of the Roman church were called the patrimony of St. Peter in Abruzzo, the patrimony of St. Peter in Sicily, and the like.

PATRIOT, n. s. } Fr. *patriote*; Gr. πατριω-
PATRIOTISM. } τρις. One who loves his
 country: the love of one's country.

The firm *patriot* there,
 Who made the welfare of mankind his care,
 Shall know he conquered. *Addison's Cato.*
Patriots who for sacred freedom stood.

Tichel.
 Here tears shall flow from a more generous cause,
 Such tears as *patriots* shed for dying laws. *Pope.*
 A man who is a spendthrift, and will not pay a
 just debt, may have his injustice transformed into
 liberality; cowardice may be metamorphosed into
 prudence; intemperance into good nature and good-
 fellowship; corruption into *patriotism*. *Id.*

But living princes have a claim to his attachment
 and respect; upon these terms there is no danger in
 being a *patriot*. *Junius.*

To be suspected, thwarted, and withstood,
 Even when he labors for his country's good;
 To see a band call'd *patriot* for no cause,
 But that they catch at popular applause,
 Careless of all the anxiety he feels,
 Hook disappointment on the public wheels.

Couper.

PATRIPASSIANI, PATRIPASSIANS, a sect
 of Christians, who appeared about the end of
 the second century, so called from their ascrib-
 ing passion or suffering to the Father; for they
 asserted the unity of God in such a manner as
 to destroy all distinction of persons, and to make
 the Father and Son precisely the same. The
 author of this heresy was Praxeas, a philosopher
 of Phrygia. Swedenborg and his followers seem
 to hold a similar faith.

PATRIX (Peter), a French poet, born at
 Caen in 1585. Several of his poems are on re-
 ligious subjects; but one of them, entitled *The*
Dream, has been often translated and imitated.
 He died at Paris in 1673, aged eighty-eight.

PATRIZI (Francis), a learned Italian, born
 in 1530, at Cherso, in Istria; who taught philo-
 sophy at Rome, Ferrara, and Padua, with great
 reputation. He was an opponent of the Peri-
 patetici. He wrote many works; but his *Pa-*
ralleli Militari, or *Parallel of the Ancient Mil-*
itary Art with the Modern, Rome, 1594, folio, is
 esteemed his best piece. He died in 1597,
 aged sixty-seven.

PATROCLUS, a Grecian chief at the Trojan
 war. He was the son of Menætiæus, king of
 Opus, by Sthenele, Philomela, or Polimela.
 Accidentally killing Clysonymus, the son of
 Amphidamas, in his youth, he was compelled to
 fly from Opus. He went to the court of Peleus,
 king of Phthia; was cordially received, and
 contracted the most intimate friendship with
 Achilles, the king's son. When the Greeks went
 to the Trojan war, Patroclus went with them, at

the express desire of his father, and embarked
 with ten ships from Phthia. He was the con-
 stant companion of Achilles; lodged in the
 same tent; and when he refused to appear in
 the field of battle, on account of Agamemnon's
 injustice, Patroclus imitated his example, and
 his absence was the cause of much loss to the
 Greeks. At last Nestor prevailed upon him to
 return to the war, and Achilles permitted him to
 appear in his armour. The bravery of Patro-
 clus, with the terror which the sight of the arms
 of Achilles inspired, soon routed the Trojans,
 and obliged them to fly to the city. He would
 have broken down the walls; but Apollo op-
 posed him; and Hector, at the instigation of
 that god, dismounted from his chariot to attack
 him as he attempted to strip a Trojan whom he
 had slain. This engagement was obstinate;
 but Patroclus was at length overpowered by
 Hector, with the aid of Apollo. His body was
 at last recovered, and carried to the Grecian
 camp, where Achilles received it with the
 loudest lamentations. His funeral rites were ob-
 served with the greatest solemnity. Achilles
 sacrificed near the burning pile twelve young
 Trojans, four of his horses, and two of his dogs;
 and the whole was concluded by the exhibi-
 tion of funeral games, in which the conquerors
 were liberally rewarded by Achilles. Achilles,
 laying aside his resentment against Agamemnon,
 entered the field to avenge the fall of his friend;
 and his anger was gratified only by the slaugh-
 ter of Hector, who had kindled his wrath by
 appearing at the head of the Trojan armies in
 the armour taken from Patroclus. The patro-
 nymic of Actorides is applied to Patroclus, be-
 cause Actor was father to Menætiæus.

PATROL, n. s., & v. n. Fr. *patrouille, pa-*
trouillier; Span. *patrula*. The act of going the
 rounds of a camp or garrison; those who go
 rounds: as a verb, to go the rounds.

These outguards of the mind are sent abroad,
 And still *patrolling* beat the neighbouring road;
 Or to the parts remote obedient fly,
 Keep posts advanced, and on the frontier lie.

Blackmore.

O thou! by whose almighty nod the scale
 Of empire rises, or alternate falls,
 Send forth the saving virtues round the land
 In bright *patrol*.

Thomson's Summer.

The **PATROL**, in war, generally consists of
 five or six men, detached from a body on guard,
 and commanded by a serjeant. They go every
 hour of the night, from the beating of the tattoo
 until the reveille: they walk in the streets in
 garrisons, all over the camp in the field, to pre-
 vent disorders, or any number of people from
 assembling together; they are to see the lights
 in the soldiers' barracks put out, and to take up
 all the soldiers they find out of their quarters.
 Sometimes patrols consist of an officer and thirty
 or forty men, as well infantry as cavalry; but
 then the enemy is generally near at hand, and
 consequently the danger greater.

PATRON, n. s. } Fr. *patron*; Lat.
PATRONAGE, n. s. & v. a. } *patronus*. One who
PATRONAL, adj. } supports or counte-
PATRONES, n. s. fem. } nances; an advocate:
PATRONISE, v. a. } defender; guardian:

hence a guardian saint; and one who has the donation of a church living: patronage is the quality or state of being a patron; protection or support; guardianship; donation of, or right of presentation to, a benefice: to patronage is used by Shakspeare for to patronise: patronal is, guardian; protecting; supporting: patroness, the feminine of patron: patronise, to support; protect; countenance.

Lady, most worthy of all duty, how falls it out that you, in whom all virtue shines, will take the *patronage* of fortune, the only rebellious handmaid against virtue? *Sidney.*

Thou amongst those saints, whom thou do'st see, Shall be a saint, and thine own nation's friend

And *patron*. *Spenser.*

We are no *patrons* of those things; the best defence whereof is speedy redress and amendment. *Hooker.*

An out-law in a castle keeps,

And uses it to *patronage* his theft. *Shakspeare.*

I'll plead for you, as for my *patron*. *Id.*

All things should be guided by her direction, as the sovereign *patroness* and protectress of the enterprise. *Bacon.*

Churchmen are to be had in due respect for their work sake, and protected from scorn; but, if a clergyman be loose and scandalous, he must not be *patronised* nor winked at. *Id.*

Of close escapes the aged *patroness*, Blacker than earst, her sable mantle spread,

When with two trusty maids in great distress, Both from mine uncle and my realm I fled. *Fairfax.*

Where art is encouraged it will soon rise high, and go far; and not suffer a channel of the sea to stay it from the presence of a more bountiful *patronage*. *Bp. Hall.*

Here's *patronage*, and here our heart desires What breaks its bonds, what draws the closer ties, Shows what rewards our services may gain, And how too often we may court in vain. *Creech.*

Befriend me, night, best *patroness* of grief, Over the pole thy thickest mantle throw. *Milton.*

The name of the city being discovered unto their enemies, their penates and *patronal* gods might be called forth by charms. *Browne.*

I have been esteemed and *patronised* by the grandfather, the father, and the son. *Dryden.*

St. Michael is mentioned as the *patron* of the Jews, and is now taken by the Christians as the protector general of our religion. *Id.*

He petitioned his *patroness*, who gave him for answer, that providence had assigned every bird its proportion. *L'Estrange.*

Whether the minds of men have naturally imprinted on them the ideas of extension and number, I leave to those who are the *patrons* of innate principles. *Locke.*

All tenderness of conscience against good laws is hypocrisy, and *patronised* by none but men of design, who look upon it as the fittest engine to get into power. *South.*

From certain passages of the poets, several ships made choice of some god or other for their guardians, as among the Roman Catholics every vessel is recommended to the *patronage* of some particular saint. *Addison.*

Ne'er let me pass in silence Dorset's name;
Ne'er cease to mention the continued debt,
Which the great *patron* only would forget. *Prior.*

It was taken into the protection of my *patronesses* at court. *Swift.*

Far more the *patrons* than the clerks infirm,
Patrons of sense afraid, but not of vice,
Or swoln with pride, or sunk in avarice. *Wesley.*

Patron of all those luckless brains,

That, to the wrong side leaning,

Indite much metre with much pains,

And little or no meaning. *Cowper.*

PATRON, among the ancient Romans, was an appellation given to a master who had freed his slave. As soon as the relation of master expired, that of patron began: for the Romans, in giving their slaves their freedom, did not despoil themselves of all rights and privileges in them; the law still subjected them to considerable services and duties towards their patrons, the neglect of which was very severely punished. Patron was also a name which the ancient Romans gave to some great man, under whose protection they usually put themselves; paying him all kinds of honor and respect, and denominating themselves his clients; while the patron, on his side, granted them his credit and protection. They were therefore mutually attached and mutually obliged to each other; and thus, in consequence of reciprocal ties, all those seditions, jealousies, and animosities, which are sometimes the effect of a difference of rank, were prudently avoided; for it was the duty of the patron to advise his clients in points of law, to manage their suits, to take care of them as of his own children, and secure their peace and happiness. The clients were to assist their patrons with money on several occasions; to ransom them or their children when taken in war; to contribute to the portions of their daughters; and to defray, in part, the charges of their public employments. They were never to accuse each other, or take contrary sides: and, if either of them was convicted of having violated this law, the crime was equal to that of treason, and any one was allowed to kill the offender with impunity. This patronage was a tie as effectual as any consanguinity or alliance, and had a wonderful effect towards maintaining union and concord among the people for the space of 600 years; during which time we find no dissensions nor jealousies between the patrons and their clients, even in the times of the republic, when the populace frequently mutinied against those who were most powerful in the city.

PATRON, in the church of Rome, a saint whose name a person bears, or under whose protection he is put, and whom he takes particular care to invoke; or a saint in whose name a church or order is founded.

PATRON, in the canon or common law, a person who, having the advowson of a parsonage, vicarage, or the like spiritual promotion, belonging to his manor, has on that account the gift and disposition of the benefice, and may present to it whenever it becomes vacant. The patron's right of disposing of a benefice originally arises either from the patron or his ancestors, &c., being the founders or builders of the church; from their having given lands for the maintenance thereof; or from the church's being built on their ground.

PATRONAGE, Lat. *patronatus*, or advowson, is a sort of incorporeal hereditament, consisting in

the right of presentation to a church or ecclesiastical benefice. Advowson, *advocatio*, signifies the taking into protection; and therefore is synonymous with patronage, and he who has the right of advowson is called the patron of the church. For when lords of manors first built churches in their own demesnes, and appointed the tithes of those manors to be paid to the officiating ministers, which before were given to the clergy in common, the lord who thus built a church, and endowed it with a glebe or land, had, of common right, a power annexed of nominating such minister as he pleased (provided he were canonically qualified) to officiate in that church of which he was the founder, endower, maintainer, and patron. Advowsons are either advowsons appendant, or advowsons in gross. They are also either presentative, collative, or donative. See Advowson. As the law now stands, if the true patron once waives his privilege of donation, and presents to the bishop, and his clerk is admitted and instituted, the advowson becomes for ever presentative, and shall never become donative any more. For these exceptions to general rules and common right are ever looked upon by the law in an unfavorable view, and construed as strictly as possible. If therefore the patron, in whom such peculiar right resides, does once give up that right, the law, which loves uniformity, will interpret it to be done with an intention of giving it up for ever; and will therefore reduce it to the standard of other ecclesiastical livings. See Law.

PATRONAGE, ARMS OR, in heraldry, are those on the top of which are some marks of subjection and dependence; thus the city of Paris lately bore the fleur-de-lis in chief to show her subjection to the king; and the cardinals, on the top of their arms, bear those of the pope, who gave them the hat, to show that they are his subjects.

PATRONYMIC, *n. s.* Fr. *patronymique*; Gr. *πατρωνυμικός*. Name expressing that of a father or ancestor: as, Tydides the son of Tydeus.

It ought to be rendered the son, Tectonides being a *patronymich*. *Brooms.*

PATRONYMICS, among grammarians, are derived, 1. From the name of the father; as Pelides, i. e. Achilles the son of Peleus. 2. From the mother; as Philyrides, i. e. Chiron the son of Philyra. 3. From the grandfather on the father's side; as Æacides, i. e. Achilles the grandson of Æacus. 4. From the grandfather by the mother's side; as Atlantiades, i. e. Mercury the grandson of Atlas. And 5. From the kings and founders of nations; as Romulidæ, i. e. the Romans, from their founder king Romulus. The terminations of Greek and Latin patronymics are chiefly four, viz. *des*, of which we have examples above; *as*, Thaumantias, i. e. Iris, the daughter of Thaumias; *is*, as Atlantis, i. e. Electra the daughter of Atlas; and *æ*, as Nerine the daughter of Nereus. Of these terminations, *des* is masculine; and *as*, *is*, and *æ*, feminine: *des* and *æ* are of the first declension, *as* and *is* of the third. The Russians, in their usual mode of address, never prefix any title or appellation of respect to their names:

but persons of all ranks, even those of the first distinction, call each other by their Christian names, to which they add a patronymic. These patronymics are formed in some cases by adding *vitch* to the Christian name of the father; in others by *of* or *ef*; the former is applied only to persons of condition, the latter to those of inferior rank. Thus, Ivan Ivanovitch, Ivan Ivanof, is Ivan the son of Ivan, Peter Alexivich, Peter Alexiof, Peter the son of Alexis. The female patronymic is *Efna*, *Ofna*, or *Owna*, as Sophia Alexeefna or Alexiowna, Sophia the daughter of Alexis; Maria Ivanofna or Ivanowna, Mary the daughter of John.

PATROS, a country mentioned by Jeremiah and Ezekiel, appears from the context to mean a part of Egypt. Bocchart thinks it denotes the Higher Egypt: the Septuagint translate it the country of Pathure, Pliny mentions Nomos Phaturites in the Thebais; and Ptolemy, Pathyris, probably the metropolis.

PATRU (Oliver), a counsellor in parliament, and dean of the French Academy, born at Paris, in 1604. Upon his admission into the French academy, in 1640, he made an oration of thanks, which gave rise to the custom of admissory speeches. He died very poor, on the 16th of January, 1681. The great exactness with which he finished every thing he wrote did not permit him to publish much. His miscellaneous works were printed at Paris in 1670, 4to.; the third edition in 1714, 4to., was augmented with several pieces. They consist of Pleadings, Orations, Letters, Lives of some of his Friends, Remarks upon the French Language, &c.

PATTAN, or PUTTUN, a Mahratta district of Hindostan, province of Gujerat, situated about 24° N. lat. The country is thinly inhabited and poorly cultivated. It contains the remains of an ancient capital, called also Puttun or Nehrwalla.

PATTAN, a town of Hindostan, province of Aurungabad, belonging to the Nizam. Long. 75° 33' E., lat. 19° 29' N.

PATTAN, or PUTN, a town of the province of Nepal, Northern Hindostan. It is situated at the distance of one mile and a half from Catmandoo, on the banks of the Bhagmutty River. It is a neat town, and contains a number of good stone houses. Long. 85° 40' E., lat. 27° 31' N. There are other places of this name in Hindostan.

PATTEALAH, a city of the province of Delhi, Hindostan, now the residence of one of the seik chiefs. It is said to have been founded by Rai Ram Deo, about the year 1465. It is surrounded with a strong mud wall, and has in the centre of it a square citadel, which contains the palace of the rajah. For a long period it was the residence of the collectors of the district, many of whom expended large sums of money in temples, mosques, and gardens, for which it was much celebrated. It also contains the tombs of a number of devout Mahometans, and is still the most flourishing town in the district of Sirhind. Long. 75° 33' E., lat. 30° 18' N.

PATTEN, *n. s.* Fr. *patin*; Ital. *pattino*. A shoe of wood with an iron ring, worn under the common shoe by women, to keep them from the dirt.

Their shoes and *patterns* are snouted and piked more than a finger long, crooking upwards, which they call crackowes, which were fastened to the knees with chains of gold and silver. *Camden.*

Good housewives.

Underneath the umbrella's oily shed,
Safe through the wet on clinking *patterns* tread.

Gay.

PATTER, *v. n.* Dr. Johnson says from *Fr. patte*, the foot; but more probably a frequentative of **PAT**. To make a quick repeated noise like the quick steps of many feet.

Patt'ring hail comes pouring on the main,
When Jupiter descends in hardened rain.

Dryden.

The stealing shower is scarce to *patter* heard
By such as wander through the forest walks.

Thomson.

PATTERN, *n. s. & v. a.* *Fr.* and *Span. patrón*, of *Lat. patrō*. An exemplar or example; archetype; copy designed to be followed; specimen; instance: to pattern is used by Shakspeare, after the *Fr. patronner*, for to make a copy as well as for to serve as a copy or example.

As though your desire were that the churches of old should be *patterns* for us to follow, and even glasses wherein we might see the practice of that which by you is gathered out of scripture. *Hooker.*

They hold that from the very apostles' time till this present age, wherein yourselves imagine ye have found out a right *pattern* of sound discipline, there never was any time safe to be followed. *Id.*

Ay, such a place there is, where we did hunt,
Patterned by that the poet here describes.

Shakspeare.

When I that censure him do so offend,
Let mine own judgment *pattern* out my death,
And nothing come in partial. *Id.*

I will be the *pattern* of all patience;
I will say nothing. *Id. King Lear.*
The example and *pattern* of the church of Rome.

Clarendon.

Lose not the honour you have early won,
But stand the blameless *pattern* of a son.

Dryden.

Measure the excellency of a virtuous mind; not as it is the copy, but the *pattern* of regal power.

Grew.

Patterns to rule by are to be sought for out of good, not loose reigns. *Davenant.*

Christianity commands us to act after a nobler *pattern* than the virtues even of the most perfect men. *Rogers.*

This *pattern* should be our guide, in our present state of pilgrimage. *Atterbury.*

Take *pattern* by our sister star,

Delude at once and bless our sight;

When you are seen, be seen from far,

And chiefly chuse to shine by night. *Swift.*

PATTI, a beautiful town in the north-west of Sicily, situated on an eminence, near a bay of the same name. Its streets terminate in a piazza or square; and the principal building is the cathedral. An earthen-ware manufacture here supplies a great part of the island. The surrounding country displays the greatest beauty and fertility. Inhabitants 5000. Thirty-three miles west of Messina.

PATTRINGTON, a market town and parish, of Yorkshire, seated on a branch of the Humber, ten miles south-east from Hedon, and 191 north of London. The church is well built, and has a

lofty spire, which serves as a landmark for entering the Humber. This town had formerly the advantage of a commodious harbour, and was much more populous, but its haven, a mile distant, will now only admit vessels of very small burden. Market on Saturday.

PATTUR, **PATTUGOTTA**, or the Stone Quay, a town of the district of Boglipoore, Bengal, pleasantly situated at the foot of a range of hills, on the eastern bank of the Ganges, which here is very dangerous for boats, containing many large stones. Near this place, also, there is a rock in the river, on which are carved representations of the Hindoo deities. It is situated seven miles below Colgong. There are several other places of this name in Hindostan.

PATU (Claudius Peter), a French dramatist, born at Paris in 1729. In 1754 he published a comedy, entitled *Adieux du Gout*, which had a great run. He came to England, and translated several English comedies with great taste and accuracy. He went with M. Palissot to Geneva, to see Voltaire, who received him with great kindness. He afterwards went to Naples and Rome, but died of a consumption in 1757, soon after his return to Paris, aged twenty-eight.

PATUKET FALLS, on the Merrimack, between Chelmsford and Dracut, a little above the mouth of Concord River, one mile and a half below the head of Middlesex Canal, ten miles west of Andover. The perpendicular descent is twenty-eight feet. A canal, one mile and a half long, is constructed around the falls, and a bridge is built across the river at the principal descent. Here is a small village in the township of Chelmsford, with a post-office and two cotton manufactories.

PATUXENT, a river of Maryland, which runs south-east into Chesapeake Bay, eighteen miles north of the Potomac. It is navigable for vessels of 250 tons to Nottingham, fifty miles.

PAU, an island of the South Pacific Ocean, one of the Tefee group. It is famous for sandal wood, particularly a part of it called *Vooiha*. Vessels repairing hither can obtain several tons at a time. The natives have curled hair, and are fierce and warlike, and occasionally treacherous. It seems that they are among the principal cannibals now existing in the world. Their dress is very scanty, and their skins coarse and unoiled; and on the whole, both in personal appearance and manners, they are inferior to the Friendly Islanders. Some Englishmen have of late been resident here.

PAU, an ancient and very pretty town, and the principal place of the department of the Lower Pyrenees, or the Bearn, in the south-west part of France. It has a royal court for the departments of the Lower and Upper Pyrenees and the Landes, a lower court of justice, a chamber of commerce, an agricultural society, a university, academy, and a royal college. It is a post town, containing about 11,500 inhabitants. This town is situated at the extremity of a vast plain, overlooking a delightful valley, through which flows the Gave de Pau, and surrounded with country houses, fine gardens, and charming groves, that present a ravishing prospect. It is large, very well built, airy, adorned

with a beautiful public fountain, encompassed with agreeable walks, and crossed by the rivulets of Hedas and the Ousse, which unite at the Gaue de Pau. The chateau, where Henry IV. was born, since made a royal residence, stands at the northern extremity on the peak of a rock, the bottom of which is washed by the river, and forms one of the finest ornaments of the town, overlooking it and the surrounding country. A superb bridge crosses the stream, supported by seven arches, and remarkable for its loftiness. The view from this point is magnificent; the eye wanders with delight over the valley, the river in the bottom, the meadows with which it is covered, and the surrounding hills, beyond which rises, in the form of an amphitheatre, the chain of the Pyrenees, capped by the majestic Pie-du-Midi, whose top is lost in the clouds. This is the native place not only of Henry IV., but of Goston, de Foix, the viscount Orthez, who spared the lives of the Protestants of Bayonne, at the time of the massacre of St. Bartholemew's day, and general Bernadotte, now king of Sweden.

Here are manufactures of handkerchiefs, table linen, and carpets, with paper-mills, tan-yards, and dye-houses. A considerable trade is carried on in Jurancon wines, Bayonne hams, goose legs, excellent chestnuts, spun and dyed cotton, iron, and limestone. There is a royal stud here. Some delightful walks are in the neighbourhood. Pau is sixty miles south of Mont de Marsan; thirty west of Tarbes; seventy-eight E. S. E. of Bayonne, and 615 south-west of Paris, in long. 2° 43' W. from that city, lat. 43° 19' N.

PAVAN, or PAVANE, a grave dance used among the Spaniards, and borrowed from them, wherein the performers formed a kind of wheel or tail before each other, like that of a peacock, pavo, from whence the name is derived. The pavane was formerly in great repute; and was danced by gentlemen with cap and sword; by those of the long robe in their gowns, by princes with their mantles, and by the ladies with their gown-tails trailing on the ground. It was called the grand ball, from the solemnity with which it was performed. To moderate its gravity, it was usual to introduce several flourishes, passades, capers, &c., by way of episodes. Its tablature or score is given at large by Thoinot Arbeau in his *Orchesographia*.

PAUCAROLLA, a province of Peru, bounded by the lake of Titicaca on the north-east, on the east by the lake and the provinces of Chucuito, north by that of Lampa, west by that of Moqueba, and south by the province of Arica and Pacajes. It is eighty-six leagues long, and twenty-eight broad, and is watered by several streams. The climate is cold; in the parts bordering on Lake Titicaca are found Peruvian bark, papas, barley, &c. Cattle, sheep, pigs, and lammas, flourish here; and there are many vicunas, deer, partridges, and lake fowl, which are largely caught by the natives. The lake also supplies fish, and transports the dressed hides, thread, gum, &c., of the district, which are given in exchange for wines, brandies, and other commodities, from the adjacent parts. The natives fabricate also the wool of the Peruvian camel, and carry on a

considerable traffic in that article. Here are also rich mines of gold and silver. Population 26,000.

PAUCAROLLA, formerly the capital of the above province, has fallen off in population, and lost this distinction. It is situate on the shore of the lake Titicaca.

PAUCARTAMBO, a province of Peru, bounded north-west and west by Calca and Lares, north-east and east by the frontier of the Indians, and south by that of Quispicanchi. It is a large ravine or valley, terminating in the Andes; twenty-six leagues from north to south, and from six to seven in breadth. On the heights its temperature is cold; but in the low parts warm. It produces wheat, barley, maize, seeds, and various fruits in abundance. Population 8000, dispersed in eleven settlements.

PAUCITY, *n. s.* Lat. *paucitas*, from *paucus*. Fewness; smallness in number or quantity.

The multitude of parishes, and *paucity* of schools. *Hooker.*

This *paucity* of blood is agreeable to many other animals, as lizards, frogs, and other fishes.

Brown's Vulgar Errors.

In such slender corpuscles as those of colour, may easily be conceived a greater *paucity* of protuberant corpuscles.

Boyle.

Socrates well understood what he said touching the rarity and *paucity* of friends.

L'Estrange.

PAUCTION (Alexis John Peter), a learned mathematician, born near Lussan, in 1732. His principal work was his *Metrologie*, first published in 1760, which contains a collection of the measures of all countries. The astronomer Lalande assisted him in the foreign department. This excellent work contains also calculations of the ancient measures, with dissertations on population, agriculture, &c. He also published *A Theory of the laws of Nature*, in 1781, wherein he attempts to refute the systems of Newton and Nollet. He died in 1799.

PAVE, *v. a.* } Fr. *paver*; Lat. }
PAVEMENT, *n. s.* & *v. a.* } *pavio* (to beat). To }
PAVOR, *n. s.* } lay with hard or }
beaten materials; floor with stone or brick: }
pavement is the material, so laid or consolidated: Bishop Hall makes a fine use of pavement as a verb: a pavior is one who makes or mends pavement.

Should she kneel down,
Her brother's ghost his paved bed would break,
And take her hence in horror. *Shakspeare.*

The marble pavement closes, he is entered
Into his radiant roof. *Id. Cymbeline.*

Let not the court be paved; for that striketh up a great heat in summer, and much cold in winter.

Bacon.

It might open and pave a prepared way to his own title. *Id.*

Whether thou meanest to terminate this miracle in thy body, or in the waves which thou troddest upon; whether so lightening the one that it should make no impression in the liquid waters, or whether so consolidating the other that the paved waves yielded a firm causeway to thy sacred feet to walk on, I neither determine nor enquire. *Bp. Hall.*

A broad and ample road, whose dust is gold,
And pavement stars seen in the galaxy. *Milton.*

From this chymic flame
I see a city of more precious mold,
With silver paved, and all divine with gold.
Dryden.

The streets are paved with brick or freestone.
Addison.

The long laborious pavement here he treads,
That to proud Rome the admiring nations leads.
Id.

For thee the sturdy power thumps the ground,
Whilst every stroke his lab'ring lungs resound.
Gay.

The foundation of Roman ways was made of rough stone joined together with cement; upon this was laid another layer, consisting of small stones and cement, to plane the inequalities of the lower stratum in which the stones of the upper pavement were fixed: for there can be no very durable pavement, but a double one.
Arbutnot.

From these their politics our quidnuncs seek,
And Saturday's the learning of the week:
These labouring wits, like paviors, mend our ways
With heavy, huge, repeated, flat, essays;
Ram their coarse nonsense down, though ne'er so dull,

And hem at every thump upon your scull. *Young.*

PAVEMENT, *lat.* pavementum, from pavo, to beat, the construction of streets, highways, or ground-floors in such a way as that they may be conveniently walked upon, &c.

According to Isidorus the Carthaginians were the first people who paved their towns with stones. 188 years after the expulsion of the kings Appius Claudius Cæcus paved the greater part of the city of Rome, and constructed the Via Appia. At length all the high roads leading from the city were laid with stone, and, by degrees, continued throughout the whole empire; and the remains of them are found, in a greater or less degree of preservation, in the different provinces of which that immense empire was composed. Several of these public roads, besides the Appian, received their names from those of the parties who had dictated their construction. Aurelius Cotta founded, in the year 512, after the foundation of Rome, the Aurelian way; Flaminius the Flaminian way; and the Æmilian way was executed by the command of Æmilius. The censors superintended the forming of these highways, and directed their situations, &c.

With regard to the pavements in the interior of the Roman edifices, they styled such as were constructed upon stages of timber work *contignata pavimenta*; and those made of oaken plank were denominated by them *coassationes*. The opulent Romans appear to have had portable pavements carried about to pave their tents in time of war, as by Julius Cæsar. These were chiefly of mosaic.

In Great Britain the pavement of the principal streets, &c., is generally of flint or rubble-stone, while churches, courts, stables, domestic offices, &c., are paved with tiles, bricks, flags, or fire stone; sometimes with a kind of free stone or rag stone. In some continental churches the pavement is of marble, and sometimes of mosaic, as in the cathedral of St. Mark at Venice, &c.

In France the public roads, in common with the streets, courts, &c., are all paved with gris or grit (a kind of free stone), and the elegance and convenience arising from the use of flag

stones in the streets of English towns are unknown even in Paris, where the pedestrian is in constant danger of being run down by the pole of a carriage.

At Amsterdam and the chief cities of Holland they call their brick pavement the burgher-master's pavement, to distinguish it from the stone or flint pavement, which usually takes up the middle of the street, and which serves for carriages; the brick which borders it being destined for the passage of people on foot. Pavements of free stone, flint, and flags, in streets, &c., are laid dry, i. e. in a bed of sand; those of courts, stables, ground-rooms, &c., are laid in a mortar of lime and sand; or in lime and cement, especially if there be vaults or cellars underneath. Some masons, after laying a floor dry, especially of brick, spread a thin mortar over it; sweeping it backwards and forwards to fill up the joints. The several kinds of pavement are as various as the materials of which they are composed, and whence they derive the name by which they are distinguished.

PAVETA, in botany, a genus of the monogynia order, and tetrandria class of plants; natural order forty-seventh, stellatæ: cor. monopetalous and funnel-shaped above: the stigma carved: the berry dispermous. Species seven, natives of China and of India.

PAVIA, a province or delegation of Austrian Italy, surrounded by those of Milan, Lodi, and Parma; and in the government of Milan. Its surface, for the most part level, is so fertile as to have procured for it the name of the Garden of the Milanese. It contains 320 square miles, and is watered by the Po, the Ficino, and the Olana. The vine and rice are the chief objects of culture. Silk is likewise raised in large quantities; the pastures feed fine cattle, and the cheese of the district forms an important branch of export. The trade of the province is carried on by the Po and the Ticino, and greatly facilitated by the canal, which forms a communication between Milan and Pavia. The climate is mild and salubrious, but has been rendered somewhat unhealthy by the irrigation connected with the extended cultivation of rice.

PAVIA, the ancient Ticinum or Papia, a large town of Austrian Italy, the capital of the delegation of the same name, in the government of Milan. It is situated on an eminence on the banks of the Ticino, four miles above its confluence with the Po. The streets are broad and straight, and most of them contain respectable edifices; but, with the exception of the churches, nothing of splendid or imposing architecture appears. Its length, from east to west, is about a mile. In the Strada Nuova, or principal street, are the mouldering palaces of the Pavian nobility, mingled with shops, churches, colleges, caffès, theatres, and hospitals. 'In the morning this long but not spacious avenue (though the centre of the city, and indeed the city itself, for the lateral streets are few and inferior), is still lifeless,' says lady Morgan, 'and exhibits but little of the bustle of trade, which, we are assured, was ruined under the late changes. In the evening the Strada Nuova is the Corso, not only for the few old carriages with the few old nobles

who occupy them, but the lounge of all the young students of the university, whom we at first took for military à demi-soldes. Nothing, indeed, can be more military than their air and step, set off by spruce large cocked hats; for the university of Pavia has not yet resumed the monkish frock, and the youth have still the air of the élèves of the polytechnic schools of Paris. Mixed with the carriages of the nobles are the pedestrians of all classes and ages, all coming forth 'per pigliar il fresco,' as they call swallowing dust, and perspiring between rows of heated walls, which render the street an oven. Meantime the Austrian officers lounge on benches under the extended awnings of the caffes, smoke their cigars in the faces of the passengers, and talk German.

'The Strada Nuova terminates the length of the city at the gate and bridge of the Ticino. This bridge is one of the most curious objects in Italy, and one of the most striking monuments of the energy and activity of the Italians of the middle age in all works of public utility. It was raised in 1351, when Giovanni di Mandello was Podesta of Pavia. It is 300 feet long by twelve wide; and is covered by a curious roof, supported by 100 columns of granite. When we saw the Ponte del Ticino it was crowded with little oratories and temporary chapels, mostly consecrated to the Virgin, but raised equally for exciting piety and extorting charity; as each shrine was guarded by a very noisy solicitor, in a pilgrim's habit, demanding 'carità' in the name of the Madonna, and of all the saints who had, since the Restoration, taken the structure under their special protection. A curious circumstance was that, while one end of the bridge was guarded by Austrian soldiers, Doganieri, police, &c. &c. &c., the other was protected by the forces of his Sardinian majesty: the Ticino being the actual limit between the legitimate possessions of these respective autocrats. How long it will please Heaven to preserve this partition of its 'divine grace,' seems at present very doubtful.'

From the main street others of greater antiquity branch off at right angles, where all is sad, desolate, and silent; some terminate in piazze or squares, opening before vast and cumbersome palaces, with windows half sashed, doors hanging from their hinges, balconies mouldering over beautiful but fallen porticoes, and the grass shooting up every where between the pavement. In one of these by-streets is shown the site of the imperial palace when Pavia was a royal capital. This was a palace of Theodoric, often cited in the story of various barbarous invasions. It was standing in all its Gothic grandeur in the eleventh century, when a popular insurrection against the tyranny of the emperor Henry II. levelled it to the ground.

'Of the extraordinary edifices which gave to Pavia the name of 'città delle cento torre,' the number now is considerably diminished. Of those that still remain, one is most fearfully attached to the Casa Belcrede, and has an elevation of fifty-six metres; another belongs to the Casa Maino—and both are considered as marks of great distinction and nobility. The original intention of these turrets was internal defence,

before gunpowder or artillery was known. But this primitive design soon degenerated into a spirit of rivalry and ambition; and a tower adjoining to a nobleman's house became a necessary appendage to his grandeur—a distinctive proof of his rank and consequence;—in a word, the landmark of the most puerile vanity. In one of these towers (now no more), in the time of Theodoric, king of the Goths, the celebrated Boethius was shut up, and there he composed his treatise *De Consolatione Philosophiæ*. The tower, as long as it existed, bore his name. On the site where it stood now stands the Casa Malaspina, whose very enlightened lord has placed at the entrance to his palace a marble monument and bust of the illustrious philosopher, with an appropriate inscription, by the abbé Morcelli. It is well known that the Roman consul only left this tower to be executed on the space near the church of St. Peter in ciel d'oro. Another of these towers, now fortunately laid low, was called Torre del Pizzo in. Giu, from its being a reversed pyramid.'

Joseph II. suppressed many of the forty-six convents once seen here; and the government of the kingdom of Italy put down the few that remained. The churches, however, though half shut up and unfit for service, were seldom absolutely destroyed. Near the site of the palace of the Lombard kings stands the ancient Basilicum of St. Michael. History asserts it to be contemporary with the grim king, Grimoaldi, of the sixth century. Contrary to the Lombard manner, it is not built in pietra-cotta, but in marble. Its curious and ponderous façade is covered with bas-reliefs that are of infinite value, for the manners they record. In one compartment the angel Gabriel, a most dolorous figure, with a face as long as if he belonged to the house of Austria, is playing the fiddle. In another there is a representation of the Annunciation; which savours of the Arianism at that time predominant among the Lombards. The angelic messenger is seen presenting a large full grown bambino to the Virgin Mary, who smiles most terribly upon him. Every where monsters, the most strangely deformed, obtrude themselves among Christian seraphim and cherubim. With this barbarous architecture are combined some fine arches of pure Gothic, introduced at a later period into Italy, and called by the Italians, when thus employed, stilo misto. The dark, dank entrance, or portico, of this very ancient building, is painted in fresco, in forms so terrible, as greatly to add to its awful gloom. They are by Andriino D'Edesia, a contemporary of Giotto's; though one might well suppose them coeval with the church's foundation. The interior of this temple is equally gloomy, and almost as barbarous, as the exterior. There is one spot curiously paved with ancient Mosaic, where, it is said, the Lombard kings were crowned, when Pavia, the grave of two dynasties, was the capital and royal city of the kingdom of Italy.

The cathedral of Pavia is a vast and ugly edifice, begun under the episcopal sway of cardinal Visconti, brother to the then reigning duke of Milan, Giovanni Galeazzo Visconti, in the fifteenth century, and lately repaired extensively.

The church of San Pietro in ciel d'oro, or of the Augustinians, though suppressed by the emperor Joseph II., contained the tomb of Boethius, and the body of St. Augustin:—history at least states that king Luitprand had his precious remains conveyed thither from Africa; but Mr. Eustace chills the reverence with which it would naturally be approached, by his fears, that 'instead of the dust of the Christian Plato, the tribute we wish to offer to virtue and wisdom should be erroneously paid to the putrid dust of some Northern invader, or half-savage Lombard.'

San Pietro in ciel d'oro is the scene of one of the pleasant adventures of Boccaccio's *Pavese hero*, Messer Torrello d'Istria di Pavia; and the lovers of Boccaccio in Pavia, according to the lively traveller we have already quoted, numerous there as throughout Italy, point out the spot where they suppose that humorous and most philosophical genius to have placed the sumptuous bed of Torrello, where he was found by the monks, the victim or rather the protégé of necromancy.

The university of Pavia, to which it owes its title of the Insubrian Athens, has the testimony of the imperial diploma of Charles IV. to its importance in the fourteenth century, but is said to have been founded by Charlemagne. To Pavia, through the long course of the middle ages, all the learned of Europe occasionally came; wrestlers in metaphysics, and gladiators in polemics, from all parts of France and Italy in particular; while the Alciati and Baldus drew disciples to their schools, from the most opposite quarters of the world. At one period, in the time of Giasone Maino, Pavia contained 3000 students; but it declined in numbers and reputation, like every thing else in Italy, under the Spanish and Austrian influence; until, towards the end of the eighteenth century, it was so fallen, that even its former reputation was almost forgotten; and this splendid establishment was without a library, a museum, collections, or any means of affording assistance to public education. The wise and excellent count Firmin, minister plenipotentiary in Lombardy, was the first to revive institutions once the glory of northern Italy; and with the assistance of Boscovich, Spallanzani, Tissot, Frank, Volta, Scarpa, &c. &c., he restored to the university much of its ancient consequence.

When Buonaparte became emperor, he visited Pavia (1805) on his way to his coronation at Milan, and particularly noticed the university. The pomp of this journey, and the manner of his reception in the capital of Lombard kings, left far behind the recorded visitations of Charlemagne and Charles V. The rector, at the head of its members, received and harangued him at the gates; terminating his oration with the following words:—'Da Carlo il Grande ebbe questo celebre Archiginnasio li suoi primi principj; da Napoleone il Grande abbia la perfetta sua gloria ed eterna stabilità!' Napoleon is said scarcely to have permitted the eloquent Rettore to conclude his oratorical eulogy, when, rushing by the learned corps, he ran with his natural vivacity, petulance, and curiosity, from class room to class-room, while his splendid military suite

'toiled after him in vain.' Even the attendant professors found his celerity of movement and enquiry too much; and could scarcely find time, or breath, to follow and answer him. 'Che scuola è questa?'—he asked of the first school he entered. It was the class of metaphysics. He sneered and took snuff; then, turning to one of the boys, he asked 'Qual è la differenza fra la somiglia e la morte?' meaning thereby, 'What is the difference between sleep and death?' This naturalization of the French word 'sommeil' was too much for the boy; and he turned for assistance to his learned master, who was as much at a loss as his pupil to comprehend the mystery of these royal metaphysics. 'The case, however, was urgent: for a professor to confess ignorance would never do; but not to understand the emperor was still worse; so down he plunged into a mortal disquisition on death, till Napoleon, perceiving he was not understood, and that the metaphysician was talking nonsense on a nonsensical subject, turned from him petulantly, uttering the word 'Bêtise!' too well pronounced to be misunderstood by any present!—He then hurried to another class-room, with his usual question of 'Che Scuola!' &c. &c. It was the class of his favorite mathematics, and his eyes sparkled at the intelligence! He looked round him for a moment with great satisfaction, then snatching a book from one of the young students' hands, he gave him a problem to work. When the boy had finished the task assigned him by the imperial mathematician, his majesty looked it over, and said, 'Non è così.' 'You are wrong.' The boy boldly persisted that it was 'così,' and that he was right. Napoleon snatched the book and pencil out of his hand; and the master coming in to the emperor's assistance, endeavoured to convince him his pupil was not mistaken; to the infinite (and not concealed) satisfaction of the rest of the class. The emperor then took the slate; and, while marshal Jourdain and others stood yawning behind him, he began to work the problem himself; till, self-convinced of his error he returned the slate, with a 'Sì sì, è bene,' but with the sulky air of a school-boy, who had lost his place at the head of his class. He then proceeded to another school:—It was the school of Volta, the Newton of Electricity. Napoleon ran up to him with open arms, and begged his class might be drawn out. To every proof of their extraordinary progress, the emperor clapped the venerable professor familiarly on the shoulder, exclaiming: 'Bravo, Volta! bravo! vous êtes digne d'élèver la jeunesse!' 'You are worthy to bring up youth.' It was in this class that the emperor perceiving a little boy gazing on him with all the fearless curiosity of childhood, took him by the hand, and asked his name. The animated countenance and ready answers of the boy pleased him; he wrote down his name in his tablets. Shortly after he sent for the lad to Milan; and, until his own fortunes fell, he never lost sight of him. This youth became one of the most distinguished officers in the Italian service.' The University of Pavia was now an object of munificent protection to the new government of the kingdom of Italy; the imperial visit of 'Napoleone il grande,' being not among the least

cause of its aggrandizement.' As a building, the exterior of the university is remarkable for its elegant simplicity: its courts and colonnades are antiquated, and have a cloistral air that suits well with the whole. Its porticoes are spacious; and are encrusted with monuments, raised to the honor of the most illustrious of its deceased members. The cabinet of natural history is described as magnificent. The gallery of animals is near 200 feet long, and the subjects are raised in successive tiers or stages along the walls; an elephant, and some other of the larger races, occupy the centre of the room. The library was founded in the last years of Maria Theresa's reign, under count Firmin: but it owes its principal wealth to Joseph II., and to the additions made to it by the Italian government. To the activity and liberality of this government, the university is also indebted for its fine botanical garden, the hot-houses, and a collection of exotics from New Holland. The corso, the opera, the church, include all the occupation and amusement of Pavia. Its great attraction is its university; and the youth who compose it, like the students of Turin and Bologna, all seem to belong to Europe.

The far-famed Certosa of Pavia, an abbey for Carthusian monks, is four Italian miles from the city, and was built and endowed for the express purpose of expiating the death of his uncle, or, as the Italian chronicle has it, 'ad espiazione delle sue colpe, e redenzione dell'anima'—by Galeazzo Veranti. Galeazzo was one of the most pious sovereigns of the fourteenth century. He made pilgrimages to the shrine of the Virgin at the head of 2000 armed men (his ordinary guard, says the historian); and though such acts of piety were always followed by some terrible crime, yet he was the special favorite of all the bishops of Lombardy; and when he laid the first stone of the Certosa, in 1396, he issued forth from his castle of Pavia, attended by the bishops of Pavia, of Novarro, of Feltré, and of Vicenza, with a body of the principal ecclesiastics of his dominions. The church and monastery rose with incredible speed and splendor; and in three years it was sufficiently advanced to receive the prior and twenty-four monks of the order of the Chartreuse. The immense estates granted by its founder rendered it one of the richest convents in Italy; and a codicil to his will, intimating that the monks should lay by a sum annually for its decoration and improvement, added to its beauty and richness. Successive donations still further increased the wealth of the house; the genius and talent of ages contributed to its ultimate perfection, and the cloisters of the Certosa became the studio of Luino, Giacomo della Porta, Procaccini, Sacchi, Guercino, and others of equal note and ability. Commenced in the fourteenth century, the artists of Italy were still working at it in the eighteenth; yet the labor of 400 years scarcely accounts for the immensity of its details, its sculptures, its carvings, its statuary, its works in gold, bronze, ivory, and ebony, its accumulations of precious stones, of mosaics, of pictures, of frescoes, and all the wonders of wealth and art, which go to the perfecting its chapels, its choirs, and its sacristies, its altars, monuments, and mausoleums. Even the

Lavatoio, the washing-room of the monks, is incrustured with basso-relievo, with busts and gems of the most exquisite workmanship; and its magnificent window of stained glass employed for years the genius of Christoforo Matteis, who finished it in 1477. In the midst of its silent and overpowering magnificence rises the mausoleum of its founder. This superb monument was raised by the monks, a century after his death; to give a hint perhaps, to his successors, the Sforzas, to go and do likewise! It was begun by Pellegrini in 1490, and was finished by Giacomo della Porta in 1562; its arabesque foliage and delicate ornaments were by Christoforo Romano; and the whole is of the most precious Parian marble.

The cloisters of the Certosa, where every thing is simple and solemn, contrast finely with the splendor of the temple. They are found behind a noble fabric, once occupied by the prior, and reserved for the reception of strangers and pilgrims of rank; and are encrusted with tracery and relieves in terra-cotta, serving as a portico to twenty-four isolated houses. These were the cells of the monks; each cell has two rooms, a little garden, with a fountain and marble seat. A wheel, on the outside, turned to receive their food; for there was no communication between the brethren, except in the church. The prior's apartments are spacious and princely; a vast room in the attic was said to have been the temporary prison of Francis I., after the memorable battle of Pavia. One of the first acts of the reforming system of Joseph II. was the suppression of this convent. The prior and monks were pensioned off, and obliged to return to that society which they had vowed to abandon for ever. Four priests were appointed to officiate in the church on Sundays and holidays; a sacristan was named to watch over and keep it in order. Except a few pictures removed by the emperor to Vienna, and a few by the French, the church and convent remain rich and picturesque, as in the days of their greatest prosperity.

The trade of Pavia is insignificant, and consists principally in silk and wine. It is the see of a bishop, and eighteen miles south of Milan and eighty west of Mantua.

PAVILION, *n. s. & v. a.* *Fr. pavillon.* A tent; a temporary or moveable house; to furnish with tents.

For in the time of trouble he shall hide me in his pavilion. *Psa. xxvii. 5.*

He, only he, heaven's blue pavilion spreads
And on the ocean's dancing billows treads.

Sandys.

Flowers being under the trees, the trees were to them a pavilion, and the flowers to the trees a mosaic floor. *Sidney.*

She did lie

In her pavilion, cloth of gold, of tissue.

Shakespeare.

Jacob in Mahanaim saw

The field pavilioned with his guardians bright.

Milton.

It was usual for the enemy, when there was a king in the field, to demand in what part of the camp he resided that they might avoid firing upon the royal pavilion. *Addison.*

The glowing fury springs.
Once more invades the guilty dome, and shrouds
Its bright pavilion in a veil of clouds. *Pope.*

With his battenning flocks the careful swain
Abides pavilioned on the grassy plain. *Anon.*

When troubles rise and storms appear,
There may his children hide;

God has a strong pavilion, where
He makes my soul abide. *Watts.*

PAVILION, in architecture, signifies a kind of turret or building, usually insulated, and contained under a single roof; sometimes square, and sometimes in form of a dome: thus called from the resemblance of its roof to a tent. Pavilions are sometimes also projecting places, in the front of a building, marking the middle thereof; sometimes the pavilion flanks a corner, in which case it is called an angular pavilion. The Louvre is flanked with four pavilions: the pavilions are usually higher than the rest of the building. There are pavilions built in gardens, commonly called summer-houses, pleasure-houses, &c. Some castles or forts consist only of a single pavilion.

PAVILION, in heraldry, denotes a covering in form of a tent, which invests or wraps up the armories of divers independent kings and sovereigns. The pavilion consists of two parts; the top, which is the chapeau, or coronet; and the curtain, which makes the mantle. None but sovereign monarchs, according to the old French heralds, may bear the pavilion entire, and in all its parts. Those who are elective, or have any dependence, say the heralds, must take off the head, and retain nothing but the curtains.

PAUL, previously named **SAUL**, was of the tribe of Benjamin, a native of Tarsus in Cilicia, a Pharisee by profession; first a persecutor of the church, and afterwards a disciple of Jesus Christ, and apostle of the Gentiles. He was a Roman citizen, because Augustus had given the freedom of the city to all the freemen of Tarsus, in consideration of their firm adherence to his interests. His parents sent him early to Jerusalem, where he studied the law at the feet of Gamaliel, a celebrated doctor. He made great progress in his studies, was very zealous for the observation of the whole law of Moses. But he persecuted the church of Christ; and, when the protomartyr St. Stephen was stoned, Saul was not only consenting to his death, but he even took care of the clothes of those that stoned him. This happened A. D. 33, a short time after our Saviour's death. After the death of St. Stephen, Saul showed the utmost violence against the Christians; and having obtained credentials from the high priest Caiaphas, and the elders of the Jews, to the chief Jews of Damascus, with power to bring to Jerusalem all the Christians he should find there, he went to seize all of that profession he could find. But as he was upon the road, and drawing near to Damascus, on a sudden, about noon, he perceived a great light to come from heaven, which encompassed him and all those that were with him. They fell suddenly to the ground, and Saul heard a voice saying to him, 'Saul, Saul, why persecutest thou me?' His answer, with his blindness, the cure, and the other surprising circumstances that followed and ended in his conversion, are recorded in the ninth chapter of the Acts. That Saul, from being a zealous

persecutor of the disciples of Christ, became all at once a disciple himself, is a fact which cannot be controverted without overturning the credit of all history. He must therefore have been converted in the miraculous manner in which he himself said he was, and of course the Christian religion be a divine revelation, or he must have been either an impostor and enthusiast, or a dupe to the fraud of others. There is not another alternative possible. If he was an impostor, who declared what he knew to be false, he must have been induced to act that part by some motive: but the only conceivable motives for religious impostures are, the hope of advancing one's temporal interest, credit, or power; or the prospect of gratifying some passion or appetite under the authority of the new religion. That none of these could be St. Paul's motive, for professing the faith of Christ crucified is plain from the state of Judaism and Christianity at the period of his forsaking the former and embracing the latter faith. Those whom he left were the disposers of wealth, of dignity, of power in Judea: those to whom he went were indigent oppressed men. As to credit or reputation, could the scholar of Gamaliel hope to gain either by becoming a teacher in a college of fishermen? Could he flatter himself that the doctrines which he taught would, either in or out of Judea, do him honor, when he knew that 'they were to the Jews a stumbling block, and to the Greeks foolishness?' Was it then the love of power that induced him to make this great change? Power! over whom? over a flock of sheep whom he himself had assisted to destroy, and whose very Shepherd had lately been murdered! See lord Lyttleton's Observations on the Conversion of St. Paul; a treatise to which it has been truly said, that infidelity has never been able to fabricate a specious answer. The escape of St. Paul from Damascus, where the Jews had influenced the governor to seize him; his meeting at Jerusalem with the disciples, who were still afraid of him; the plot of the Jews to kill him; his journey to Caesarea, and thence to Tarsus, where he continued from A. D. 37 to 43; his journey thence with Barnabas to Antioch, and from that city to Jerusalem, with supplies to the disciples during the famine, A. D. 44, when he met with the prophets Simeon, Lucius, and Manaen, and when he is supposed to have had his ineffable vision of heaven (2 Cor. xii. 2-4); his journey with Barnabas to Cyprus; the opposition of Barjesus; his blindness; the conversion of Sergius Paulus, A. D. 45; the change of Saul's name into Paul; his journey to Perga, and preaching in the synagogues there, as well as at Antioch, Iconium, Lystra, and Derbe; the miracles he wrought, and persecutions he suffered at these places; his recovery after his being stoned, and supposed to be dead; the dissension about circumcision at Antioch; his mission with Barnabas to Jerusalem for the opinion of the other apostles on this subject, with their decision; his censure of St. Peter for his dissimulation: his separation from Barnabas, and junction with Silas; their journey through Lycaonia, Phrygia, Galatia, Mysia, and Troas, to Macedonia; their imprisonment, &c., at Philippi; the conversion of Lydia and the jailor, and their

spirited expostulation with the magistrates; their journey through Amphipolis and Apollonia, ¹⁰ Thessalonica and Berea; the tumults raised by the Jews against them in these cities; Paul's voyage to Athens, A. D. 52; his disputes there with the philosophers; his defence before the Areopagus; the conversion of Dionysius and Damaris; his Journey to Corinth, where he continued eight months, and whence, or from Athens, he wrote his two epistles to the Thessalonians; his accusation before Gallio, and acquittal; his voyage to Ephesus, Cæsarea, and Jerusalem; his journey through Antioch, Galatia, Phrygia, and the higher provinces of Asia; his return to Ephesus, where he continued three years, from A. D. 54 to 57, wrote his epistle to the Galatians, and performed many miracles; and where he says, he also fought with beasts, but whether literally in the amphitheatre, in consequence of a sentence of the heathen magistrates, or whether the expression is only a metaphorical allusion to the trouble he had with Demetrius and the silver-smiths, commentators are not agreed; his journey after this to Philippi in Macedonia, along with Timothy, whence he wrote his two epistles to the Corinthians; thence to Achaia, Corinth, Assos, Mitylene, Miletus, Coos, Rhodes, Patara, Tyre, Ptolemais, and Cæsarea, where he met with Philip the evangelist, and the prophet Agabus, who foretold his future sufferings; his journey thence to Jerusalem, where, by the advice of St. James, he took the vow of a Nazarite; the riot raised in the temple against him by the Jews; his rescue from their fury by Lysias; his unjust treatment by Ananias the high priest; the division between the Pharisees and Sadducees respecting him; the bloody vow of the Jewish assassins to murder him; his transmission to Felix by Lysias; his accusation by Tertullus, and his animated defence; the injustice of Felix; Paul's spirited oration before Festus and Agrippa; its effect upon the latter; Paul's appeal to Cæsar, and consequent voyage from Adramyttium over the seas of Cilicia and Pamphylia, to Myra, and thence to Crete; the storm of fourteen days; the shipwreck on the coast of Malta; the cure of Publius, &c.; Paul's re-embarkation and voyage to Syracuse, Rhegium, and Puteoli, with his final arrival at Rome, and reception there by his countrymen, are all fully recorded by St. Luke, in the Acts of the Apostles, from chap. ix. to xxviii. Paul dwelt for two whole years at Rome, from A. D. 61 to 63, in a hired lodging; where he received all that came to him, preaching the religion of Jesus Christ without intermission. His captivity contributed greatly to the advancement of religion: for he converted several persons even of the emperor's court.—Philip. i. 12-18, and iv. 22. The Christians of Philippi, hearing that St. Paul was a prisoner at Rome, sent Epaphroditus to him, with money, to assist him in their name.—Phil. ii. 25. Epaphroditus fell sick at Rome; and when he went back to Macedonia the apostle sent by him his Epistle to the Philippians. It is not known by what means St. Paul was delivered from prison, but it is certain that he was set at liberty, after having been two years a prisoner at Rome. He wrote

VOL. XVI.

also, during this imprisonment, his Epistles to Philemon and the Colossians. He travelled over Italy; and, according to some of the fathers, passed into Spain; then into Judea; went to Ephesus, and there left Timothy (Heb. xiii. 24, and 1 Tim. i. 3); preached in Crete, and there fixed Titus, to cultivate the church in that place. Probably he might also visit the Philippians (Phil. i. 23, 26, and ii. 24); and it is believed that it was from Macedonia that he wrote the First Epistle to Timothy. Some time after he wrote to Titus, whom he had left at Crete; desiring him to come to Nicopolis, whence probably he sent this letter. The year following, that is, A. D. 65, he went into Asia, and came to Troas (2 Tim. iv. 13). Thence he went to visit Timothy at Ephesus, and from that to Miletus. (2 Tim. iv. 20.) Lastly, he went to Rome; and St. Chrysostom says that it was reported, that having converted a cup-bearer and a concubine of Nero, this so provoked the emperor that he caused St. Paul to be apprehended and put in prison. It was in this last place of confinement that he wrote his Second Epistle to Timothy, which Chrysostom looks upon as the apostle's last testament. This great apostle is said to have at last consummated his martyrdom, the 29th of June, A. D. 66, by having his head cut off, at a place called the Salvian Waters. He was buried on the Via Ostia.

PAUL, first bishop of Narbonne, or Sergius Paulus the proconsul, converted and made bishop by St. Paul, was descended from one of the best families of Rome. The Spaniards venerate him as their apostle; and say that he died a martyr at Narbonne.

PAUL III. (Pope), whose original name was Alexander Farnese, was born in 1467, and elected pope in 1534. He established the inquisition, approved of the society of the Jesuits, and acted with great violence against Henry VIII. of England. The famous council of Trent was held in his reign. He died in 1549, aged eighty-two.

PAUL IV. (Pope), whose original name was John Peter Caraffa, was born in 1475. He was a learned man, and wrote on the Creed, and other subjects; but was very violent against the reformers. He was elected pope in 1555, when he was eighty, and died in 1559.

PAUL V. (Pope), was born in 1552, in Rome; was first clerk of the chamber, and afterwards nuncio to Clement VIII. in Spain, who made him a cardinal. He was elected pope on the 16th May, 1603, after Leo. XI. The ancient quarrel between the secular and ecclesiastical jurisdictions, which formerly had occasioned much bloodshed, revived in his reign. The senate of Venice had condemned by two decrees, The new foundations of monasteries made without their concurrence; and, The alienation of the estates both ecclesiastical and secular. The first decree passed in 1603, and the second in 1605. About this time a canon and abbot, accused of rapine and murder, were arrested by order of the senate, and delivered over to the secular court; which gave great offence to the court of Rome. Clement VIII. took no notice of the affair; but Paul V., who had managed the Genoese upon a similar occasion, hoped that the Venetians would

be equally pliant. But the senate maintained that they held their power to make laws of God only; and therefore refused to revoke their decrees, and deliver up the ecclesiastical prisoners to the nuncio. Paul, provoked at this behaviour, excommunicated the doge and senate; and threatened to put the whole state under an interdict if satisfaction was not given him within twenty-four hours. The senate protested against this menace, and forbade the publication of it in their dominions. A number of pamphlets were published on both sides. The Capuchins, Theatines, and Jesuits, were the only religious orders who observed the interdict. The senate shipped them all off for Rome, and banished the Jesuits for ever. Meantime Paul was preparing to make the refractory republic submit to his tyranny by force of arms. He levied troops against the Venetians; but at length had recourse to Henry IV. to settle the differences; who soon brought about a reconciliation. His ambassadors at Rome and Venice began the negotiation, and cardinal de Joyeuse finished it in 1607. Paul was strongly solicited to make the immaculate conception of the holy virgin an article of faith, but he only prohibited the contrary doctrine to be publicly taught. He afterwards embellished Rome, and collected the works of the most eminent painters and engravers. He brought water into the city by an aqueduct thirty-five miles long. He completed the frontispiece of St. Peter, and the magnificent palace of Mount Cavallo. He also restored and repaired several ancient monuments. His pontificate was honored with several illustrious embassies. The kings of Japan, and other Indian princes, sent ambassadors to him; and he sent missionaries, and founded bishoprics in their countries. He showed the same attention to the Maronites and other eastern Christians. He also sent legates to different orthodox princes. He died 28th January 1621, aged sixty-nine; after having confirmed the French oratory, the Ursulines, the Order of Charity, and some other institutions. He enjoined all the religious in the prosecution of their studies to have regular professors for Latin, Greek, Hebrew, and Arabic.

PAUL (Father), whose name, before he entered into the monastic life, was Peter Sarpi, was born at Vienna, August 14th, 1552. His father was a merchant, who died leaving his family unprovided for, but the son's abilities rendered him, under the tuition of a maternal uncle, master of languages and science at a very early age. At fourteen he took the habit of the order of the Servites, and at twenty-two was made a priest. After passing successively through the dignities of his order, he was chosen provincial for Venice at twenty-six years of age; and discharged this post with such honor, that in 1579 he was appointed, with two others, to draw up new regulations and statutes. This he executed with great success; and, when his office of provincial was expired, he retired to the study of experimental philosophy and anatomy, in which he is said to have made some useful discoveries. In the dispute between the pope and the senate of Venice, his controversial writings irritated the papal court so highly, that they hired assassins to mur-

der him, but he escaped with severe wounds. This, and other attempts upon his life, obliged him to confine himself to his convent, where he engaged in writing the History of the Council of Trent, on which, and other works of less consequence, he spent the remaining part of his life. He died on the 14th of January, 1623. He was buried with great pomp at the public expense; and a magnificent monument was erected to his memory.

PAUL, in naval affairs, is a short bar of wood or iron, fixed close to the capstern or windlass of a ship, to prevent those engines from rolling back or giving way, when they are employed to heave in the cable, or otherwise charged with any great effort.

PAUL'S (St.), a town and district of Brasil, about twelve leagues from the sea, and 190 miles west of Rio Janeiro. The town stands on an eminence of about two miles in extent, surrounded on three sides by meadow land, and washed at the base by rivulets, which in rainy weather insulate it, except on the narrow ridge by which it is connected with the high land. The rivulets flow into a large stream called the Tieti, which runs within a mile of the town, and are crossed south-west by several bridges of stone and wood. The streets are in general remarkably clean, and the material with which they are paved is said literally to contain particles of gold, that are found in the chinks and hollows after heavy rains. Here are several squares, two convents, three monasteries, and eight churches, the greater part of which, as well as of the whole town, is built of clay beaten into a frame-work of wood. The principal houses are two or three stories high, and stuccoed in various colors. Mr. Mawe mentions that he saw some of these clay houses that had lasted 200 years. He speaks highly of this capital and its inhabitants.

A little coarse cotton is spun by the hand, and woven into cloth for wearing apparel, sheets, &c.; but here are few manufactures of consequence. They also make a beautiful network for hammocks, which are fringed with lace, and form, being slung low, an elegant piece of furniture: the making of lace is a general employment for females. Here are many apothecaries and small dealers who make large sums of money; silver-smiths, whose articles are equally indifferent both in metal and workmanship; tailors and shoemakers in great numbers; and joiners, who manufacture very beautiful wood at high prices. In the outskirts live a number of Creoles, who manufacture earthenware for culinary purposes, large jars, &c. The greatest proportion of the inhabitants, however, consist of agriculturalists, who cultivate small portions of land, on which they breed large stocks of pigs and poultry. The markets are also well supplied with fruit, and a profusion of esculent plants. The gardens in the vicinity are laid out with great taste and elegance. The jasmine is every where a favorite tree, and in this fine climate bears flowers perennially: carnations, pinks, passion-flowers, cocks-combs, &c., are also in great plenty.

The town is said to have been founded in the year 1570, by some malefactors who were transported from Portugal. This, however, is not the

case. It was founded by a colony of Jesuits, and chosen more from the gold which abounded in the neighbourhood, than from the salubrity of the air and climate. The country around, however, has for more than a century been exhausted of this metal. The inhabitants, according to Mr. Mawe, amount to 20,000; the clergy, including all religious orders, to 500. They are in general free from bigotry; so that no stranger would be molested here on account of his religious opinions: the climate is also mild and temperate, the thermometer ranging from 50° to 80°. In the morning it may be observed at 48°; and it is lower in the winter months. Mr. Mawe was obliged to exhibit his license twice in the course of his journey to this place; the city being seldom visited by foreigners, and the passes being guarded with soldiers, who have authority to stop and search all passengers, in order to prevent them from carrying off gold or diamonds. His appearance excited considerable curiosity among all classes: but he was well received and hospitably entertained. 190 miles west of Rio Janeiro.

The province of St. Paul stretches along the coast about 400 miles, and is about 500 in depth. It is connected, as well as the above city, with the history of the singular republic of this name; and is bounded to the west by the great river Parana, which separates it from the Spanish province of Paraguay; on the south by the Iguazu, and a line drawn from this river to the small river St. Francisco, and down to its mouth. It is one of the most fertile and delightful provinces of South America. The great range of mountains which here runs along the coast on the western side, is a vast inclined plain, down which some of the largest branches of the Parana flow into that immense river. The western slope is so gentle as scarcely to be perceptible, and, although not level, it can hardly be considered hilly or mountainous. On the eastern side the ascent is very steep; the road from Santos to St. Paul ascends a mountain 6000 feet high, and is perhaps the most considerable work of this description in Brasil. From this point, however, in following the mountains to the southward, they gradually retire from the coast, leaving a broken country between them and the sea, through which the Paraíba of the south takes its course. Between these mountains and the coast an extraordinary number of cataracts and cascades are formed, by the waters which are precipitated down the eastern side. The navigation of the rivers on the western side is also impeded by a great number of falls and rapids; but the intervals between the portages are navigated by large perogues, such as are used on our western waters, made out of the single trunks of trees, of which there is an abundance on their banks, of a prodigious size. The river Tiete, which rises near the city of St. Paul, is generally used as the channel of communication to the mines of Matto Grosso. After descending to the Parana, they continue down its stream to the mouth of the Pardo, which enters from the west, and up this river to the foot of a chain of mountains, which they cross to the river Taquari, which flows into the river Paraguay, above the Spanish

possessions. The inhabitants of St. Paul took advantage of this route at an early period, for the purpose of committing depredations on the numerous Indian tribes settled on that river.

The climate is probably the most pleasant in Brasil. Though nearer the equator than the provinces of La Plata, the disadvantage is more than counterbalanced by its height; the commencement of the slope is 6000 feet above the sea, and 2000 feet above the inferior limit for the cultivation of European grain. The thermometer descends as low as 40°, though it rarely rises above 80°. In the evenings it is sometimes so cold as to render necessary a change of clothes, and to make use of brazeros (a kind of pan filled with embers, used by Spaniards and Portuguese, instead of fire-places and chimneys). In the vicinity of the capital the tropical fruits are not in as great perfection as they are on the sea coast, but, in lieu of these, all the European fruits, apples, grapes, peaches, are uncommonly fine. This delightful country may be considered as still in a state of wilderness, and inhabited by a number of savage tribes towards the Parana, who are continually at war with the Portuguese, and retain the same ferocity as when the country was first settled. They must finally disappear before the march of civilisation. The principal port of Santo is said to be safe and commodious; but being merely the entrepot to St. Paul, as Laguira is to Caraccas, the town is inconsiderable.

The history of the inhabitants of St. Paul occupies one of the most conspicuous pages in American annals; their character has been variously represented, and generally little to their advantage. Charlevoix, and all the Jesuits, represent them in the most unfavorable light, and they have been spoken of by most writers as barbarians, possessing enough of civilisation to render them formidable, as well as mischievous. They have been also represented as forming a kind of military republic, like that of early Rome, composed of outcasts and adventurers from all countries, under a nominal subjection to the Portuguese, in virtue of which they paid a small tribute of gold and diamonds. A Portuguese writer has undertaken to vindicate their character from these imputations. Mr. Mawe places them above all the people he saw in Brasil, for their highly polished manners, and manly frankness of character, traits by which they are every where distinguished; but he does not reflect, that a century, or even half a century, might produce a very material change in their character. The accounts given of these people, as well as of their enemies the Jesuits, by Dr. Southey, is certainly the most fair and satisfactory. We abstract the substance of it.

The celebrated republic of St. Paul, as it is usually denominated, had its rise about the year 1531, from a very inconsiderable beginning. A mariner of the name of Ramalho, having been shipwrecked on this part of the coast, was received among a small Indian tribe called the Piratiniga, after the name of their chief. Here he was found by De Sousa, some years afterwards, and, contrary to the established policy, of permitting no settlement excepting immedi-

ably on the sea coast, he allowed this man to remain, on account of his having intermarried and having a family. The advantages of this establishment were such that permission was soon after given to others to settle here, and, as the adventurers intermarried with the natives, their numbers increased rapidly. Romalho also allied himself with one of the chief of the Goaynazes by marrying his daughter; for it seems he had conformed to the Indian custom of polygamy. A mixed race was formed, possessing a compound of civilised and uncivilised manners and customs. The Jesuits soon after established themselves with a number of Indians they had reclaimed, and exerted a salutary influence, in softening and humanising the growing colony. In 1581 the seat of government was removed from St. Vincent on the coast to St. Paul's; but its subjection to Portugal was little more than nominal; cut off from all communication, and almost inaccessible, but little notice was taken of it. The mixture produced an improved race; 'the European spirit of enterprise,' says Southey, 'developed itself in constitutions adapted to the country.' But it is much more likely that the free and popular government which they enjoyed produced the same fruits here as in every other country; a restless spirit of enterprise and emulation among each other; the mother of great qualities, but, without a well ordered government, the good was not likely to outweigh the bad. They soon quarrelled with the Jesuits, on account of the Indians whom they had reduced to slavery. The Jesuits declaimed against the practice; but as there were now many wealthy families among the Paulistas, the greater part of whose fortunes consisted in their Indians, it was not heard with patience. The Paulistas first engaged in war against the enemies of their allies, and afterwards on their own account, on finding it advantageous. They established a regular trade with the other provinces whom they supplied with Indian slaves. They by this time acquired the name of Mamelukes, from the peculiar military discipline they adopted, bearing some resemblance to the Mamelukes of Egypt. The revolution in Portugal, when Philip II. of Spain placed himself on its throne, cast the Paulistas in a state of independence, as they were the only settlement of Brasil, which did not acknowledge the new dynasty. From the year 1580, until the middle of the following century, they may be regarded as a republic, and it was during this period they displayed that active and enterprising character for which they were so much celebrated. They discovered and worked the gold mines of Jaragua near St. Paul's; they established colonies in the interior at the numerous mines which they discovered; and their exploring parties were sometimes absent for years, engaged in wandering over this vast country. While a Spanish king occupied the throne of Portugal, they attacked the Spanish settlements on the Paraguay, alleging that the Spaniards were encroaching on their territory, and destroyed the Spanish towns of Villa Rica, Ciudad Real, and Villa de Xerez, besides a number of small settlements. They attacked the Jesuit missions, which by the most extraordinary perseverance, after repeated trials during 100

years, had been at last established. As they had fixed themselves east of the Parana, the Paulistas laid hold of this as a pretext. They carried away upwards of 2000 of their Indians into captivity, the greater part of whom were sold and distributed as slaves. The Jesuits complained to the king of Spain and to the pope; the latter fulminated his excommunication. The Paulistas attacked the Jesuits in their college, and put their principal to death, expelled the remainder, and set up a religion of their own; at least no longer acknowledged the supremacy of the pope. In consequence of the interruption of the African trade during the Dutch war, the demand for Indian slaves was very much increased. The Paulistas redoubled their exertions, and traversed every part of the Brasils in armed troops, to the great terror of the Indians; who were on some of the principal rivers numerous, and established in villages. The foundation was laid of enmity to the Portuguese, which continues to this day, although a complete stop was put to the infamous practice in the year 1756.

This little republic, like all others, was continually distracted by internal factions. Two families, the Piratiningo and the Thaubatenos, were continually struggling for a monopoly of power, and at one time actually engaged in a civil war; but a reconciliation was brought about by the interposition of some ecclesiastics, who proposed that the governor should be alternately elected from the members of the rival families. This continued for nearly a century. When the house of Braganza, in 1640, ascended the throne, the Paulistas, instead of acknowledging him, conceived the idea of electing a king for themselves. They actually elected a distinguished citizen of the name of Bueno, who persisted in refusing to accept, upon which, they were induced to acknowledge Joam IV. It was not until long afterwards, that they came under the Portuguese government.

PAUL'S BAY OF ST., on the northern shore of the St. Lawrence, runs about three miles inland, and is thirty-five miles below the island of Orleans. From the capes Corbeau and LaBaire, which form the exterior points of the bay, the ridges of high lands describe a circuit before they close upon the river. Their lofty and craggy summits form a grand back ground, in the form of an amphitheatre, where is situated the St. Paul's Bay settlement.

PAUL'S ISLAND (St.), an island in the strait between Newfoundland and Cape Breton. It is about fifteen miles north-east of North Cape, in Cape Breton. Long. 60° 2' W., lat. 47° 13' N.

PAULA, a learned Roman lady, who flourished in the fourth century. She was descended from the Scipios and the Gracchi, and added to the brightest qualities of the mind the virtues of Christianity. She was well versed in the Hebrew Scriptures, and was the intimate friend of St. Jerome. She died A. D. 407.

PAULEE, a town of the province of Ajmeer, one of the greatest commercial marts in Hindostan. Here the merchants exchange the commodities of Europe, Persia, and the Dekkan, for those of the Cashmere and the eastern and northern parts of Hindostan.

PAULEE, PAULITZER, or Surgusgur, a fortress

and town of Hindostan, in the province of Aurungabad, situated on the south-east side of the Nagootan River, about twenty miles inland from Bombay. It is said to have been built in the seventeenth century by the celebrated Mahratta chief Sevagee; but is probably even of older date. It is erected on the top of a mountain, about 1500 feet high, and inaccessible except on the north side. There are several reservoirs of water in it; and store-rooms and other places dug out of the solid rock. In 1681 Akbar, fourth son of Aurungzebe, having absconded from his father, took refuge at this place, and was well received by the Mahratta chief Sambajee. This strong fortress was taken by the British troops in February 1818, after a three days' siege.

PAULIANISTÆ, PAULIANISTS, a sect of heretics, so called from their founder, Paulus Samosatenus, a native of Samosata, elected patriarch of Antioch in 262. His doctrine amounted to this: that the Son and the Holy Ghost exist in God in the same manner as reason and activity do in man; that Christ was born a mere man; but that the reason or wisdom of the Father descended into him, and by him wrought miracles upon earth, and instructed the nations; and, finally, that, on account of this union of the divine word with the man Jesus, Christ might, though improperly, be called God. He did not baptise in the name of the Father and the Son, &c.; for which reason the council of Nice ordered those baptised by him to be re-baptised. Being condemned by Dionysius Alexandrinus in a council, he abjured his errors to avoid deposition; but soon after resumed them, and was deposed by another council in 269. His errors are severely condemned by the council of Nice, whose creed differs but little from that now used, under the same name, in the church of England.

PAULICIANS, a branch of the ancient Manichees, so called from their founder, one Paulus, an Armenian, of the seventh century; who, with his brother John, both of Samosata, formed this sect: though others are of opinion that they were thus called from another Paulus, an Armenian by birth, who lived in the reign of Justinian II. In the seventh century a zealot called Constantine revived this drooping sect, which was ready to expire under the severity of the imperial edicts. The Paulicians, however, by their numbers, and the countenance of the emperor Nicephorus, became formidable to all the east. But the cruel rage of persecution, which had for some years been suspended, broke forth with redoubled violence in the reigns of Michael Curopalates and Leo the Armenian, who inflicted capital punishment on such of the Paulicians as refused to return into the bosom of the church. Under the empress Theodora, tutress of the emperor Michael, in 845, several of them were put to death, and more retired among the Saracens. Upon this they entered into a league with the Saracens; and choosing for their chief an officer of the greatest resolution and valor, whose name was Carbeas, they declared a war against the Greeks, which was carried on for fifty years with the greatest vehemence and fury. During these commotions some Paulicians, towards the

conclusion of this century, spread abroad their doctrines among the Bulgarians: many of them, either from zeal, or to avoid persecution, retired, about the close of the eleventh century, from Bulgaria and Thrace, and formed settlements in other countries. Their first migration was into Italy; whence they sent colonies into most of the other provinces of Europe, and formed gradually a considerable number of religious assemblies, who adhered to their doctrine, and who were afterwards persecuted with the utmost vehemence by the Roman pontiffs. In Italy they were called Patarini, from Pataria, in Milan, where they held their assemblies; and Gothari or Gazari, from Gazaria, or the Lesser Tartary. In France they were called Albigenses, though their faith differed widely from that of the Albigenses whom Protestant writers generally vindicate. See **ALBIGENSES**. The first religious assembly the Paulicians formed in Europe was at Orleans in 1017, in the reign of Robert, when many of them were burnt alive. The ancient Paulicians, according to Photius, expressed the utmost abhorrence of Manes and his doctrine. Greek writers comprise their errors under the six following particulars:—1. They denied that this inferior and visible world is the production of the Supreme Being; and they distinguish the Creator of the world and of human bodies from the most high God who dwells in the heavens; and hence some think that they were a branch of the Gnostics rather than of the Manichæans. 2. They refused to worship the Virgin Mary. 3. They refused to celebrate the institution of the Lord's supper. 4. They refused to follow the practice of the Greeks, who paid to the pretended wood of the cross a sort of religious homage. 5. They rejected the books of the Old Testament; and looked upon the writers of that sacred history as inspired by the creator of this world, and not by the supreme God. 6. They excluded presbyters and elders from all part in the administration of the church.

PAULINA, a Roman lady, wife of Saturninus, governor of Syria, in the reign of the emperor Tiberius. Her conjugal peace was disturbed, and violence was offered to her person, by a young man named Mundus, who fell in love with her, and had caused her to come to the temple of Isis by means of the priests of that goddess, who declared that Anubis wished to communicate to her something of moment. Saturninus complained to the emperor of the violence which had been offered to his wife; and the temple of Isis was overturned, and Mundus banished.

PAULINIA, in botany, a genus of the trigynia order, and octandria class of plants; natural order twenty-third, trihilatæ. Its characters are these: the flower has a permanent empalement, composed of four small oval leaves; it has four oblong oval petals, twice the size of the empalement, and eight short stamina with a turbinate germen, having three short slender styles crowned by spreading stigmas; the germen turns to a large three-cornered capsule with three cells, each containing one almost oval seed. Linné reckons seven, and Miller nine species, natives of the West Indies.

PAULINUS, bishop of Nola, was born at Bourdeaux, about A. D. 353. He was consul of Rome, and married Therasia, who converted him to Christianity. He was made bishop of Nola, where he continued till it was taken and sacked by the Goths, in 410. He wrote Letters and Poems with elegance, and died in 431.

PAULINUS, an English bishop, who flourished in the early part of the seventh century. He was the first archbishop of York, about A. D. 626. He built a church at Almonbury, and dedicated it to St. Alban, where he converted the Brigantes. Camden mentions a cross at Dewsborough, which had been erected by him, with this inscription, *Paulinus hic prædicavit et celebravit*. York was so small about this time that there was not so much as a small church in it, in which king Edwin could be baptised. Constantius made it a bishopric. Pope Honorius made it a metropolitan see. At Walsstone, in Northumberland, he baptised Segbert, king of the East Saxons. Bede says 'Paulinus, coming with the king and queen to the royal manor called Ad-Gebrin, staid there thirty-six days with them, employed in the duties of catechising, instructing, and baptising the people in the neighbouring river Glen.' He adds, that 'he preached the word in the province of Lindissi, and converted the governor of the city of Lindocollina, whose name was Blecca, with all his family. In this city he built a stone church of exquisite workmanship, whose roof being ruined, only the walls are now standing.' He also founded a collegiate church of prebends near Southwell, in Nottinghamshire, dedicated to the Virgin Mary, when he baptised the Coritani in the Trent.

PAULO (Mark), a celebrated traveller, son of Nicolas Paulo, a Venetian, who went with his brother Matthew, about 1255, to Constantinople, in the reign of Baldwin II. In the course of their mercantile travels, having been favorably received at the court of Kublai, grand khan of the Tartars, they returned thither with two missionaries from Rome, and young Mark. This young man, having learned the different dialects of Tartary, was employed in embassies which gave him the opportunity of traversing Tartary, China, and other eastern countries. At length, after a residence of seventeen years at the court of the grand khan, the three Venetians returned to their own country, in 1295, with immense fortunes. A short time after his return, Mark serving his country at sea against the Genoese, his galley, in a great naval engagement, was sunk, and himself taken prisoner and carried into Genoa. He remained there many years in confinement; and composed the history of his own and his father's voyages, under this title, *Delle Maraviglie del mondo da lui vidute, &c.*; printed first at Venice in 8vo., 1496.

PAULOVASELO, a town of the Russian government of Niznei-Novgorod, on the Oka, with 6000 inhabitants. Most of them are locksmiths or hardware manufacturers. The town and district are the property of a rich nobleman.

PAVLOVSK, a well built town of the south of Russia, in the government of Voronez, on the Don, with 2000 inhabitants. Seventy-six miles S. S. E. of Veronez.

PAULUS SAMOSATENUS, the founder of the

sect of Paulianists. Zenobia, queen of Palmyra, had a great esteem for him, on account of his eloquence; and he is said to have framed his heresy chiefly with a view to make a convert of her; but she adhered to her prejudices in favor of Judaism.

PAUNCH, *n. s. & v. a.* French *panse*; Ital. *pancio*; Span. *pança*; Lat. *panter*. The stomach; the region of the guts; particularly of a beast; to take out the paunch.

Batter his skull, or *paunch* him with a stake.

Shakspeare.

Demades, the orator, was talkative, and would eat hard: Antipater would say of him, that he was like a sacrifice, that nothing was left of it but the tongue and the *paunch*.

Bacon.

Pleading Matho borne abroad for air,
With his fat *paunch* fills his new fashioned chair.

Dryden.

Chiron attacked Talthibius with such might,
One pass had *paunched* the huge hydropick knight.

Garth.

PAVO, in astronomy, the peacock, a constellation in the southern hemisphere, unknown to the ancients, and not visible in our latitude. See **ASTRONOMY**.

PAVO, in ichthyology. See **PEACOCK FISH**.

PAVO, the peacock, in ornithology, a genus belonging to the order of galline. The head is covered with feathers which bend backwards; the feathers of the tail are very long and beautifully variegated with eyes of different colors. Latham enumerates eight species.

1. *P. albus*, the white peacock, is, as its name imports, entirely white, not excepting even the eyes of the train, which are nevertheless easily traced out. This variety is, in Latham's opinion, more common in England than elsewhere. He met with two instances of the females of this species having the external marks of the plumage of the male.

2. *P. bicalcaratus* is larger than the common pheasant. The bill is black, but from the nostrils to the tip of the upper mandible red. The irides are yellow. The feathers on the crown of the head are sufficiently long to form a crest, of a brown dull color. The space between the bill and eyes is naked, with a few scattered hairs: the sides of the head are white; the neck is bright brown, striated across with dusky brown: the upper parts of the back, scapulars, and wing coverts, are dull brown, dotted with paler brown and yellowish; besides which each feather is marked near the end with a roundish large spot of a gilded purple color, changing into blue and green in different lights; the lower part of the back and rump are dotted with white: all the under parts are brown, striated transversely with black: the quills are dusky, the secondaries are marked with the same spot as the rest of the wing: the upper tail coverts are longer than the tail, and each marked at the end with a spot like the wing feathers, each of which is surrounded, first with a circle of black, and ultimately with an orange one: the legs and claws are brown, and on the back part of each leg are two spurs, one above the other. The female is a third smaller than the male. The head, neck, and under parts are brown; the head smooth; the upper parts are also brown, and the feathers mark-

ed with a dull blue spot, surrounded with dirty orange: the feathers which cover the tail are similar; but marked at the end with an obscure dull oval spot of blue: the legs have no spurs. This species is of Chinese origin, and some of them have been brought from China to England alive.

3. *P. cristatus*, the common peacock of English authors, has a compressed crest and solitary spurs.—It is about the size of a turkey; the length from the top of the bill to the end of the tail being three feet eight inches. The bill is nearly two inches long, and is of a brown color. The irides are yellow. On the crown there is a sort of crest, composed of twenty-four feathers, which are not webbed, except at the ends, which are gilded green. The shafts are of a whitish color; and the head, neck, and breast, are of a green gold color. Over the eye there is a streak of white, and beneath there is the same. The back and rump are of a green gold color, glossed over with copper: the feathers are distinct, and lie over each other like shells. Above the tail springs an inimitable set of long beautiful feathers, adorned with a variegated eye at the end of each; these reach considerably beyond the tail; and the longest of them in many birds are four feet and a half long. This beautiful train, or tail as it is improperly called, may be expanded upwards to a perpendicular at the will of the bird. The true tail is hid beneath this group of feathers, and consists of eighteen gray brown feathers, one foot and a half long, marked on the sides with rufous gray: the scapulars and lesser wing coverts are reddish cream color, variegated with black; the middle coverts deep blue, glossed with green gold: the greatest and bastard wing rufous: the quills are also rufous; some of them variegated with rufous, blackish, and green: the belly and vent are greenish black: the thighs yellowish: the legs stout; those of the male furnished with a strong spur three quarters of an inch in length; the color of them gray brown. The female is rather less than the male. The tail is very short, being much shorter than the train, and scarcely longer than its coverts; neither are the feathers furnished with eyes. The crest on the head is similar to that on the head of the male: the sides of the head have a greater portion of white: the throat and neck are green: the rest of the body and wings are cinereous brown: the breast is fringed with white: the bill is the same: the irides are lead-colored: the legs are as in the male; but the spur is generally wanting, though in some birds a rudiment of one is seen. In some male birds all the wing coverts and scapulars are of a fine deep blue green, very glossy; but the outer edge of the wing and quills are of the common color. These birds, now so common in Europe, are of eastern origin. They are found wild in the islands of Ceylon and Java in the East Indies; and at St. Helena, Barbuda, and other West India islands. They are not natural to China; but they are found in many places of Asia and Africa. They are, however, nowhere so large or so fine as in India, in the neighbourhood of the Ganges, whence they have spread into all parts, increasing in a wild state in the warmer climes; but requiring

care in the colder regions. In ours, this species does not come to its full plumage till the third year. The female lays five or six grayish-white eggs; in hot climates twenty, the size of those of a turkey. These she lays in some secret place, at a distance from the usual resort, to prevent their being broken by the male, which he is apt to do if he find them. The time of sitting is from twenty-seven to thirty days. The young may be fed with curd, chopped leeks, barley-meal, &c., moistened; and are fond of grasshoppers, and some other insects. In five or six months they will feed as the old ones, on wheat and barley, with what else they can pick up in the circuit of their confinement. They seem to prefer the most elevated places to roost on during night; such as high trees, tops of houses, and the like. Their cry is loud and inharmonious; a perfect contrast to their external beauty. They are caught in India, by carrying lights to the trees where they roost, and having painted representations of the bird presented to them at the same time; when they put out the neck to look at the figure, the sportsman slips a noose over the head, and secures his game. In most ages they have been esteemed a salutary food. Hortensius set the example at Rome, where it was carried to the highest luxury, and sold dear: and a young peacock is thought a dainty even in the present times. The life of these birds is reckoned by some at about twenty-five years; by others 100. So beautiful a species of birds as the peacock could not long remain unknown; so early as the days of Solomon, we find, among the articles imported in his Tarshish navies, apes and peacocks. Ælian relates that they were brought into Greece from some barbarous country; and that they were held in such high esteem that a male and female were valued at Athens at 1000 drachmæ, or £32 5s. 10d. At Samos they were preserved about the temple of Juno, being sacred to that goddess; and Gellius, in his *Noctes Atticæ*, commends the excellency of the Samian peacocks. When Alexander was in India, he found vast numbers of wild ones on the banks of the Hyattis; and was so struck with their beauty as to appoint a severe punishment on any person that killed them. Peacocks' crests, in ancient times, were among the ornaments of the kings of England. Ernald de Aclent was fined to king John in '140 palfries, with sack-buts, lorains, gilt spurs, and peacocks' crests, such as would be for his credit!

4. *P. muticus* is about the size of the crested peacock: but the bill is larger and ash-colored; the irides are yellow, round the eyes red; on the top of the head is an upright crest four inches long, and shaped somewhat like an ear of corn. The color is green mixed with blue. The top of the neck and head are greenish, marked with spots of blue, which have a streak of white down the middle of each: the back is greenish blue: the breast is blue and green gold mixed: the belly, sides, and thighs are ash-color, marked with black spots, streaked with white on the belly; the wing coverts and secondaries are not unlike the back: the greater quills are green, transversely barred with black lines, but growing yellowish towards the ends; where they are

black: the upper tail coverts are fewer than those of the common peacock, but much longer than the tail; they are chestnut brown, with white shafts, and have at the end of each a large spot gilded in the middle, then blue, and surrounded with green: the legs are ash-colored, and not furnished with spurs, or they have been overlooked by those who have seen them. The female is smaller than the male; and has the belly quite black, and the upper tail coverts much shorter; the tail is green, edged with blue and white shafts. It inhabits Japan.

5. *P. Tibetanus* is about the size of a pintado, being about two feet and nearly two inches long. The bill is above an inch and a half long, and cinereous: the irides are yellow: the head, neck, and under parts, are ash-colored, marked with blackish lines: the wing covert, back, and rump, are gray, with small white dots; besides which, on the wing covert and back, are large round spots of a fine blue, changing in different lights to violet and green gold; the quills and upper tail coverts are also gray, marked with blackish lines; the quills have two round blue spots on each, like those of the coverts: on the outer webs, and on each tail feather, there are four of the same, two on each side the web; the middle coverts are the longest, the others shorten by degrees: the legs are gray, furnished with two spurs behind: the claws are blackish. This species inhabits the kingdom of Thibet.

PAVOR, *METUS*, or *TIMOR*, Fear, a Roman deity, whose worship was introduced by Tullus Hostilius, who, in a panic, vowed a shrine to him, and one to Pallor, Paleness; and therefore they are found on the coins of that family. The Ephori of Sparta erected a temple to Fear, near their tribunal, to strike an awe to those who approached it. Fear was likewise worshipped at Corinth. The poets did not forget this imaginary deity. Virgil places him in the entrance of hell, in company with diseases, old age, &c. *Æn.* vi. 273. Ovid places him in the retinue of Tisiphone, one of the furies, *Met.* iv. 485.

PAUPER, *n. s.* Lat. *pauper*. A poor person; one who receives parish assistance.

For distressed objects, who of necessity must have the whole of their support from the parish, there should be a sufficient number of small cottages built, each cottage having a piece of ground for the production of potatoes, turnips, &c.; if widely dispersed over several parts of the same parish, so much the better; they should be made to hold two persons, and one or two children, or, in lieu of the children, one or two of those *paupers* who should be found the most infirm. *Middleton's Survey of Middlesex.*

PAUSANIA, in Grecian antiquity, a festival in which were solemn games, wherein nobody contended but free-born Spartans; in honor of Pausanias the Spartan general. See PAUSANIAS.

PAUSANIAS, a Spartan king and general, who signalled himself at the battle of Platæa against the Persians. The Greeks, sensible of his services, rewarded his merit with a tenth of the spoils taken from the Persians. He was afterwards appointed to command the Spartan armies, and he extended his conquests in Asia; but the haughtiness of his behaviour created him many enemies; and the Athenians soon obtain-

ed a superiority in the affairs of Greece.—Pausanias, dissatisfied with his countrymen, offered to betray Greece to the Persians if he received in marriage, as the reward of his perfidy, the daughter of their king. His intrigues were discovered by a young man who was entrusted with his letters to Persia, and who refused to go, on recollecting that such as had been employed in that office before had never returned. The letters were given to the Ephori of Sparta, and the perfidy of Pausanias was thus discovered. He fled for safety to a temple of Minerva; and, as the sanctity of the place screened him from the violence of his pursuers, the sacred building was surrounded with heaps of stones, the first of which was carried thither by the indignant mother of the unhappy man. He was starved to death in the temple, and died about A. A. C. 474. There was a festival instituted to his honor, and an oration annually spoken in his praise, in which his actions were celebrated, particularly the battle of Platæa and the death of Mardonius. See PAUSANIA.

PAUSANIAS, a learned Greek historian and orator, in the second century, under Antoninus the philosopher. He was the disciple of Herodes Atticus; he lived for a long time in Greece; and afterwards went to Rome, where he died at a great age. He wrote an excellent description of Greece, in ten books, of which abbé Gedoin has given a French translation in 2 vols. 4to.

PAUSE, *n. s. & v. n.* Fr. *pause*; barb. Lat.

PAUSER, *n. s.* { *pausa*. Gr. *παυς*. A break or stop in point of time; an intermission; hence suspense; doubt; break; paragraph or sign marking a break: to pause and pauser follow these senses.

Neither could we ever come to any *pause*, whereon to rest our assurance this way. *Hooker.*

Solyman, *pausing* a little upon the matter, the heat of his fury being over, suffered himself to be intreated. *Kneble.*

Comes a fellow crying out for help,
And Cassio following with determined sword,
To execute upon him; this gentleman
Steps in to Cassio and entreats his *pause*.

Shakspeare.

Like a man to double business bound,
I stand in *pause* where I shall first begin,
And both neglect. *Id. Hamlet.*

Give me leave to read philosophy,
And, while I *pause*, serve in your harmony. *Shakspeare.*

The expedition of my violent love
Outruns the *pauser*, reason. *Id. Macbeth.*
Some *pause* and respite only I require,
Till with my tears I shall have quenched my fire. *Denham.*

As one who in his journey baits at noon,
Though bent on speed, so here the archangel *paused*
Between a world destroyed and world restored. *Milton.*

The punishment must always be rigorously exacted, and the blows by *pauses* laid on till they reach the mind, and you perceive the signs of true sorrow. *Locke.*

He writes with warmth, which usually neglects method, and those partitions and *pauses* which men, educated in the schools, observe. *Id.*

Our discourse is not kept up in conversation, but falls into more *pauses* and intervals than in our neighbouring countries. *Addison.*

Whilst those exalted to primeval light,
Only perceive some little *pause* of joys,
In those great moments when their god employs
Their ministry. *Prior.*

What awe did the slow solemn knell inspire,
The pealing organ, and the *pausing* choir,
And the last words that dust to dust conveyed !
Ticket.

Creation sleeps ! 'Tis as the general pulse
Of life stood still, and nature made a *pause*
An awful *pause* ! prophetic of its end. *Young.*

PAUSIAS, a famous ancient painter, the inventor of encaustic painting, was a native of Sicyon. He was a disciple of Pamphilus, and flourished about A. A. C. 352. He drew a beautiful picture of his mistress Glycere, for which Lucullus gave two talents. The Sicyonians being obliged to sell his pictures, to clear an enormous debt, they were all purchased by M. Scaurus, the Roman.

PAUTE, a large river of Quito, in the province of Cuenca, which rises in the Tarqui Mountains, to the south of that city. It finally assumes the name of the Mayer and enters the Santiago in S. lat. 4° 7'.

PAUW (Cornelius de), a learned German canon, was born at Amsterdam in 1739, and died in 1799, at Xantem, near Aix-la-Chapelle; he was uncle to Anarcharsis Clootz, of the French revolution. His principal works are, *Recherches Philosophiques sur les Americains*, les Egyptiens, et les Chinois, 7 vols. 1768; and *Recherches Philosophiques sur les Grecs*, 2 vols. 8vo. 1787.

PAW, *n. s., v. n., & v. a.* Wel. *paucen*; Teut. and Belg. *pawt*; Qu. the Pers. and Hind. *pa*? The foot of a wild beast; in contempt, the hand: to draw the fore foot on the ground; strike with the fore foot.

The Lord that delivered me out of the paw of the lion, and out of the paw of the bear; he will deliver me out of the hand of this Philistine.

1 Sam. xvii. 37.

He *paoweth* in the valley, and rejoiceth in his strength.

Job xxxix. 21.

One chose his ground,
Whence rushing he might surest seize them both,
Griped in each paw. *Milton's Paradise Lost.*

The bee and serpent know their stings, and the bear the use of his paws. *More against Atheism.*

Each claims possession,

For both their paws are fastened on the prey.

Dryden.

Be civil to the wretch imploring,
And lay your paws upon him without roaring. *Id.*

The fiery courser, when he hears from far
The sprightly trumpets and the shouts of war,
Pricks up his ears, and trembling with delight
Shifts place, and paws, and hopes the promised fight.
Id.

If lions had been brought up to painting, where you have one lion under the feet of a man, you should have had twenty men under the paw of a lion.

L'Ettrange.

The bear, that tears the prey, and when pursued,
lest he become a prey, goes backward into his den
that the hunter rather mistakes, than finds the way
of his paw. *Holiday.*

'Tis hot courser pawed the Hungarian plain,
And adverse legions stood the shock in vain.

Ticket.

The' impatient courser pants in every vein,
And *pawing*, seems to beat the distant plain;
Hills, vales, and floods appear already crossed,
And, ere he starts, a thousand steps are lost.

Pope.

Once, a fiery horse, *pawing* with his hoof, struck a hole in my handkerchief. *Swift.*

PAWLET, a river which rises in Vermont, and runs north-west into Wood Creek, in New York.

PAWLET, a post town of Rutland county, Vermont, thirty-three miles north of Bennington. Population 2233. This is a considerable agricultural township, and has a village containing some manufactures and trade. Haystack Mountain is in this township.

PAWLING, a post town of Dutchess county, New York, twenty miles south-east of Poughkeepsie, 105 south of Albany. Population 1756.

PAWN, *n. s.* Pers. *paan*. A common man at chess.

Here I a pawn admire,
That still advancing higher,
At top of all became
Another thing and name.

Cowley.

PAWN, *n. s. & v. a.* } Fr. and Swed. *pan*;
PAWN-BROKER. } Belg. *paand*; Lat. *pignus*. A pledge given as security for money: the state of being pledged: a pawnbroker is one who lends money upon pledges.

Her oath for love, her honour's pawn.

Shakespeare.

Sweet wife, my honour is at pawn.
And, but my going, nothing can redeem it. *Id.*
Redeem from broken pawn the blemished crown,
Wipe off the dust that hides our sceptre's guilt. *Id.*

I hold it cowardice

To rest mistrustful, where a noble heart
Hath pawned an open hand in sign of love. *Id.*
Let's lead him on with a fine baited delay, till he
hath pawned his horses. *Id.*

I dare pawn down my life for him, that he hath writ this to feel my affection to your honour. *Id.*

Will you thus break your faith?

—I pawned you none:

I promised you redress.

Id. Henry I.

I'll pawn the little blood which I have left,
To save the innocent. *Id. Winter's Tale.*
As for mortgaging and pawning, men will not take
pawns without use; or they will look for the forfeiture. *Bacon.*

He retains so much of his primitive esteem, that abroad his very word will countervail the bond or pawn of another. *Howel.*

If any thought annoys the gallant youth,
'Tis dear remembrance of that fatal glance,
For which he lately pawned his heart. *Waller.*

She who before had mortgaged her estate,
And pawned the last remaining piece of plate.

Dryden.

Here's the very heart, and soul, and life-blood of Gomez; pawns in abundance, till the next bribe helps their husbands to redeem them.

Id. Spanish Fryar.

The usurers or money-changers were a sort of a scandalous employment at Rome; those money-scriveners seem to have been little better than our pawnbrokers. *Arbuthnot.*

One part of the nation is pawned to the other, with hardly a possibility of being ever redeemed. *Swift.*

No man can mortgage his injustice as a pawn for his fidelity.

Burke.

There shall he learn, ere sixteen winters old,
That authors are most useful *pawned*, or sold;
That pedantry is all that schools impart,
But taverns teach the knowledge of the heart.

Cowper.

Pawn. According to our law, the party who pawns goods, hath a general property in them; they cannot be forfeited by the pawnee, or party who hath them in pawn, for any offence of his; nor be taken in execution for his debt, neither may they otherwise be put in execution, till the debt for which they are pawned is satisfied. Litt. Rep. 332. For the absolute property is in another; therefore they are not alienable, nor, by consequence, forfeitable; because they cannot be forfeited without loss and danger to the absolute owner; and all qualified possessors do take the property under the restriction to preserve the property of the right owner. And if a man pawns goods for money, and afterwards a judgment is had against the pawner at the suit of one of the creditors; the goods in the hands of the pawnee shall not be taken in execution, until the money is paid to the pawnee: because he had a qualified property in them, and the judgment creditor only an interest. 3 Bulst. 17. And when a person hath jewels in pawn for a certain sum, and he who pawned them is attainted, the king shall not have the jewels unless he pay the money. For the alteration of the general property doth not alter the special property in the pawnee. On this principle he may assign the pawn over to another, subject to the same conditions: and, if the pawnee die before redeemed, his executors shall have it upon the like terms as he had it.

If goods pawned are perishable, and, no day being set for payment of the money, they lie in pawn till spoiled, without any default in him who hath them in keeping; the party who pawned them shall bear the damage; for it shall be adjudged his fault that he did not redeem them sooner: and he to whom pawned may have action of debt for his money. Where goods are pawned for money borrowed, without a day set for redemption, they are redeemable at any time during the life of the borrower. They may be redeemed after the death of him to whom pawned; but not after the death of him who pawned the goods. 2 Cro. 245; Noy 137; 1 Bulst. 9. Where a day is appointed, and the pawner dieth before the day, his executors may redeem the pawn at the day, and this shall be assets in their hands. If goods are redeemable at a day certain, it must be strictly observed; and the pawnee, in case of failure of payment at the day, may sell them. 1 Rol. Rep. 181, 215. But still the right owner, as in case of a mortgage, has his redemption in equity.

Where a broker or pawnee refuses (upon tender of the money) to redeliver the goods in pawn, he may be indicted; because, being secretly pawned, it may be impossible to prove a delivery for want of witnesses, if trover should be brought for them. If goods are lost, after the tender of money, the pawnee is liable to make them good to the owner; for, after tender, he is a wrongful detainer; and he who keeps goods wrongfully must answer for them at all events. But if they

are lost before a tender, it is otherwise; the pawnee is not liable, if his care of keeping them was exact; and the law requires nothing of him, but only that he should use an ordinary care in keeping the goods, that they may be restored on payment of the money for which they were deposited; and in such case, if the goods are lost, the pawnee hath still his remedy against the pawner for the money lent.

If the pawnee be robbed, he is not in general answerable; though if he useth the thing as a jewel, watch, &c., that will not be the worse for wearing, which he may do, it is at his peril; and if he is robbed, he is answerable to the owner, as the using occasioned the loss, &c. If the pawn is of such a nature, that the keeping is a charge to the pawnee, as a cow, or a horse, &c., he may milk the one, or ride the other; and this shall go in recompense for his keeping. Things, which grow the worse by usage, he may not use.

If the vender of a leasehold estate deliver the conveyance as an escrow, to take effect on payment of the residue of the purchase-money, the property in the title-deeds of the estate is so vested in the vendee, that the vendor obtaining possession of those, and pawning them, does not confer on the pawnee a right to detain them, after tender of the purchase-money. 6 W. P. Taunton, 12. A factor cannot pawn the goods of his principal: he to whom goods are delivered for safe custody cannot pawn them: and there can be no market-overt for pawning. Where money is lent on a pledge, the borrower is personally liable to the payment, unless there be an agreement to the contrary.—*Strange*, 919.

PAWNBROKERS. By the stamp acts, pawnbrokers are annually to take out a license.

By stat. 39, 40 Geo. III. c. 99, rates of profit are allowed to pawnbrokers, and regulations are made to prevent oppression by them, viz. (as given in Tomlin's Dictionary), for every pledge upon which there shall have been lent not exceeding 2s. 6d. one halfpenny is allowed as interest, &c., for any time during which the said pledge shall remain in pawn, not exceeding one calendar month; and the same for every month afterwards, including the current month in which such pledge shall be redeemed, although such month shall not be expired. For 5s. one penny; 7s. 6d. one penny halfpenny; 10s. two-pence; 12s. 6d. two-pence halfpenny; 15s. threepence; 17s. 6d. three-pence halfpenny; £1. four-pence; and so on progressively, and in proportion for any sum not exceeding 40s.; and for any intermediate sum between 2s. 6d. and 40s. at the rate of four-pence for 20s.: and for every sum exceeding 40s., and not exceeding 42s. eight-pence; and for every sum exceeding 42s. and not exceeding £10, at the rate of three-pence, and no more for the loan of every 20s. of such money lent by the calendar month; and so in proportion for any fractional sum. § 1, 3.

A party applying for the redemption of goods pawned, within seven days after the expiration of any month, may redeem them without paying any thing for the seven days, and applying after seven, and within fourteen days, pays the profit for one month and a half of another month; but after the expiration of the first fourteen days the

pawnbroker may take for the whole month. § 5. Entries to be made and duplicates given. § 6, 7. Any person fraudulently pawning the goods of another, and convicted before a justice, shall forfeit from £5 to 20s., and also the value of the goods pawned, &c., to be ascertained by the justice; and, on failure of payment, may be committed to the house of correction, for not more than three months, and be publicly whipped; the forfeitures, when paid, to be applied towards making satisfaction to the party injured, and defraying the costs; the overplus, if any, to the poor of the parish. § 8. Any person counterfeiting or altering a duplicate, may be seized and taken before a justice; who is to commit the party to the house of correction for not more than three months, nor less than one. § 9.

If any person shall offer to pawn any goods, refusing to give a satisfactory account of himself and the goods; or if there shall be reason to suspect that such goods are stolen; or if any person not entitled shall attempt to redeem goods pawned, they may be taken before a justice, who shall commit them for further examination: and if it appear that the goods were stolen, or illegally obtained, or that the person offering to redeem the same has no title or pretence to them, the justice is to commit him to be dealt with according to law, where the nature of the offence shall authorise such commitment by any other law; or otherwise, for not more than three months. § 10. Persons buying or taking in pledge unfinished goods, or any linen, &c., entrusted to be washed, shall forfeit double the sum lent, and restore the goods. § 11.

A justice may grant a search-warrant, in executing which, a peace-officer may break open doors, and the goods, if found, shall be restored to the owner. § 12, 13. Pawnbrokers refusing to deliver up goods pledged within one year, on tender of the money lent, and interest, on conviction, a justice is empowered to commit the offender till the goods be delivered up, or reasonable satisfaction made. § 14.

Persons producing notes are not to be deemed owners, unless on notice to the contrary from the real owner. § 15. Duplicates being lost, the owners, on oath before a justice, shall be entitled to another from the pawnbroker. § 16.

Goods to be sold by public auction after the expiration of one year, being exposed to public view, and catalogues thereof published, and two advertisements of sale by the pawnbroker to be inserted in some newspaper two days at least before the first day's sale, under penalty of £10 to 40s. to the owner. § 17. Pictures, prints, books, statues, &c., shall be sold only four times in a year. § 18. Pawnbrokers receiving notice from the owners of goods before the expiration of a year, shall not dispose of them, until after the expiration of three months from the end of the said year. § 19.

Pawnbrokers to enter an account of sales in their books of all goods pawned for upwards of 10s.; and in case of any overplus by the sale, upon demand within three years, it shall be paid to the owner, the necessary costs, principal and interest being deducted; persons possessing duplicates entitled to the inspecting of the book;

and in case the goods shall have sold for more than the sum entered, or the further entries not made, or the overplus is refused to be paid, the offender shall forfeit £10 and treble the sum lent, to be levied by distress. § 20. Pawnbrokers shall not purchase goods whilst in their custody, or suffer them to be redeemed for that purpose; nor lend money to any person appearing to be under twelve years of age, or intoxicated, or purchase duplicates of other pawnbrokers, or buy any goods before eight in the forenoon, and after seven in the evening; nor receive any goods in pawn before eight in the forenoon, or after eight at night, between Michaelmas and Lady-day, and before seven o'clock in the forenoon, and after nine at night, during the remainder of the year; except till eleven o'clock on the evenings of Saturday, and that preceding Good Friday and Christmas-day; nor carry on the trade on any Sunday, Good Friday, or Christmas-day, or any fast or thanksgiving-day. § 20.

Pawnbrokers are to place in their shops a table of rates allowed by this act. § 21. Pawnbroker's Christian and surname, and business, to be written over the door, under a penalty of £10, half to the informer and half to the poor. § 23. Pawnbrokers having sold goods illegally, or having embezzled or injured goods, justices may award reasonable satisfaction to the owners, in case the same shall not amount to the principal and profit; or, if it does, the goods shall be delivered to the owner, without paying any thing, under a penalty of £10. § 24. They are to produce their books before any justice, if required, on a penalty of £10 to £5. § 25.

Penalty on pawnbrokers neglecting to make entry £10, and for every offence against this act, where no penalty is provided, 40s. to £10, half to the informer, the remainder to the poor. § 26. But complaint shall, in all cases, be made within twelve months § 27.

No person convicted of a fraud or felony may be an informer under this act. § 29. Churchwardens to prosecute for every offence at the expense of the parish, on notice from a justice. § 28. This act does not extend to persons lending money upon goods at 5 per cent. interest. But to extend to the executors, &c., of pawnbrokers and pawners. § 31. The form of conviction is settled by § 33; and an appeal given to the quarter sessions. § 35.

PAWNEES, native Indians of Louisiani, on, and west of, the Platte. Population 5500.

PAWTUCKET, a post town, partly in North Providence, Rhode Island, and partly in Seekonk, Massachusetts, on the Pawtucket: four miles north-east of Providence. Population about 2000. It is finely situated on the beautiful and interesting Falls of Pawtucket, and has very extensive and flourishing manufactures. It contains two houses of public worship, one for Episcopalians, and one for Baptists; two banks, nine cotton manufactories, containing about 10,000 spindles; two screw manufactories, two furnaces, one nail manufactory, one oil mill, one rolling mill, one fulling mill, and two corn mills.

PAWTUCKET, a river of Rhode Island, which rises in Massachusetts, where it is called the

Blackstone, passes through the north-east part of Rhode Island; and flows into Narraganset Bay, just below Providence. Below the falls it is called the Seekhonk. The descent at the falls is about fifty feet.

PAWTUXET, another river of Rhode Island, which runs into Narraganset Bay, four miles below Providence.

PAX, the goddess of peace, among the ancients. The Athenians erected a statue of her, representing her as holding Plutus, the god of wealth, in her lap. They first erected an altar to her, after Cimon's victory over the Persians; (Plutarch :) or after that of Timotheus over the Spartans. Nepos. The Romans represented her with an olive branch in the one hand, and the horn of plenty in the other.

PAXO (the ancient Ericusa), a small island of the Mediterranean, seven miles south of Corfu: it is five miles long and two broad, rocky, and generally barren, but affords some oil, wine, and fruits, in small quantity. It has three good ports, of which that named Porto Gai, perhaps the best, contains a chapel on the site of the supposed residence of St. Paul. The absence of any venomous or hideous reptile in this island is ascribed to this saint; and, according to the popular belief, he has even bestowed greater benefits on the island than he himself experienced; for a person of the neighbouring countries, where such reptiles are found, being bitten, has only to ascend a hill, and get a sight of Paxo, to be cured! San Nicholo, the only town of the island is on the east. Anti-Paxo, a league south of Paxo, is uninhabited and uncultivated.

PAY, *v. a. & n. s.* } *Fr. payer; Ital. pagare;*
 PAY'ABLE, *adj.* } *Span. and Port. pagar, à*
 PAY'-DAY, *n. s.* } *Lat. pacare. To satisfy;*
 PAY'ER, } *discharge a debt: hence*
 PAY'-MASTER, } *reward; chasten; atone;*
 PAYMENT. } *discharge any obligation:*
 as a noun substantive, hire; wages; a servant's or soldier's reward: payable is, due; to be paid; possible to be paid: pay-day, payer, and pay-master, seem obvious in their meaning: payment is, the act of paying; thing paid; or any reward.

An hundred talents of silver did the children of Ammon pay. 2 *Chronicles* xxvii. 5.

The wicked borroweth, and payeth not again.

I have peace-offerings with me: this day have I paid my vows. *Psalms.*
Proverbs vii. 14.

She does what she will, say what she will, take all, pay all. *Shakspeare. Merry Wives of Windsor.*

If this prove true, they'll pay for't. *Shakspeare.*

You have done enough, and have performed A saint-like sorrow; and indeed paid down More penitence, than done trespass. *Id.*

I followed me close, and, with a thought, seven of the eleven I paid. *Id. Henry IV.*

Come on, brave soldiers, doubt not of the day; Aud, that once gotten, doubt not of large pay. *Shakspeare.*

Thy husband commits thy body To painful labour both by sea and land, And craves no other tribute at thy hands But love, fair looks, and true obedience; Too little payment for so great a debt. *Id.*

Give her an hundred marks.

—An hundred marks! by this light I'll ha' more.

An ordinary groom is for such payment. *Id.*

The marriage-money the princess brought, was payable ten days after the solemnization. *Bacon.*

Persons of eminent virtue, when advanced, are less envied, for their fortune seemeth but due unto them; and no man envieth the payment of a debt. *Id.*

Howsoever they may bear sail for a time, yet are they so sure paymasters in the end, that few have held out their lives safely. *Hayward.*

Forty things more, my friends, which you know true,

For which, or pay me quickly, or I'll pay you.

Ben Jonson.

If we desire that God should approve us, it is a sign we do his work, and expect him our paymaster. *Taylor.*

Bold Prometheus, whose untamed desire Rivalled the sun with his own heavenly fire, Now doomed the Scythian vulture's endless prey, Severely pays for animating clay. *Roscommon.*

Money, instead of coming over for the pay of the army, has been transmitted thither for the pay of those forces called from thence. *Temple.*

The king and prince

Then paid their offerings in a sacred grove

To Hercules.

Dryden.

She I love, or laughs at all my pain, Or knows her worth too well; and pays me with disdain. *Id. Knight's Tale.*

The soldier is willing to be converted, for there is neither pay nor plunder to be got. *L'Estrange.*

Men of parts, who were to act according to the result of their debates, and often pay for their mistakes with their heads, found those scholastic forms of little use to discover truth. *Locke.*

Riches are got by consuming less of foreign commodities, than what by commodities or labour is paid for. *Id.*

Labourers pay away all their wages, and live upon trust till next payday. *Id.*

To repay by a return equivalent is not in every one's power; but thanks are a tribute payable by the poorest. *South.*

The wages that sin bargains with the sinner are life, pleasure, and profit; but the wages it pays him with are death, torment, and destruction: he that would understand the falsehood and deceit of sin thoroughly, must compare its promises and its payments together. *Id.*

Here only merit constant pay receives, Is blest in what it takes, and what it gives. *Pope.*

It is very possible for a man that lives by cheating to be very punctual in paying for what he buys; but then every one is assured that he does not do so out of any principle of true honesty. *Law.*

For then the farmers come jog, jog.

Along the miry road,

Each heart as heavy as a log,

To make their payments good. *Concise.*

PAYNE (Nevil), an English dramatic writer, who flourished under Charles II. He published three plays, viz.:—1. The Fatal Jealousy; a tragedy, 4to. 1673. 2. The Morning Ramble, or the Town Humors; a comedy; 4to. 1673. 3. The siege of Constantinople; a tragedy; 4to. 1675.

PAYSE, *v. n. 2* Used by Spenser for poise

PAYS'ER, *n. s.* } To balance: one who weighs.

Ne was it island then; ne was it payed

Amid the ocean waves, but all was desolate.

Spenser.

To manage this coinage, porters bear the tin, *paytors* weigh it, a steward, comptroller, and receiver, keep the account. *Corew.*

PAZ, a town of Mexico, in the intendency of Valladolid: 120 miles N.N.W. of Mexico. Population about 3000. It is also the name of several insignificant settlements.

PAZ, LA, a district formerly included in Peru, but now in the state of Buenos Ayres, north of Sicasica, and consisting only of a small district round the city of the same name, in the vicinity of the western cordillera of the Andes. The surface is rough and its temperature cold. The adjacent cordillera, only twelve leagues distant, is high: one of its summits, called Illimani, is covered with perpetual snow, but the city is not subject to extreme cold, enjoying a salubrious and rather warm air. The snow-clad mountains, the fertile valleys, and the fine river of the neighbourhood, give charms to its scenery rarely equalled. The higher grounds are covered with forests, which afford shelter to bears, jaguars, pumas, &c. Some gold is found in the river, when it is increased by the melting of the snow. In 1730 an Indian discovered in this stream a lump of gold of such a size that it was bought for 12,000 piastres. The country is fertile in grain and fruits.

PAZ, LA, a city, the capital of the above district, founded in 1548, and so called in memory of the public tranquillity being settled, by the defeat of Gonzalo Pizarro. Beside the cathedral, the city has four churches, five convents, and three nunneries. According to Helms, it suffered considerably by the revolt of the Indians; but it had in his time 20,000 inhabitants. One great article of trade here is Paraguay tea. The bishop has very considerable revenues: 120 miles E.S.E. of Arequipa, 288 south-east of Cuzco, and 612 south-east of Lima.

PEA, *n. s.* Sax. *pira*; Fr. *pois*; Lat. *pi-PEASE*, } *sum.* When it is mentioned as
PEASE-COD, } the plural of a single body, makes
PEA-SHELL, } peas; but, when collectively, as
food, or a species, it is called *pease*, anciently
peason: the *peascod* and *pea-shell* are the husk
of peas.

A *pea* hath a papilionaceous flower, and out of his empalement rises the pointal, which becomes a long pod full of roundish seeds; the stalks are fistulous and weak, and seem to perforate the leaves by which they are embraced; the other leaves grow by pairs along the midrib, ending in a tendril. The species are sixteen. 1. The greater garden *pea*, with white flowers and fruit. 2. Hotspur *pea*. 3. Dwarf *pea*. 4. French dwarf *pea*. 5. *Pea* with an esculent husk. 6. Sickle *pea*. 7. Common white *pea*. 8. Green rouncival *pea*. 9. Grey *pea*. 10. Maple rouncival *pea*. 11. Rose *pea*. 12. Spanish moretto *pea*. 13. Marrowfat or Dutch admiral *pea*. 14. Union *pea*. 15. Sea *pea*. 16. Pig *pea*. *Miller.*

Sow *peason* and beans in the wane of the moon;
Who soweth them sooner, he soweth too soone.

Thou art a shealed *peascod*.

Shakspeare. King Lear.

I saw a green caterpillar as big as a small *peascod*.

Walton.

As *peascods* once I plucked, I chanced to see
One that was closely filled with three times three.
I o'er the door the spell in secret laid. *Gay.*

Pease, deprived of any aromatic parts, are mild and demulcent; but, being full of aerial particles, are flatulent. *Arbuthnot.*

Calces o' fossils, earth, and trees;

True sal-marimum o' the seas;

The farina of beans and *pease*;

He has 't in plenty;

Aqua-fortis, what you please,

He can content ye. *Burns.*

PEA, in botany. See *PISUM*.

PEA CHICK, See *CICER*.

PEACE, *n. s. & interj.*

PEACE'ABLE, *adj.*

PEACE'ABLENESS, *n. s.*

PEACE'ABLY, *adv.*

PEACE'FUL, *adj.*

PEACE'FULLY, *adv.*

PEACE'FULNESS,

PEACE-MAKER,

PEACE-PARTED.

Fr. *pair*; Ital. *pace*;

Span. Port. and Lat.

par. Quiet; stillness;

rest; respite from war.

disturbance, or terror;

reconciliation of dif-

ferences; state of

agreement or unity.

In law, the general

security and quiet which the king warrants to his subjects, and of which he therefore avenges the violation; every forcible injury is a breach of 'the king's peace:' as an interjection, a word commanding silence: peaceable is, quiet; undisturbed; free from war or tumult; of quiet disposition: peaceably and peaceableness the corresponding adverb and noun substantive: peaceful is a poetical synonyme of peaceable: peace-maker, one who reconciles differences, or disagreeing parties: peace-parted, dismissed in peace.

These men are *peaceable*, therefore let them dwell in the land and trade. *Genesis xxxiv. 21.*

A sacrifice of *peace*-offering offer without blemish.

Lev. iii. 1.

Peace be unto thee, fear not, thou shalt not die.

Judges vi. 23.

If I have rewarded evil unto him that was at peace with me, let the enemy persecute my soul.

Psalms vii. 4.

Blessed are the *peace-makers*, for they shall be called the children of God. *Matt. v. 9.*

The God of hope fill you with all joy and *peace* in believing, that ye may abound in hope. *Romans.*

Peace! fear, thou comest too late, when already the arm is taken. *Sidney.*

The laws were first intended for the reformation of abuses and *peaceable* continuance of the subject.

Spenser.

To his crown she him restored,

In which he died, made ripe for death by eld,

And after willed it should to her remain,

Who *peaceably* the same long time did weld.

Spenser.

All assembled here in arms against God's *peace* and the king's, we charge you to repair to your dwelling places. *Shakspeare.*

Shallow, you have yourself been a great fighter, though now a man of *peace*.

Well, *peace* be with him that hath made us heavy!

—*Peace* be with us, lest we be heavier! *Id.*

'Twill out;—I *peace!*

No, I will speak as liberal as the air. *Id.*

The pangs of Death do make him grin;

Disturb him not, let him pass *peaceably*. *Id.*

Think us

Those we profess, *peacemakers*, friends, and servants.

Shakspeare.

We should profane the service of the dead,

To sing a requiem, and such rest to her

As to *peaceparted* souls. *Id. Hamlet.*

There be two false *peaces* or unities: the one grounded upon an implicit ignorance. *Bacon.*

n an examination, a freed servant, who had much power with Claudius, very saucily had almost all the words: and, amongst other things, he asked in scorn one of the examinates, who was a freed servant of Scribonianus; I pray, Sir, if Scribonianus had been emperor, what would you have done? he answered, I would have stood behind his chair and held my peace.

The king gave judgment against Warren, and commanded that Sherborn should hold his land in peace.

Peace, good reader, do not weep;

Peace, the lovers are asleep. *Crashaw.*

Plant in us all those precious fruits of piety, justice, and charity, and peaceableness, and bowels of mercy toward all others. *Hammond's Fundamentals.*

Preserve us in peace, so preserve us in peace, that war may be always more odious to us than necessity.

But peace, I must not quarrel with the will Of highest dispensation. *Milton's Agonistes.*

Silence, ye troubled waves, and thou deep, peace! Said then the omnific word. *Milton.*

As one disarmed, his anger all be lost; And thus with peaceful words upraised her soon.

The Chaldeans flattered both Cæsar and Pompey with long lives and a happy and peaceable death; both which fell out extremely contrary. *Hale.*

Religion directs us rather to secure inward peace than outward ease, to be more careful to avoid everlasting torment than light afflictions. *Tillotson.*

I prythee peace! Perhaps she thinks they are too near of blood.

She said, and held her peace: Æneas went Sad from the cave. *Dryden.*

The peaceful power that governs love repairs To feast upon soft vows and silent prayers. *Id.*

Our loved earth; where peacefully we slept, And far from heaven quiet possession kept. *Id.*

The Dane and Swede, roused up to fierce alarms, Bless the wise conduct of her pious arms; Soon as her fleets appear, their terror cease, And all the northern world lies hushed in peace. *Addison.*

Lie, Philo, untouched on my peaceable shelf, Nor take it amiss, that so little I heed thee; I've no envy to thee, and some love to myself, Then why should I answer; since first I must read thee? *Prior.*

Succeeding monarchs heard the subject's cries, Nor saw displeased the peaceful cottage rise. *Pope.*

The reformation of England was introduced in a peaceable manner, by the supreme power in parliament. *Swift.*

The balance of power was provided for, else Pisistratus could never have governed so peaceably, without changing any of Solon's laws. *Id.*

Farewell my friends! Farewell my foes!

My peace with these, my love with those—

The bursting tears my heart declare, Farewell the bonny banks of Ayr! *Burns.*

But what have these done, their far Remote descendants, who have lived in peace, The peace of heaven, and in her sunshine of Piety? *Byron.*

PEACE, TEMPLE OF, a celebrated temple at Rome, which was consumed by fire A. D. 191; which Dio Cassius supposes began in the adjoining houses. Be that as it may, the temple, with all the surrounding buildings, was reduced to ashes. That magnificent structure had been raised by Vespasian after the destruction of Je-

rusalem, and enriched with the spoils and ornaments of the temple of the Jews. The ancients speak of it as one of the most stately buildings in Rome. There men of learning used to hold their assemblies, and lodge their writings, as many others deposited their jewels, and whatever else they esteemed of great value. It was likewise made use of as a kind of magazine for the spices brought by the Roman merchants out of Egypt and Arabia; so that many rich persons were reduced to beggary, all their valuable effects and treasures being consumed in one night, with the temple.

PEACE RIVER, or Unjiah River, a river of North America, which has its rise, according to Mackenzie, in the Rocky Mountains, lat. 54° 24' N., and long. 121° W., or only a few miles from that of the Columbia, which, taking an opposite direction, falls into the Pacific Ocean. After a long winding course, during which it is increased by many large streams, it passes the Lake of the Hills, and is called Slave River. It now runs through Slave Lake, and afterwards receiving the name of Mackenzie's River, emptying itself into the frozen Ocean, in 70° N. lat. and about 135° W. long. Its stream is from 200 to 800 yards wide, generally navigable, except within the Rocky Mountains, when its course is much interrupted by rapids. Where it falls into the Slave River it is upwards of a mile broad; and the country between this and the Lake of the Hills is frequently inundated by it.

PEACH, *v. a.* Corrupted from IMPEACH. A slang term for to accuse of a crime.

If you talk of *peaching*, I'll *peach* first, and see whose oath will be believed; Ill trounce you. *Dryden.*

PEACH, *n. s.* } French *peache*; Ital. }
PEACH-COLORED, *adj.* } *persio*, *pecco*; Port. }
passigo; Span. *persiga*; Lat. *persica*. (Evi- }
dently from Persia.) A tree and fruit. See below.

One Mr. Caper comes to jail at the suit of Mr. Threepile the mercer, for some four suits of peach-coloured sattin, which now peaches him a beggar.

Shakespeare. Measure for Measure.

September is drawn with a cheerful countenance: in his left hand a handful of millet, withal carrying a cornucopia of ripe peaches, pears, and pomegranates. *Peacham.*

The sunny wall Presents the downy peach.

Thomson's Autumn.

While glossy and smooth, and as soft as the skin Of a delicate peach, is the down of her chin; But nothing unpleasant, or sad, or severe, Or that indicates life in its winter—is here.

Cowper

PEACH. See AMYGDALUS.

PEACHAM, a post town of Caledonia county, Vermont; six miles south of Danville, fifty-one north of Dartmouth College. Population 1301. This is a pleasant and valuable agricultural town, and it has a small village containing an academy, and a Congregational meeting-house.

PEACHICK, *n. s.* Pea and chick. The chicken of a peacock.

Does the snivelling *peachick* think to make a cuckold of me? *Southern.*

PEACOCK, *n. s.* } Sax. *papa*; Lat. *pavo*.
PE'AKEN. } Perhaps, originally, peak

cock, says Dr. Johnson, from the tuft of feathers on its head; the peak of women being an ancient ornament; if it be not rather a corruption of Fr. *beaucoq*, from the more striking lustre of its spangled train. A bird remarkable for the beauty of his feathers, and particularly of his tail.

The peacock, not at thy command, assumes
His glorious train; nor ostrich her rare plumes.

Sandys.

Let frantick Talbot triumph for a while;
And, like a peacock, sweep along his tail.

Shakespeare.

The birds that are hardest to be drawn are the
tame birds; as cock, turkey-cock and peacock.

Peacham.

The peacock's plumes thy tackle must not fail,
Nor the dear purchase of the sable's tail.

Gay.

The self-applauding bird the peacock see—

Mark what a sumptuous Pharisee is he!
Meridian sunbeams tempt him to unfold
His radiant glories, azure, green, and gold.

Cowper.

PEACOCK, in ornithology. See PAVO.

PEACOCK FISH, in ichthyology, *Pinna* ani radiis 55, caudali falcata. The body is of various colors; the fin of the anus has fifty-five streaks, and its tail is in the form of a crescent. The head is without scales; it is brown upon the upper part, yellow above the eyes, and of a silver color on the sides. The back is round, and adorned with beautiful blue streaks in a serpentine form, and the belly bright as silver. The fins of the breast are round, and, like those of the belly, have a yellow ground with a gray border; that of the back is of a violet color; that of the anus is straw colored; and, lastly, that of the tail is yellow on the sides, red towards the middle, and bordered with a deep blue. Its length is not known. There is a variety of this fish found only in the Indian seas, and therefore called the Indian peacock fish; which is thus described in the language of Linneus: *Pavo pinna caudali forcipata: spinis dorsalibus 14: ocello ceruleo pone oculos*. It has the fin of its tail forked; fourteen sharp points or prickles on the back, with a round blue streak behind the eyes. The body of this fish is of an elliptical form; the head is covered with scales to the tip of the snout; the two jaws are armed with long and sharp teeth; the ball of the eye is black, and the iris of a white color with a mixture of green. At the insertion of the fins of the belly is found a bony substance. The head, back, and sides, are of a yellow color, more or less deep, and covered with lines or streaks of sky blue. These colors are so agreeably mixed that they resemble the elegance of the peacock's tail.

PEAK, *n. s. & v. n.* Sax. *peac*; Fr. *pique*, *pic*, *pica*. The pointed top of a hill or eminence. See BEAK. As a verb, to look sickly or sharp featured; hence, look mean.

Weary se'ennights, nine times nine,
Shall he dwindle, peak, and pine.

Shakespeare. Macbeth.

I, a dull and muddy mettled rascal, peak,
Like John a dreams, unpregnant of my cause.

Shakespeare.

The peaking cornuto her husband, dwelling in a continual larum of jealousy, comes in the instant of our encounter. *Id.*

Thy sister seek,

Or on Meander's bank of Latmus' peak.

Prior.

PEAK OF DERBYSHIRE, a chain of very high mountains in that county, famous for the mines they contain, and for their remarkable caverns. The most remarkable of these are Pool's Hole and Elden Hole. The former is a cave at the foot of a high hill called Coitmoos, so narrow at the entrance that passengers are obliged to creep on all-fours; but it soon opens to a considerable height, extending to above a quarter of a mile, with a roof somewhat resembling that of an ancient cathedral. By the petrifying water continually dropping in many parts of the cave are formed a variety of curious figures and representations of the works both of nature and art. There is a column here as clear as alabaster, which is called The Queen of Scots' Pillar, because queen Mary is said to have proceeded thus far when she visited the cavern. After sliding down the rock a little way, is found the dreary cavity turned upwards: following its course, and climbing from crag to crag, the traveller arrives at a great height, till the rock, closing over his head on all sides, puts an end to any further subterraneous journey. Just at turning to descend, the attention is caught by a chasm, in which is seen a candle glimmering at a vast depth underneath. The guides say that the light is at a place near Mary queen of Scots' pillar, and no less than eighty yards below. It appears frightfully deep indeed to look down; but perhaps does not measure any thing like what it is said to do. If a pistol be fired by the queen of Scots' pillar, it would make a report as loud as a cannon. Near the extremity there is a hollow in the roof, called the Needle's Eye; in which if a candle is placed it will represent a star in the firmament to those who are below. At a little distance from this cave is a small clear stream consisting of hot and cold water, so near each other, that the finger and thumb of the same hand may be put, the one into the hot water and the other into the cold. Elden Hole is a dreadful chasm in the side of a mountain; which, before the end of the seventeenth century, was thought to be altogether unfathomable. In 1699 captain Sturmy descended by ropes fixed at the top of an old lead-ore pit, four fathoms almost perpendicular, and thence three fathoms more obliquely, between two great rocks. At the bottom of this he found an entrance into a very spacious cavern, whence he descended along with a miner for twenty-five fathoms perpendicular. At last they came to a great water, which he found to be twenty fathoms broad and eight deep. As they walked by the side of this water, they observed a hollow in the rock some feet above them. The miner went into this place, which was the mouth of another cavern; and walked for about seventy paces in it. The floor of these caverns is a kind of white stone enamelled with lead ore, and the roofs are encrusted with shining spar. On his return from this subterraneous journey,

captain Sturmy was seized with a violent headache, which, after continuing four days, terminated in a fever, of which he died in a short time. See DERBYSHIRE.

PEAK OF TENERIFFE. See TENERIFFE.

PEAK'S HOLE, AND POOL'S HOLE, two remarkable horizontal springs under mountains; the one near Castletown, the other just by Buxton. They seem to have owed their origin to the springs which have their current through them; when the water had forced its way through the horizontal fissures of the strata, and had carried the loose earth away with it, the loose stones must fall down of course: and, where the strata had few or no fissures, they remained entire; and so formed these very irregular arches, which are now so much wondered at. The water which passes through Pool's Hole is impregnated with particles of lime-stone, and has incrustated the whole cavern in such a manner that it appears as one solid rock.

PEAKS, a range of mountains in New Hampshire, extending from Strafford to the White Mountains. 2500 feet high.

PEAKS OF OTTER, in Bedford county, Virginia; thirty miles west by north of Lynchburg. Lat. 37° 33' N. They are summits of the Blue Ridge, and are considered the most elevated points of land in Virginia. The altitude of the eastern peak is 3104 feet; that of the western 2946. According to another statement, the elevation is 3955 feet. The summits are composed of granite.

PEAL, *n. s. & v. a.* Belg. *belvi*; Dan. *biel*. (The noise of bells.) A succession of loud noises; to assail with loud noise.

Ere to black Hecate's summons
The shard-born beetle with his drowsy hums
Hath rung night's yawning peal, there shall be done
A deed of dreadful note. *Shakespeare. Macbeth.*

The breach of faith cannot be so highly expressed, as in that it shall be the last peal to call the judgments of God upon men. *Bacon's Essays.*

They were saluted by the way, with a fair peal of artillery from the tower. *Hayward.*

I myself
Vanquished with a peal of words, O weakness!
Give up my fort of silence to a woman. *Milton.*

Nor was his ear less pealed
With noises loud and ruinous, than when Bellona

storms,
With all her battering engines, bent to rase
Some capital city. *Id. Paradise Lost.*

Let the pealing organ blow
To the full-voiced quire below,
In service high and anthems clear,
As may, with sweetness down mine ear,
Dissolve me into extasies,
And bring all heaven before mine eyes.

Milton.
From the Moor's camp the noise grows louder
still;

Peals of shouts that rend the heavens. *Dryden.*
Oh! for a peal of thunder that would make
Earth, sea, and air, and heaven and Cato tremble,
Addison.

The pealing organ, and the pausing choir;
And the last words that dust to dust conveyed.

Titchel.
Peal upon peal redoubling all around,
Shakes it again and faster to the ground:

Now flashing wide, now glancing as in play,
Swift beyond thought the lightnings dart away.

Cowper.

PEAR, *n. s.* Fr. *poire*; Lat. *pyrum*. A
PEARMAIN, } well known tree and fruit. See
PEAR'-TREE, } PYRUS. Of which the apple
pearmain is also a species.

They would whip me with their fine wits, till I were
as crest fallen as a dried pear. *Shakespeare.*

The pear-tree critics will have to borrow his name
of *tip*, fire. *Bacon.*

August shall bear the form of a young man, of a
choleric aspect, upon his arm a basket of pears, plums,
and apples. *Peucham.*

Pearmain is an excellent and well known fruit.

Mortimer.

The juicy pear
Lies in a soft profusion scattered round.

Thomson.

PEARCE (Dr. Zachary), bishop of Rochester, was the son of a distiller in High Holborn. He was born in 1690, and educated at Westminster, where he was distinguished by his merit, and elected one of the king's scholars. In 1710, when he was twenty years old, he was elected to Trinity College, Cambridge. During the first years of his residence at the university he wrote *Essays*, some of which are inserted in the *Guardian* and *Spectator*. In 1716 he published his edition of *Cicero de Oratore*, and dedicated it to lord chief justice Parker (afterwards earl of Macclesfield), to whom he was a stranger. This laid the foundation of his future fortune; for lord Parker recommended him to Dr. Bentley, master of Trinity, to be made one of the fellows. In 1717 Mr. Pearce was ordained, at the age of twenty-seven. In 1718 lord Parker was appointed chancellor, and invited Mr. Pearce to live with him as chaplain. In 1719 he was instituted rector of Stapleford Abbots, in Essex: in 1720 of St. Bartholomew, worth £400 per annum. In 1722 he was presented to St. Martin's in the Fields. In 1723 he married Miss Adams, the daughter of a distiller, with a considerable fortune; and in 1724 the degree of D. D. was conferred on him by archbishop Wake. The same year he dedicated to the earl of Macclesfield his edition of *Longinus* on the Sublime, with a new Latin version and notes. When the church of St. Martin's was rebuilt, Dr. Pearce preached a sermon at the consecration, which he printed, and accompanied with an *Essay* on the Origin and Progress of Temples, traced from the rude stones which were first used for altars to the noble structure of Solomon, which he considers as the first temple completely covered. Dr. Pearce was appointed dean of Winchester in 1739; and in 1744 he was elected prolocutor of the lower house of convocation for Canterbury. He was consecrated bishop of Bangor, February 12th, 1748. Upon the death of bishop Wilcocks he was promoted to the see of Rochester and deanery of Westminster in 1756. In 1768 he resigned the deanery; in 1773 he lost his lady; and, after some months of lingering decay, he died at Little Ealing, June 29th, 1774, aged eighty-five. This eminent prelate distinguished himself in every part of his life by the virtues proper to his station. His literary abilities, and application to sacred and philological learning,

appear by his works; the principal of which are, 1. A Letter to the clergy of the Church of England, on occasion of the Bishop of Rochester's commitment to the Tower; second edition, 1722. 2. Miracles of Jesus Vindicated, 1727 and 1728. 3. A Review of the Text of Milton, 1733. 4. Two Letters against Dr. Middleton, occasioned by the Doctor's Letter to Waterland, on the publication of his treatise, entitled *Scripture Vindicated*; third edition, 1752. And, 5, since his death, A Commentary with Notes on the Four Evangelists and the Acts of the Apostles, with a new translation of St. Paul's First Epistle to the Corinthians, with a paraphrase and notes, have been published, with his life prefixed, from original MSS. in 2 vols. 4to.

PEARCE (Nathaniel), a late African traveller, was born of respectable parents at East Acton, in Middlesex. At an early age he went to sea, and landed on the shore of the Red Sea; whence he found his way to Abyssinia, where he was much caressed. After residing there some years, he went to Cairo, with the intention of revisiting his native land. But having, at the latter end of May, 1820, taken charge of some antiquities for the British Museum, as well as for individuals, he proceeded to Alexandria, and was about to embark, when a bilious fever carried him off suddenly, on the 12th of August. He was buried the same evening in the Greek convent, his body being carried by six English sailors. He left all his manuscripts to his friend and patron Mr. Salt, our consul in Egypt.

PEARCH, in ichthyology. See PERCA. The perch affords good sport for the angler. The best time for their biting is when the spring is over, and before the heats of summer come on. At this time they are very greedy; and the angler, with good management, may take at one standing all that are in a hole, be they ever so many. The proper baits are minnows or young frogs; but the worm called the brandling, well scoured, is also excellent at all times of the year. When the perch bites, he should always have a great deal of time allowed him to swallow the bait. The perch will bite all day if the weather be cloudy; but the best time is from eight to ten A.M., and from three to six P.M. The perch is very abstemious in winter, and will seldom bite in this season: if he does at all, it is in the middle of the day; at which time indeed all fish bite best. If the bait be a minnow, which is the bait that affords most diversion to the angler, it must be fastened to the hook alive, by putting the hook through the upper lip or back-fin; it must be kept at about mid-water, and the float must be a quill and a cork, that the minnow alone may not be able to sink it. The line must be of silk, and strong; and the hook armed with a small and fine wire, that if a pike should take the bait, as is not unfrequently the case, he may be taken. The way to carry the minnows or small gudgeons alive for baits is this: a tin pot is to be provided, with holes in the lid, and filled with water; and, the fish being put in this, the water is to be changed once in a quarter of an hour by the holes, without taking off the lid at any time, except when the bait is to be taken out. A small casting net, made for

these little fish, should be taken out with the perch-tackle; and one or two casts of this will take baits enough for the day without any farther trouble. When the bait is a frog, the hook is to be fastened to the upper part of the leg. The best place for the fishing for perch is in the turn of the water near some gravelly scour. A place of this kind being pitched upon, it should be baited over-night, with lobworms chopped to pieces; and in the morning, on going to it, the depth is to be regularly plumbed, and then the hook is to be baited with the worm or other bait; and, as it drags along, the perch will soon seize upon it.

PEARL, *n. s.* Fr. *perle*; Span. *perla*. Supposed by Salmasius to come from Lat. *spherulæ*; but there is an Arab *para, loo loo* (jewel of the sea).

The kingdom of heaven is like unto a merchant-man seeking goodly pearls, who, when he had found one pearl of great price, sold all that he had and bought it. Matt. xiii. 45, 46.

Flowers purpled, blue and white,
Like sapphire, pearl, in rich embroidery
Buckled below fair knighthood's bending knee.

Shakspeare.

Dropping liquid pearl,
Before the cruel queen, the lady and the girl
Upon their tender knees begged mercy. Drayton.
Which when she heard, full pearly floods
I in her eyes might view. Id.

This (moderation) is the centre wherein all, both divine and moral philosophy meet; the rule of life; the governess of manners; the silken string, that runs through the pearl-chain of all virtues.

Bp. Hall.

The water nymphs
Held up their pearly wrists, and took her in,
Bearing her straight to aged Nereus' hall. Milton.

Some in their pearly shells at ease, attend
Moist nutriment. Id. *Paradise Lost*.
For what the day devours, the nightly dew
Shall to the morn in pearly drops renew. Dryden.

Another was invested with a pearly shell, having
the suture: finely displayed upon its surface.

Woodward.

A pearl julep was made of a distilled milk.

Wiseman.

Cataracts pearl coloured, and those of the colour of burnished iron, are esteemed proper to endure the needle. Sharp.

A PEARL, in natural history, is a hard, white, shining body, usually roundish, found in a testaceous fish resembling an oyster. See MYA. The fish in which these are usually produced is the East Indian pearl oyster. Besides this shell there are many others that are found to produce pearls; as the common oyster, the mussel, and several others, the pearls of which are often very good; but those of the true Indian berberi, or pearl oyster, are in general superior to all. The small or seed pearls, also called ounce pearls, from their being sold by the ounce and not by tale, are vastly the most numerous and common. We have Scotch pearls frequently as big as a little tare, some as big as a large pea, and some few of the size of a horse-bean; but these are usually of a bad shape, and of little value in proportion to their weight. Philip II. of Spain

had a pearl perfect in its shape and color, and of the size of a pigeon's egg. Their color ought to be a pure white; and that not a dead and lifeless but a clear and brilliant one; they must be perfectly free from any foulness, spot, or stain; and their surfaces must be naturally smooth and glossy; for their natural polish art is not able to improve. All pearls are formed of the matter of the shell, and consist of a number of coats spread with perfect regularity one over another, in the manner of the several coats of an onion, or like the several strata of the stones found in the bladders or stomachs of animals, only much thinner.

Very little is known of the natural history of the pearl fish. The general belief is that the mussel is constantly stationary in a state of repose, and cannot transfer itself from place to place. This is a vulgar prejudice, and one of those facts that are mistaken for want of sufficient pains or opportunity to make more critical observations. Others, finding the first opinion a false one, and that they are endowed with power of changing place like other animals, have, upon the same foundation, gone into the contrary extreme, so far as to attribute swiftness to them, a property surely inconsistent with their being fixed to rocks. Mr. Bruce says that the mussels found in the salt springs of Nubia likewise travel far from home, and are sometimes surprised, by the ceasing of the rains, at a greater distance from their beds than they have strength and moisture to carry them. From the shells a judgment may be formed whether they contain pearls. Those which have a thick calcareous crust on them, to which *serpulæ*, *tubuli marini*, *cristagalli*, *madrepores*, *millipores*, *spongie*, and other *zoophites*, adhere, commonly contain the best pearls; the smooth ones either none or very small ones.

The colors of pearls are different according to the shells in which they are found. There are three kinds of bivalve shells chiefly sought after by the pearl fishers. The first is a kind of mussel chiefly found in the north end of the Red Sea. It produces pearls of a fine shape and excellent lustre, but seldom of that very fine color which enhances their price. The second kind, called pinna, is broad and semicircular at the top, and sharp at the hinge, the outside rough and red, the inside lined with mother of pearl. It produces pearls having the reddish cast of the inner shell of the pinna called mother of pearl; which confirms the opinion of Reaumur, that the pearls are formed from the glutinous fluid which makes the first rudiments of the shell; and this kind of pearl is found to be more red as it is formed nearer the broad part of the shell, which is redder than the other end. The third sort of shell resembles the oyster, and produces pearls of extreme whiteness. The value of these commodities depends upon their size, regularity of form, whether round or not, weight, smoothness, color, and the different shades of that color. The pearl fishers say that, when the shell is smooth and perfect, they never expect to find any pearls, but always do so when it has begun to be deformed and distorted. Hence M. Reaumur supposes that, as the fish becomes older, the vessels containing the juice for forming the shell, and keep-

ing it in its vigor, grow weak and ruptured; and thence, from this juice accumulating in the fish, the pearl is formed, and the shell brought to decay.

He observes that pearls are formed like other stones in the animals; as those, e. gr. in the bladder, kidneys, &c., and that they are apparently the effects of a disease of the fish. In effect, they are all formed of a juice extravasated out of some broken vessels, and detained, and fixed among the membranes. To evince the possibility of this, M. Reaumur shows that the shells of sea-fish, as well as those of snails, &c., are wholly formed of a glutinous stony matter, oozing out of the body of the animal. Now it is no wonder that an animal which has vessels wherein circulates a sufficient quantity of stony juice to build, thicken, and extend a shell, should have enough to form stones also, in case the juice, destined for the growth of the shell, shall chance to overflow, and burst forth in any cavity of the body, or among the membranes.

To confirm this system, he observes, that the inner surface of the common pearl-mussel, found on the coasts of Provence, is of a pearl, or mother-of-pearl color, from one part of its extent, which he determines, to another; after which it becomes reddish: now there are pearls of two colors found in the shell; and the colors of the pearls are precisely the same with those of the shell; nay, more, each kind of colored pearl is found in the corresponding colored part of the shell; which shows that, in the same place wherein the transpiration of a certain juice had formed, and would have continued to form a coat or layer of shell of a certain color; the vessels which conveyed that juice being broken, there is formed a little mass or collection of the juice, which, hardening, becomes a pearl of the same color with the part of the shell to which it corresponds.

Add to this, that the silver, or pearl-colored part of the shell, is formed of strata, or layers, over one another, like an onion; and the reddish part of little cylindrical short fibres applied against one another. The pearls of the two colors have also this difference of texture; not but they are both composed of concentric couches; but those of the reddish pearls are much less sensible; and, besides, they have threads, which, like radii, proceed from their centre to their circumference. These circumstances seem effectually to determine the formation of pearls.

The extravasations above-mentioned may be caused by heterogeneous bodies, such as sand coming in with the food, which the animal covers with its glutinous matter, to prevent disagreeable friction, and which, as it is successively secreted, forms many regular lamellæ, in the manner of the coats of an onion, or like different strata of bezoars, only much thinner; this is probable, for if we cut through the centre of a pearl, we often find a foreign particle, which ought to be considered as the nucleus, or primary cause of its formation. The loose pearls may originally have been produced within the body, and on their increase may have separated and fallen into the cavity of the shell. Those compact ones, fixed to the shells, seem to be produced by similar ex-

travasation, occasioned by the friction of some roughness on the inside of the shell. These and the pearl-like nodes have a different aspect from the pearls, and are of a darker and bluer color. The art of forcing shell-fish to produce pearls was known, in the first centuries of the Christian era, to the inhabitants of the coasts of the Red Sea, as we are told by the philosopher Apollonius (Philostrat. in Vita Apollon. lib. iii. c. 57, edit. Olearii, p. 139), who thought that circumstance worthy of particular notice. The process employed by the Chinese at present, to cause a certain kind of mussels to form pearls, seems to confirm the account given by Philostratus. In the beginning of the summer, at the time when the mussels repair to the surface of the water and open their shells, five or six small beads, made of mother-of-pearl, and strung on a thread, are thrown into each of them. At the end of two years when the mussels are drawn up and opened, the beads are found covered with a pearly crust, in such a manner that they have a perfect resemblance to real pearls. The truth of this information cannot be doubted, though some experiments made in Bohemia for the same purpose were not attended with success. It has been confirmed by various persons, and it is very probable, that some operations and secrets, without which the process would prove fruitless even in China, may be unknown to the Europeans. Professor Fabricius says, that he saw in the possession of Sir Joseph Banks, in London, large chamsa, brought from China, in which there were several bits of iron wire, incrustated with a substance of a perfect pearly nature. These bits of wire, he said, had been sharp, and it appeared as if the mussels, to secure themselves against the points of the wire, had covered them with this substance, by which means they had been rendered blunt.

The celebrated Linné informed the king and council of Sweden, in the year 1761, that he had discovered an art by which mussels might be made to produce pearls, and he offered to disclose the method for the benefit of the kingdom. This however was not done, but he disposed of his secret to one Bagge, a merchant at Gottenburg, for the sum of 18,000 copper dollars, which make about 500 ducats.

The most complete account of the artificial formation of pearls with which we have met was furnished by a gentleman to the Edinburgh Philosophical Journal, and from which our limits will allow but a short extract.

‘Pearls, in general,’ says our author, ‘take the color of the shell in which they are formed, being nothing else than the substance of the shell disposed in concentric layers, and tending more or less to a spherical form. From the great number of small pearls which I have frequently collected from the small sea-mussel (*Mytilus edulis*) so common in the streets of London, I find that there is no part of the flesh of this animal in which pearls do not occur. The natural expenditure of the substance which forms the pearl is only for the purpose of producing the shell or testaceous covering of the shell-fish; but various causes producing wounds in the animal, or otherwise irritating it, will produce a secretion of the

shelly matter to defend the injured part; and however sharp or angular the offending substance may be, it by degrees assumes a round form, in proportion as it is covered by a greater number of coats. The assertion advanced by Linné, and repeated in some works, that the Chinese have a mode of producing by art real pearls in the living shell-fish, though in general little credited, seemed to me so feasible, that I was led to attempt a similar experiment, which I tried upon the large mussel of our ponds (*anodonta cygnea*), being the only convenient shell-fish which I could command in the central parts of England. I procured, therefore, the largest of these, from five to six inches long, from the duke of Marlborough's water of Blenheim; but, although the vigor of the animals promised me success, several of them died. I shall only relate what happened in the surviving ones.

I drilled several holes in the most convex part of these shells, and introduced brass wires of two-thirds of a line in diameter. These wires had a sharp point, and were fixed in the shell in the way of cramps; some were disposed in strait lines, and others in such artificial forms as to show plainly that the pearls so produced, if the experiment should succeed, were the work of design, and not the unmolested operation of nature. One of these which, I believe, is still preserved in the Anatomical School at Christ Church in Oxford is an indisputable proof of this, the points forming the initial letters of my name. I let them down in a wooden box, perforated with holes, and loaded with a weight, into the River Isis; and, on examining them a few months after, I found some of them dead, and, it is probable, they died very soon after the operation, as the brass-points remained perfectly naked. I returned the living ones into the water, and took them up at the expiration of eighteen months from the operation. I then killed the animal, in order to examine the shell, and I found, in one instance, the points of the wires fairly covered with a calcareous substance, rather coarser than the inside of the shell, which circumstance was probably owing to the more hasty deposition of the earthy matter, which, therefore, wanted the compactness and the pearly color of the inner layer of the shell. Instead of points, the wires were now terminated by a round head, and the fish having survived is a proof that it was sufficiently defended from the injury which it must at first have received. On examining other shells, I found the points of the wires, which projected at least two lines within the shell, covered only with a mucous substance, which, however, preserved a rounded form; so that these, also, resembled the heads of large pins.

These experiments I made many years ago, and, more lately, I commenced others of a similar nature, but better planned, introducing, in place of pointed wires, round beads of different materials, through holes in the shell. These beads were of glass, steel, &c., and, from their form, I supposed would produce less irritation, and afford a fairer surface for the adventitious earthy matter. What I here attempted by art is not unfrequently produced by nature herself. I have two scallop-shells (the flat shell), the inner

surface of which is very thick, and set with extremely minute points of the substance of the shell, which, it appears, the animal had, in this instance, also produced in its own defence in order to guard itself against the invasion of a species of boring molluscous animal, which had made its way through the outer layers of the shell, and was proceeding inwards, so as to oblige the animal to secure in many points its inner wall against the invader.

In the museum of the College of Surgeons are some artificial pearls of a very fine water, and nearly orbicular; their base is supported by a small process, which separates at the end into short diverging processes, which stand off at right angles to the central rib. On more minute examination, it appeared that these pearls were produced by there being introduced between the mantle of the animal (while yet alive) and the shell, a small piece of silver wire, bent into a peculiar form, that is to say, so as to form a right angle, with one arm ending in two diverging processes, so as to make the simple end always to keep its erect position. These wires must be introduced in the same manner as the semi-orbicular pieces of mother-of-pearl in the other method of forming artificial pearls, as there is no appearance of any external injury. The pearls are solid, and nearly orbicular, with a small pedicle, which is continued so as to entirely cover the wire.

In the British Museum there is, or was, a famous pink pearl, of a respectable size, and of an oval form: probably produced by one of the large West India conchs. In the waters in Scotland between Perth and Auchtermuchty the mussels afford green pearls: the blue pearls from Montrose are also radiated in their texture, though extremely dense, so that the radii are invisible to the naked eye.

That pearls are calcareous is inferred from Cleopatra's having been able to dissolve hers in vinegar, and by these means to gain a wager from her lover, as we are told by Pliny and Macrobius. She must, however, have employed stronger vinegar than that which we use for our tables, as the pearls, on account of their hardness and their natural enamel, cannot be easily dissolved by a weak acid. Cleopatra, perhaps, broke and pounded the pearls; and it is probable that she afterwards diluted the vinegar with water, that she might be able to drink it; though dissolved calx destroys acids and renders them imperceptible to the tongue. We are told that the dissipated Ciodius gave to each of his guests a pearl dissolved in vinegar to drink; 'ut expeiretur in gloria palati,' says Pliny, 'quid sapient margaritæ; atque ut mirè placuere, ne solus hoc sciret, singulos unione convivi absorbendos dedit.' Horace says the same. The entertainment we should imagine to have been more costly than agreeable. Caligula, also, 'margaritas pretiosissimas aceto liquefactas sorbebat.' That pearls are soluble in vinegar is remarked by Pausanias and Vitruvius.

The oriental pearls are the finest, on account of their largeness, color, and beauty, being of a silver white; whereas the occidental pearls seldom exceed the color of milk. In Europe pearls

are sold by the carat-weight, the carat containing four grains. In Asia the weights used for pearls are different states. The value of pearls increases as the square of their weight.

PEARL FISHERIES. There are many rivers, great and small, in Eastern Tartary, considerable for pearl fishery; but these pearls, though much esteemed by the Tartars, would be little valued by Europeans, on account of their defects in shape and color. The emperor Kang-hi had several chaplets or strings of these pearls, each containing 100, which were very large, and exactly matched. There are many rivulets in Livonia which produce pearls almost equal in size and clearness to the oriental ones. There are several fisheries both on the east and west coasts of Africa; the most considerable of which lie round some small islands near Sofala; but the people thus employed, instead of exposing the oysters to the warmth of the sun, which would induce them to open, lay them upon the embers; by which absurd method those pearls which they catch contract a dull kind of redness, which robs them of their natural lustre as well as of their value. In the sea of California also there are very rich pearl fisheries. The most esteemed pearls are those of Asia and the east coast of Africa. In Japan likewise there are found pearls of great price. Pearls are met with in all parts of the Red Sea, in the Indian Ocean, on the low part of the coast of Arabia Felix named Baharen, adjoining to the Persian Gulf. They are likewise found on the low coast about Gombroon east of the Persian Gulf; and many of the finest kind are met with on the coast of Ceylon. They are most plentiful in the Baharen, between the coast of Arabia Felix and Ormus, whence they are transported to Aleppo, then sent to Leghorn, and then circulated through Europe. In Scotland, especially to the northward, in all rivers running from lakes, there are found mussels that have pearls though seldom of large size.

In Ceylon the first business, previous to the commencement of the fishery, is to survey the different oyster banks, to ascertain the state of the oysters, and to make a report on the subject to government. If the quantity is found to be sufficient, and in a proper state of maturity, the particular banks to be fished that year are put up for sale to the highest bidder, and are usually purchased by a black merchant. Sometimes the government deems it more advantageous to fish the banks on its own account, and to dispose of the pearls afterwards to the merchants. When this plan is adopted, boats are hired for the season on account of government from different quarters, at a variable price, but usually from 500 to 800 pagodas for each boat. As it would not be expedient to fish the whole of the banks in one year, they are divided into three or four different portions, one portion of which is fished annually in succession. By this contrivance a sufficient interval is allowed for the oysters to attain their proper growth; and as the portion first used generally recovers its maturity by the time the last portion has been fished, the fishery becomes almost regularly annual. The oysters are supposed to attain their highest state of maturity in seven years; for, if they be left too

long, the pearls become so large and so disagreeable to the fishes, that they vomit and throw them out of the shell.

The fishing season commences in February, and ends about the beginning of April. The period allowed the merchant for fishing the banks is six weeks, or at the most two months; but the interruptions that occur prevent the fishing days from exceeding more than about thirty. In a bad season, the purchaser of the fishery is allowed a few days more as a favor. There are two seasons for pearl-fishing: the first is in March and April, and the last in August and September; and the more rain there falls in the year, the more plentiful are these fisheries. At the beginning of the season there are sometimes 250 barks on the banks: the larger barks have two divers; and the smaller, one. As soon as the barks arrive at the place where the fish lie, and have cast anchor, each diver binds a large stone under his body; which serves him as ballast, prevents his being driven away by the motion of the water, and enables him to walk more steadily under the waves. They also tie another very heavy stone to one foot, by which they are very speedily sent to the bottom of the sea; and as the oysters are usually firmly fastened to the rocks, they arm their hands with leather mittens, to prevent their being wounded in pulling them violently off; but this task some perform with an iron rake. Each diver carries down with him a large net in the manner of a sack, tied to his neck by a long cord, the other end of which is fastened to the side of the bark. This net is to hold the oysters gathered from the rock, and the cord is to pull up the diver when his bag is full, or when he wants air. In this equipage he sometimes precipitates himself sixty feet under water; and, as he has no time to lose, he no sooner arrives at the bottom, than he begins to run from side to side, tearing up all the oysters he meets with, and cramming them into his budget. The exertion undergone during this process is so violent, that, upon being brought into the boat, the divers discharge water from their mouths, ears, and nostrils, and frequently even blood. But this does not hinder them from going down again in their turn. They will often make from forty to fifty plunges in one day; and at each plunge bring up about 100 oysters. Some rub their bodies over with oil, and stuff their ears and noses to prevent the water from entering; while others use no precaution whatever. Although the usual time for remaining under water does not much exceed two minutes, yet there are instances known of divers who could remain four and even five minutes. The longest instance ever known was that of a diver who came from Anjanga in 1797, and who absolutely remained under water full six minutes.

The appearance of a single shark is sufficient to spread dismay among the whole body of divers; for as soon as one of them sees a shark he instantly gives the alarm to his companions, who as quickly communicate it to the other boats; a panic speedily seizes the whole, and they often return to the bay without fishing any more for that day. The sharks which create all this alarm sometimes turn out to be nothing

more than a sharp stone on which the divers happen to alight. As false alarms excited in this manner prove very injurious to the progress of the fishery, every means is employed to ascertain whether they are well or ill founded; and, if the latter be the case, the authors of them are punished. When they find themselves strained, they pull the rope to which the bag is fastened, and hold fast by it with both hands; when those in the bark, taking the signal, heave them up into the air, and unload them of their fish; which is sometimes 500 oysters, and sometimes not above fifty. Most of the divers need a short respite to recover breath; others jump in again instantly, continuing this violent exercise for several hours. On the shore they unload their barks, and lay their oysters in a vast number of little pits dug in the sand, four or five feet square, raising heaps of sand over them to the height of a man; and in this condition they are left till the rain, wind, and sun, have obliged them to open, which soon kills them: upon this the flesh rots and dries, and the pearls, thus disengaged, fall into the pit on their taking out the shells. After clearing the pits of the grosser filth, they sift the sand several times in order to find the pearl: but, whatever care they take, they always lose some. After cleaning and drying the pearls, they are passed through a kind of sieve, according to their sizes; the smallest are then sold by weight as seed-pearls, and the rest put up to auction, and sold to the highest bidder. The divers are paid differently according to their private agreement with the boat-owners. They are paid either in money, or with a proportion of the oysters caught, which they take the chance of opening on their own account; the latter is the method most commonly adopted. The agreement with the people who hire out the boats is conducted much in the same manner. They contract either to receive a certain sum for the use of their boats, or pay the chief farmer of the banks a certain sum for permission to fish on their own account. Some of those who pursue the latter plan are very successful and become rich; while others are great losers by the speculation. Oyster lotteries are carried on here to a great extent; they consist of purchasing a quantity of the oysters unopened, and running the chance of either finding or not finding pearls in them. The European officers and gentlemen, who attend here upon duty or through curiosity, are particularly fond of these lotteries, and very frequently make purchases of this sort.

PEARLS, METHOD OF MAKING ARTIFICIAL.

Attempts have been made to take out stains from pearls, and to render the foul opaque colored ones equal in lustre to the oriental. Abundance of processes are given for this purpose in books of secrets and travels; but they are very far from answering what is expected from them. Pearls may be cleaned indeed from any external foulnesses by washing and rubbing them with a little Venice soap and warm water, or with ground rice and salt, with starch and powder blue, plaster of Paris, coral, white vitriol and tartar, cutler-bone, pumice-stone, and other similar substances; but a stain that reaches deep into the substance of pearls is impossible to be taken

out. Nor can a number of small pearls be united into a mass similar to an entire natural one, as some pretend. There are, however, methods of making artificial pearls, in such a manner as to be with difficulty distinguished from the oriental. The ingredient used for this purpose was long kept a secret; but it is now discovered to be a fine silver-like substance found upon the under side of the scales of the blay or bleak-fish. The scales, taken off in the usual manner, are washed and rubbed with fresh parcels of fair water, and the several liquors suffered to settle: the water being then poured off, the pearly matter remains at the bottom, of the consistence of oil. A little of this is dropped into a hollow bead of bluish glass, and shaken about so as to line the internal surface; after which the cavity is filled up with wax, to give solidity and weight. Pearls made in this manner are distinguishable from the natural only by their having fewer blemishes.

PEARL-ASH, a kind of fixed alkaline salt, prepared chiefly in America, Germany, Russia, and Poland, by melting the salts out of the ashes of burnt wood; and, having reduced them again to dryness, evaporating the moisture, and calcining them for a considerable time in a furnace moderately hot. The goodness of pearl ashes must be distinguished by the uniform and white appearance of them: they are nevertheless subject to a common adulteration, not easy to be distinguished by the mere appearance, which is done by the addition of common salt. In order to find out this fraud, take a small quantity of the suspected salt: and after it has been softened by lying in the air, put it over the fire in a shovel: if it contains any common salt, a crackling and a kind of slight explosion will take place as the salt grows hot. Pearl-ashes are much used in the manufacture of glass, and require no preparation, except where very great transparency is required, as in the case of looking-glass, and the best kind of window-glass. For this purpose dissolve them in four times their weight of boiling water: when they are dissolved, let the solution be put into a clean tub, and suffered to remain there twenty-four hours or more. Let the clear part of the fluid be then decanted off from the sediment, and put back into the iron pot in which the solution was made; in this let the water be evaporated till the salts be left perfectly dry. Keep those that are not designed for immediate use in stone jars, well secured from moisture and air. Mr. Kirwan, who tried a course of experiments on the alkaline substances used in bleaching, &c., tells us, that in 100 parts of the Dantzic pearl-ash, the vegetable alkali amounted to somewhat above sixty-three. His pearl-ash he prepared by calcining a lie of vegetable ashes dried into a salt to whiteness. In this operation, he says, 'particular care should be taken that it should not melt, as the extractive matter would not be thoroughly consumed, and the alkali would form such a union with the earthy parts as could not easily be dissolved.'

PEARL, MOTHER OF, the shell, not of the pearl oyster, but of the *mytilus margaritiferus*. The most beautiful shell of this kind is that of the pinna: but it is too brittle to be employed in any large pieces of workmanship; whence that

kind named *dora* is most usually employed; and great quantities of this are daily brought from the Red Sea to Jerusalem.

PEARL ISLANDS, small islands of the gulf of Panama, where there was formerly a pearl fishery; the slaves belonging to Panama being employed to dive for pearls. This fishery is now of little importance; but the islands produce abundance of maize, plantains, fish, and game. Forty-five miles from the city of Panama.

PEARL ISLAND, a small island of the West Indies, in long. 79° 13' W., and lat. 14° 53' N.

PEARSON (Margaret Eglington), an ingenious lady, was the daughter of Mr. Samuel Paterson, so well known as a literary auctioneer, and an author of no little merit. She married an artist by the name of Pearson, and resided at Hampstead, where they carried on the art of painting on glass to a high degree of perfection. Mrs. Pearson excelled all her contemporaries in this line, and the two sets from the cartoons of Raphael, executed by her for the late marquis of Lansdowne, and Sir Gregory Page Turner, are full evidence of her extraordinary merit. She died February 14th 1823.

PEARSON (Edward), D.D., a learned and amiable divine, was born on the 25th of October, 1756, in the city of Norwich. He was never placed at any public school, but derived all early education from private instruction, and his own assiduity. In 1778 he was entered at Sidney Sussex College, Cambridge; and proceeded to the degree of B.A. 1782; and M.A., 1785. In 1786 he obtained the Norrisian prize, for an Essay on the Goodness of God, as manifested in the Mission of Jesus Christ, which was soon afterwards published, in conformity to the will of the founder. In 1792 he took the degree of B.D., and during a considerable period Mr. Pearson filled the situation of tutor to the college. In 1797 he was presented by his kind and esteemed friend, Dr. Elliston, the master, to the rectory of Rempstone, Nottinghamshire. In the same year he married Susan, the daughter of Richard Johnson, Esq., of Henrietta-Street, Covent Garden. In 1807 he was chosen, by the trustees, to preach the Warburtonian lectures at Lincoln's Inn, which he completed early in 1811. In 1808, on the death of Dr. Elliston, he was elected master of Sidney Sussex College, on which occasion he received, by royal mandate, the degree of D.D., and in the same year was appointed vice-chancellor. In 1810 he was elected by the university to the office of Christian advocate. The arduous duties connected with these various and important appointments had visibly affected his health, and whilst taking his customary walk in the garden of his parsonage, at Rempstone, he was suddenly attacked with an apoplectic seizure, from which he never recovered sufficiently to articulate; but expired on the 17th of August, 1811. The works of Dr. Pearson, besides that already mentioned, are the following: Discourses to Academic Youth; a Letter to a Member of the Senate of the University of Cambridge; and Remarks on the Theory of Morals. The Warburtonian Letters were also published, as well as several family prayers, written by him.

PEARSON (John), a learned English bishop, born at Snoring, in 1613. He was educated at Eton and Cambridge; entered into orders in 1639; and was made prebendary of Netherhaven in the church of Sarum. In 1640 he was appointed chaplain to the lord keeper Finch, and by him presented to Torrington in Suffolk. In 1650 he was made minister of St. Clement's, East Cheap, London. About 1660 he published in London *An Exposition of the Creed*, in folio; also *The Golden Remains of Mr. John Hales of Eton*; with a preface. In 1660 he was presented, by Juxon, bishop of London, to the rectory of St. Christopher's in that city; created D.D. at Cambridge; installed prebendary of Ely; archdeacon of Surry; and made master of Jesus College, Cambridge. March 25th 1661 he was appointed Margaret professor of divinity, and in 1662 one of the commissioners for the review of the liturgy. April 14th 1662 he was made master of Trinity College, Cambridge; and, in August, resigned his rectory of St. Christopher's and prebend of Sarum. In 1667 he was admitted F. R. S. In 1672 he published at Cambridge, in 4to., *Vindiciæ Epistolarum S. Ignatii*, in answer to M. Daillé; to which is subjoined, *Isaaci Vossii epistolæ duæ adversus Davidem Blondellum*. Pearson was appointed successor to bishop Wilkins in the see of Chester, February 9th 1672-3. In 1682 his *Annales Cyprianici, sive tredecim annorum, quibus S. Cyprian. inter Christianos versatus est, historia chronologica*, was published at Oxford, with Fell's edition of that Father's works. He died at Chester, July 16th 1686.

PEAR TREE. See **PYRUS**.

PEAS'ANT, *n. s.* } Fr. *païsan*; Ital. *pasano*;

PEAS'ANTRY. } Lat. *pagus*. A rustic; one whose business is rural labor: peasantry, a collective name for rustics; country people.

He holdeth himself a gentleman, and scorneth to work, which, he saith, is the life of a *peasant* or churl.

I had rather coin my heart, than wring
From the hard hands of *peasants* their vile trash.

Shakspeare.

How many then should cover, that stand bare!
How much low *peasantry* would then be gleaned
From the true seed of honour! how much honour
Pickt from the chaff!

Shakspeare. Merchant of Venice.

The poor *peasants* in the Alpine countries diversified themselves in the fields, and after their labour would be lively and brisk.

Brown's Travels.

The *peasantry* in France, under a much heavier pressure of want and poverty than the day-labourers of England of the reformed religion, understood it much better than those of a higher condition among us.

Locke.

'Tis difficult for us, who are bred up with the same infirmities about us with which we were born, to raise our thoughts and imaginations to those intellectual perfections that attended our nature in the time of innocence, as it is for a *peasant* bred up in the obscurities of a cottage to fancy in his mind the unseen splendours of a court.

South.

The citizens being two thousand men, with which they could make head against twelve thousand *peasants*.

Addison.

PEAS, in botany. See **PRISM**.

PEAT, *n. s.* Fr. *petit*. A fondling; a darling; a dear play thing; now commonly written *pet*.

A pretty *peat*! It is best but finger in the eye,
An she knew why.

Shakspeare. Taming of the Shrew.

A citizen and his wife

Both riding on one horse, upon the way
I overtook; the wench a pretty *peat*. *Donne.*

PEAT, *n. s.* Isl. *pyt*. A species of turf used for fuel.

Turf and *peat*, and cowsheards, are cheap fuels and last long.

Bacon's Natural History.

Carew, in his survey of Cornwall, mentions nuts found in *peat* earth two miles east of St. Michael's.

Woodward.

PEAT is a well-known inflammable substance, used in many parts of the world as fuel. There are two species, viz. 1. A yellowish brown or black *peat*, found in moorish grounds in Scotland, Holland, and Germany. When fresh it is of a viscid consistence, but hardens by exposure to the air. While soft, it is formed into oblong pieces for fuel, after the stony matters are separated. By distillation it yields water, acid, oil, and volatile alkali; the ashes containing a small proportion of fixed alkali; and being either white or red, according to the proportion of pyrites contained in the substance. The oil obtained from *peat* has a very pungent taste; and an empyreumatic smell, less fetid than that of animal substances, more so than that of mineral bitumens: it congeals in the cold into a pitchy mass, which liquefies in a small heat; it readily catches fire from a candle, but burns less vehemently than other oils, and immediately goes out upon removing the external flame; it dissolves almost totally in rectified spirit of wine into a dark brownish-red liquor. 2. The second species is found near Newbury in Berkshire. In the Philosophical Transactions we have the following accounting of this species:—*Peat* is a composition of the branches, twigs, leaves, and roots of trees, with grass, straw, plants, and weeds, which, having lain long in water, is formed into a mass so soft as to be cut through with a sharp spade. The color is a blackish brown, and it is used in many places for firing. There is a stratum of this *peat* on each side the Kennet, near Newbury in Berks, which is from a quarter to half a mile wide, and many miles long. The depth below the surface of the ground is from one foot to eight. Great numbers of entire trees are found lying irregularly in the true *peat*. They are chiefly oaks, alders, willows, and firs, and appear to have been torn up by the roots; many horses' heads, and bones of several kinds of deer, the horns of the antelope, the heads and tusks of boars, and the heads of beavers are also found in it. Some years ago an urn, of a light brown color, was found in the *peat*-pit in Speen Moor; near Newbury, at about ten feet from the river, and four feet below the level of the neighbouring ground. Just over the spot where the urn was found an artificial hill was raised about eight feet high; and, as this hill consisted both of *peat* and earth, it is evident that the *peat* was older than the urn. From the sides of the river, several semicircular ridges are drawn round the hill,

with trenches between them. The urn was broken to shivers by the peat-diggers who found it, so that it could not be critically examined. With peat also may be classed that substance called in England stone-turf; which hardens after its first exposure to the air, but afterwards crumbles down. The other common turf consists only of mould interwoven with the roots of vegetables; but when these roots are of the bulbous kind, or in large proportion, they form the worst kind of turf. 'Although it may appear incredible,' says M. Magellan, 'it is nevertheless a real fact, that, in England, peat turf is advantageously employed in Lancashire to smelt the iron ore of that county. Mr. Wilkinson, brother-in-law to Dr. Priestley, makes use of peat turf in his large smelting furnaces. I have seen in the possession of Mr. S. More, secretary to the Society of Arts, a kind of black tallow, extracted by the said Mr. Wilkinson from peat turf. It was very soft, and nearly of the same consistence with butter. It burnt very rapidly, with a smoaky flame, in the fire; but the smell was very disagreeable, like that of peat.' The great cause of the differences of peat most likely arises from the different mineral admixtures. Some sorts of peat yield, in burning, a very disagreeable smell, which extends to a great distance; whilst others are inoffensive. Some burn into gray or white, and others into red ferruginous ashes. The ashes yield, on elixation, a small quantity of alkaline salt, with sometimes one, and sometimes another salt of the neutral kind. The smoke of peats does not preserve or harden flesh like that of wood; and the soot into which it condenses is more disposed to liquefy in moist weather.

PEAT ASHES, properly burnt for a manure, are very useful both on corn and grass land; but the substance from which they should be got is an under stratum of the peat, where the fibres and roots of the earth, &c., are well decayed. Indeed the very best are procured from the lowest stratum of all. This will yield a large quantity of very strong ashes, in color (when first burnt) like vermilion, and in taste very salt and pungent. Great care and caution should be used in burning these ashes, and also in preserving them afterwards. The method of burning them is much the same as burning charcoal. The peat must be collected into a large heap, and covered so as not to flame out, but suffered to consume slowly, till the whole substance is burnt to an ash. The ashes thus burnt are held in most esteem; but the peat-ashes burnt in common firing, are in many places used for the same purposes. Peat ashes are excellent in sweetening sour meadow-land, destroying rushes, and other bad kinds of grass. They burn great quantities of peat-ashes in some parts of Berkshire, and Lancashire, and esteem them one of the best dressings for their spring crops. The sulphureous and saline particles, with which the ashes abound, have a most happy effect in promoting vegetation; and, if used with discretion, the increase procured by them is truly wonderful. All ashes are of a hot, fiery, caustic nature; they must, therefore, be used with caution. With respect to peat-ashes, almost the only danger proceeds from laying them on in too great quantities at improper seasons.

On wheat crops these ashes are of the greatest service, but they must be laid on with the utmost discretion. Were they to be spread in any quantity before winter, after the sowing the corn, they would make the wheat too rank, and do more harm than good; were the spreading this manure, on the contrary, deferred till spring, the corn could not possibly during the winter season be benefited by it. The beginning of November, before the hard frosts set in, seems to be the proper season for this purpose; and it is necessary to sow on every acre of heavy clayey wheat-land, about eight Winchester bushels of these ashes; on lighter warmer lands in wheat, four will be sufficient for this season. The winter dressing is thought by practical farmers to be of great service; trifling as the quantity may seem, it warms the root of the plant, brings it moderately forward, and preserves its verdure. About the end of February, or the beginning of March, on heavy lands in wheat, another dressing of ashes, by sowing of them on every acre eight bushels more will do much good; on light lands, in the second dressing, six bushels may be allowed. These ashes laid on in the spring are of the greatest service, without any probability of danger; if rain falls a few days after the dressing is laid on it is washed in, and has a happy effect on the succeeding crop, co-operating with the manure that was laid on in November; if, on the contrary, dry weather for a long continuance succeeds, the first winter dressing has its full effect, and the quantity laid on in the spring is in fact so small, that there is very little probability of its burning or hurting the crop. This excellent manure is also of great use in the turnip husbandry, particularly as it much contributes to preserve the young crop from being devoured by the fly. But one of the principal advantages derived from these ashes is the very great service they are of to every kind of artificial pasture. Saintfoin receives great benefit from this manure, and so does clover, rye-grass, and trefoil, provided it is laid on with discretion: the proper season is about February. The quantity must be regulated by the nature of the crop and soil; but it ought scarcely in any instance to exceed thirty Winchester bushels. Clover, with the help of this manure, grows with great luxuriance, insomuch that there have often been two large crops of hay from the same field in a year, and good autumn seed afterwards. They have an excellent effect on tares or vetches: to peas they seem to be hurtful. The effects of this manure will be visible at least three years; nor does it leave the land in an impoverished state, when its virtues are exhausted and spent. Peat-ashes are not, however, so certain a manure for barley and oats as for winter corn; for, as these are quick growers, and occupy the land but a few months, this warm manure is often apt to push them forward too fast, and make them run too much to coarse straw, yielding only a lean immature grain. Oats, however, are not so apt to be damaged by it as barley. Peat-ashes approach, in their effects on the several crops on which they are laid, to coal soot; but two-thirds of the quantity that is used of soot will be sufficient of the ashes, as they are in a much stronger

degree impregnated with a vegetative power; and they are besides in most places easier procured in quantities, and at a cheaper rate.

PEBBLE, *n. s.* } Sax. *pæbol*, *pæbol*-*ana*,
PEBBLESTONE. } as Mr. Thomson suggests
PEBBLED, *adj.* } from Goth. *boll*. A hard,
PEBBLY. } small, and generally round
stone, found among flints, in a homogeneous mass, though sometimes of many colors. Particularly, any small stone: pebbled and pebbly, abounding in pebbles.

Through the midst of it ran a sweet brook, which did both hold the eye open with her azure streams, and yet seek to close the eye with the purling noise it made upon the *pebble-stones* it ran over.

Sidney.

The bishop and the duke of Glo'ster's men,
Forbidden late to carry any weapon,
Have filled their pockets full of *pebble-stones*.

Shakespeare.

Suddenly a file of boys delivered such a shower of *pebbles* loose shot, that I was fain to draw mine honour in.

Id.

You may see *pebbles* gathered together, and a crust of cement between them, as hard as the *pebbles*.

Bacon.

Collecting toys,
As children gath'ring *pebbles* on the shore. *Milton.*
Winds murmured through the leaves your long delay;

And fountains o'er the *pebbles* chid your stay.

Dryden.

Another body, that hath only the resemblance of an ordinary *pebble*, shall yield a metallic and valuable matter.

Woodward.

The crystal, in form of nodules, is found lodged in the earthy strata left in a train by the water departing at the conclusion of the deluge: this sort, called by the lapidaries *pebbles-crystal*, is in shape irregular.

Id.

This bank fair spreading in a *pebbled* shore.

Thomson.

Strowed bibulous above I see the sands,
The *pebbly* gravel next.

Id.

Once more, O Trent! along thy *pebbly* marge,
A pensive invalid, reduced and pale,
From the close sick-room newly let at large,
Woos to his wan-worn cheek the pleasant gale.

Kirk White.

PEBBLES, in mineralogy, are a genus of fossils, distinguished from the flints by their having a variety of colors. These are defined to be stones composed of a crystalline matter debased by earths of various kinds in the same species, and then subject to veins, clouds, and other variegations, usually formed by incrustation round a central nucleus, but sometimes the effect of a simple concretion; and veined like the agates, by the disposition which the motion of the fluid they were formed in gave their differently-colored substances. The variety of pebbles is so great that a hasty describer would be apt to make almost as many species as he saw specimens. A careful examination will teach us, however, to distinguish them into a certain number of essentially different species, to which all the rest may be referred as accidental varieties. In all the strata of pebbles there are constantly found some which are broken, and of which the pieces lie very near one another; but, as bodies of such hardness could not be broken without some considerable violence, their present situation seems

to indicate that they have suffered that great violence in or near the places where they now lie. Several of these broken pebbles have their edges and corners so sharp and even that it seems evident they never can have been tossed about or removed since the fracture was made; and others have their sides and corners so rounded, blunted, and worn away, that they seem to have been roughly moved and rolled about among other hard bodies, either with great violence, or for a very long continuance; since such hard bodies could not have been reduced to the condition in which we now see them without long friction. See MINERALOGY and GEOLOGY.

PECCABLE, *adj.* } All from Lat. *pecco*.
PECCABIL'ITY, *n. s.* } Liable to sin or error:
PECCADIL'LO, } peccability, state of being
PECCANCY, } so liable: peccadillo
PECCANT, *adj.* } (Span. *peccadillo*)
a small or slight fault or crime: peccancy, faultiness; criminality; bad quality: peccant, faulty; guilty; deficient; ill-disposed.

Where the common *peccability* of mankind is urged to induce commiseration towards the offenders: if this be of force in sin, where the concurrence of the will renders the person more inexcusable, it will surely hold much more in bare error which is purely involuntary.

Decay of Piety.

The wicked are only in the body of the church, as peccant humours, and excrements, and hair, and putrefaction.

Jer. Taylor.

From them I will not hide

My judgments, how with mankind I proceed;
As how with peccant angels late they saw.

Milton.

He means those little vices which we call follies and the defects of the human understanding, or at most the *peccadillos* of life, rather than the tragical vices to which men are hurried by their unruly passions.

Dryden.

With laxatives preserve your body sound,

And purge the peccant humours that abound. *Id.*
That such a peccant creature should disapprove and repent of every violation of the rules of just and honest, this right reason could not but infer.

South's Sermons.

Nor is the party cited bound to appear, if the citation be peccant in form or matter.

Ayliffe.

'Tis low ebb with his accusers, when such *peccadillos* as these are put in to swell the charge.

Atterbury.

Such as have the bile peccant or de ciant are relieved by bitters, which are a sort of subsidiary gall.

Arbutnot.

Apply refrigerants without any preceding evacuation, because the disease took its original merely from the dissection of the part, and not from the peccancy of the humours.

Wiseman.

PECHANTRE (Nicholas), a French poet, the son of a surgeon at Toulouse, where he was born in 1638. He wrote poems in Latin and French, for which he was thrice crowned by the academy des Jeux Floraux. He also wrote a tragedy entitled Geta, which was acted at Paris in 1687, with great applause. He died in 1708.

PECK, *n. s.* From *pocca*, or perhaps from *pat*, a vessel. Skinner. Rather from Arm. *pech* (a fourth part) from *pechwar*, four. A measure containing the fourth part of a bushel.

Her finger was so small, the ring
Would not stay on which they did bring;

It was too wide a *peck* ;
 It looked the great collar just
 About our young colt's neck. *Suckling.*
 Burn our vessels, like a new
 Sealed *peck* or bushel, for being true. *Hudibras.*
 To every hill of ashes, some put a *peck* of un-
 slacked lime, which they cover with the ashes till
 rain slacks the lime and then they spread them.
Mortimer's Husbandry.

He drove about his turnips in a cart ;
 And from the same machine sold *pecks* of pease.
King.

PECK, *v. a.* } Fr. *becquer* ; Belg. *bicken* ;
 PECKER, *n. s.* } Span. *pecan* ; Port. *bicar* ; or
 from Sax. *becca*, a BEAK, which see. To strike
 with the beak ; to pick up food with the beak ;
 strike with any pointed instrument ; pick up
 slanderous tales.

With a pick axe of iron about sixteen inches long,
 sharpened at the one end to *peck*, and flat-headed at
 the other to drive little iron wedges to cleave rocks.
Carew's Survey of Cornwall.

She was his only joy, and he her pride,
 She, when he walked, went *pecking* by his side.
Dryden.

The titmouse and the *peckers* hungry brood,
 And Progne with her bosom stained in blood. *Id.*
 They will make head against a common enemy,
 whereas mankind lie *pecking* at one another till they
 are torn to pieces. *L'Estrange.*

Two country factions, both inveterate enemies of
 our church, which they are perpetually *pecking* and
 striking at with the same malice. *South.*

Can any thing be more surprising than to con-
 sider Cicero observing, with a religious attention, after
 what manner the chickens *pecked* the grains of corn
 thrown them ? *Addison.*

The worstiest people are most injured by slander,
 as we usually find that to be the best fruit which the
 birds have been *pecking* at. *Swift.*

The worm, more expensively fed,
 The pride of the garden devours ;
 And birds *peck* the seed from the bed,
 Still less to be spared than the flowers.
Cowper.

PECK (Francis), was born at Stamford, in
 Lincolnshire, May 4th, 1692, and educated at
 Cambridge where he took the degrees of B. A. and
 M. A. He was appointed rector of Godeby,
 near Melton in Leicestershire. He was the
 author of many works, viz.:—1. A Poem, en-
 titled Sighs on the Death of Queen Anne ;
 1714. 2. TO ΥΠΟΘΕΣΙΣ, or an Exercise on
 the Creation, and a Hymn to the Creator of the
 World ; 1716, 8vo. 3. In 1721, being then
 curate of King's Cliff in Northamptonshire, he
 issued proposals for printing the History and
 Antiquities of his native town, which was pub-
 lished in 1727, in folio, under the title of Aca-
 demia tertia Anglicana ; or the Antiquarian
 Annals of Stamford in Lincoln, Rutland, and
 Northampton shires ; containing the History of
 the university, monasteries, guilds, churches,
 chapels, hospitals, and schools there, &c., in-
 scribed to John duke of Rutland. 4. The His-
 tory of the Stamford Bull-running. 5. In 1732
 he published vol. I. of Desiderata Curiosa ; or
 a Collection of divers scarce and curious
 Pieces, relating chiefly to matters of English
 History ; consisting of choice tracts, memoirs,
 letters, &c., transcribed, many of them from the
 originals, and the rest from divers ancient MS.

copies, or the MS. collations of sundry famous
 antiquaries, &c. This volume was dedicated to
 lord William Manners, and was followed, in
 1735, by a second volume, dedicated to Dr.
 Reynolds, bishop of Lincoln. 6. A Complete
 Catalogue of all the Discourses written both for
 and against popery in the time of king James
 II., containing an account of 457 books and
 pamphlets, &c., 4to. 1735. 7. Nineteen Letters
 of the Rev. Henry Hammond, D. D., to Mr.
 Peter Stainnough and Dr. Nathaniel Angelo, on
 curious subjects, &c., 1739. 8. Memoirs of the
 Life and Actions of Oliver Cromwell, as de-
 livered in three panegyrics of him written in
 Latin, supposed by Mr. John Milton ; with an
 English version ; illustrated with a large histori-
 cal preface and notes, &c., 1740, 4to. 9. New
 Memoirs of the Life and Poetical Works of Mr.
 John Milton.

PECK'LED, *adj.* Corrupted from speckled.
 Spotted : varied with spots.

Some are *peckled*, some greenish.

Walton's Angler.

PECKWELL (Henry), D. D., a divine of the
 church of England, born in 1747. He was
 chaplain to the marchioness of Lothian, and
 rector of Bloxham in Lincolnshire ; but attached
 himself to the Calvinistic Methodists, among
 whom he was very popular. He patronised the
 Humane Society, and the society for the relief
 of persons imprisoned for small debts. He
 studied physic, and founded a society for visit-
 ing the sick at their own houses ; but fell a
 sacrifice to his philanthropy, by wounding him-
 self in the hand, while opening the body of a
 patient who had died of a putrid fever. The
 part mortified, and he died August 18th 1787.
 He printed several sermons.

PECORA, in zoology, the fifth order of the
 class mammalia, in the Linnæan system. See
 ZOOLOGY.

PECQUET (Anthony), a celebrated French
 philosopher, born in 1704. He was appointed
 grand master of the water-works and forests of
 Rouen. His writings on philosophy, politics,
 and morals, are numerous. His Spirit of Law
 and of Political Maxims, and his Thoughts on
 Man, are most esteemed. He died in 1762.

PECQUET (John), a celebrated physician born
 in Dieppe. He was physician in ordinary to
 the celebrated Fouquet, whom he entertained
 with experiments in natural philosophy. He
 acquired immortal honor by the discovery of a
 lacteal vein, which conveys the chyle to the
 heart ; and which from him is called le Reser-
 voir de Pecquet. This discovery was a fresh
 proof of the truth of the circulation of the
 blood ; though it was opposed by many of the
 learned, particularly the famous Riolaui, who
 wrote a treatise against the author of it, with
 this title : Adversus Pecquetum et Pecquetianos.
 Pecquet's works are, 1. Experimenta nova
 Anatomica ; Paris, 1654. 2. A Dissertation,
 De Thoracis Lacteis ; Amsterdam, 1661. He
 was a man of a lively and active genius. He
 recommended, as a remedy for many diseases,
 the use of brandy. The use of this remedy,
 however, contributed to shorten his own days.
 He died at Paris, in 1674.

PECTEN, the scallop, a genus of shell-fish. The characters are these:—the animal is a *tethys*; the shell bivalve and unequal; the hinge toothless, having a small ovated hollow. This shell fish is one of the spinners, having the power of spinning threads like the mussels; but they are much shorter and coarser than those of that fish. The use of the threads which are spun upon the scallop is to fix the creature to any solid body near its shell. All these proceed, as in the mussel, from one common tree. It is an evident proof that the fish has a power of fixing itself at pleasure to any solid body by means of these threads, that after storms the scallops are often found tossed upon rocks where there were none the day before; and yet these are fixed by their threads, as well as those which had remained long in their place. They form their threads in the same manner with the mussel; only their organ for spinning is shorter, and has a wider hollow, whence the threads are necessarily thicker and shorter. The pecten, such as the sole pecten, the ducal mantle pecten, the knotted, and others, seem to be in general inhabitants of the Indian Seas; some of them frequent those of Africa and the South Seas. The name pecten seems to have been given to these animals from the longitudinal striæ with which their surface is covered, which resemble somewhat the teeth of a comb; and hence also the Greek name *κτεν*. By the general character of this shell, it evidently includes cockles as well as scallops, which are the pectens without ears, and having less flat or elated shells. Cockles are called by all authors by a name which is only a diminutive of pecten, pectunculus. The having ears indeed is the common mark of distinction between the pectens and the cockles, which last usually have none. The pectens by some are esteemed as delicious a food as the oyster. They differ very materially in a variety of circumstances. The pectens sail on the surface of the water; and, if attacked by a foe, they let down the membrane which nature has provided them for a sail, and drop to the bottom. ‘Behold,’ says Barbut, ‘the splendor of the pectines, which rival the glowing colors of the papilionaceous tribe, as numerous as they are beautiful, flirting from place to place, and may well be called the papiliones of the ocean. What superior qualities does not the pecten enjoy above the ostrea edulis, which, constantly confined to its native bed, seems wholly destined to afford food for other creatures, not having any means of defence but its shelly castle, which is often attacked and stormed by its numerous enemies?’ The grand mark of distinction between the pectens and oyster seems to be the locomotive faculty. It was long supposed that the oyster possessed no power of motion, that it always remained in the place in which nature or accident had placed it, and that its life differed little from that of vegetables. Experience, however, has taught us to reject these premature conclusions. See **OSTREA**. The most remarkable species is, the

P. maximus, or great scallop, being the same with what Barbut calls the ducal-mantle pecten. It has fourteen rays, very prominent and broad,

and striated both above and below. They are rugged and imbricated with scales. They grow to a large size, and are found in beds by themselves; are dredged up and barrelled for sale. The ancients say that they have a power of removing themselves from place to place by vast springs or leaps. The fish was used both by the Greeks and Latins as a food. When dressed with pepper and cummin, it was taken medicinally. The scallop was formerly worn by pilgrims on their hat, or the cape of their coat, as a mark that they had crossed the sea in their way to the Holy Land, or some distant object of devotion.

PECTINAL, *n. s.* } Lat. *pecten*. A comb:
PECTINATED, *adj.* } comb-like: state of be-
PECTINATION, *n. s.* } ing pectinated.

There are other fishes whose eyes regard the heavens, as plain and cartilaginous fishes, as *pectinals*, or such as have their bones made laterally like a comb.

Browne.

The complication or *pectination* of the fingers was an hieroglyphic of impediment.

Id.

To sit cross-legged or with our fingers *pectinated*, is accounted bad.

Id. Vulgar Errors.

PECTIS, in botany, a genus of the polygamia superflua order, and syngenesia class of plants; natural order forty-ninth, composite.

PECTORAL, *adj. & n. s.* Lat. *pectoralis*. Belonging to the breast: forming the name of a breast-plate.

Being troubled with a cough, *pectorals* were prescribed, and he was thereby relieved. *Wiseman.*

PECTORAL, a sacerdotal vestment, worn by the Jewish high-priest. The Jews call it *Hoshchen*, the Greeks *λογιον*, the Latins *rationale* and *pectorale*, and in our version of the Bible it is called breast-plate. It was about a span square.

PECTORALE, a breast-plate of thin brass, about twelve fingers square, worn by the poorer soldiers in the Roman army, who were rated under 1000 drachmæ. See **LORICA**.

PECULATION, or **PECULATE**, in civil law, the crime of embezzling the public money, by a person intrusted with the receipt, management, or custody thereof.

PECU'LIAR, *adj. & n. s.* } Fr. *pecule*; Lat.
PECULIAR'ITY, *n. s.* } *peculiaris*, *pecu-*
PECULIARLY. } *lium*. Appropriate; belonging exclusively to one; particular; sole: as a noun substantive the exclusive property of one; something exempt from ordinary jurisdiction: peculiarity is, particularity; that which is found only in one; oddity; peculiarly follows the senses of peculiar as an adjective.

Some *peculiar*s exempt from the jurisdiction of the bishops.

Lesley.

The only sacred hymns they are that Christianity hath *peculiar* unto itself, the other being songs too of praise and of thanksgiving, but songs wherewith as we serve God, so the Jews likewise.

Hooker.

Thus Tivy boasts this beast *peculiarly* her own.

Drayton.

Certain *peculiar*s there are, some appertaining to the dignities of the cathedral church at Exon.

Carew.

One *peculiar* nation to select

From all the rest, of whom to be invoked.

Milne.

By tincture on reflection, they augment
Their small *peculiar*. *Id. Paradise Lost.*

I neither fear, nor will provoke the war;
My fate is Juno's most *peculiar* care. *Dryden.*

When his danger increased, he then thought fit to
pray *peculiarly* for him. *Fell.*

Space and duration being ideas that have some-
thing very abstruse and *peculiar* in their nature, the
comparing them one with another may be of use for
their illustration. *Locke.*

Revenge is so absolutely the *peculiar* of Heaven,
that no consideration whatever can empower even the
best men to assume the execution of it. *South.*

That is *peculiarly* the effect of the sun's variation.
Woodward.

I agree with Sir William Temple, that the word
humour is *peculiar* to our English tongue; but not
that the thing itself is *peculiar* to the English, be-
cause the contrary may be found in many Spanish,
Italian, and French productions. *Swift.*

If an author possessed any distinguishing marks of
style, or *peculiarity* of thinking, there would remain
in his least successful writings some few tokens
whereby to discover him. *Id.*

Every man hath something *peculiar* in the turn or
cast of his mind, which distinguishes him as much as
the particular constitution of his body. *Mason.*

PECULIAR, in the canon law, signifies a parti-
cular parish or church that has jurisdiction within
itself for granting probates of wills and adminis-
trations, exempt from the ordinary or bishop's
court. The king's chapel is a royal *peculiar*,
exempt from all spiritual jurisdiction, and re-
served to the visitation and immediate govern-
ment of the king himself. There is likewise the
archbishop's *peculiar*: for it is an ancient privi-
lege of the see of Canterbury, that wherever any
manors or advowsons belong to it, they forthwith
become exempt from the ordinary, and are re-
puted *peculiars*: there are fifty-seven such *pecu-
liars* in the see of Canterbury. Besides these,
there are some *peculiars* belonging to deans,
chapters, and prebendaries, which are only ex-
empted from the jurisdiction of the archdeacon:
these are derived from the bishop, who may visit
them, and to whom there lies an appeal.

PECULIARS, COURT OF, is a branch of, and an-
nexed to, the court of arches. It has a jurisdic-
tion over all those parishes dispersed through
the province of Canterbury in the midst of other
dioceses, which are exempt from the ordinary's
jurisdiction, and subject to the metropolitan only.
All ecclesiastical causes, arising within these *pecu-
liar* or exempt jurisdictions, are originally
cognizable by this court: from which an appeal
lay formerly to the pope, but now, by the statute
25 Henry VIII. c. 19, to the king in chancery.

PECULIUM, in law, the stock or estate which
a person, in the power of another, whether male
or female, either as his or her slave, may acquire
by his industry. Roman slaves frequently
amassed considerable sums in this way. The
word properly signifies the advanced price which
a slave could get for his master's cattle, &c.,
above the price fixed upon them by his master,
which was the slave's own property.

PECUNIA, in mythology, a goddess among
the Romans, whom they invoked with a view of
procuring money in abundance. But as the
specie was coined of different metals, especially

of gold, silver, and brass, and as one divinity had
too much occupation in taking care of the dif-
ferent coinages, a particular one was appointed
for each. Three goddesses represented upon
some medals of the emperor Commodus and
his successors, with a pair of scales, the cornu-
copia, and a heap of money by them, prove that
there was at least that number, and the antiqua-
ries agree that they presided over the coinage of
three metals, æs, aurum, argentum.

PECUNIARY, *adj.* Fr. *pecuniaire*; Lat. *pecu-
narius*, *pecunia*. Relating to money; consist-
ing of money.

Pain of infamy is a severer punishment upon in-
genious natures than a *pecuniary* mulct. *Bacon.*

Their impostures delude not only unto *pecuniary*
defraudations, but the irreparable deceit of death.
Browne.

The injured person might take a *pecuniary* mulct
by way of atonement. *Browne.*

PED, *n. s.* From *pad*, a road. Commonly
pronounced *pad*. A small pack-saddle, basket,
or hamper.

A pannel and wanty, packsaddle and *ped*.

A haak is a wicker *ped*, wherein they use to carry
fish. *Tusser.*
Spenser.

PEDAGOGUE, *n. s. & v. a.* } Lat. *peda-*
PEDAGOGY, *adj.* } *gogus*; Gr.
παιδαγωγος, *παις*, a boy, and *αγω*, to teach.
One who teaches boys; a school master: a pe-
dant: to pedagogue is to teach with supercil-
ious airs: pedagogy, early or first discipline.

Few *pedagogues* but curse the barren chair,
Like him who hanged himself for mere despair
And poverty. *Dryden.*

In time the reason of men ripening to such a pitch,
as to be above the *pedagogy* of Moses's rod and the
discipline of types, God thought fit to display the
substance without the shadow. *South's Sermons.*

This may confine their younger styles,
Whom Dryden *pedagogues* at Will's:
But never could be meant to tie,
Authentic wits, like you and I. *Prior.*

The old sabbath appertained to the *pedagogy* and
rudiments of the law: and therefore when the great
master came and fulfilled all that was prefigured by
it, it then ceased. *White.*

A **PEDAGOGUE**, or **PÆDAGOGUE**, is an instruc-
tor in grammar and other arts. The word is
formed from the Greek *παιδων αγωγος*, *puerorum*
ductor, i. e. a leader of boys. M. Fleury ob-
serves, that the Greeks gave this name to slaves
appointed to attend their children, lead them,
and teach them to walk, &c. The Romans gave
the same denomination to the slaves who were
intrusted with the care and instruction of their
children.

PED'ALS, *n. s.* Lat. *pedalis*; Fr. *pedales*.
The large pipes of an organ: so called because
played upon and stopt with the foot.

The organ which Dr. Kemp exhibited in his lec-
tures at the Russel Institution, for which Mr. Loesch-
man has a patent (see the Philosophical Magazine,
vol. xxxvii. p. 326, and vol. xxxviii. p. 47), has
twenty-four sounds, and as many pipes in each oc-
tave. By the help of six *pedals*, and the twelve usual
finger-keys, the performer is enabled to execute the
mean-tone system correctly, or any other, in the
twenty-four usual keys. *Dr. A. Rea.*

PED'ANT, *n. s.*
 PEDAN'TICAL, *adj.*
 PEDANT'ICALLY, *adv.*
 PED'ANTRY, *n. s.*

Fr. *pedant*; of Gr. *παιδευω*. A school-master; a man vain of his learning: the derivatives all follow this sense.

A *pedant* treads in a rule; while one hand scans verses, and the other holds his sceptre: he dares not think a thought that the nominative case governs not the verb. To be brief he is a heteroclitite; for he wants the plural number, having only the single quality of words.

Sir T. Overbury.

A *pedant* that keeps a school i' the church.

Shakspeare.

Mr. Cheeche had eloquence in the Latin and Greek tongues; but for other sufficiencies *pedantic* enough.

Hayward.

Horace has enticed me into this *pedantry* of quotation.

Cowley.

The *pedant* can hear nothing but in favour of the conceits he is amorous of.

Glanville.

'Tis a practice that savours much of *pedantry*, a reserve of puerility we have not shaken off from school.

Browne.

The last main given to learning has been by the scorn of *pedantry*, which the shallow, the superficial, and the sufficient among scholars first drew upon themselves, and very justly, by pretending to more than they had.

Temple.

The boy who scarce has paid his entrance down To his proud *pedant*, or declined a noun.

Dryden.

The earl of Roscommon has excellently rendered it; too faithfully is, indeed, *pedantically*, 'tis a faith like that which proceeds from superstition.

Id.

The preface has so much of the *pedant*, and so little of the conversation of men in it, that I shall pass it over.

Addison.

When we see any thing in an old satyrast that looks forced and *pedantic*, we ought to consider how it appeared in the time the poet writ.

Id.

Make us believe it if you can: it is in Latin, if I may be allowed the *pedantry* of a quotation, non persuadebis, etiamsi persdaseris.

Id.

The obscurity is brought over them by ignorance and age, made yet more obscure by their *pedantic* elucidators.

Felton.

We now believe the Copernioan system; yet we shall still use the popular terms of sun-rise and sun-set, and not introduce a new *pedantic* description of them from the motion of the earth.

Bentley.

In learning let a nymph delight,

The *pedant* gets a mistress by't.

Swift.

A spirit of contradiction is so *pedantic* and hateful, that a man should watch against every instance of it.

Watts.

To say a person writes a good style, is originally as *pedantic* an expression, as to say he plays a good fiddle.

Shenstone.

Pursuit of fame with *pedants* fills our schools.

And into coxcombs burnishes our fools.

Young.

PEDANT is used for a rough, unpolished, man of letters, who makes an impertinent use of the sciences, and abounds in unseasonable criticisms and observations. Madam Dacier defines a *pedant*, a person who has more reading than good sense. Malebranche describes a *pedant* as a man full of false erudition, who makes a parade of his knowledge, and is ever quoting some Greek or Latin author, or hunting back to a remote etymology. Lord Chesterfield justly and successfully ridiculed this species of *pedantry*, but set the example, which has been since very much followed, of what may be styled modern *pedantry*, by constantly interlarding his letters and

other works with French, Spanish, and Italian quotations. St. Evremont says, that to paint the folly of a *pedant*, we must represent him as turning all conversation to some one science or subject he is best acquainted with. There are *pedants* of all conditions, and all robes. Wicquefort says, an ambassador always attentive to formalities and decourms is nothing else but a political *pedant*.

PEDARIANS, in Roman antiquity, a name anciently given to such of the Roman senators as by merely walking over to their party signified their opinion with their feet. According to Dr. Middleton, though the magistrates of Rome had a right to a place and vote in the senate both during their office and after it, and before they were put upon the roll by the censors, yet they had not probably a right to speak or debate there on any question, at least in the earlier ages of the republic. For this seems to have been the original distinction between them and the ancient senators, as it is plainly intimated in the formule of the consular edict sent abroad to summon the senate, which was addressed to all senators, and to all those who had a right to vote in the senate. From this distinction, those who had only a right to vote were called in ridicule *pedarian*; because they signified their votes by their feet, not their tongues, and, upon every division of the senate, went over to the side of those whose opinion they approved. It was in allusion to this old custom, which seems to have been wholly dropt in the latter ages of the republic, that the mute part of the senate continued still to be called by the name *pedarians*, as Cicero informs us, who, in giving an account to Atticus of a certain debate and decree of the senate upon it, says that it was made with the eager and general concurrence of the *pedarians*, though against the authority of all the consulars.

PEDDABALABARAM, or GREAT BALIPOOR, a large trading town and fortress of Mysore, south of India. The latter, although entirely built of mud, is strong, as the shot buries itself in the rampart. The town is fortified likewise by a wall and hedge. On the dissolution of the Hindoo kingdom of Bijanagur, the polygar, or chief of Balipoor, kept possession of this fortress, and it was not taken from his successor until about the middle of the last century, by the nizam. It was then conferred as a jagire on a Mogul named Abdool Russoul, from whose family it was taken in 1761, by Hyder Aly; since which period it has been subject to the ruler of Mysore. Long. 77° 47' E., lat. 13° 17' N. Fourteen miles to the eastward is Little Balipoor, the capital of a small district.

PEDESTAL, *n. s.* Fr. *pedestal*. The lower member of a pillar; the basis of a statue.

The poet bawls,

And shakes the statues and the *pedestals*.

Dryden.

In the centre of it was a grim idol; the forepart of the *pedestal* was curiously embossed with a triumph.

Addison.

So stiff, so mute! some statue would you swear Stept from its *pedestal* to take the air.

Pope.

View him at Paris in his last career, Surrounding throughs the demigod reverse,

Exalted on his *pedestal* of pride,
And fumed with frankincense on every side,
He begs their flattery with his latest breath,
And smothered in't at last is praised to death.

Cowper.

PEDESTRIAN, *adj.* & *n. s.* ? Lat. *pedes-*
PEDESTRIOSUS, *adj.* } *tris.* On foot;
or going on foot: this is the meaning of both ad-
jectives: a pedestrian is a traveller on foot.

Men conceive they never lie down, and enjoy not
the position of rest, ordained unto all *pedestrian* ani-
mals.

Browne.

Statue, *Pedestrian* [is], a statue standing on foot;
as that of king Charles II. in the Royal Exchange;
and that of king James II. in the Privy Gardens.

Dr. A. Ross.

PEDIACI, or **PEDIÆANS**, in Grecian anti-
quity. The city of Athens was anciently divided
into three different parts; one on the descent of
a hill; another on the sea shore; and a third in
a plain between the other two. The inhabitants
of the middle region were called *Πεδίαι*, *Pedi-*
æans; or, as Aristotle will have it, *Pediaci*;
formed from *πῆδιον*, plain or flat: those of the
hill, *Diacrians*; and those of the shore, *Paraliens*.
These quarters usually composed so many dif-
ferent factions. Pisistratus made use of the
Pediæans against the *Diacrians*. In the time of
Solon, when a form of government was to be
chosen, the *Diacrians* chose the democratic; the
Pediæans demanded an aristocracy, and the *Pa-*
raliens a mixed government.

PEDICLE, *n. s.* Fr. *pedicule*; Lat. *pedis*.
The footstalk, that by which a leaf or fruit is
fixed to the tree.

The cause of the holding green, is the close and
compact substance of their leaves and *pedicles*.

Bacon.

PEDICULARIS, in botany, rattle coxcomb,
or louse-wort, a genus of the angiospermia order
and didynamia class of plants; natural order
fortieth, personate. Species thirty-four, all
European plants.

PEDICULUS, the louse, in entomology, a
genus of insects belonging to the order of aptera.
It has six feet, two eyes, and a sort of sting in
the mouth: the feelers are as long as the thorax;
and the belly is depressed and sublobated.
It is an oviparous animal, not peculiar to
man, but infesting other animals, as quadru-
peds and birds, and even fishes, insects, and
vegetables; but these are of peculiar species on
each animal, according to the particular nature
of each. Nay, even insects are infested with
vermin which feed on and torment them. Several
kinds of beetles are subject to lice; but parti-
cularly that kind called the lousy beetle. The
lice on this are very numerous, and cannot be
shaken off. The earwig is often infested with
lice, just at the setting on of its head; these are
white, and shining like mites, but they are much
smaller; they are round-backed, flat-bellied, and
have long legs, particularly the foremost pair.
Snails of all kinds, but especially the large naked
sorts, are very subject to lice; which are conti-
nually seen running about them and devouring
them. Numbers of little red lice, with a very small
head, and in shape resembling a tortoise, are
often seen about the legs of spiders, and they

never leave the animal while he lives; but, if he
is killed, they almost instantly forsake him. A
species of whitish lice are found on humble
bees; they are also found upon ants; and fishes
are not less subject to them than other animals.
Kircher tells us that he found lice also on flies.
The louse which infests the human body makes
a very curious appearance through a microscope.
It has naturally three divisions, the head, the
breast, and the tail part. In the head appear
two fine black eyes, with a horn that has five
joints, and is surrounded with hairs standing
before each eye; and from the end of the nose
or snout there is a pointed projecting part,
which serves as a sheath or case to a piercer or
sucker, which the creature thrusts into the skin
to draw out the blood and humors which are its
destined food; for it has no mouth. This piercer
or sucker is said to be 700 times smaller than a
hair, and is contained in another case within the
first, and can be drawn in or thrust out at plea-
sure. The breast is very beautifully marked in
the middle; the skin is transparent, and full of
little pits; and from the under part of it proceed
six legs, each having five joints, and their skin
all the way resembling shagreen, except at the
end, where it is smoother. Each leg is termi-
nated by two claws, which are hooked, and are
of an unequal length and size. These it uses as
we would a thumb and middle finger; and
there are hairs between these claws as well as all
over the legs. On the back part of the tail there
may be discovered some ring-like divisions, and
a sort of marks which look like the strokes of a
rod on the human skin; the belly looks like
shagreen, and towards the lower end it is very
clear, and full of pits; at the extremity of the
tail there are two semicircular parts all covered
with hairs, which serve to conceal the anus.
When the louse moves its legs, the motion of
the muscles, which all unite in an oblong dark
spot in the middle of the breast, may be distin-
guished perfectly, and so may the motion of the
muscles of the head when it moves its horns.
We may likewise see the various ramifications
of the veins and arteries out. But the most sur-
prising of all is the peristaltic motion of the en-
trails, which is continued all the way from the
stomach down to the anus. If one of these
creatures, when hungry, be placed on the back
of the hand, it will thrust its sucker into the
skin, and the blood which it sucks may be seen
passing in a fine stream to the fore part of the
head; where, falling into a roundish cavity, it
passes again in a fine stream to another circular
receptacle in the middle of the head; thence it
runs through a small vessel to the breast, and
then to a vessel which reaches to the hinder part
of the body, where, in a curve, it turns again a
little upward; in the breast and entrails the
blood is moved without intermission, with a
great force; especially in the latter, where it oc-
casions such a contraction as is very surprising.
In the upper part the propelled blood stands
still, and seems to undergo a separation, some
of it becoming clear and waterish, while other
black particles are pushed forward to the anus.
If a louse be placed on its back, two bloody
darkish spots appear; the larger in the middle

of the body; the lesser towards the tail; the motions of which are followed by the pulsation of the dark bloody spot, in or over which the white bladder seems to lie. This motion of the systole and diastole is best seen when the creature begins to grow weak; and on pricking the white bladder, which seems to be the heart, the creature instantly dies. The lower dark spot is supposed to be the excrement in the gut.

Lice have been supposed to be hermaphrodites: but this is erroneous; for Mr. Lieuwenhoeck observed, that the males have stings in their tails, which the females have not. And he supposes the smarting pain which those creatures sometimes give, to be owing to their stinging when made uneasy by pressure or otherwise. He says that he felt little or no pain from their suckers, though six of them were feeding on his hand at once. To know the true history and manner of breeding of these creatures, Mr. Lieuwenhoeck put two female lice into a black stocking, which he wore night and day. He found, on examination, that in six days one of them had laid above fifty eggs; and, upon dissecting it, he found as many yet remaining in the ovary: whence he concludes that in twelve days it would have laid 100 eggs. These eggs naturally hatch in six days, and would then probably have produced fifty males, and as many females; and these females, coming to their full growth in eighteen days, might each of them be supposed after twelve days more to lay 100 eggs; which eggs, in six days more, might produce a young brood of 5000: so that in eight weeks, one louse may see 5000 of its own descendants. Signior Rhedi, who has more attentively observed these animals than any other author, has given several engravings of the different species of lice found on different animals. Men, he observes, are subject to two kinds; the common and the crab-louse. He observes, also, that the size of the lice is not at all proportioned to that of the animal which they infest; since the starling has them as large as the swan. Some kinds of constitutions are more apt to breed lice than others; and in some places of different degrees of heat, they are certain to be destroyed upon people who in other climates are over-run with them. Cleanliness is doubtless the grand secret, by which to keep clear from them, especially in wearing woollen clothes. Monkeys and some Hottentots, we are told, eat lice; and are thence denominated phthirophages. On the coast of the Red Sea it is reported that there is a nation, of small stature and of a black color, who use locusts for the greatest part of their food, prepared only with salt. On such food these men live till forty, and then die of a pedicular or lousy disease. It is also a fact that the negroes on the west coast of Africa take great delight in making their women clear their bodies of lice, and the latter devour them with greediness. In ancient medicine lice were esteemed aperient, febrifuge, and proper for curing a pale complexion. The natural repugnance to those ugly creatures (says Lemery) perhaps contributed more to banish the fever than the remedy itself. In the jaundice five or six were swallowed in a soft egg. In the suppression of urine, which

happens frequently to children at their birth, a living louse is introduced into the urethra, which, by the tickling it occasions in the canal, forces the sphincter to relax, and permits the urine to flow. A bug produces the same effect. Farriers have also a custom (says M. Bourgeois) of introducing one or two lice into the urethra of horses when they are seized with a retention of urine, a disease pretty common among them. But, according to the Continuation of the Materia Medica, to use the pedicular medicine with the greatest advantage, one would need to be in Africa, where those insects are carefully sought after and swallowed as a delicious morsel. The great distinction between those which infest mankind is into the head and body louse. The former is hard and high colored, and the latter less compact and more of ashen color. If it were possible to give a reason why some families of the same species stick to the head and others to the clothes, &c., it would also, in all probability, be possible to understand the nature of many contagious diseases.

PED'IGREE, *n. s.* Per and degré. Skinner. Rather from Fr. *piéd*; Lat. *pes*, a stem or root and degré. Genealogy; lineage; account of descent.

I am no herald to enquire of men's *pedigrees*; it sufficeth me if I know their virtues. *Sidney.*

You tell a *pedigree*

Of threescore and two years, a silly time.

Shakespeare.

Alterations of surnames, which in former ages have been very common, have obscured the truth of our *pedigrees*, that it will be no little labour to deduce many of them. *Comden.*

To the old heroes hence was given

A *pedigree* which reached to heaven. *Waller.*

The Jews preserved the *pedigrees* of their several tribes with a more scrupulous exactness than any other nation. *Atterbury.*

The sportive wind blows wide

Their fluttering rags, and shows a tawny skin

The vellum of the *pedigree* they claim. *Cowper.*

And he would gaze upon his store,

And o'er his *pedigree* would pore,

Until by some confusion led,

Which almost looked like want of head,

He thought their merits were his own. *Byron.*

PEDILUVIUM, bathing of the feet. The uses of warm bathing in general, and of the pediluvium in particular, are so little understood, that they are often preposterously used, and sometimes as injudiciously abstained from. Warm bathing is of no service where there is an irresoluble obstruction, though, by its taking off from a spasm in general, it may seem to give a moment's ease; nor does it draw from the distant parts, but often hurts by pushing against matter that will not yield with a stronger impetus of circulation than the stretched and diseased vessel can bear: so that, where there is any suspicion of scirrhus, warm bathing of any sort should never be used. On the other hand, where obstructions are not of long standing, and the impacted matter is not obstinate, warm baths may be of great use to resolve them quickly. In recent colds, with slight humoral peripneumonies, they are frequently an immediate cure. This they effect by increasing the force of the

circulation, opening the skin, and driving freely through the lungs that lentor which stagnated or moved slowly in them. As thus conducing to the resolution of obstructions, they may be considered as short and safe fevers; and in using them we imitate nature, which by a fever often carries off an obstructing cause of a chronic ailment. Borelli, Boerhaave, and Hoffman, are all of opinion, that the warm pediluvium acts by driving a large quantity of blood into the parts immersed. But arguments must give way to fact: the experiments related in the Medical Essays seem to prove to a demonstration, that the warm pediluvium acts by rarifying the blood. A warm pediluvium, when rightly tempered, may be used as a safe cordial, by which circulation can be roused, or a gentle fever raised; with this advantage over the cordials and sudorifics, that the effect of them may be taken off at pleasure. See BATHING.

PEDIR, a town on the west coast of Sumatra. The principal trade of this place is in pepper, betel nut, gold dust, canes, rattans, bees'-wax, camphor, and benzoin. The soil is fertile, and well watered with rivulets; though the low lands next the sea are bogs, which produce only reeds, and bamboo canes, the soil is in general fertile. The animals found are horses of a small breed, oxen, buffaloes, goats, and hog deer. Wild animals abound in the woods and mountains; there are also alligators, guanas, porcupines, serpents, and other venomous animals, together with abundance of poultry.

PEDLER, *n. s.* } A petty dealer. 'A
PEDLERY, } contraction produced by
PEDDLING. } frequent use,' says Dr. Johnson. Minshew more probably from French *pedier aller*, to go on foot. One who travels the country with small wares: pedlery, the wares of a pedler: peddling, his habit of dealing.

All as a poor *pedler* he did wend,
Bearing a trusse of trifles at his back;
As belles and babies and glasses in his packe.

Spenser.

If you did but hear the *pedler* at the door, you would never dance again after a tabor and a pipe.

Shakespeare.

He is wit's *pedler*, and retails his wares
At wakes, and wassails, meetings, markets, fairs.

Id.

So slight a pleasure I may part with, and find no miss; this *peddling* profit I may resign, and 'twill be no breach in my estate.

Decay of Piety.

Had sly Ulysses at the sack
Of Troy brought thee his *pedler's* pack.

Cleaveland.

Atlas was so exceeding strong,
He bore the skies upon his back,
Just as a *pedler* does his pack.

Swift.

The sufferings of those of my rank are trifles in comparison of what all those are who travel with fish, poultry, *pedlery* ware, to sell.

Id.

PEDLER, or **PEDLAR**, a travelling foot trader. See **HAWKER**. In Britain (and formerly in France) pedlars are despised; but it is otherwise in other countries. In Spanish America the business has been so profitable that it is thought by no means dishonorable; and there have been gentlemen in Old Spain, who, when their circumstances were declining, sent their

sons to the Indies to retrieve their fortunes in this way. In Poland, where there are few or no manufactures, almost all the merchandise is carried on by pedlars, who are said some time since to have been generally Scotsmen, and who, in the reign of Charles II., amounted to no fewer than 50,000.

PEDOMETER, or **PODOMETER**, from Greek *πες*, pes, foot, and *μετρον*, measure, a mechanical instrument, in form of a watch, consisting of various wheels with teeth, catching in one another, all disposed in the same plane; which by means of a chain or string fastened to a man's foot, or to the wheel of a chariot, advance a notch each step, or each revolution of the wheel; so that the number being marked on the edge of each wheel, one may number the paces, or measure exactly the distance from one place to another. There are some of them which mark the time on a dial-plate, and are in every respect much like a watch, and are accordingly worn in the pocket like a watch.

PEEBLES, a royal burgh and county town of the shire in Scotland to which it gives its name. It is situate on a fine plain on the north bank of the Tweed, over which there is a bridge of five arches, and is wholly surrounded with high hills. It is twenty-one miles south of Edinburgh. The town is well built, and is divided into the Old and New Town by the Eddlestone-Water. In the Old Town are the ruins of two ancient churches. The New consists chiefly of one street, which is broad and spacious, and the houses are neat and tolerably well built. At the west end stands the church, on a small eminence, where formerly the castle stood, and beside it is the county-jail. Besides these it has apartments for the sheriffs' and town-courts, and a hall where the business of the county is transacted; together with an elegant inn and assembly-rooms. Peebles has an excellent grammar-school, and another for English, arithmetic, &c. It manufactures stockings, and a great deal of weaving is carried on here. Here is also an extensive brewery, famous for its excellent ale. The town is governed by a council of eighteen persons, of which a provost and two bailies make a part. It joins with Lanark, Linlithgow, and Selkirk, in sending a member to parliament. It has a weekly market on Tuesday, and eight annual fairs, viz. second Tuesday in January, first Tuesday in March, second Wednesday in May, first Tuesday in July, Tuesday before August 24th, first Tuesday in September, 17th of October, and first Tuesday before November 12th.

PEEBLES, a small river in the above parish, which runs through the north part of the town into the Tweed, called also Eddlestone Water.

PEEBLESHIRE, or **TWEEDDALE**, a county of Scotland, bounded on the east and south-east by the shires of Berwick and Selkirk, on the south by Dumfries, on the west by Lanark, and on the north by Mid-Lothian, being about thirty-six miles in length, and about ten in breadth. It contains one royal borough, Peebles; and is divided into sixteen parochial districts. It is a hilly country, watered by the rivers Tweed, Yarrow, and Leithen, and several smaller streams; on the banks of which the soil is fertile, and adapted to every kind of husbandry; but the

greater portion is in pasturage, and the hills are covered with innumerable flocks of sheep, famous for the excellence of their wool. All the rivers and waters contain salmon and trout. Being an agreeable country, it is adorned with numerous seats of the nobility and gentry, and contains some esteemed mineral springs. It abounds with coal and lime-stone, and iron and lead ores are found in many of the parishes.

PEEK, in the sea-language, a word used in various senses. The anchor is said to be a-peek, when the ship being about to weigh comes over her anchor in such a manner that the cable hangs perpendicularly between the hause and the anchor. To heave a-peek is to bring the peek so that the anchor may hang a-peek. A ship is said to ride a-peek, when, lying with her main and fore yards hoisted up, one end of her yards is brought down to the shrouds, and the other raised up on end; which is chiefly done when she lies in rivers, lest other ships falling foul of the yards should break them. Riding a broad peek denotes much the same, excepting that the yards are only raised to half the height. Peek is also used for a room in the hold, extending from the bitts forwards to the stern: in this room men of war keep their powder, and merchantmen their victuals.

PEEL, *n. s. & v. a.* } *Fr. pelure, peler*; Lat. *PEEL'ER.* } *pellis*. Skin or rind; to strip off the skin or rind: a peeler is one who performs this operation; and, metaphorically, a robber or plunderer.

Yet otes with her sucking a *peeler* is found,
Both ill to the maister and worse to some ground.
Tusser.

The skilful shepherd *peeled* me certain wands,
And stuck them up before the fulsome ewes.
Shakspeare.

Who once just and temperate conquered well,
But governed ill the nations under yoke,
Peeling their provinces, exhausted all
But lust and rapine. *Milton's Paradise Regained.*
Lord-like at ease, with arbitrary power,
To *peel* the chiefs, the people to devour;
These, traitor, are thy talents. *Dryden.*
As 'tis a *peeler* of land, sow it upon lands that are rank.
Mortimer.

PEEL, in geography, a small island, on the west coast of the Isle of Man. It is naturally strong, but was rendered much more so by Thomas earl of Derby, who encompassed it with a wall, towers, and other fortifications; so that in these days it was impregnable.

PEELE (formerly Holm), a small town in the Isle of Man, situate on the west side of the island, twelve miles west of Douglas. It is a straggling place on the sea-shore; the harbour is neglected, the pier destroyed, and the trade of the town has recently much declined; but it has a very spacious and commodious bay. The church is dedicated to St. Peter; but here are the remains of two other churches, one dedicated to St. Patrick, and the other called St. Germain's.

The castle and the cathedral of St. Germain stand on Peele-Island, encircled by the sea. Near the ruins of St. Patrick's church, are the armoury, the episcopal palace, and the lord's mansion. The channel which divides this island from the main land, is very deep at high water,

VOL. XVI.

but at low water it is fordable, and was formerly joined to the main land by a strong quay. The walls of the castle enclose an area of about two acres.

PEELE (Francis), a dramatic writer, who flourished in the reign of queen Elizabeth. He was born in Devonshire; studied at Oxford in 1573; and took his degree of M. A. in 1579. He was a good pastoral poet, and his plays were acted, says Wood, with great applause.

PEEP, *v. n. & n. s.* } Dr. Johnson has cu-
PEEP'ER, *n. s.* } riously encumbered the
PEEP'HOLE, } etymology of this word
PEEP'ING-HOLE. } with learning. 'It has no etymology,' he says, 'except that of Skinner, who derives it from Dut. *ophessen*, to lift up; and of Casaubon, who derives it from *ὀφειννῆς*, a spy: perhaps it may come from Lat. *pip*, *pipio*, to cry as young birds: when the chickens first broke the shell and cried, they were said to begin to pip or peep; and the word that expressed the act of crying was, by mistake, applied to the act of appearing that was at the same time: this is offered till something better may be found.' But Minshew finds a Teut. *pipen*, to peer or look up; and old Fr. *pipper*, Ital. *pipire*, of the same signification. To look up; look slyly; make a first appearance; pry: peep is, first appearance; sly or prying look: peeper, applied particularly to young chickens breaking the shell; and, b. Addison, to the unfledged young ladies of his day: peep-hole and peeping-hole, a hole through which one may peep unobserved.

Them that have familiar spirits, and wizards that
peep and that mutter. *Isaiah viii. 19.*

A fool will *peep* in at the door. *Eccles. xxi. 23.*

She, her gay painted plumes disordered,
Seeing at last herself from danger rid,
Peeps forth, and soon renews her native pride.

Spenser.

Who is the same which at my window *peeps*. *Id.*

Your youth
And the true blood, which *peeps* forth fairly through
it,
Do plainly give you out an unstained shepherd.

Shakspeare.

I can see his pride

Peep through each part of him. *Id.*

Come, thick night!

That my keen knife see not the wound it makes;
Nor heaven *peep* through the blanket of the dark,
To cry hold! *Id. Macbeth.*

The timorous maiden-blossoms on each bough
Peeps forth from their first blushes; so that now
A thousand ruddy hopes smiled in each bud,
And flattered every greedy eye that stood. *Crashaw.*

The trembling leaves through which he played,
Dappling the walk with light and shade,
Like lattice-windows, give the spy
Room but to *peep* with half an eye. *Cloveland.*

With words not hers, and more than human sound,
She makes the obedient ghosts *peep* trembling through
the ground. *Roscommon.*

Fair as the face of nature did appear,
When flowers first *peeped*, and trees did blossoms
bear,

And winter had not yet deformed the inverted year.
Dryden

All doors are shut, no servant *peeps* abroad,
While others outward went on quick dispatch. *Id.*

3 A

The daring flames *peep* in, and saw from far
The awful beauties of the sacred quire;
But since it was prophaned by civil war,
Heaven thought it fit to have it purged by fire. *Id.*
The fox spied him through a *peepinghole* he had
found out to see what news. *L'Estrange.*

A *peeper* works with her hands, eyes, and fan;
one of which is continually in motion, while she
thinks she is not actually the admiration of some
ogler in the congregation. *Spectator.*

O, my muse, just distance keep;
Thou art a maid, and must not *peep*. *Prior.*

By the *peepholes* in his crest,
Is it not virtually confest,
That there his eyes took distant aim? *Id.*
Printing and letters had just *peeped* abroad in the
world; and the restorers of learning wrote very
eagerly against one another. *Atterbury.*
Those remote and vast bodies were formed not
merely to be *peep*t at through an optic glass.
Bentley's Sermons.

Most souls but *peep* out once an age,
Dull sullen prisoners in the body's cage. *Pope.*
Would not one think, the almanack-maker was
crept out of his grave to take't other *peep* at the stars?
Swift.

In vain his little children *peeping* out
Into the mingling storm, demand their sire.
Thomson.

Dishes I chuse, though little, yet genteel;
Snails the first course, and *peepers* crown the meal.
Bramst.

Though but the very white end of the sprout *peep*
out in the outward part of the couch, break it open,
you will find the sprout of a greater largeness.
Mortimer's Husbandry.

PEER, *v. n.* A contraction of APPEAR. To
come first into sight; PEEP, which see.

Now for a clod-like hare in form they *peer*,
Now bolt and cudgel squirrels leap do move,
Now the ambitious lark with mirror clear
They catch, while he, fool! to himself makes love. *Sidney.*

As the sun breaks through the darkest clouds,
So honour *peereth* in the meanest habit. *Shakspeare.*

Yet many of your horsemen *peer*,
And gallop o'er the field. *Id. Henry V.*

Even through the hollow eyes of death
I spy life *peering*. *Shakspeare.*

See how his gorget *peers* above his gown,
To tell the people in what danger he was. *Ben Jonson.*

Hell itself will pass away,
And leave her dolorous mansion to the *peering* day.
Milton.

And, when some curious rare idea *peer'd*
Upon his mind, he dipped his hasty pen,
And by the glimmering lamp, or moon light-beam,
That through his lattice *peeped*, wrote fondly down
What seem'd in truth imperishable song. *Pollak.*

PEER, *n. s.* } Fr. *pair*; of Lat. *par*.
PEER'AGE, } Equal; of the same rank;
PEER'ESS, } companion: hence a noble,
PEER'LESS, *adj.* as equal in the highest de-
gree: peeress is the female of peer: peerage, the
dignity of a peer, or body, of peers: peerless,
unequall'd.

He all his *peers* in beauty did surpass. *Spenser.*
His *peers* upon this evidence

Have found him guilty of high treason. *Shakspeare.*

I see thee compass with thy kingdom's *peers*,
That speak my salutation in their minds:
Hail, king of Scotland! *Id. Macbeth.*

King Henry's *peers* and chief nobility
Destroyed themselves, and lost the realm of France.
Shakspeare.

Her *peerless* feature, joined with her birth,
Approves her fit for none but for a king. *Id.*

Amongst a man's *peers*, a man shall be sure of
familiarity: and therefore it is good a little to keep
state. *Bacon.*

Oh! what is man, great maker of mankind!
That thou to him so great respect do'st bear!
That thou adorn'st him with so bright a mind,
Mak'st him a king, and ev'n an angel's *peer*. *Davies.*

All these did wise Ulysses lead, in counsel *peer* to
Jove. *Chapman.*

If you did move to night,
In the dances, with what spright
Of your *peers* you were beheld,
That at every motion swelled. *Ben Jonson.*

Hesperus, that led
The starry host, rode brightest; till the moon,
Rising in cloudy majesty, at length,
Apparent queen, unveiled her *peerless* light.
Milton.

In song he never had his *peer*,
From sweet Cecilia down to chanticleer. *Dryden.*

Who bear the bows were knights in Arthur's reign,
Twelve they, and twelve the *peers* of Charlemagne.
Id.

Be just in all you say, and all you do;
Whatever be your birth, you're sure to be
A *peer* of the first magnitude to me. *Id.*
Not only the penal laws are in force against pa-
pists, and their number is contemptible, but also the
peerage and commons are excluded from parliament.
Id.

Her dress, her shape, her matchless grace,
Were all observed, as well as heav'nly face;
With such a *peerless* majesty she stands,
As in that day she took the crown. *Id.*

Statesman and patriot ply alike the stocks;
Peeress and butler share alike the box. *Pope.*

His friendships he to few confined;
No fools of rank or mongrel breed,
Who fain would pass for lords indeed;
Where titles give no right or power,
And *peerage* is a withered flower. *Swift.*

PEER was anciently applied to the vassals or
tenants of the same lord, who were called peers,
because they were all equal in condition, and
obliged to serve and attend him in his courts,
and peers in fiefs, because they all held fiefs
of the same lord. The term peers is now applied
to those who are impannelled in an inquest upon
a person, for convicting or acquitting him of any
offence laid to his charge; and the reason why
the jury is so called is because, by the common
law and custom of this kingdom, every person is
to be tried by his peers or equals; a lord by the
lords, and a commoner by commoners. See
JURY.

A peeress may be noble by descent, creation,
or marriage. If a peeress by descent or creation,
marries a person under the degree of nobility, she
still continues noble; but, if she obtains that dignity
only by marriage, she loses it on her afterwards mar-
rying a commoner; yet by courtesy she generally
retains the title of her nobility. A countess or
baroness may not be arrested for debt or trespass;
for though, in respect of their sex, they cannot
sit in parliament, they are nevertheless peers of

the realm, and shall be tried by their peers, &c.

PEER OF THE REALM, a noble lord who has a seat and vote in the house of lords or peers. These lords are called peers, because though there is a distinction of degrees in our nobility, yet in public actions they are equal, as in their votes in parliament, and in trying any nobleman or other person impeached by the commons, &c. See **PARLIAMENT**. In a judicial capacity the house of peers is the supreme court of the kingdom, having at present no original jurisdiction over causes, but only upon appeals and writs of error; to rectify any injustice or mistake of the law committed by the courts below. To this authority they succeeded of course, upon the dissolution of the Aula Regia. For as the barons of parliament were constituent members of that court, and the rest of its jurisdiction was dealt out to two other tribunals, over which the great officers who accompanied those barons were respectively delegated to preside, it followed that the right of receiving appeals, and superintending all other jurisdictions, still remained in that noble assembly, from which every other great court was derived. They are, therefore, in all cases the last resort, from whose judgment no farther appeal is permitted; but every subordinate tribunal must conform to their determination.

PEER, a town of the Netherlands, thirty miles north of Liege, and thirty north-east of Louvain.

PEERGAUM, in geography, a town of Hindostan, in the province of Aurnghabad, between POONAH, and Perrainda. It is situated at the confluence of the Sursutty and the Beemah, and belongs to the Mahrattas. Long. 79° 59' E. Lat. 18° 23' N.

PEEVISH, *adj.* } Supposed by Junius
PEEVISHLY, *adv.* } to be formed by corrup-
PEEVISHNESS, *n. s.* } tion from perverse;
Skinner rather derives it from beeish, as we say waspish; Minsheu from the Teut. *vietrich i. e. pecuinus*; 'quodd similis sit bruto.' Petulant; fretful; querulous; waspish; the adverb and noun-substantive corresponding.

For what can breed more *peevish* incongruities, Than man to yield to female lamentations? *Sidney*.

She is *peevish*, sullen, froward,
Proud, disobedient, stubborn, lacking duty. *Shakespeare*.

If thou hast the mettle of a king,
Being wronged as we are by this *peevish* town,
Turn thou the mouth of thy artillery,
As we will ours against these saucy walls. *Id.*

I will not presume
To send such *peevish* tokens to a king. *Id.*

He was so *peevishly* opinionative and proud that he would neither ask nor hear the advice of any. *Hayward*.

Some miscarriages in government might escape through the *peevishness* of others; envying the public should be managed without them. *King Charles*.

Those deserve to be doubly laughed at, that are *peevish* and angry for nothing to no purpose. *L'Estrange*.

It will be an unpardonable, as well as childish *peevishness*, if we undervalue the advantages of our knowledge, and neglect to improve it. *Locke*.

Neither will it be satire or *peevish* invective to affirm, that infidelity and vice are not much diminished. *Swift*.

You may find

Nothing but acid left behind.

From passion you may then be freed,
When *peevishness* and spleen succeed. *Id.*

The *peevish* youth, who ne'er had found before
A rival of his skill, indignant heard,
And soon (for various was his tuneful store)
In loftier tones defied the simple bird. *Couper*.

PEG, *n. s. & v. a.* Teut. *pegge*; Dan. *pege*; Swed. *pigg*. A wooden pin; to fasten with a peg; 'to take down a peg,' or 'a peg lower,' is to depress, degrade in some given or supposed degree

You are well tun'd now; but I'll let down
The *pegs* that make this musick. *Shakespeare*.

I will rend an oak,
And *peg* thee in his knotty entrails, till
Thou'st howl'd away twelve winters. *Id.*
Solid bodies foreshew rain; as 'boxes and *pegs* of wood, when they draw and wind hard. *Bacon*.

Remember how in arms and politics,
We still have worsted all your holy tricks
Trepanned your party with intrigue,
And took your grandees down a *peg*. *Hudibras*.

Taking the shoots of the past spring, and *pegging* them down in very rich earth, by that time twelve-month they will be ready to remove. *Evelyn*.

The teeth are about thirty in each jaw: all of them claviculars or *peg* teeth, not much unlike the tusks of a mastiff. *Grew*.

If he be cholerick, we shall treat him like his little friend, and hang him upon a *peg* till he comes to himself. *Addison*.

The *pegs* and nails in a great building, though they are but little valued in themselves, are absolutely necessary to keep the whole frame together. *Id. Spectator*.

A finer petticoat can neither make you richer, more virtuous, or wise, than if it hung upon a *peg*. *Swift*.

PEGANUM, in botany, wild Syrian rue, a genus of the monogynia order, belonging to the dodecandria class of plants; and in the natural method ranking under the twenty-sixth order, multisilique.

PEGASIDES, a name of the Muses, from Pegasus.

PEGASUS, among the poets, a horse imagined to have wings, and fabled to have sprung from the blood of Medusa: being that whereon Bellerophon was fabled to be mounted when he engaged the Chimæra. See **CHIMERA**. He was also mounted by Perseus when he destroyed the sea-monster that was to devour Andromeda.—Ovid. The opening of the fountain Hippocrene, on mount Helicon, is ascribed to a blow of Pegasus's hoof. He was feigned to have flown away to heaven, where he became a constellation. Hence

PEGASUS, in astronomy, the name of a constellation of the northern hemisphere, in form of a flying horse. See **ASTRONOMY**.

PEGU, or **PEGUE**, formerly a considerable kingdom of Asia, beyond the Ganges, but now a province of the Burmhan empire.

The original inhabitants call themselves *Mow*, by the Chinese and Burmese they are termed *Taleing*; and by the Siamese, *Mingmon*. The province of Pegu extends along the mouths of the two great rivers, Irrawaddy and Thualayn, (or of Ava and Martaban), and occupies the sea-

coast from the frontiers of Aracan to those of Siam. The town of Prome was its northern frontier.

The river Pegu, which was supposed to come from China, rises among the hills about 100 miles from the sea, which form the boundaries between the Burmhan and Pegu countries. Its communication with the sea is by the Rangoon, and in the fair season it is almost dry. The country inland from the river is clear of trees and brushwood; but on the banks of the river there are thickets which abound with the domestic fowl in a wild state, and peacocks, but is also infested with tigers. About a day's journey to the south of the town of Pegu the inhabitants are much molested by wild elephants, that occupy in great numbers a forest to the north-east. These powerful animals, allured by the early crops of rice and sugar-cane, make predatory incursions in large troops, and do a great deal of mischief, devastating much more than they devour. This province appears to be the favorite abode of the elephant, and one of his Burmhan majesty's titles is, 'lord of the white elephant, and of all the elephants in the world.'

Pegu having long been subject to the Burmhan empire of Ava, the history of its conquest and other particulars will be found under the article **BURMHAN EMPIRE**. When the Burmese had completed its subjugation, they subdivided it into thirty-two districts, and named it Henza-wuddy, which is the Sanscrit name for the whole province. Minderajee Praw, the fifth king of the present dynasty, abrogated many severe penal laws imposed by his predecessors upon the native Peguers. Justice is now distributed with considerable impartiality, and the only distinction at present between a Burmhan and a Peguer consists in the exclusion of the latter from places of public trust and power. In Pegu there are no brick buildings allowed, except such as belong to the king, or are dedicated to their divinity Gaudma, his majesty having prohibited the use of brick and stone in private buildings.

From the plenty of teak with which the Pegu forests about this province has long been famous for ship-building. So early as 1707 the Arabs of Muscat, a considerable maritime power, were accustomed to build ships here, some of which carried from thirty to fifty guns. For the procuring of this valuable timber a great intercourse subsists between Pegu and all the British provinces, particularly Bengal, where the vessels are almost wholly fabricated from Pegu teak, with the assistance of the country timber.

The inhabitants of Pegu appear to have, attained civilisation at a more early period than the Burmese; and, though now reduced, formerly to have been a great and potent nation. In the early Portuguese histories they are denominated the Pandalus of Mon, and they are supposed to have founded the ancient Kalaminhm empire. The name Kalaminhm, mentioned by the Portuguese, is probably connected with the Siamese name of the nation, Mingmon. The Mon language is still used by the inhabitants of Pegue, and appears quite original. It is said by the Burmese and Siamese to have no affinity to either of their languages.

Owing to the long and sanguinary wars carried on between the Burmese and Peguers, the greater part of this province, although one of the most productive in India, remains desolate and uncultivated.

PEGU, the capital of the foregoing province, is situated ninety miles by water above Rangoon. Its ancient extent may be traced by the ruins of the ditch and wall that surround it. From these it appears to have been a quadrangle, each side measuring one mile and a half; the breadth of the ditch was about sixty yards, and the depth ten or twelve feet. When in repair, even in the dry season, the ditch had seldom less than four feet of water. The wall was composed of brick badly cemented with clay mortar, about thirty-five feet thick, with small equidistant bastions about 300 yards asunder; but the whole in a most ruinous state. The Burmhan monarch, Alompra, when he acquired possession of the city in 1757, razed every building to the ground, and dispersed or led into captivity all the inhabitants. The temples, or praws, which are very numerous, were the only buildings that escaped his fury, and and of these the great pyramid of Shoemadoo has alone been kept in repair. This temple is composed of brick and mortar, without excavation or aperture of any sort, octagonal at the base, and spiral at the top; each side of the base measuring 162 feet. The great breadth diminishes abruptly in the shape of a speaking trumpet. The extreme height of the building, above the level of the country, is 361 feet. On the top is an iron tee or umbrella, fifty-six feet in circumference, which is gilt, and it is the intention of the king to gild the whole building. On the north side of the building are three large bells of good workmanship, suspended near the ground, to announce to the spirit of Guadma the approach of a suppliant, who places his offering, consisting of boiled rice, a plate of sweetmeats, or a cocoa-nut fried in oil, on a bench near the foot of the temple. After it is offered the devotee seems indifferent what becomes of it, and it is often devoured in his presence by the crows or dogs, whom he never attempts to disturb during their repast. Numberless images of Guadma lie indiscriminately scattered about.

About 1790 the reigning monarch of Ava, to conciliate the natives, issued orders to rebuild Pegu, and invited the scattered families of former inhabitants to repeople their deserted city. At the same time he ordered the viceroy to quit Rangoon, and make Pegu his future residence. The present inhabitants, who have been induced to return, consist chiefly of rhaahans, or priests, the followers of the court, and a few poor Pegu families. The men of business continue to reside at Rangoon, and the whole number of inhabitants of this town do not as yet exceed 7000. A great proportion of the former inhabitants are either extinct or scattered over the provinces of Tongho, Martahan, and Talowmeon. The city, in its renovated state, is fenced round with a stockade from ten to twelve feet high. There is one main street running east and west, crossed at right angles by two smaller streets. At each extremity of the principal street there is a gate defended by a wretched piece of ordnance, and a

few musketeers, who never post sentinels, and are generally asleep in a neighbouring shed. The streets of Pegu are spacious, and paved with brick, which the ruins of the old town plentifully supply. The houses are all made of mats, or of sheathing boards, supported on bamboos or posts, and extremely combustible. As a precaution against fire, at each door there stands a long bamboo, with an iron hook to pull down the thatch; and there is also another pole adapted to suppress flame by pressure. Almost every house has earthen pots filled with water on the roof, and a particular class of people, whose business is to prevent and extinguish fires, walk the street during the night. The only article of consequence manufactured here is silk and cotton, which the females weave for domestic use. The thread is well spun, and the texture of the web close and strong, being chequered like tartan.

PEGUNTUM, in ancient geography, according to Ptolemy, or *Peguntæ*, as Pliny has it, a town or citadel of Dalmatia, on the Adriatic, opposite to the island Brattia, five miles off, and forty east of Salona. According to Fortis, a mountain, a large hollow, and submarine springs are seen here.

PEINE FORT ET DURE, Lat. *pœna fortis et dura*, signifies a special punishment formerly inflicted on those who, being arraigned of felony, refuse to put themselves on the ordinary trial, but stubbornly stand mute.

PEINGHEE, a town of the Burmhan empire, situated on the west side of the Irrawaddy, in lat. $18^{\circ} 31' N.$, long $94^{\circ} 50' E.$ In the vicinity a great quantity of teak timber is procured, which is carried to Rangoon, and thence exported to the British territories. The forests are in sight from the river: the trees are felled in the dry season, and when the monsoon sets in carried down the Irrawaddy. Here also ships of 300 or 400 tons are frequently built.

PEIRCE (James), an eminent dissenting minister, was born at Wapping, in London, in 1664, and was educated at Utrecht and Leyden; after which he spent some time at Oxford, for the benefit of the Bodleian library. He then for two years preached the Sunday evening lecture at the meeting-house in Miles Lane, London, and afterwards settled at Cambridge. In 1713 he was removed to a congregation at Exeter, where he continued till 1718: when he was ejected for refusing to sign the Calvinistic articles of faith. Upon this a new meeting was opened at Exeter, of which Mr. Peirce continued minister till his death, in 1726. He was a man of the strictest virtue, exemplary piety, and great learning. He wrote, 1. *Exercitatio philosophica de Homœmeria Anaxagorea*. 3. Thirteen pieces on the Controversy between the Church of England and the Dissenters. 3. Ten pieces on the Controversy about the Ejectment at Exeter. 4. Six pieces on the Doctrine of the Trinity. 5. A Paraphrase and Notes on the Epistles of St. Paul to the Colossians, Philipians, and Hebrews. 6. An Essay in favor of giving the Eucharist to Children. 7. Fourteen Sermons.

PEIRESC (Nicolas Claude Fabri), an eminent antiquarian, born in 1580, was descended

from an ancient and noble family, seated originally at Pisa in Italy. At ten years of age he was sent to Avignon, where he spent five years in the Jesuits' College, in the study of the languages. In 1595 he removed to Aix, and entered upon philosophy. In 1596 he was sent to finish his course under the Jesuits at Tournon, where he turned his attention to cosmography. Being recalled by his uncle, in 1597, he returned to Aix, and entered there upon the study of the law. In 1598 he went again to Avignon, to carry on his course of law under one Peter David; who was also well skilled in antiquities. He returned in 1603 to Aix, at the earnest request of his uncle, who resigned to him his senatorial dignity, for which the degree of LL.D. was a necessary qualification. Peiresc, therefore, took that degree January 18th 1604. In 1618 he was nominated by Louis XIII. abbot of Sancta Maria Aquestrensis. He died the 24th of June 1637 in his fifty-seventh year. His works are, 1. *Historia provinciæ Galliæ Narbonensis*; 2. *Nobilium ejusdem provinciæ familiarum Origines, et separatim Fabriciæ*; 3. *Commentarii rerum omnium memoriâ dignarum suâ ætate gestarum*; 4. *Liber de ludicris naturæ operibus*; 5. *Mathematica et astronomica varia*; 6. *Observationes mathematicæ*; 7. *Epistolæ ad S. P. Urbanum VIII., cardinales Barbarinos, &c.*; 8. *Authores antiqui Græci et Latini de ponderibus et mensuris*; 9. *Eulogia et epitaphia*; 10. *Inscriptiones antiquæ et novæ*; 11. *Genealogia domûs Austriacæ*; 12. *Catalogus librorum biblioth. reg.*; 13. *Pœmata varia*; 14. *Nummi Gallici, Saxonici, Britannici, &c.*; 15. *Linguae Orientales, Hebræa, Samaritana, Arabica, Egyptiaca, et Indices librorum harum linguarum*; 16. *Observationes in varios auctores.*

PEKAN, in zoology. See **MUSTELA**.

PEKIN, or **PEKING**, the capital of China, where the emperor generally resides; it is situated in a very fertile plain, twenty leagues from the great wall. This name, which signifies the northern court, is given it to distinguish it from the city Nankin, or the southern court. The emperor formerly resided in the latter, but the Tartars, a restless and warlike people, obliged him to remove his court to the northern provinces, that he might more effectually repel their incursions. It is an exact square, and divided into two parts; namely, that which contains the emperor's palace, which is in the new city, or, as it is called, the Tartars' city, because it is inhabited by Tartars ever since they conquered this empire; the other, called the Old City, is inhabited by the Chinese. The circuit of both these together is fifty-two Chinese lys, each of which contains 240 geometrical paces; being, without the suburbs, full six leagues in circumference, according to the most accurate measurement made by order of the emperor. The population is generally estimated at 2,000,000, but others state it at double that number. See our articles **CHINA**, and **OBSERVATORY**.

PELAGIANS, a Christian sect who appeared about the fifth, or end of the fourth century. They maintained, it is said, the following doctrines: 1. That Adam was by nature mortal, and, whether he had sinned or not, would cer-

tainly have died. 2. That the consequences of Adam's sin were confined to his own person. 3. That new born infants are in the same situation with Adam before the fall. 4. That the law qualified men for the kingdom of heaven, and was founded upon equal promises with the gospel. 5. That the general resurrection of the dead does not follow in virtue of our Saviour's resurrection. 6. That the grace of God is given according to our merits. 7. That this grace is not granted for the performance of every moral act; the liberty of the will, and information in points of duty, being sufficient, &c. The founder of this sect was

PELAGIUS, a native of Great Britain; but whether of England, Scotland, or Wales, is uncertain. Dr. Henry says, he was born in North Wales November 13th, 354; and that his real name was Morgan, of which Pelagius is a translation. He was educated in the monastery of Banchor, in Wales, of which he became a monk, and afterwards abbot. In the early part of his life he went over to France, and thence to Rome, where he promulgated opinions different from those of the church. His morals being irreproachable, he gained many disciples; and the heresy made so rapid a progress that it became necessary for the pope to exert his power. Pelagius, to avoid the danger, in 409 passed over to Sicily, attended by his friend and pupil Celestius. In 411 they landed in Africa, continued some time at Hippo, and were present at the famous conference between the Catholics and Donatists, held at Carthage in 412. Thence they travelled to Egypt; and from Egypt, in 415, to Palestine, where they were graciously received by John, bishop of Jerusalem. In the same year Pelagius was cited to appear before a council of seventeen bishops, held at Diospolis. They were satisfied with his creed, and absolved him of heresy. The African bishops, however, being displeased with their proceedings, appealed to the Roman pontiff: he first approved, and afterwards condemned, the opinions of Pelagius, who, with his pupil Celestius, was publicly excommunicated; and all the bishops who refused to subscribe the condemnation of the Pelagian heresy were immediately deprived. What became of him after this period is unknown; but it is probable that he retired to Bangor, and died abbot of that monastery. He wrote, 1. *Expositionum in epist. Paulinas*, lib. xiv. 2. *Epistola ad Demetriadem de virginitate*. 3. *Explanaciones symboli ad Damasum*. 4. *Epistolæ ad viduam duæ*. 5. *De libero arbitrio*. These and many other fragments are scattered among the works of St. Jerome. They are also collected by Garnerius, and published in *Append. op. Mercatoris*, p. 373. Cave.

PELAGIUS I., pope of Rome, was born in Rome, and elected pope in 555. He endeavoured to reform the clergy; and, when Rome was besieged by the Goths, obtained many concessions from Totila, in favor of the citizens. He died in 560.

PELAGIUS II. (pope), succeeded Benedict I. in 578. He labored much to reconcile the bishops of Istria and Venice to the Roman see, but without success, and he opposed John, pa-

triarch of Constantinople. He died of the plague in 590.

PELAGOSA, an island in the Adriatic, near Dalmatia, which, together with several rocks that appear above water near it, are the remains of an ancient volcano. Fortis, in his *Travels into Dalmatia*, says, 'The lava which forms the substance of this island is perfectly like the lava of Vesuvius. If a naturalist should land there, and visit on purpose the highest parts of the island, perhaps we might then know whether it has been thrown up by a submarine volcano, as the island near Santerini was in our age; or if we ought to believe it the top of some ancient volcanic mountain, of which the roots and sides have been covered by the waters which divided Africa from Spain, forming the straits of Gibraltar; an invasion that no one can doubt of who has examined the bottoms and shores of our sea. The Lissan fishermen say that Pelagosa is subject to frequent and violent earthquakes; and the aspect of the island proves, at first sight, that it has suffered many revolutions; for it is rugged, ruinous, and subverted.' It is sixteen miles south-west of Agosta, and thirty from the Diomedæ Isles.

PELAIAM, a Levite, one of the chiefs of those who returned from captivity, and who signed the covenant that Nehemiah renewed with the Lord. Neh. viii. 7, x. 10.

PELASGI, **PELASGIANS**, a very ancient people of Greece, originally of Arcadia, according to Hesiod; so named from Pelasgus, their first king, though others derive the name from Πελαιγος, a stork, on account of their wandering manner of life.—Strabo. They first inhabited Argolis, in Peloponnesus, which from them was called Pelasgia. Thence, about A. A. C. 1883, they emigrated into Æmonia, and were afterwards dispersed into various parts of Greece; particularly Epirus, Crete, Lemnos, Lesbos, and Argos. Some of them settled in Magna Græcia, in Italy: others occupied a third part of Thessaly, hence called Pelasgiotis. In short, they spread through so many parts of Greece that the poets gave their name to the Greeks in general, and name the whole country from them.—Homer, Hesiod.

PELASGIA, a name given to Greece, from the PELASGI. See the last article.

PELASGIA, 1. The ancient name of Lesbos; so called from the Pelasgi.—Diodorus Siculus, Pliny. 2. The ancient name of Peloponnesus, from Pelasgus, a native of the country.—Nicolaus Damascenus, Ephorus. 4, 5. Pelasgia was also an ancient name of Epirus and Peloponnesus.

PELASGICUM, the north wall of Athens; so called from the builders, the Pelasgi.—Pausanias, Pliny. There was an execration pronounced on any that should build houses under this wall; because the Pelasgi, while dwelling there, entered into a conspiracy against the Athenians.—Thucydides.

PELASGIOTÆ. See PELASGI.

PELASGIOTIS, a third part of Thessaly, situated between Pieria and Macedonia on the north and west, Thessalotis on the south, and Magnesia on the east.—Strabo, Pliny.

PELASGUS, in fabulous history, a son of Jupiter and Niobe, who reigned in Sicily, and from whom his subjects, the Pelasgi, derived their name.

PELATE, free-born citizens, among the Athenians, who by poverty were reduced to the necessity of serving for wages. During their servitude they had no vote in the management of public affairs, as having no estate to qualify them; but this restriction was removed, whenever they had released themselves from their servile situation, which they were allowed to do when able to support themselves. While they continued servants, they had a right to change their masters. They were often called *Thetæ*.

PELATIAH, son of Hananiah, and father of Ishi, of the tribe of Simeon. He subdued the Amalekites upon the mountain of Seir. 1 Chron. iv. 42.

PELATIAH, the son of Benaiah, a prince of the Jews, who lived in the time of Zedekiah king of Judah, and opposed the wholesome advice given by Jeremiah, to submit to king Nebuchadnezzar (See Jerem. xxxviii. 15—20, and Ezek. xi. 1—4). Ezekiel's vision, while he was a captive in Mesopotamia, against Pelatiah, Jaazaniah, and twenty-three other princes who joined with them, is recorded in Ezek. xi. 5—13, with the immediate death of Pelatiah, while Ezekiel was delivering his prophecy.

PELE, two ancient towns of Thessaly; the one subject to Eurypylus, the other to Achilles; both extinct. Peleus was the gentilitious name. Steph.

PELEG, son of Eber, the fifth in descent from Noah, was born in A. M. 1757. He was named Peleg, which signifies division, because in his time the earth began to be divided (Gen. x. 25, xi. 16). Whether Noah had begun to divide the earth among his descendants, some years before the building of Babel; or Peleg came into the world the same year that Babel was begun, and at the confusion of languages; or whether Eber, by a spirit of prophecy, gave his son the name of Peleg before the tower of Babel was begun, is not certain. That which here perplexes the interpreters is, first, that Peleg came into the world not above 100 years after the deluge. But it should seem that the number of men was not then sufficient for such an undertaking as that of Babel; second, Joktan, the brother of Peleg, had already thirteen sons at the time of this dispersion, which happened after the confusion of Babel, Gen. x. 26—29. Peleg being born in the thirty-fourth year of Eber (Gen. xi. 16), it is impossible that Joktan should have had such a number of children at the birth of Peleg. It seems therefore probable that he was not born at the time of the dispersion. To this may be answered, that Moses has there enumerated the names of the thirteen sons of Joktan by way of anticipation, though they were not born till a good while after the confusion at Babel; but, as they possessed a very large country, it was proper to take notice of them among the other descendants of Noah, who divided the provinces of the east among themselves. However this may have been, at the age of thirty Peleg begat Reu; and he died at the age of 239.

PELETHITES, AND CHERETHITES, ~~1800~~ famous in the reign of king David. They were the most valiant men in the army of that prince, and had the guard of his person. See 2 Sam. xv. 18, xx. 7; Patrick's Commentaries, Pool's Annotations, and Delany's History of David.

PELETHRANII, a name given to the Lapithæ, either from their town of Pelethronium, or from their leader Pelethronius. To them mankind are indebted for the invention of the bit with which they tamed their horses.

PELETHRONIUM, a town of Thessaly, in a flowery part of mount Pelios; so named from Pelios, and *ῥοσά*, flowers.—Nicander. Lucan says the Centaurs were natives of that place; to whom Virgil assigns mount Othrys. See CENTAURS, LAPITHÆ, and LAPITHUS.

PELEUS, in fabulous history, a king of Thessaly, son of Æacus and Endeis, the daughter of Chiron. He was the only mortal man who ever married an immortal. He was concerned in the murder of his brother Phocus, and was therefore obliged to leave his father's dominions, and he fled to the court of Eurytus the son of Actor, who reigned at Phthia; or, according to Ovid, to Ceyx, king of Trachinia. He was purified of his murder by Eurytus, who gave him his daughter Antigone in marriage. As Peleus and Eurytus went to the chase of the Calydonian boar, the father-in-law was accidentally killed by an arrow, which his son-in-law had aimed at the beast. This obliged him to banish himself from Phthia, and he went to Iolchos, where he was purified of this homicide by Acastus, the king of the country. His residence at Iolchos was short: Astydamia, the wife of Acastus, fell in love with him; but, when she found him insensible to her passion, she accused him of attempts upon her virtue. The king partly believed the accusation; but not willing to violate the laws of hospitality, by putting him to death, he ordered his officers to conduct him to Mount Pelion, and there tie him to a tree, and leave him to the wild beasts. The order of Acastus was obeyed; but Jupiter, knowing the innocence of his grandson Peleus, ordered Vulcan to set him at liberty. Peleus then assembled his friends to punish Acastus. He took Iolchos, drove the king from his possessions, and put to death the wicked Astydamia. On the death of Antigone, Peleus made love to Thetis, but the goddess fled from him; and, the more effectually to evade his pursuit, she assumed the shape of a bird, a tree, or a tygress. Peleus offered a sacrifice to the gods; and Proteus informed him, that, to obtain Thetis, he must surprise her while she was asleep in her grotto, near the shores of Thessaly. This advice was followed, and Thetis, unable to escape, at last consented to marry him. Their nuptials were celebrated with extraordinary solemnity, all the gods attending and making them valuable presents. Ate, the goddess of Discord, was the only one who was not invited, and she punished this neglect by throwing an apple into the midst of the assembly, with this inscription, *Detur pulchriori*. The celebrated Achilles was the fruit of this marriage, whose education was early entrusted to his great grandfather Chiron, and afterwards to Phœnix, the son of Amyntor. His death

was the source of great grief to Peleus; but Thetis, to comfort her husband, promised him immortality, and ordered him to retire into the grotto of the island of Leuce, where he should see and converse with the manes of his son. Peleus had a daughter called Polydora, by Antigone.

The PELEW, or PALAOS ISLANDS, so called by the Spaniards, who discovered them, were made known to the rest of the world chiefly by the shipwreck of the East India Company's packet Antelope in 1783, captain Wilson, the relation of which, composed by Mr. Keate, has given to these islands an interest much beyond what they would have excited under any other circumstances; none of them being above a league in circuit, and the whole surrounded by a coral reef, which extends from them six leagues to the west. They are moderately elevated, covered with trees, amongst which are the ebony, the bread fruit, and cocoa palm. The sugar-cane is indigenous here, and the natives make a confection of its juice. The woods abound in fowls, which were allowed to remain unmolested until the English taught the natives that they might be taken for food.

The natives are described by Mr. Keate in terms of the warmest eulogy, as a hospitable, gay, and innocent race. They are well-made, of a deep copper-color, with long hair; the men go naked, but the women wear two pieces of fringe made of the fibres of the cocoa-nut husk; both sexes are tattooed, and stain their teeth black. Their houses are elevated off the ground three feet on stones, and are constructed of planks and bamboos; they have besides large halls for the holding public assemblies. Their utensils, instruments, and canoes, are similar to those of the Society Islands, and they make pots of clay. Fish is their principal food. The government is composed of a king, and rupacks, or nobles, whose insignia of dignity is a bracelet of bone on the wrist: to the king belongs the whole territorial property of the islands, the subjects having no other riches than their canoes, their arms, and utensils. Their only idea of religion consists in the belief of the soul's surviving the body. Their language is the Polynesian, or dialect of the Malay. The geographical position of these islands is lat. 6° 10' N., 134° to 135½° E.

The Pelew Islands may be considered as the western limit of the great chain of New Philippines, or Carolinas, which extend between lat. 5° and 12°, and long. 134° and 170°. This great chain is very little known, but it seems to be formed of a number of groups, whose particular direction is north and south, like most of the chains of the Grand Ocean.

The king of Pelew imbibed so great an esteem for captain Wilson that he entrusted his second son, Lee Boo, to his care, to accompany him to England. The prince was of a most amiable disposition, and of good capacity: he died of the small-pox at captain Wilson's house in London, in the year 1784, at about twenty years of age. In return for the kindness shown by Abba Thulle, the prince of Pelew, to the crew of the Antelope, the East India Company in the year 1791 sent

him a number of cattle and other handsome presents. The stock left in the Pelew Islands, with the exception of the sheep, had greatly increased in 1802. At that time several Europeans resided on the islands, for the purpose of collecting biche de mar, tortoise-shell, and shark's fins. The Jesuits of Manila, in the Philippines, endeavoured in 1696 to reduce these islands, and effected a landing in 1710. But those who landed were never more heard of; and the ship which transported them was compelled to depart, leaving them to their fate.

PELF, *n. s.* Barb. Lat. *peltra*. Money; riches.

The thought of this doth pass all worldly *pel*.
Sidney.

Hardy elf,
Thou darrest view my direful countenance;
I read thee rash and heedless of thyself,
To trouble my still seat and heaps of precious *pel*.
Spenser.

Immortal gods, I crave no *pel*,
I pray for no man but myself. *Shakespeare.*

Of traffic or return she never taketh care;
Not provident of *pel*, as many islands are.
Dryden.

He called his money in;
But the prevailing love of *pel*
Soon split him on the former shelf:
He put it out again. *Dryden's Horace.*
To the poor if he refused his *pel*,
He used them full as kindly as himself. *Swift.*

PELIADES, the daughters of Pelias, were Alceste, Pisidice, Pelopea, and Hippothoe, to whom Hyginus adds Medusa. Their mother's name was Anaxibia, the daughter of Bias and Philomache, the daughter of Amphion. After their parricide (see PELIAS) the Peliades fled to the court of Admetus, where Acastus, the son-in-law of Pelias, pursued them, and took their protector prisoner. The Peliades died, and were buried in Arcadia.

PELIAS, in fabulous history, the twin-brother of Neleus, was son of Neptune by Tyro, daughter of Salmoneus. Their birth was concealed by their mother, who wished their father to be ignorant of her incontinence. They were exposed in the woods, but were preserved by shepherds; and Pelias received his name from a spot of the color of lead in his face. Some time after Tyro married Cretheus, son of Æolus, king of Iolchos, and became mother of three children, of whom Æson was the eldest. Pelias visited his mother, and was received in her family; and, after the death of Cretheus, he unjustly seized the kingdom, which belonged to the children of Tyro by Cretheus. To strengthen himself in his usurpation, Pelias consulted the oracle; and when he was told to beware of one of the descendants of Æolus, who should come to his court with one foot shod and the other bare, he privately removed the son of Æson, and declared that he was dead. These precautions proved vain. Jason, the son of Æson, who had been educated by Chiron, returned to Iolchos, when come to years of maturity; and, having lost one of his shoes in crossing the Anaurus or the Evenus, Pelias perceived that this was the person whom he had so much dreaded. He was unwilling to act with violence

to a stranger, who had excited the admiration of the people. But when Jason arrived at his palace with his friends, and boldly demanded the kingdom, Pelias said that he would voluntarily resign the crown to him, if he would go to Colchis to avenge the death of Phryxus, the son of Athamas, whom Æetes had cruelly murdered; adding that the expedition would be attended with the greatest glory, and that nothing but the infirmities of age had prevented himself from punishing the assassin. This patriotic proposal was accepted by the young hero, and his intended expedition was made known all over Greece. See ARGONAUTS, JASON, and MEDEA. According to Ovid, Æson was still living when the Argonauts returned, and was restored to youth by the magic of Medea. This change in the vigor and the constitution of Æson astonished all the inhabitants of Iolchos; and the daughters of Pelias expressed their desire to see their father's infirmities vanish by the same powerful magic. Medea, who wished to avenge the injuries which her husband Jason had received from Pelias, raised the desires of the Peliades, by cutting an old ram to pieces, and boiling the flesh in a cauldron, and then turning it into a fine young lamb. After they had seen this successful experiment, the Peliades cut their father's body to pieces, after they had drawn all the blood from his veins, on the assurance that Medea would replenish them by her wonderful power. The limbs were immediately put into a cauldron of boiling water; but Medea suffered the flesh to be totally consumed, and refused to give the promised assistance, and the bones of Pelias did not even receive a burial.

PELICAN, *n. s.* Fr. *pellican*; Lat. *pelicanus*. A bird of the anseres order. See below.

I am like a *pelican* of the wilderness.

Psalm cii. 6.

Should discarded fathers

Have this little mercy on their flesh;

'Twas this flesh begot those *pelican* daughters.

Shakspeare.

The *pelican* hath a beak broad and flat, like the slice of apothecaries.

Hakewill on Providence.

There are two sorts of *pelicans*; one lives upon the water and feeds upon fish; the other keeps in deserts, and feeds upon serpents and other reptiles: the *pelican* has a peculiar tenderness for its young; it generally places its nest upon a craggy rock; the *pelican* is supposed to admit its young to suck blood from its breast.

Calmet.

PELICAN, in ornithology. See PELICANUS.

PELICAN, in chemistry, is a glass alembic, consisting of one piece. It has a tubulated capital, from which two opposite and crooked beaks pass out, and enter again at the belly of the cucurbit. This vessel has been contrived for a continual distillation and cohobation, which chemists call circulation. The volatile parts of substances put into this vessel rise into the capital, and are obliged to return through the crooked beaks into the cucurbit; and this without interruption, or luting and unluting the vessels. Although the *pelican* seems to be a very convenient instrument, it is now little used; either because the modern chemists have not so much patience as the ancient chemists had for making long experiments; or because they find that two

mattresses, the mouth of one of which is inserted in the mouth of the other, produce the same effect.

PELICANUS, in ornithology, a genus belonging to the order of anseres. The bill is straight, without teeth, and crooked at the point; the face is naked, and the feet are palmated. Mr. Latham enumerates no fewer than thirty different species, besides varieties. The most remarkable are:—

1. *P. aquilus*, or the man-of-war bird, in the body about the size of a large fowl; in length three feet, and in breadth fourteen. The bill is slender, five inches long, and much curved at the point; the color is dusky; from the base a reddish dark-colored skin spreads on each side of the head, taking in the eyes: from the under mandible hangs a large membranaceous bag attached some way down the throat, as in the *pelican*, and applied to the same uses; the color of this is a fine deep red, sprinkled on the sides with a few scattered feathers: the whole plumage is brownish black, except the wing coverts, which have a rufous tinge: the tail is long, and much forked; the outer feathers are eighteen inches or more in length, the middle ones from seven to eight: the legs are small, all the toes are webbed together, and the webs are deeply indented; the color of them is dusky-red. The female differs in wanting the membranaceous pouch under the chin, and in having the belly white: in other things it is like the male. The frigate *pelican*, or man-of-war bird, is chiefly, if not wholly, met with between the tropics, and ever out at sea, being only seen on the wing. It is usual with other birds, when fatigued with flying, to rest on the surface of the water; but nature, from the exceeding length of wing ordained to this, has made the rising therefrom utterly impossible; though perhaps this is no defect, as it scarcely seems to require much rest. From the length of wing, and its apparent easy gliding motion (much like that of the kite), it appears capable of sustaining very long flights, and it is often seen above 100, and sometimes above 200, leagues from land. It also attacks gulls and other birds which have caught a fish, when it obliges them to disgorge it, and then seizes it before it falls into the water. They make nests on trees, and on the rocks. They lay one or two eggs of a flesh-color marked with crimson spots. The young birds are covered with grayish-white down: the legs are of the same color, and the bill is white. There is a variety of this species, which is less, measuring only two feet nine inches in length; the extent from wing to wing is five feet and a half. The bill is five inches long, and red; the base of it and bare space round the eye are of the same color; the nostrils are sufficiently apparent, and appear near the base; the shape of the bill is as in the larger one: the head, hind part of the neck, and upper parts of the body and wings are ferruginous brown; the throat, fore part of the neck, and breast, are white; the tail is greatly forked as in the other; the legs are of a dirty-yellow. Some suppose that the greater and lesser frigates are the same birds, in different periods of age.

2. *P. bassanus*, the gannet, or sofian goose,

weighs seven pounds; the length is three feet one inch; the breadth six feet two inches. The bill is six inches long, straight almost to the point, where it inclines down; and the sides are irregularly jagged, that it may hold its prey with more security: about an inch from the base of the upper mandible is a sharp process pointing forward; it has no nostrils, but in their place a long furrow, that reaches almost to the end of the bill; the whole is of a dirty white, tinged with ash color. The tongue is very small, and placed low in the mouth; a naked skin of a fine blue surrounds the eyes, which are of a pale yellow, and are full of vivacity: this bird is remarkable for the quickness of its sight. Martin tells us that *solan* is derived from an Irish word expressive of that quality. From the corner of the mouth is a narrow slip of black bare skin, that extends to the hind part of the head; beneath the chin is another that, like the pouch of the pelican, is dilatable, and of size sufficient to contain six entire herrings; which in the breeding season it carries at once to its mate or young. The young birds, during the first year, differ greatly in color from the old ones; being of a dusky hue, speckled with numerous triangular white spots; and at that time resemble in colors the speckled diver. Each bird, if left undisturbed, would only lay one egg in the year, but if that be taken away they will lay another, if that is also taken then a third, but never more than that season. Their egg is white and rather less than that of the common goose; the nest is large, and formed of any thing the bird finds floating on the water, such as grass, sea-plants, shavings, &c. These birds frequent the Isle of Ailsa, in the Frith of Clyde; the rocks adjacent to St. Kilda; the Stalks of Soulliskerry, near the Orkneys; the Skelig Isles, off the coasts of Kerry, Ireland; and the Bass Isle, in the Frith of Forth: the multitudes that inhabit these places are prodigious. These birds are well known on most of the coasts of England, but not by the name of the *solan* geese. In Cornwall and in Ireland they are called gannets; by the Welsh *gan*. We are uncertain whether the gannet breeds in any other parts of Europe besides our own islands; except, as Mr. Ray suspects, the *sula* (described in Clusius's *Exoticks*, which breeds in Feroe Isles) be the same bird.

3. *P. carbo*, the corvorant, sometimes exceeds seven pounds in weight; the length three feet four inches; the extent four feet two inches; the bill dusky, five inches long, destitute of nostrils; the base of the lower mandible is covered with a naked yellow skin, that extends under the chin, and forms a sort of pouch; a loose skin of the same color reaches from the upper mandible round the eyes and angles of the mouth; the head and neck are of a sooty blackness, but under the chin of the male the feathers are white; and the head in that sex is adorned with a short, loose, pendant crest; in some both the crest and hind part of the head are streaked with white. The coverts of the wings, the scapulars, and the back, are of a deep green, edged with black, and glossed with blue; the quill feathers and tail dusky; the legs are

short, strong, and black; the middle claw serrated on the inside; the irides are of a light ash-color. These birds occupy the highest parts of the cliffs that impend over the sea; they make their nests of sticks, sea-tang, grass, &c., and lay six or seven white eggs of an oblong form. In winter they disperse along the shores, and visit the fresh waters, where they make great havoc among the fish. They are remarkably voracious, having a most sudden digestion, promoted by the vast quantity of small worms that fill their intestines. The corvorant has the rankest and most disagreeable smell of any bird, even when alive. Its form is disagreeable; its voice hoarse and croaking, and its qualities base. The Chinese make great use of these birds, or a congenerous sort, in fishing; not for amusement, but profit.

4. *P. graculus*, the shag, called in the north of England the crane, is much inferior in size to the corvorant; the length is twenty-seven inches; the breadth three feet six inches; the weight three pounds and three quarters. The bill is four inches long, and more slender than that of the preceding; the head is adorned with a crest two inches long, pointing backward; the whole plumage of the upper part of this bird is of a fine and very shining green; the edge of the feathers a purplish black; but the lower part of the back, the head, and neck, wholly green; the belly is dusky; the tail of a dusky hue, tinged with green; the legs are black, and like those of the corvorant. Both these kinds agree in their manners, and breed in the same places; and, what is very strange in web-footed birds, will perch and build in trees: both swim with their head quite erect, and are very difficult to be shot; for, like the grebes and divers, as soon as they see the flash of the gun, they pop under water, and never rise but at a considerable distance.

5. *P. onocrotalus*, or the pelican of Asia, Africa, and America; though Linnæus thinks that the pelican of America may be a distinct variety. This creature, in Africa, is much larger in the body than a swan, and somewhat of the same shape and color. Its four toes are all webbed together; and its neck in some measure resembles that of a swan; but the singularity in which it differs from all other birds is in the bill and the great pouch underneath. This enormous bill is fifteen inches from the point to the opening of the mouth, which is a good way back behind the eyes. At the base the bill is somewhat greenish, but varies towards the end, where it hooks downwards. The under chap is still more extraordinary; for to the lower edges of it hang a bag, reaching the whole length of the bill to the neck, which is said to be capable of containing fifteen quarts of water. This bag the bird has a power of wrinkling up into the hollow of the under chap; but by opening the bill, and putting one's hand down into the bag, it may be distended at pleasure. The skin of which it is formed will then be seen of a bluish ash-color, with many fibres and veins running over its surface. It is not covered with feathers, but with a short downy substance, as smooth and as soft as satin, and is attached all along to

the under edges of the chap, is fixed backward to the neck of the bird by proper ligaments, and reaches nearly half way down. When this bag is empty it is not seen; but, when the bird has fished with success, it is then incredible to what an extent it is often seen dilated. For the first thing the pelican does in fishing is to fill up the bag; and then it returns to digest its burden at leisure. When the bill is opened to its widest extent, a person may run his head into the bird's mouth, and conceal it in his monstrous pouch, thus adapted for very singular purposes. Tertre affirms that it will hide as many fish as will serve sixty hungry men for a meal. This pelican was once also known in Europe, particularly in Russia; but it seems to have deserted our coasts. This is the bird of which so many fabulous accounts have been propagated; such as its feeding its young with its own blood, and its carrying a provision of water for them in its great reservoir in the desert. But the absurdity of the first account answers itself; and, as for the latter, the pelican uses its bag for very different purposes than that of filling it with water. Clavigero, in his History of Mexico, says that, "there are two species, or rather varieties, of this bird in Mexico; the one having a smooth bill, the other a notched one." The pelican, says Labat, has strong wings, furnished with thick plumage of an ash-color, as are the rest of the feathers over the whole body. Its eyes are very small, when compared with the size of its head; there is a sadness in its countenance, and its whole air is melancholy. It is slow of flight, and, when it rises to fly, performs it with difficulty and labor; but, when it perceives a fish sufficiently near the surface, it darts down upon it with the swiftness of an arrow, seizes it with unerring certainty, and stores it up in the pouch. It reposes for the night, and often spends a great part of the day, sitting in dismal solemnity, and, as it would seem, half asleep on a tree. The same indolence attends them even in preparing for incubation, and defending their young when excluded. The native Americans kill vast numbers; not to eat, for they are not fit even for the banquet of a savage, but to convert their large bags into purses and tobacco pouches. Some authors say the pelican lives sixty or seventy years. Captain Keeling, in his voyage to Sierra Leone, says the pelicans there are as large as swans, of a white color, with exceeding long bills; and M. Thevenot, in his Travels to the Levant, observes that the pelicans about some parts of the Nile near the Red Sea swim by the bank side like geese, in such great numbers that they cannot be counted. F. Morrolla, in his Voyage to Congo, says, pelicans are often met with in the road to Singa, and are all over black, except on their breast, which is of a flesh color like the neck of a turkey. He adds that father Francis de Pavia informed him that on his journey to Singia he observed certain large white birds, with long beaks, necks, and feet, which, whenever they heard the sound of an instrument, began immediately to dance and leap about the rivers, where they always reside, and whereof they were great lovers; this, he said, he took a great pleasure to contemplate, and conti-

nued often upon the banks of the rivers to observe.

6. *P. pussus*, or the great booby, called by Linnæus *pelicanus bassani pussus*, frequents the rivers and sea coasts of Florida, pursuing and devouring fishes. Mr. Catesby informs us, that he has several times found them disabled, and sometimes dead, on the shore; whence he thinks that they meet with sharks or other voracious fishes, which destroy them. The bird is about the size of a goose; the head and neck remarkably prominent; the back of a brown color; the belly dusky white; the feet black, and shaped like those of a corvorant; the head elegantly spotted with white; the wings extend six feet when spread. Both this species and the *sula* have a joint in the upper mandible of the bill, by which they can raise it considerably from the lower one without opening the mouth.

7. *P. sula*, the booby, is somewhat less than a goose; the basis of the bill yellow, and of bare feathers; the eyes of a light gray color; the lower part of the bill of a light brown. The colors of the body are brown and white; but varied so in different individuals that they cannot be described by them. Their wings are very long; their legs and feet pale yellow, shaped like those of corvorants. They frequent the Bahama Islands, where they breed all months in the year, laying one, two, or three eggs, on the bare rock. While young, they are covered with a white down, and continue so till they are almost ready to fly. They feed on fish, but have a very troublesome enemy in the man-of-war bird, which lives on the spoils obtained from other sea-birds, particularly the booby. Such readers as desire further information respecting this numerous genus may consult Edwards's History of Birds; Natural History of Jamaica; Mem. de l'Academie Royale des Sciences, depuis 1666 jusqu'à 1699, tom. 3, p. 186; Willoughby; Pennant's British and Arctic Zoology; and Latham's Synopsis of Birds.

PELIDES, a patronymic of Achilles and Pyrrhus, as descended of Peleus.

PELIGNI, an ancient nation of Italy, who dwelt near the Sabines and the Marsi. Their chief towns were Continium and Sulmo. Liv. viii. 6, 29. Strabo 5.

PELINNA, or PELINNÆUM, an ancient town of Macedonia. Strabo. xiv. Liv. xxxvi. 10, and 14.

PELION, or PELIOS, a mountain of Thessaly, near Ossa, hanging over the Sinus Pelasgicus, or Pegasicus; its top covered with pines, the sides with oaks, and wild ash. (Diod. Sic. Mela. Virg. Hor. Ovid. Sen. V. Flac.) From this mountain was cut the spear of Achilles, called pelias, which none but himself could wield. (Homer.) Dicearchus, Aristotle's scholar, found this mountain 1250 paces higher than any other of Thessaly. (Pliny.) Pelius, and Pelias, the epithets. (Cic. Catul.)

PELLIUM, a town of Macedonia. Liv. 31, 40.

PELL (John), D.D., an eminent mathematician, of an ancient family in Lincolnshire, born at Southwyke in Sussex, March, 1st, 1610, and educated at Cambridge, where he took his degree of M.A. in 1630. In 1629 he drew up

the Description and Use of the Quadrant. In 1643 he was chosen professor of mathematics at Amsterdam. In 1646 the prince of Orange appointed him professor of that at Breda. He returned to England in 1652; and, in 1654, was sent by Oliver Cromwell as agent to the protestant Swiss Cantons. He resided at Zurich four years, with the title of Ablegatus, and returned on the 23d of June, 1658. After the Restoration, which he contributed to promote, he entered into orders; was created D.D., ordained deacon in 1661, and rector of Laington, in Essex, in 1663. He published a work on Algebra, and on the tenth of Euclid, with other tracts. He died at London, December 12th, 1685.

PELLA, in ancient geography, a town of Macedonia on the confines of Emathia. (Ptolemy.) Herodotus allots it to Bottiaea, a maritime district on the Sinus Thermaicus. It was the royal residence, situated on an eminence, on the south-west, encompassed with unpassable marshes summer and winter: in which, next the town, a citadel rose like an island, placed on a bank or dam, a prodigious work, both supporting the wall and securing it from hurt by the circumfluent water. At a distance, it seemed close to the town, but was separated from it by the Ludias, running by the walls, and jointed to it by a bridge, 120 stadia from the sea, the Ludias being so far navigable. (Liv. Strab.) Mela calls it Pelle. It was the birth-place of Philip, who enlarged it; and afterwards of Alexander (Strabo, Mela); and continued to be the royal residence down to Perseus. (Livy.) It is called Pella Colonia, by Pliny, and Colonia Julia Augusta upon coin. It afterwards declined, and had but few and mean inhabitants. (Lucian.) It is now called Παλατισια, Palatisia, i. e. the little Palace. (Holstenius.) Pellæus, the gentili-tious name and epithet. Lucian, Juv. Mart.

PELLA, a town of the Decapolis, on the other side the Jordan; abounding in water. (Poly. Plin.) built by the Macedonians (Strabo); or by Seleucus (Eusebius); anciently called Butis (Stephanus); and Apamea (Strabo); thirty-five miles north-east of Gerasa. (Ptol.) Thither the Christians, just before the siege of Jerusalem by Titus, were divinely admonished to fly. (Eusebius.) It was the utmost boundary of the Peræa, or Transjordan country, on the north. (Josephus.)

PELLÆUS, a title of Alexander.

PELLANE, a town of Laconia. Paus. iii. 21.

PELLE. See PELLA.

PELLEGRIN (Simon Joseph), a learned French writer, born at Versailles, in 1663. He entered into the order of Servites; and wrote on various subjects, some spiritual, others dramatic, poetical, &c. In 1704 he obtained the Academy's prize, for his Epistle to Louis XIV. on the success of his arms. He wrote also some comedies and operas. By the influence of madame Maintenon, he was translated to the order of Cluny. He died in 1745, aged eighty-two.

PELLEGRINI (Antony), an eminent historical painter, born at Padua, in 1674. He studied at Venice under Paul Pagan. The duke of Manchester brought him over to England, where he performed several capital works for the nobility. He died in 1741.

PELLEGRINO (Tibaldi, or Theobald), an eminent Italian painter and sculptor, born at Bologna, in 1522. He was employed by Charles V. to ornament the Escorial; for which he was rewarded with 100,000 crowns and the title of marquis. He died in 1592, aged seventy.

PELLEGRINO of Modena, an eminent Italian painter, born in that city in 1511. He studied under Raphael, and was employed in the paintings of the Vatican. He died of a wound received in the street in attempting to rescue his son, who had committed murder.

PELLERIN (Joseph), an eminent French antiquarian, born in 1683. He was commissary general, and clerk of the French marine. He became famous for a capital collection of medals, which Louis XIV. enabled him to purchase; and he enriched the science with a valuable work on the subject, in nine vols. 4to. with numerous elegant plates. He died in 1782, aged ninety-nine.

PEL'LET, *n. s.* } Fr. *pelote*; a diminutive
PEL'LETED, *adj.* } of Lat. *pila*. A little ball;
a bullet: pelleted is consisting of bullets.

That which is sold to the merchants is made into little pellets and sealed. *Sandya.*

My brave Egyptians all,
By the discarding of this pelleted storm,
Lie graveless. *Shakespeare.*

A cube or pellet of yellow wax as much as half the spirit of wine, burnt only eighty-seven pulses.

Bacon.

The force of gunpowder hath been ascribed to rarefaction of the earthy substance into flame, and so followeth a dilatation: and therefore, lest two bodies should be in one place, there must needs also follow an expulsion of the pellet or blowing up of the mine; but these are ignorant speculations; for flame, if there were nothing else, will be suffocated with any hard body, such as a pellet is, or the barrel of a gun; so as the hard body would kill the flame.

Id.

How shall they reach us in the air with those pellets they can hardly roll upon the ground?

L'Estrange.

In a shooting trunk, the longer it is to a certain limit, the more forcibly the air passes and drives the pellet.

Ray.

I dressed with little pellets of lint. *Wierman.*

PELLETS, in heraldry, those roundles that are black; called also ogresses and gunstones, and by the French heralds *toteaux de sable*.

PELLETIER (Claude), a learned French lawyer, born at Paris, in 1630. He was counsellor of the Chatelet, and president of the Merchants; in which office he constructed the celebrated quay which bears his name. He succeeded M. Colbert, as comptroller general of the finances. He wrote several books on Law; also *Comes Theologus*, *Comes Rusticus*, &c.

PELLETIER (James), M.D., and an eminent mathematician, born at Mans in 1517. He was an excellent Latin and French poet, a good orator, physician, and grammarian. He wrote *Oeuvres Poétiques*, *Commentaires Latins sur Euclide*, and a Treatise on Orthography. He died at Paris in 1683.

PELLETIER (Bertrand), a late eminent French chemist, born at Bayonne in 1761. He was ad-

mitted a pupil in the chemical laboratory of the French College, when very young, and gave early proofs of genius. He studied five years under the celebrated professor Darcet, and at twenty-one years of age published *Observations on the Arsenical Acid*. After this his discoveries and publications became numerous: on the crystallisation of sulphur, cinnabar and the deliquescent salts; on zeolites; on the oxygenated muriatic acid; on ethers, phosphorus, the phosphoric acid, &c. But during his operations on that most astonishing production of chemistry phosphorus, he burned himself so dangerously, that he was confined to bed for six months. On his recovery, he began his analysis of the plumbagos of various countries: and, during his analysis of the carbonate of barytes, discovered by experiments on various animals that this earth is a true poison. He also analysed strontian, verditer, &c. &c., and was going on successfully with his chemical experiments, when he at last fell a sacrifice to his thirst after science, by respiring the oxygenated muriatic gas till it had almost killed him instantaneously; but, though he recovered for the moment, it induced a convulsive asthma, and pulmonary consumption, which cut him off in the flower of his age; and he died at Paris, July 21st, 1797. He was a member of the Academy of Sciences at Paris.

PELLEW'S (Sir Edward), ISLANDS, a group of islands on the north coast of New Holland, and west shore of the gulf of Carpentaria. They extend thirty-four miles east and west, by twenty-two north and south: the five principal islands being from seven to seventeen miles in length. They are of a hard close grained sand-stone, with a small mixture of quartz, slightly impregnated with iron. Where the surface is not bare rock, it is sand, with a small proportion of vegetable soil, in no case approaching to fertility. The larger islands are, however, covered with trees, bushes, and in some low places with grass. In the larger islands traces of the kangaroo and turtle tracks are to be seen. The names of them are Vanderlin's, North-West, South-West, and Centre Islands. Lat. of Centre Island 15° 39' south.

PELLEW, CAPE, the northern point of an island of Sir Edward Pellew's group, in the gulf of Carpentaria, called North Island. Long. 137° 2' E., lat. 16° 30' 30" S.

PEL'LICLE, *n. s.* Lat. *pellicula*. A thin skin or film.

After the discharge of the fluid, the *pellicle* must be broke. *Sharp.*

PELLICLE, among physicians, denotes a thin film or fragment of a membrane.

PELLISON, or PELISSON FONTANIER (Paul), an author of the seventeenth century, was born at Beziers in 1614, and educated in the Protestant religion. In 1652 he purchased the post of secretary to the king, and in 1657 became first deputy to M. Fouquet. He suffered by the disgrace of that minister; and in 1661 was confined in the Bastille, whence he was not discharged till 1665. During his confinement he applied himself to the study of controversy; and in 1670 abjured the Protestant religion. Louis XIV. rewarded him with an annual pension of 2000

crowns, and several posts. In 1676 he had the abbey of Giment, and some years after the priory of St. Orens at Auch. He died at Versailles in 1693. His principal works are 1. The History of the French Academy. 2. Reflections on Religious Disputes, &c., in four vols. 12mo. 3. The History of Louis XIV. 4. Historical Letters and Miscellanies in three vols. 12mo.

PELLITORY, BASTARD, PELLITORY, DOUBLE. Two species of achillaea.

PELLITORY OF SPAIN. See ANTHEMIS.

PELLITORY OF SPAIN, FALSE, a species of chrysanthemum.

PELLITORY, TREE. See ZANTHOXYLUM.

PE'LLMELL, *adv.* Fr. *pelle melle*; Lat. *pello* and *miscella*. Confusedly; tumultuously; with confused violence.

When we have dashed them to the ground,

Then *desse* each other; and *pell-mell*

Make work upon ourselves.

Shakespeare. King John.

Never yet did insurrection want

Such moody beggars, starving for a time

Of *pell-mell* havock and confusion. *Shakespeare.*

He knew when to fall on *pell-mell*,

To fall back and retreat as well. *Hudibras.*

After these senators have in such manner, as your grace hath heard, battered episcopal government, with their paper-shot, then they fall *pell-mell* upon the service-book. *White.*

PELLS, *n. s.* Lat. *pellis*, *pell*, a record. Rolls or records of the Exchequer.

Clerk of the *pell*, an officer belonging to the exchequer, who enters every teller's bill into a parchment roll called *pellis acceptorum*, the roll of receipts; and also makes another roll called *pellis exituum*, a roll of the disbursements. *Bailey.*

PELLUCID, *adj.* Lat. *pellucidus*. Clear; transparent; not opaque.

The air is a clear and *pellucid* menstruum, in which the insensible particles of dissolved matter float, without troubling the *pellucidity* of the air; when on a sudden by a precipitation they gather into visible misty drops that make clouds. *Locke.*

We consider their *pellucidness*, and the vast quantity of light that passes through them without reflection. *Keill.*

The colours are owing to the intermixture of foreign matter, with the proper matter of the stone: this is the case of agates and other coloured stones, the colours of several whereof may be extracted, and the bodies rendered as *pellucid* as crystal, without sensibly damaging the texture. *Woodward.*

If water be made warm in any *pellucid* vessel emptied of air, the water in the vacuum will bubble and boil as vehemently as it would in the open air in a vessel set upon the fire, till it conceives a much greater heat. *Newton's Opticks.*

PELOPEIA, in fabulous history, the daughter of THYESTES, and mother, by him, of ÆGISTHUS. See these articles.

PELOPIA, a festival observed by the Eleans in honor of Pelops. A ram was sacrificed on the occasion, which both priests and people were prohibited from partaking of, on pain of excommunication from Jupiter's temple; the neck only was allotted to the officer who provided wood for the sacrifice. This officer was called *ῥυτρυς*; and white poplar was the only wood made use of at this solemnity.

PELOPIDAS, the son of Hippoclus, a celebrated general of Thebes, in Bœotia. He was descended of an illustrious family, and had immense riches, which he distributed with uncommon liberality among the poor citizens. He was the intimate friend of Epaminondas; and these two patriots, by their valor and public spirit, raised their country to a degree of importance and glory, that it never enjoyed before or after them. Thebes had been for some time under the government of Spartan tyrants, who exiled Pelopidas and the other friends of Theban independence; but Pelopidas returned from Athens, with a chosen band of twelve other exiled Thebans, who killed the Spartan tyrants, and restored liberty to their country. The Thebans then elected him governor of Bœotia, and associated Epaminondas with him; and these two great men immortalised their names by the decisive victory at Leuctra. In a war which the Thebans afterwards carried on against Alexander, tyrant of Phœræ, Pelopidas was appointed commander, but had nearly lost his life, by trusting himself unarmed in the tyrant's camp. Though in the character of an ambassador, he was seized as a prisoner, but rescued by Epaminondas. He was afterwards killed in a battle with the same tyrant, though his troops obtained the victory, A. A. C. 364; but his death was amply revenged by the Thebans, who took Phœræ, and killed the tyrant. Statues of brass were erected, and every other mark of respect paid to the memory of Pelopidas; and his children were endowed with a large territory of land.—Xenoph. Plut. C. Nep. Diod. Polyb.

PELOPONNESIAN WAR, Peloponnesiacum bellum, a famous war, which lasted twenty-seven years between the Athenians and the inhabitants of Peloponnesus, with their respective allies, and which ended in the overthrow of the Athenian republic, and its subjection to thirty tyrants. It is the most interesting of all the wars which happened among the inhabitants of ancient Greece. See **ATTICA**.

PELOPONNESUS, a large peninsula in the south of Greece; so called, from Pelopis *πेलίος*, or insula, though properly not an island, but a peninsula; yet wanting but little to be one, viz. the isthmus of Corinth, ending in a point.—Dionysius. It was anciently called Apia and Pelasgia; and is situated between the Ægean and Ionian Seas, and resembles a plantain leaf, by its angular recesses or bays.—Plin, Strabo, Mela. Strabo adds, from Homer, that one of its ancient names was Argos, with the epithet Achaicum, to distinguish it from Thessaly, called Pelasgium. It was divided into six parts; viz. Argolis, Laconica, Messenia, Elis, Achaia, and Arcadia.—Mela. It is now called the Morea. It comprehended the most southern parts of Greece; and was 200 miles long, and 140 broad.

PELOPS, in fabulous history, the son of Tantalus king of Phrygia. In his infancy he was murdered by his father, cut in pieces, and served up as a feast to the gods, to try their divine omniscience. None of them however eat of him, but Ceres, who eat one of his shoulders. Jupiter restored him to life, and gave him an

ivory shoulder, which had the miraculous power of healing all diseases by its touch; and he punished the impiety of Tantalus, by condemning him to eternal hunger and thirst, in the view of excellent food and drink in hell. Pelops afterwards went into Elis, where he became a suitor of Hippodamia, the daughter of Oenomaus, king of Pisa, who, being warned by an oracle that he would perish by the hands of his son-in-law, and being himself an excellent charioteer, refused to marry her to any person but the man who should overcome him in a chariot race. The previous condition being that those whom he defeated were to forfeit their lives, thirteen young princes had already perished. Pelops, however, ventured to compete with him, and having previously bribed Myrtilus, his charioteer, to mount him on an insufficient chariot, Oenomaus was killed in the course, but, with his last breath, requested Pelops to avenge him on Myrtilus; which he accordingly did, by throwing him into the sea, from him named Myrtoum Mare. Pelops then married Hippodamia, by whom he had Atreus, Thyestes, Pitheus, Troezen, &c. He afterwards became so powerful that all the territory of Greece beyond the isthmus of Corinth was from him named Peloponnesus. After his death he received divine honors, and was revered above all the other heroes of Greece. He had a temple at Olympia, erected by Hercules near that of Jupiter.

PELORIAS, **PELORIS**, or **PELORUS**, in ancient geography, one of the three capes of Sicily, now called Faro. It is said to have been so named from Pelorus, the pilot of the ship which carried Hannibal out of Italy, whom that general, when he found the tide driving the vessel into the straits of Charybdis, killed, on the supposition that he was going to betray him to the Romans; and therefore, to gratify his name, he named the cape after him.

PELT, *n. s.* Teut. *peltze*; Lat. *pellis*. Skin; hide.

The camel's hair is taken for the skin or *pelt* with the hair upon it. *Brown's Vulgar Errors*.

A scabby tetter on their *pelts* will stick,
When the raw rain has pierced them to the quick.

Dryden.

PELT, *v. a.* } Fr. *peloter*; from German
PELTING, *adj.* } *pollern*. Skinner. More probably as Lye suggests contracted from **PELLET**. To throw at; strike with something thrown; hence to annoy: pelting, therefore, is used by Shakspeare for paltry annoyance.

Poor naked wretches, wheresoe'er you are,
That bide the *pelting* of this pitiless storm!
How shall your houseless heads and unfed sides,
Your looped and windowed raggedness defend you?
Shakspeare.

Do but stand upon the foaming shore,
The chiding billows seem to *pelt* the clouds. *Id.*
Could great men thunder, Jove could ne'er be quiet;

For every *pelting* petty officer
Would use his heaven for thunder. *Id.*

Fogs, falling in the land,
Have every *pelting* river made so proud,
That they have overborn their continents. *Id.*
A tenement or *pelting* farm. *Id.*

No zealous brother there would want a stone
To maul us cardinals, and pelt pope Joan. *Dryden.*

My Phillis me with pelted apples plies,
Then tripping to the woods the wanton hies. *Id.*
Obscure persons have insulted men of great worth,
and pelted them from coverts with little objections.

The whole empire could hardly subdue me, and I
might easily with stones pelt the metropolis to pieces. *Swift.*

No learned disputants would take the field,
Sure not to conquer, and sure not to yield:
Both sides deceived, if rightly understood,
Pelting each other for the public good. *Comper.*

PELTA, a small, light, manageable buckler, used by the ancients. It was worn by the Amazons. It is said to have resembled an ivy leaf in form; by others, it is compared to the leaf of an Indian fig-tree, and, by Servius, to the moon in her first quarter.

PELTARIA, in botany, a genus of the siliculosa order, belonging to the tetradynamia class of plants; and in the natural method ranking under the thirty-ninth order, siliquose. The silicula is entire, and nearly orbiculated, compressed plane, and not opening.

PELVIS. (Gr. *πελvis*, a basin; because it is shaped like a basin used in former times). The cavity below the belly. It contains the rectum and urinary bladder, the internal organs of generation, and has its muscles and bones.

The pelvis consists, in the child, of many pieces, but, in the adult, it is formed of four bones; of the os sacrum behind, the ossa innominata on either side, and the os coccygis below. It is wide and expanded at its upper part, and contracted at its inferior aperture. The upper part of the pelvis, properly so called, is bounded by an oval ring, which parts the cavity of the pelvis from the cavity of the abdomen. This circle is denominated the brim of the pelvis; it is formed by a continued and prominent line along the upper part of the sacrum, the middle of the ilium, and the upper part, or crest, of the os pubis. The circle of the brim supports the impregnated womb; keeps it up against the pressure of labor pains; and sometimes this line has been 'as sharp as a paper-folder, and has cut across the segment of the womb;' and so by separating the womb from the vagina, has rendered delivery impossible; and the child escaping into the abdomen the woman has died. The lower part of the pelvis is denominated the outlet. It is composed by the arch of the ossa pubis, and by the sciatic ligaments; it is wide and dilatable, to permit the delivery of the child; but being sometimes too wide, it permits the child's head to press so suddenly, and with such violence upon the soft parts, that the perineum is torn.

Marks of the female skeleton have been sought for in the skull, as in the continuation of sagittal suture; but the truest marks are those which relate to that great function by which chiefly the sexes are distinguished; for while the male pelvis is large and strong, with a small cavity, narrow openings, and bones of greater strength, the female pelvis is very shallow and wide, with a large cavity and slender bones, and every peculiarity which may conduce to the easy passage of the

child. The office of the pelvis is to give a steady bearing to the trunk, and to connect it with the lower extremities, by a sure and firm joining, to form the centre of all the great motions of the body.

PELUSIUM, in ancient geography, a noble and strong city of Egypt, without the Delta, twenty stadia from the sea; situated amidst marshes; and hence its name and its strength. It is called the key or inlet of Egypt, by Diodorus and Hirtius; which being taken, the rest of Egypt lay quite exposed to an enemy. It is called Sin by Ezekiel. Pelusiacus the epithet. (Virgil, Diodorus.) From its ruins arose Damietta. Pelusium was often taken and pillaged during the wars of the Romans, the Greeks, and the Arabs. But in spite of so many disasters she preserved to the time of the Crusades her riches and her commerce. The Christian princes, having taken it by storm, sacked it. It never again rose from its ruins; and the inhabitants went to Damietta. See DAMIETTA.

PEMBROKE, a borough and market town of South Wales, consisting of the two parishes in Castle Martin hundred, Pembrokeshire, and situate on a branch of Milford Haven, ten miles south by east from Haverfordwest, and 256 west from London. It consists principally of one long street, and has two churches, St. Mary's and St. Michael's, and a third, St. Nicholas', in the suburbs. It has a strong resemblance to Edinburgh and Sterling, but on a much smaller scale. It has a town-hall and a free-school, and is watered by two small rivers, over which are handsome bridges. It was anciently surrounded by walls, of which a large portion remain, and had a magnificent castle, seated on a rock, at the west end of the town, supposed to have been founded in 1092 by Arnulph de Montgomery, son of the earl of Shrewsbury, on the site of a more ancient British work. During the Welsh wars it was frequently besieged; but always considered impregnable. It was reduced by Oliver Cromwell. It is now entirely ruinous. Of the town gates that facing the north is the only one now standing; the other two having been long since destroyed. The east gate, which remained in Leland's time, is described by him as consisting of solid iron, and as being highly ornamented.

PEMBROKESHIRE, a county of Wales, takes its name from Pembroke, its principal town, and is seated on the south-west extremity of the principality, being bounded on all sides by the sea, except on the east, where it joins to Caernarvonshire, it being washed on the south by the Bristol Channel, and on the west and north by St. George's Channel or the Irish Sea. Its extent from north to south is about thirty-five miles, and from east to west twenty-nine miles, comprehending about 368,000 acres. It is divided into seven hundreds, containing seven towns, and 144 parishes.

This county is in the province of Canterbury and diocese of St. David's. The surface is for the most part composed of swells or easy slopes, but not mountainous, except a ridge of hills which runs from the coast, near Fisgard, to the borders of Caernarvonshire. These hills are

called the mountains; and the people distinguish the country with reference to the hills, the north side being called above the mountains, and the south side below. A considerable tract, consisting of the country which lies west of Milford Haven, and between that bay and St. George's Channel, is called by the Welsh *Rhos*, which signifies a green field. In this district a colony of Flemings settled, by the permission of Henry I., at the time when the sea had broke through the dykes of their own country, and had done incredible damage. This district was, in Camden's time, called Little England beyond Wales. Giraldus, speaking of the Flemish settled here, says, they are a stout resolute nation, very offensive to the Welsh by their frequent skirmishes: and observes that they were much inured to the clothing trade, and to merchandise; and ready to increase their stock by any labor and hazard, both by sea and land. The Flemings' Way or Road, a work performed by them, may be still seen extending through a long tract of ground. The Welsh, who were not well pleased with this colony, frequently attempted to drive them out by ravaging and spoiling their borders, but without success. The annotator upon Camden informs us, that all Wales with their united force have several times invaded their country, but the Flemings maintained their ground; and *Rhos* is still inhabited by their descendants, who may yet be distinguished by their speech and customs. Mr. Malkin observes that Pembrokeshire has a very great extent of coast; and indeed it seems almost as if it were appended to the main land on the eastern side. The instances of longevity are numerous and remarkable, so that persons living to the age of ninety are by no means of rare occurrence. The country is much subject to rain, in which nature seems kindly to have provided for the dryness of the soil. Snow in ordinary seasons is seldom known to lie longer than a day near the coast. The mountains, however, in the north of the county have their full share. It is a circumstance which has been often noticed, but may be worth repeating, how curiously the woods, exposed to the south and west, are shorn by the winds from the sea. With the exception of a small tract towards the north, this is the most level part of Wales, and seems to bear a resemblance to the general face of English country, as close as the affinity of its inhabitants to the English people; so that it has been called Little England beyond Wales, as before observed. The practice of using surnames always prevailed here as in England; at least in the southern hundreds. The style of building in the towns is little if at all superior to that of Wales in general; but the cottages are good and comfortable. Animal food is much more in use than among the common people in the neighbouring counties, who live very much on the produce of the dairy. The churches of the English or Flemish hundreds afford a very pleasing contrast to those whose external meanness and internal deformity has been so frequently noticed: here they are never seen without tower or spire, and are in general well kept, and adorned with decent monuments. In the places near the coast the defalcation from the simplicity of the Welsh

character is very apparent; and indeed there are few parts of the country where more dissolute manners seem to prevail than about Fismard, Newport, and St. Dogmaels.

The great division of the county is into English and Welsh. There are about 144 parishes of these seventy-four are inhabited by the English, and sixty-four by the Welsh. The rest speak both languages, or rather neither. The country west of Kilgernow, Remais, and Dewis Land hundreds, is esteemed equal in purity to that of any other district. The English hundreds, four out of the seven, are those of Ross, Castle-Martin, Narberth, and Dangleddy. In these two last, and in the western and northern parts of Ross hundred, the English and Welsh are mixed. It is far from being the fact that these two descriptions of people are so estranged from each other as never to intermarry. In all the English towns and villages of Pembrokeshire we find instances enough of English husbands and Welsh wives, or the reverse, to contradict at least the universality of a separation, in itself so highly unnatural. It is one of those strange tales which, having once gone abroad, is inadvertently bandied about by the very people of whom it is told. In former ages, when great animosities prevailed between the old and new settlers, they might probably stand aloof from each other; but after the tranquillity of centuries, that so unaccountable a reserve should continue among the inhabitants of a little district, not exceeding a square of thirty miles, under the same government and laws, frequenting the same weekly markets for the sale of their agricultural produce, and united by the same interests, is in itself improbable, and will be found to be a mistake, to the extent in which it is asserted. This mistaken idea derives its origin from Giraldus, when these puny rivals were continually at war. No doubt it was then true: and from this source the notion was scattered abroad in popular opinions and tales, which still keep their ground; while the original facts and circumstances that occasioned them have been vanishing gradually away. The result of more recent inquiries into the actual state of the two parties is, that though doubtless the subsisting diversity of language prevents that unrestrained intercourse which would otherwise be natural to near neighbours, and tends to perpetuate the recollection of national rivalry, the accounts of absolute and unconquerable alienation, contained in many writers, are by far too highly colored. A similar but equally mistaken idea prevails respecting the difference of language in North and South Wales. It has been said that those who speak one dialect cannot understand the other. In truth they differ not so much from each other as the vulgar English dialects of Kent and Somersetshire. Their principal repugnance consists in the different idiomatic acceptations of words, referable to common roots. The same literary dialect is used by all writers, and is equally understood in all parts of Wales.

The principal rivers of this county are the Teify, Cleddy, and Dowlodge: the less considerable ones are the Gwain, Biran, Nefren, and Rudford. The Teify rises at Llyn Teife, in the

north-east part of Cardiganshire; and, running south-west, passes the towns of Tregaron, Llam-beter, and Newcastle-in-Emlin; at the latter town, turning north-west, it soon afterwards enters this county at Maen, or Defy, and, forming its boundary on the north, passes the town of Cardigan, and unites with St. George's Channel at Kemmaes Head. The Cleddy rises in the north part of the county, in the Prescles Mountains, near Monachlogdu, and, running nearly south, passes within a short distance of Narberth; and, gently winding to the S. S. W., meets the West Cleddy at Llandshipping, and both united flow into Milford Haven, near Lawrenny. The Douglodge River rises in the west part of the county, to the north of Walwy's Castle, and running east is augmented by the waters of the Hiog, about a mile below Haverfordwest; here it turns to the south-east, and unites with the Cleddy opposite Llandshipping.

The sea-coast is in general hilly, with steep or perpendicular cliffs. On tracing it from its north-east point, at the mouth of the Teify, the most remarkable place is Aberkibor Bay, formed by Cammaes Head on the north, and Pendrowry Head on the south, having in its centre the small fishing town of Penyrallt. Next succeeds Newport Bay, near which are the town of Newport and fishing-village of Eglwys Dinas. Fishguard Bay, forming a much better harbour than either of the above, next presents itself, which has near its centre the town of Fishguard, noted for its trade in herrings. Hence the coast running south-west winds round Stumble Head to that of St. David's, off which lies Ramsey Island, with a group of rocks called the Bishop and his Clerks, which are frequented in the breeding season by vast multitudes of sea-fowl, many of which are unknown in every other part of the island. The large bay of St. Bride's succeeds, forming a safe retreat for vessels in all winds but the west and south-west; and beyond some islands on its south side is the entrance to the celebrated Milford Haven and its branches. This justly admired harbour, indenting deeply the southern coast of this county, occupies a large space of it with its great basin and the various curving channels that contribute to form it, which are fed by some inconsiderable streams from the interior of the country. Few of these are dignified with any certain appellation, except the Hiog, though most of them suddenly become great estuaries from mere rivulets, united with the main basin as the claws are with the body of a crab, and equally sinuous. The Hiog rises near the village of St. Catherine, in the north-western part of the county, not far from Fishguard, passing through the centre of the county, and forming a romantic dell for many miles before it reaches the capital town of Haverfordwest in its way to the south. It then becomes navigable, and, widening in its course, meets another branch of the Haven at Llandshipping Ferry, which, fed also by its creative stream, descends from the north-east beneath the groves of Slebratch and Picton Castle. A long winding course succeeds, till a third branch from Loveston in the north-east, and a fourth from the noble ruin of Carew Castle in the south-east, unite beneath

VOL. XVI.

the elevated mansion, fine park, and rich woods of Lourenny, and form a second junction with this great body of water beneath their impending shades. Swelling into various bays, and studded with sails, this increased estuary inclines towards the west, being soon afterwards joined by a fifth branch, flowing from the ancient town and majestic bastions of Pembroke Castle. Here the grand basin opens, inclining chiefly to the west, but turning abruptly southward near its mouth, and appearing perfectly land-locked when viewed from within. The ports of Hubberston, Haikin, and Milford, occupy one of the many bays near the centre of this great sheet of water, which undoubtedly constitutes the most spacious harbour in the British Island.

The chief manufactures of this county consist of a cotton-mill, near Haverfordwest, which employs about 150 persons; an iron forge at Blackpool; and some iron and tin works on the Teify. This county sends three members to the imperial parliament, viz. one for the shire, one for the town of Pembroke, and one for the town of Haverfordwest. Pembroke, the county town, gives the title of earl to the family of Herbert: Haverfordwest the title of baron to the family of De-la-Poer-Beresford: and Castle Martin the title of baron to the family of Campbell.

PEN, *v. a. & n. s.* (pret. and part. pass. pent). Sax. *pennan* and *pinþan*. To coop; shut up; incage: a fenced or shut up place.

Away with her, and pen her up. *Shakspeare.*

My heavy son

Private in his chamber *pens* himself. *Id.*

My father stole two geese out of a *pen*. *Id.*

The plaister alone would *pen* the humour already contained in the part, and forbid new humour.

Bacon.

The prevention of mischief is prescribed by the Jewish custom; they *pen* up their daughters, and permit them to be acquainted with none. *Harvey.*

Their armour helped their harm, crushed in and bruised

Into their substance *pent*.

Milton.

As when a prowling wolf,
Whom hunger drives to seek new haunts for prey,
Watching where shepherds *pen* their flocks at eve
In burled cotes, amid the field secure,
Leaps o'er the fence with ease into the fold. *Id.*

The glass, wherein it is *penned* up, hinders it to deliver itself by an expansion of its parts. *Boyle.*

Ah! that your business had been mine,

To *pen* the sheep.

Dryden.

She in *pens* his flocks will fold.

Id. Horace.

The cook was ordered to dress capons for supper, and take the best in the *pen*.

L'Estrange.

Ducks in thy ponds, and chickens in thy *pens*,
And be thy turkeys numerous as thy hens. *King.*

PEN, *n. s. & v. a.*

PEN'-KNIFE,

PEN'-MEN.

Lat. *penna*. An instrument of writing: to write: the knife used for making or mending pens: penmen, those who write, or largely use the pen.

I hadde many thingis to write to thee, but I wolde not write to thee bi enke and *penn*, for I hope soone to see thee. *Wiclif Jon. iii.*

No longer might he in this wise endure,

But prively a *penner* gan he borwe,

And in a letre wrote he all his sorwe.

Chaucer. Cant. Tales.

3 B

For prey these shepherds two he took,
Whose metal stiff he knew he could not bend
With hearsay pictures, or a window look,
With one good dance, or letter finely *penned*.

Sidney.

The *pens* that did his pinions bind,
Were like main-yards with flying canvas lined.

Spenser.

Never durst poet touch a *pen* to write,
Until his ink were tempered with love's sighs.

Shakespeare.

I would be loath to cast away my speech; for, be-
sides that it is excellently well *penned*, I have taken
great pains to con it.

Id.

Read this challenge, mark but the *pennings* of it.

Id.

A sentence spoken by him in English, and *penned*
out of his mouth by four good secretaries, for trial of
our orthography, was set down by them.

Camden's Remains.

Some schoolmen, fitter to guide *penknives* than
swords, precisely stand upon it.

Bacon.

He frequented sermons, and *penned* notes with his
own hand.

Hayward on Edward VI.

We might as soon fell an oak with a *penknife*.

Holyday.

The digesting my thoughts into order, and the
setting them down in writing, was necessary; for,
without such strict examination as the *pennings* them
affords, they would have been disjointed and roving
ones.

Digby on the Soul.

Almost condemned, he moved the judges thus:
Hear, but instead of me, my Oedipus;
The judges, hearing with applause, at the end
Freed him, and said, no fool such lines had *penned*.

Denham.

Feathered soon and fledged,
They summed their *pens*; and, soaring the' air sub-
lime,
With clang despaired the ground.

Milton's Paradise Lost.

He remembers not that he took off *pen* from paper
till he had done.

Fell.

Eternal deities!

Who write whatever time shall bring to pass,
With *pens* of adamant on plates of brass.

Dryden.

He takes the papers, lays them down again;
And, with unwilling fingers, tries the *pen*.

Id.

I can, by designing the letters, tell what new idea
it shall exhibit the next moment, barely by drawing
my *pen* over it, which will neither appear if my
hands stand still, or, though I move my *pen*, if my
eyes be shut.

Locke.

Gentlemen should extempore, or, after a little
meditation, speak to some subject without *pennings* of
any thing.

Id.

The four evangelists, within fifty years after our
Saviour's death, consigned to writing that history,
which had been published only by the apostles and
disciples; the further consideration of these holy
penmen will fall under another part of this discourse.

Addison.

Should I publish the praises that are so well
penned, they would do honour to the persons who
write them.

Id.

The precepts *penned*, or preached by the holy
Apostles, were as divine and as perpetual in respect
of obligation.

White.

The descriptions which the evangelists give shew
that both our blessed Lord and the holy *penmen* of
his story were deeply affected.

Atterbury.

Twenty fools I never saw

Come with petitions fairly *penned*,

Desiring I should stand their friend.

Swift.

A *PEN* is usually formed of a goose's quill.
Pens are also sometimes made of silver, brass,
or iron. Dutch *pens* are made of quills that
have passed through hot ashes, to take off the
grosser fat and moisture, and render them more
transparent.

PEN, or *PENSTOCK*. See *PENSTOCK*.

PEN, *FOUNTAIN*, is a pen made of silver,
brass, &c., which has been contrived to contain
a considerable quantity of ink, and let it flow out
by gentle degrees, so as to supply the writer a
long time without being under the necessity of
taking fresh ink.

PEN, *GEOMETRIC*, an instrument in which, by
a circular motion, a right line, a circle, an ellipse,
and other mathematical figures, may be described.
It was first invented and explained by John
Baptist Suardi, in a work entitled *Nouvo Istro-
menti per la Descrizione di diverse Curve An-
tiche e Moderne*, &c. Several writers had ob-
served the curves arising from the compound
motion of two circles, one moving round the
other; but Suardi first realised the principle,
and first reduced it to practice. It has been
lately introduced with success into the steam-
engine by Watt and Bolton.

PEN, *SEA*. See *PENNATULA*.

PENÆA, in botany, a genus of the monogy-
nia order, and tetrandria class of plants; and in
the natural method ranking with those of which
the order is doubtful; *CAL.* diphyllous; *COR.*
campanulatus; the style quadrangular; *COS.*
tetragonal, quadrilocular, and octospermous.

PEN'AL, *adj.* } Fr. *penal*, from Lat. *pena*.

PEN'ALTY, *n. s.* } Denouncing, or enacting, or
used for, punishment: penalty is the punish-
ment incurred or denounced.

Lend this money, not as to thy friend,
But lend it rather to thine enemy,
Who, if he break, thou mayest with better face
Exact the *penalty*. *Shakespeare. Merchant of Venice.*

Adamantine chains and *penal* fires.

Milton.

Many of the ancients denied the Antipodes, and
some unto the *penalty* of contrary affirmations; but
the experience of navigations can now assert them
beyond all dubitation.

Brown.

Political power is a right of making laws with
penalties of death, and consequently all less *penalties*,
for preserving property, and employing the force of
the community in the execution of laws.

Locke.

Gratitude plants such generosity in the heart of
man as shall more effectually incline him to what is
brave and becoming than the terror of any *penal* law.

South.

Beneath her footstool science groans in chains,
And wit dreads exile, *penalties*, and pains.

Duncied.

PENANCE, or } Old Fr. *penence*. Public
PEN'NANCE. } or private infliction or dis-
cipline for sin.

And bitter *penance*, with an iron whip,
Was wont him once to discipline every day.

Spenser.

Mew her up,
And make her bear the *permanence* of her tongue.

Shakespeare.

No penitentiary, though he had enjoined him
never so straight *penance* to expiate his first of-
fence, would have counselled him to have given over
the pursuit of his right.

Bacon.

Coming now to the vaults of Popery, I ask for their *penances* and purgatory; those Popish *penances* which presumptuous confessors enjoined as satisfactory, and meritorious upon their bold absolutions.

Bp. Hall.

Penance is only the punishment inflicted; not penitence, which is the right word: a man comes not to do *penance*, because he repents him of his sin, but because he is compelled to it. The old canons wisely enjoined three years' *penance*, sometimes more, because in that time a man got a habit of virtue, and so committed that sin no more for which he did *penance*.

Selden.

The scourge
Inexorable, and the torturing hour
Calls us to *penance*.

Milton's Paradise Lost.

A Lorain surgeon, who whipped the naked part with a great rod of nettles till all over blistered, persuaded him to perform this *penance* in a sharp fit he had.

Temple.

PENANCE is a punishment, either voluntary or imposed by authority, for the faults a person has committed. *Penance* is one of the seven sacraments of the Romish church. Besides fasting, alms, abstinence, and the like, which are the general conditions of *penance*, there are others of a more particular kind; as the repeating a certain number of ave-mary's, paternosters, and credos, wearing a hair shirt, and giving one's self a certain number of stripes. In Italy and Spain it is usual to see Roman Catholics almost naked, loaded with chains and a cross, and lashing themselves at every step.

PENATES, in Roman antiquity, a kind of tutelar deities, either of countries or particular houses; in which last sense they differed in nothing from the lares. See *LARES*. They were properly the tutelar gods of the Trojans, and were adopted by the Romans, who gave them the title of *penates*.

PENCARROW, a cape of Cornwall, on the south coast of the English Channel; two miles east of the mouth of the Fowey.

PENCIL, *n. s.* Lat. *penicillum*. A small brush of hair which painters dip in their colors: an instrument for writing with black lead.

Painting is almost the natural man;
For since dishonour trafficks with men's nature,
He is but outside: *pencil'd* figures are
Even such as they give out.

Shakespeare.

The Indians will perfectly represent in feathers whatsoever they see drawn with *pencils*.

Heylyn.

Pencils can by one slight touch restore
Smiles to that changed face, that wept before.

Dryden.

For thee the groves green liveries wear,
For thee the graces lead the dancing hours,
And nature's ready *pencil* paints the flowers.

Id.

A sort of pictures there is, wherein the colours, as laid by the *pencil* on the table, mark out very odd figures.

Locke.

The faithful *pencil* has designed
Some bright idea of the master's mind,
Where a new world leaps out at his command,
And ready nature waits upon his hand.

Pope.

Mark with a pen or *pencil* the most considerable things in the books you desire to remember.

Watts.

Pulse of all kinds diffused their od'rous powers,
Where nature *pencils* butterflies on flowers.

Harte.

One spirit—His

Who wore the platted thorns with bleeding brows,
Rules universal nature. Not a flower
But shows some touch, in freckle, streak, or stain,
Of his unrivalled *pencil*.

Cowper.

PENCILS are of various kinds, and made of various materials; the largest sorts are made of boars' bristles, the thick ends of which are bound to a stick, bigger or less according to the uses they are designed for: these, when large, are called brushes. The finer sorts of pencils are made of camels, badgers, and squirrels' hair, and of the down of swans; these are tied at the upper end with a piece of strong thread, and enclosed in the barrel of a quill. All good pencils, on being drawn between the lips, come to a fine point.

PENCILS, for drawing, are made of long pieces of black-lead or red chalk, placed in a groove cut in a slip of cedar; on which other pieces of cedar being glued, the whole is planed round, and, one of the ends being cut to a point, it is fit for use.

PENCKUM, a town of Germany, in Anterior Pomerania; thirteen miles south-west of Old Stettin, and forty-four N. N. W. of Custring. Long. 31° 59' E. Ferro, lat. 53° 15' N.

PENDA, the first king of Mercia, founded that kingdom, A. D. 626. He was killed by Oswy, king of Northumberland, A. D. 655. See *MERCIA*.

PENDA. See *PENBA*.

PENDALIUM, a promontory of Cyprus.

PEN'DANT, *n. s.* Fr. *pendant* of Lat. *PEN'DENCE*, *PEN'DENCY*, *PEN'DENT*, *adj.* *PEN'DING*, *PEN'DULOUS*, *PEN'DULOSITY*, *n. s.* *PEN'DULOUSNESS*. *pendens, pendeo*. A jewel or any thing suspended; a pendulum; a small flag; pendence, pendency, or pendulosity and pendulousness all mean suspension; the state of being pendent or hanging: pending is depending; hence undecided: pendulous, synonymous with pendent.

Quaint in green she shall be loose enrobed
With ribbons *pendent*, flaring about her head.

Shakespeare.

A *pendent* rock,
A forked mountain, or blue promontory
With trees upon't, that nod unto the world,
And mock her eyes with air. *Id.*
All the plagues, that in the *pendulous* air
Hang fated o'er men's faults, light on thy daughters.

Id.

The Italians give the cover a graceful *pendence* or slopiness, dividing the whole breadth into nine parts, whereof two shall serve for the elevation of the highest top or ridge from the lowest.

Wotton.

To make the same *pendant* go twice as fast as it did, or make every undulation of it in half the time it did, make the line, at which it hangs, double in geometrical proportion to the line at which it hanged before.

Digby on the Soul.

They brought by wond'rous art
Pontifical, a ridge of *pendent* rock
Over the vexed abyss.

Milton's Paradise Lost.

His slender legs he increased by riding, that is, the humours descended upon their *pendulosity*, having no support or suppedaneous stability.

Browne's Vulgar Errors.

Bellerophon's horse, framed of iron, and placed between two loadstones with wings expanded, hung *pendulous* in the air. *Browne.*

Unripe fruit, whose verdant stalks do cleave
Close to the tree, which grieves no less to leave
The smiling *pendent* which adorns her so,
And until autumn on the bough should grow.

Waller.

The grinders are furnished with three roots, and in the upper jaw often four, because these are *pendulous*.

Ray.

I sometimes mournful verse indite, and sing
Of desperate lady near a purling stream,
Or lover *pendent* on a willow tree.

Philips.

A person *pending* suit with the diocesan, shall be defended in the possession.

Agcliffe.

The judge shall pronounce in the principal cause, nor can the appellant alledge *pendency* of suit. *Id.*

The spirits

Some thrid the mazy ringlets of her hair,

Some hang upon the *pendents* of her ear. *Pope.*

PENDANTS are often composed of diamonds, pearls, and other jewels.

PENDANTS, in heraldry, parts hanging down from the label, to the number of three, four, five, or six, at most, resembling the drops in the Doric freeze. When they are more than three, they must be specified in blazoning.

PENDANTS OF A SHIP are those streamers, or long colors, which are split and divided into two parts, ending in points, and hung at the head of masts, or at the yard-arm ends.

PENDENNIS, a peninsula of Cornwall, at the mouth of Falmouth haven, a mile and a half in compass. On this Henry VIII. erected a castle, opposite to that of St. Maw's, which he likewise built. It was fortified by queen Elizabeth, and served them for the governor's house. It is one of the largest castles in Britain, and is built on a high rock. It is stronger by land than St. Maw's, being regularly fortified, and having good outworks.

PENDULUM, *n. s.* *Fr.* *pendule*; *Lat.* *pendulus*. Any weight hung so that it may easily swing backwards and forwards. See below.

Upon the bench I will so handle 'em,

That the vibration of this *pendulum*

Shall make all taylor's yards of one

Unanimous opinion.

Hudibras.

A PENDULUM is a vibrating body suspended from a fixed point. For the history of this invention, see CLOCK. The theory of the pendulum depends on that of the inclined plane. Hence, to understand the nature of the pendulum, it will be necessary to premise some of the properties of this plane. I. Let AC, fig. 1, Plate PARABULUM, be an inclined plane, AB its perpendicular height, and D any heavy body: then the force which impels the body D to descend along the inclined plane AC is to the absolute force of gravity as the height of the plane AB is to its length AC; and the motion of the body will be uniformly accelerated. II. The velocity acquired in any given time by a body descending on an inclined plane, AC, is to the velocity acquired in the same time, by a body falling freely and perpendicularly, as the height of the plane AB to its length AC. The final velocities will be the same; the spaces described will be in the same ratio; and the times of description are

as the spaces described. III. If a body descend along several contiguous planes, AB, BC, CD (fig. 2), the final velocity, namely, that at the point D, will be equal to the final velocity in descending through the perpendicular AE, the perpendicular heights being equal. Hence, if these planes be supposed indefinitely short and numerous, they may be conceived to form a curve; and therefore the final velocity acquired by a body in descending through any curve AF, will be equal to the final velocity acquired in descending through the planes AB, BC, CD, or to that in descending through AE, the perpendicular heights being equal. IV. If, from the upper or lower extremity of the vertical diameter of a circle, a cord be drawn, the time of descent along this cord will be equal to the time of descent through the vertical diameter; and therefore the times of descent through all cords in the same circle, drawn from the extremity of the vertical diameter, will be equal. V. The times of descent of two bodies through two planes equally elevated will be in the subduplicate ratio of the lengths of the planes. If, instead of one plane, each be composed of several contiguous planes similarly placed, the times of descent along these planes will be in the same ratio. Hence, also, the times of describing similar arches of circles similarly placed will be in the subduplicate ratio of the lengths of the arches. VI. The same things hold good with regard to bodies projected upward, whether they ascend upon inclined planes or along the arches of circles. The point or axis of suspension of a pendulum is that point about which it performs its vibrations, or from which it is suspended. The centre of oscillation is a point in which, if all the matter in a pendulum were collected, any force applied at this centre would generate the same angular velocity in a given time as the same force when applied at the centre of gravity. The length of a pendulum is equal to the distance between the axis of suspension and centre of oscillation. Let PN (fig. 3) represent a pendulum suspended from the point P; if the lower part N of the pendulum be raised to A, and let fall, it will by its own gravity descend through the circular arch AN, and will have acquired the same velocity at the point N that a body would acquire in falling perpendicularly from C to N, and will endeavour to go off with that velocity in the tangent ND; but, being prevented by the rod or cord, will move through the arch NB to B, where, losing all its velocity, it will by its gravity descend through the arch BN, and, having acquired the same velocity as before, will ascend to A. In this manner it will continue its motion forward and backward along the arch ANB, which is called an oscillatory or vibratory motion; and each swing is called a vibration. Prop. I. If a pendulum vibrates in very small circular arches, the times of vibration may be considered as equal, whatever be the proportion of the arches. Let PN (fig. 4) be a pendulum; the time of describing the arch AB will be equal to the time of describing CD; these arches being supposed very small. Join AN, CN; then since the times of descents along all cords in the same circles, drawn from one extremity of

Fig. 8.

Fig. 5.

Fig. 4.

Fig. 7.

Fig. 3.

Fig. 9.

Fig. 1.

Fig. 6.

Fig. 2.

the vertical diameter, are equal; therefore, the cords AN, CN, and consequently their doubles, will be described in the same time; but the arches AN, CN, being supposed very small, will therefore be nearly equal to their cords: hence the times of vibrations in these arches will be nearly equal.

PROP. II.—Pendulums which are of the same length vibrate in the same time, whatever be the proportion of their weights. This follows from the property of gravity, which is always proportional to the quantity of matter, or to its inertia. When the vibrations of pendulums are compared, it is always understood that they describe either similar finite arcs, or arcs of evanescent magnitude, unless the contrary is mentioned.

PROP. III.—If a pendulum vibrates in the small arc of a circle, the time of one vibration is to the time of a body's falling perpendicularly through half the length of the pendulum as the circumference of a circle is to its diameter. Let PE (fig. 5) be the pendulum which describes the arch A NC in the time of one vibration; let PN be perpendicular to the horizon, and draw the cords AC, AN; take the arc Ee infinitely small, and draw EFG, *efg*, perpendicular to PN, or parallel to AC; describe the semicircle BGN, and draw *er*, *gs*, perpendicular to EG; now let *t* = time of descending through the diameter 2 PN, or through the cord AN; then the velocities gained by falling through 2 PN, and by the pendulum's descending through the arch AE, will be as $\sqrt{2PN}$ and \sqrt{BF} ; and the space described in the time *t*, after the fall through 2 PN, is 4 PN. But the times are as the spaces divided by the velocities.

Therefore $\frac{4PN}{\sqrt{2PN}}$ or $2\sqrt{2PN} : t :: \frac{Ee}{\sqrt{BF}}$:

time of describing Ee = $\frac{t \times Ee}{2\sqrt{2PN} \times \sqrt{BF}}$.

But in the similar triangles PEF, Eer, and KGF, Gg , As PE = PN : EF :: Ee : er = $\frac{EF}{PN} \times Ee$; And KG = KD : FG :: Gg :

$Gg = \frac{FG}{KD} \times Gg$. But *er* = *Gg*; therefore

$\frac{EF}{PN} \times Ee = \frac{FG}{KD} \times Gg$. Hence $Ee = \frac{PN \times FG}{KD \times EF} \times Gg$. And, by substituting this value of Ee in the former equation, we have the time

of describing Ee = $\frac{t \times PN \times FG \times Gg}{2KD \times EF \times \sqrt{BF} \times 2PN}$:

But by the nature of the circle, $FG = \sqrt{BF \times FN}$, and $EF = \sqrt{PN + PF} \times FN$. Hence, by substitution we obtain the time of describing Ee =

$\frac{t \times PN \times \sqrt{BF \times FN} \times Gg}{2KD \times \sqrt{PN + PF} \times FN \times \sqrt{BF} \times 2PN} =$
 $\frac{t \times \sqrt{PN} \times Gg}{2KD \times \sqrt{PN + PF} \times \sqrt{2}} = \frac{t \times \sqrt{2PN} \times Gg}{4KD \times \sqrt{PN + PF}}$
 $= \frac{t \times \sqrt{2PN}}{2BN \times \sqrt{2PN - NF}} \times Gg$. But NF,

in its mean quantity for all the arches Gg, is nearly equal to NK; for if the semicircle described on the diameter BN, which corresponds to the whole arch AN, be divided into an indefinite number of equal arches Gg, &c., the sum of all the lines NF will be equal to as many times NK as there are arches in the same circle equal to Gg. Therefore the time of describing Ee =

$\frac{t \times \sqrt{2PN}}{2BN \times \sqrt{2PN - NK}} \times Gg$. Whence the time of describing the arch AED =

$\frac{t \times \sqrt{2PN}}{2BN \times \sqrt{2PN - NK}} \times BGN$; and the time of describing the whole arch ABC, or the time of one vibration, is =

$\frac{t \times \sqrt{2PN}}{2BN \times \sqrt{2BN - NK}} \times 2BGN$. But, when the arch ANC is very small, NK vanishes, and then the time of vibration in a very small arc is

$= \frac{t \times \sqrt{2PN}}{2BN \times \sqrt{2PN}} \times 2BGN = \frac{1}{2} t \times \frac{2BGN}{BN}$.
 Now, if *t* be the time of descent through 2 PN; then, since the spaces described are as the squares of the times, $\frac{1}{2} t$ will be the time of descent through $\frac{1}{2} PN$: therefore the diameter BN is to the circumference, 2 BGN, as the time of falling through half the length of the pendulum is to the time of one vibration.

PROP. IV.—The length of a pendulum vibrating seconds is to twice the space through which a body falls in one second as the square of the diameter of a circle is to the square of its circumference. Let *d* = diameter of a circle = 1, *c* = circumference = 3.14159, &c., *t* to the time of one vibration, and *p* the length of the corresponding pendulum; then by last proposition *c* : *d* :: 1" : $\frac{d}{c}$ = time of falling through

half the length of the pendulum. Let *s* = space described by a body falling perpendicularly in the first second: then, since the spaces described are in the subduplicate ratio of the times of description, therefore 1" : $\frac{d}{c}$:: \sqrt{s} : $\sqrt{\frac{1}{2}p}$. Hence

$c^2 : d^2 :: 2s : p$. It has been found by experiment that in latitude 51 $\frac{1}{2}^\circ$ a body falls about 16.11 feet in the first second: hence the length of a pendulum vibrating seconds in that latitude is = $\frac{32.22}{3.14159^2} = 3$ feet 3.174 inches.

PROP. V.—The times of the vibrations of town pendulums in similar arcs of circles are in a subduplicate ratio of the lengths of the pendulums. Let PN, PO (fig. 6), be two pendulums vibrating in the similar arcs AB, CD; the time of a vibration of the pendulum PN is to the time of a vibration of the pendulum PO in subduplicate ratio of PN to PO. Since the arcs AN, CO, are similar and similarly placed, the time of descent through AN will be to the time of descent through CO in the subduplicate ratio of AN to CO: but the times of descent through the arcs AN and CO are equal to half the times of vibration of the pendulums PN, PO, respectively. Hence the time of vibration

of the pendulum PN, in the arch AB, is to the time of vibration of the pendulum PO in the similar arc CD in the subduplicate ratio of AN to CO: and since the radii PN, PO, are proportional to the similar arcs AN, CO, therefore the time of vibration of the pendulum PN will be to the time of vibration of the pendulum PO in a subduplicate ratio of PN to PO. If the length of a pendulum vibrating seconds be 39.174 inches, then the length of a pendulum vibrating half seconds will be 9.793 inches. For $1'' : \frac{1}{2}'' :: \sqrt{39.174} : \sqrt{x}$; and $1 : \frac{1}{2} :: 39.174 : x$. Hence $x = \frac{39.174}{4} = 9.793$.

PROP. VI.—The length of pendulums vibrating in the same time, in different places, will be as the forces of gravity. For the velocity generated in any given time is directly as the force of gravity, and inversely as the quantity of matter. Now, the matter being supposed the same in both pendulums, the velocity is as the force of gravity; and the space passed through in a given time will be as the velocity; that is, as the gravity. Cor. Since the length of pendulums vibrating in the same time in small arcs are as the gravitating forces, and as gravity increases with the latitude on account of the spheroidal figure of the earth and its rotation about its axis; hence the length of a pendulum vibrating in a given time will be variable with the latitude, and the same pendulum will vibrate slower the nearer it is carried to the equator.

PROP. VII.—The time of vibrations of pendulums of the same length, acted upon by different forces of gravity, are reciprocally as the square roots of the forces. For, when the matter is given, the velocity is as the force and time; and the space described by any given force, is as the force and square of the time. Hence the lengths of pendulums are as the forces and the squares of the times of falling through them. But these times are in a given ratio to the times of vibration; whence the lengths of pendulums are as the forces and the squares of the times of vibration. Therefore, when the lengths are given, the forces will be reciprocally as the square of the times, and the times of vibration reciprocally as the square roots of the forces. Cor. Let p = length of pendulum, g = force of gravity, and t = time of vibration. Then since $p = g \times t^2$.

Hence $g = p \times \frac{1}{t^2}$; and $t = \sqrt{p \times \frac{1}{g}}$. That

is, the forces in different places are directly as the lengths of the pendulums, and inversely as the square roots of the times of vibration; and the times of vibration are directly as the square roots of the lengths of the pendulums, and inversely as the square roots of the gravitating forces.

PROP. VIII.—A pendulum which vibrates in the arch of a cycloid describes the greatest and least vibrations in the same time. This property is demonstrated only on a supposition that the whole mass of the pendulum is concentrated in a point: but this cannot take place in any really vibrating body; and, when the pendulum is of finite magnitude, there is no point given in posi-

tion which determines the length of the pendulum; on the contrary the centre of oscillation will not occupy the same place in the given body, when describing different parts of the tract it moves through, but will continually be moved in respect of the pendulum itself during its vibration. This circumstance has prevented any general determination of the time of vibration in a cycloidal arc, except in the imaginary case referred to. There are many other obstacles which concur in rendering the application of this curve to the vibration of pendulums designed for the measures of time the source of errors far greater than those which by its peculiar property it is intended to obviate; and it is now wholly disused in practice. Although the times of vibration of a pendulum in different arches be nearly equal, yet, from what has been said, it will appear that, if the ratio of the least of these arches to the greatest be considerable, the vibrations will be performed in different times; and the difference, though small, will become sensible in the course of one or more days. In clocks used for astronomical purposes it will therefore be necessary to observe the arc of vibration; which if different from that described by the pendulum when the clock keeps time, there a correction must be applied to the time shown by the clock. This correction, expressed in seconds of time, will be equal to the half of three times the difference of the square of the given arc, and of that of the arc described by the pendulum when the clock keeps time, these arcs being expressed in degrees; and so much will the clock gain or lose according as the first of these arches is less or greater than the second. Thus, if the clock keeps time when the pendulum vibrates in an arch of 3° , it will lose $10\frac{1}{4}''$ daily in an arch of 4° . For $4^2 - 3^2 \times \frac{1}{2} = 7 \times \frac{1}{2} = 10\frac{1}{4}''$. The length of a pendulum rod increases with heat; and the quantity of expansion answering to any given degree of heat is experimentally found by means of a pyrometer (see PYROMETER); but the degree of heat at any given time is shown by a thermometer: hence that instrument should be placed within the clock-case at a height nearly equal to that of the middle of the pendulum; and its height, for this purpose, should be examined at least once a day. Now, by a table constructed to exhibit the daily quantity of acceleration or retardation of the clock, answering to every probable height of the thermometer, the corresponding correction may be obtained. It is also necessary to observe that the mean height of the thermometer during the interval ought to be used. In Six's thermometer this height may be easily obtained; but in the thermometers of the common construction it will be more difficult to find this mean. It has been found, by repeated experiments, that a brass rod equal in length to a second pendulum will expand or contract one 1000th part of an inch by a change of temperature of 1° in Fahrenheit's thermometer; and, since the times of vibration are in a subduplicate ratio of the lengths of the pendulum, hence an expansion or contraction of one 1000th part of an inch will answer nearly to $1''$ daily; therefore a change of 1° in the thermometer will occasion a difference in the rate of the clock

equal to 1" daily. Whence, if the clock be so adjusted as to keep time when the thermometer is at 55°, it will lose 10" daily when the thermometer is at 65°, and gain as much when it is at 45°. Hence the daily variation of the rate of the clock from summer to winter will be very considerable. It is true indeed that most pendulums have a nut or regulator at the lower end, by which the bob may be raised or lowered a determinate quantity: and therefore, while the height of the thermometer is the same, the rate of the clock will be uniform. But since the state of the weather is ever variable, and as it is impossible to be raising or lowering the bob of the pendulum at every change of the thermometer, therefore the correction formerly mentioned is to be applied. This correction, however, is in some measure liable to a small degree of uncertainty; and, in order to avoid it altogether, several contrivances have been proposed, by constructing a pendulum of different materials, and so disposing them that their effects may be in opposite directions, and thereby counterbalance each other; and thus the pendulum will continue of the same length.

PENDULUM, ANGULAR, is formed of two pieces or legs like a sector, and is suspended by the angular point. This pendulum was invented with a view to diminish the length of the common pendulum, but at the same time to preserve or even increase the time of vibration. In this pendulum, the time of vibration depends on the length of the legs, and on the angle contained between them conjointly, the duration of the time of vibration increasing with the angle. Hence a pendulum of this construction may be made to oscillate in any given time. At the lower extremity of each leg of the pendulum is a ball or bob as usual. It may be easily shown, that, in this kind of a pendulum, the squares of the times of vibration are as the secants of half the angle contained by the legs: hence, if a pendulum of this construction vibrates half seconds when its legs are close, it will vibrate whole seconds when the legs are opened, so as to contain an angle equal to 151° 2' 30".

PENDULUM, CONICAL, or circular, is so called from the figure described by the string or ball of the pendulum. This pendulum was invented by Mr. Huygens, and also claimed by Dr. Hook. To understand its principles it will be necessary to premise the following lemma, viz. the times of all the circular revolutions of a heavy globular body, revolving within an inverted hollow paraboloid, will be equal, whatever be the radii of the circles described by that body. To construct the pendulum, therefore, so that its ball may always describe its revolutions in a paraboloid surface, it will be necessary that the rod of the pendulum be flexible, and that it be suspended in such a manner as to form the evolute of the given parabola. Hence, let KH (fig. 9) be an axis perpendicular to the horizon, having a pinnion at K moved by the last wheel in the train of the clock; and a hardened steel point at H moving in an agate pivot, to render the motion as free as possible. Now, let it be required that the pendulum shall perform each revolution in a second; then the paraboloid surface it moves in must be such whose latus rectum is double the

length of the common half second pendulum. Let O be the focus of the parabola MEC, and MC the latus rectum; and make $AE = MO = \frac{1}{2} MC$ = the length of a common half second pendulum. At the point A of the verge let a thin plate AB be fixed at one end, and at the other end B let it be fastened to a bar or arm BD perpendicular to DH, and to which it is fixed at the point D. The figure of the plate AB is that of the evolute of the given parabola MEC. The equation of this evolute, being also that of the semicubical parabola, is $\frac{27}{16} p x^2 = y^3$.

—Let $\frac{27}{16} p = P$; then $P x^2 = y^3$, and in the focus $P = 2y$. In this case $2x^2 = y^3 = \frac{1}{2} P^3$: hence $x^2 = \frac{1}{4} P^3$, and $x = P\sqrt{\frac{1}{4}} = \frac{27}{16} p\sqrt{\frac{1}{4}}$ = the

distance of the focus from the vertex A.—By assuming the value of x , the ordinates of the curve may be found; and hence it may be easily drawn. The string of the pendulum must be of such a length that, when one end is fixed at B, it may lie over the plate AB, and then hang perpendicular from it, so that the centre of the bob may be at E when at rest. Now, the verge KH being put in motion, the ball of the pendulum will begin to gyrate, and thereby contrive a centrifugal force which will carry it out from the axis to some point F, where it will circulate seconds or half seconds, according as the line AE is 9·8 inches, or two inches and a quarter, and AB answerable to it. One advantage possessed by a clock having a pendulum of this construction is, that the second hand moves in a regular and uniform manner, without being subject to those jerks or starts as in common clocks; and the pendulum is entirely silent.

PENDULUM, FIR. The expansion or contraction of straight-grained fir wood lengthwise, by change of temperature, is so small that it is found to make very good pendulum rods. The wood called sapadillo is said to be still better. There is good reason to believe that the previous baking, varnishing, gilding, or soaking of these woods in any melted matter, only tends to impair the property that renders them valuable. They should be simply rubbed on the outside with wax and a cloth. In pendulums of this construction the error is greatly diminished, but not taken away.

PENDULUM, GRIDIRON, or Harrison's, is an ingenious contrivance for the purpose above-mentioned. Instead of one rod, this pendulum is composed of any convenient odd number of rods, as five, seven, or nine; being so connected that the effect of one set of them counteracts that of the other set; and therefore, if they are properly adjusted to each other, the centres of suspension and oscillation will always be equidistant. Fig. 7 represents a gridiron pendulum composed of nine rods, steel and brass alternately. The two outer rods, A B, C D, which are of steel, are fastened to the cross pieces A C, B D, by means of pins. The next two rods, E F, G H, are of brass, and are fastened to the lower bar BD, and to the second upper bar E G. The two following rods are of steel, and are fastened to the cross

bars E G and I K. The two rods adjacent to the central rod, being of brass, are fastened to the cross pieces I K and L M; and the central rod, to which the ball of the pendulum is attached, is suspended from the cross piece L M, and passes freely through a perforation in each of the cross bars I K, B D. From this disposition of the rods, it is evident that, by the expansion of the extreme rods, the cross piece B D, and the two rods attached to it, will descend: but, since these rods are expanded by the same heat, the cross piece E G will consequently be raised, and therefore also the two next rods; but, because these rods are also expanded, the cross bar I K will descend; and, by the expansion of the two next rods, the piece L M will be raised a quantity sufficient to counteract the expansion of the central rod. Whence it is obvious that the effect of the steel rods is to increase the length of the pendulum in hot weather, and to diminish it in cold weather, and that the brass rods have a contrary effect upon the pendulum. The effect of the brass rods must, however, be equivalent, not only to that of the steel rods, but also to the part above the frame and spring, which connects it with the clock, and to that part between the lower part of the frame and the centre of the ball.

PENDULUM, MERCURIAL, was invented by the celebrated Mr. George Graham, and is considered as the compensating pendulum. In this the rod of the pendulum is a hollow tube, in which a sufficient quantity of mercury is put. Mr. Graham first used a glass tube, and the clock to which it was applied was placed in the most exposed part of the house. It was kept constantly going, without having the hands or pendulum altered, from the 9th of June 1722 to the 14th of October 1725, and its rate was determined by transits of fixed stars. Another clock made with extraordinary care, having a pendulum about sixty pounds weight, and not vibrating above $1^{\circ} 30'$ from the perpendicular, was placed beside the former, the more readily to compare them with each other, and that they might both be equally exposed. The result of all the observations was this, that the irregularity of the clock with the quicksilver pendulum exceeded not, when greatest, a sixth part of that of the other clock with the common pendulum, but for the greatest part of the year not above an eighth or ninth part; and even this quantity would have been lessened, had the column of mercury been a little shorter: for it differed a little the contrary way from the other clock, going faster with heat and slower with cold. To confirm this experiment more, about the beginning of July 1723 Mr. Graham took off the heavy pendulum from the other clock, and made another with mercury, but with this difference, that instead of a glass tube he used a brass one, and varnished the inside to secure it from being injured by the mercury. This pendulum he used afterwards, and found it about the same degree of exactness as the other.

M. Thiout's Pendulum.—Another excellent contrivance for the same purpose is described by M. Thiout, a French author on clock-making. Of this pendulum, somewhat improved by Mr. Crosthwaite, watch and clock maker, Dublin, we

have the following description in the Transactions of the Royal Irish Academy, 1788:—‘A and B, fig. 8, are two rods of steel forged out of the same bar, at the same time, of the same temper, and in every respect similar. On the top of B is formed a gibbet C; this rod is firmly supported by a steel bracket D, fixed on a large piece of marble E, firmly set into the wall F, and having liberty to move freely upwards between cross staples of brass, 1, 2, 3, 4, which touch only in a point in front and rear (the staples having been carefully formed for that purpose); to the other rod is firmly fixed by its centre the lens G, of twenty-four pounds weight, although it should in strictness be a little below it. This pendulum is suspended by a short steel spring on the gibbet at C; all which is entirely independent of the clock. To the back of the clock-plate I are firmly screwed two cheeks nearly cycloidal at K, exactly in a line with the centre of the verge L. The maintaining power is applied by a cylindrical steel stud, in the usual way of regulators, at M. Now it is very evident that any expansion or contraction that takes place in either of these exactly similar rods is instantly counteracted by the other; whereas in all compensation pendulums composed of different materials, however just calculation may seem to be, that can never be the case, as not only different metals, but also different bars of the same metal that are not manufactured at the same time, and exactly in the same manner, are found by a good pyrometer to differ materially in their degrees of expansion and contraction, a very small change affecting one and not the other.’ Theory has pointed out several other pendulums, known by the names of elliptic, horizontal, rotulary, &c., pendulums. We can only select two or three of the more modern inventions of this kind.

Elliott's compensating pendulum.—The adjustment of the rods for the temperature in the Grid-iron pendulum of Harrison being found in convenient, and accompanied sometimes by a considerable change in the rate: in the pendulum of Elliott two levers are adopted instead of one, and they are applied at the bob instead of at the superior end of the verge.

Fig. 1, plate II., PENDULUMS, represents this pendulum; *ab* is a bar of brass made quite fast at the upper end by pins, and held contiguous at several equal distances, by the screws, 1, 2, &c., to the rod of the pendulum, which is a bar of iron; and, so far as the brass bar reaches, is filed of the same size and shape, though it does not appear so in the figure, but, a little below the end of the brass, the iron is left broader, as at *dd*, for the convenience of fixing the work to it, and is made of a sufficient length to pass quite through the ball of the pendulum to *c*. The holes 1, 2, &c., in the brass, through which the screws pass into the iron rod of the pendulum, are filed of a sufficient length to suffer the brass to contract and dilate freely by heat and cold under the heads of the screws: *eeee* represent the ball of the pendulum; *ff*, two strong pieces of steel, or levers, whose inner centres, or pivots, turn in two holes drilled in the broad part of the pendulum rod, and their outer ones in a strong

Fig. 1.

Fig. 6.

bridge, or cock, screwed upon the same part of the rod, but omitted in the figure, to show the mechanism: g, g , are two screws entering at the edges, and reaching into the cavity near the centre of the ball. The ends of the screws next the centre are turned into the form seen in the figure, which, pressing with the weight of the ball against the longer arms of the levers, cause the short ends to press against the brass bar at b . Let us now suppose that the rod of the pendulum, and the brass annexed to it, grow longer by heat, and that the brass lengthens more than the iron of the same length; then the brass, by the excess of its dilation, will press the short ends of the levers downwards at b , and at the same time necessarily lift up the ball, which rests on the long ends of the same lever, at f, f , to any proportion necessary for due compensations. The calculated proportion of the short arms of the levers must be to the long ones as the excess in the expansion of brass is to that of the whole length of iron; and, if this calculation be found on trial not perfectly accurate, the side screws g, g , will produce the exact compensation at a few adjustments. At i, k , the inferior end of the iron verge, a strong double spring is fixed to bear the major part of the ball's weight, by its pressure upwards against two points of the ball, equidistant from the vertical line. This is the description of the first pendulum made in this way; and the only alteration that the inventor made afterwards was placing the side screws in the body of the ball. Cumming proposes, in his *Elements of Clock and Watch-work*, that the brass bar should elongate between two iron bars, in order to keep it straight, and to prevent the jerks to which he conceives the foregoing construction liable: he proposes also to alter the structure of the short arms of the levers, by making them turn each on an axis of motion, and to change their places of pressure mutually, in order that their united action may be applied in the same point, at the centre of the brass bar, in direct opposition to the line of downward expansion. See his *Elements*, p. 106, and plate xi. Mr. Hardy of Clerkenwell has also improved considerably Elliott's pendulum.

Mr. Troughton's mercurial pendulum.—This is an improvement on Graham's mercurial pendulum. About the year 1790 Mr. Edward Troughton, with a view of doing away the most material prejudice against this useful instrument, contrived a modification of the mercurial pendulum, which must be considered as a distinct invention; the materials being differently arranged both as to quality, quantity, and situation. The prejudice alluded to was that the metallic rod of Graham, and the vessel of mercury, would not be affected by changes of temperature in a contemporaneous manner, but that the mercury being below the rod, and having on that account a quicker motion, would cool sooner than the metallic rod, and be liable to more frequent changes from its greater susceptibility. Mr. Troughton therefore substituted a strong glass tube with a bulb at the lower extremity, to be filled to a certain height with mercury, which should rise and fall precisely as in a thermome-

ter which instrument, in fact, his tube is; and, to make it useful as such, it carries a graduated scale. The tube in question is about the size of a barometer tube, and the bulb large enough to contain forty-five ounces of pure mercury by the aid of one-half the tube. Fig. 2 of plate II. exhibits Mr. Troughton's arrangement. A B is the mercurial rod filled with mercury to the middle point of the rod; C D the bulb guarded by the surrounding lenticular bob of brass and lead made in the usual way, except that it is hollow in the centre: the metallic parts of the pendulum weigh about nine pounds exclusively of the mercury; the rim that surrounds the bulb, and by which the weight of the lenticular bob is supported, projects into two notches cut in the interior edges of the metallic lens, at each side of the cavity, and the nice fitting of the bulb to its rim renders the glass capable of bearing the weight of metal supported by it. The compensation of this pendulum is effected entirely by the ascent and descent, alternately, of the mercury up and down the glass tube as the heat varies; and as the expansion of glass varies much less than that of any of the metals, the small column of mercury contained in the tube is found sufficient to answer its purpose completely after a trial of more than twenty years.

Ward's compensation pendulum.—This is an invention of Mr. Henry Ward, of Blandford in Dorsetshire, who, in March 1806, communicated it to the Society of Arts, accompanied by a model, which gained him the silver medal of the society. It consists of three bars, two of iron and one of zinc, arranged in a manner very similar to Deparcieux's improvement of Regnault's old French pendulum, but without the adjustment lever. The instrument appears in fig. 3, plate II., where h, h and i, i are two flat rods of iron or steel, about half an inch wide and an eighth of an inch thick each; and k, k is a rod of zinc, of nearly a quarter of an inch thick, interposed; the two extreme or iron rods are cranked, one at the top to receive the suspension spring, and the other at the bottom to hold the ball in the same vertical line with the zinc rod. These three parallel rods are united by four screws, l, l, l, l , which, passing through oblong holes in the bars h, h and k, k , screw into the rod i, i , while the rod h, h is fastened to the zinc one k, k , by the single screw m near its lower extremity, which screw is the screw of adjustment for temperature, and requires several holes to be made in the bar h, h , and also in k, k , that the length of the zinc bar may be limited to its due proportion for exact compensation. The iron bar i, i rests by a chimpiece on the upper end of the zinc bar, and therefore the ball supported by its lower tapped end stretches all the bars equally. If the zinc bar had rested on the crank at the bottom of the bar h, h , instead of being held by the screw m , the arrangement would have been the same as in Deparcieux's, but with zinc substituted for brass, which consequently does not require the aid of a lever to increase its effect. The proportional expansions of zinc and iron were taken for this pendulum from Smeaton's table in the forty-eighth volume of the *Phil. Trans.* of London, and were made for hammered zinc as 373 : 151; but subsequent observations on the rate of the clock,

to which the pendulum was applied, proved that the expansion of the hammered zinc was greater than Smeaton's table gives it, though the quantity was within the reach of the adjustment.

Reid's compensation pendulum.—Another compensation pendulum by Mr. Adam Reid of Woolwich was also presented to the Society of Arts in April 1809, and the inventor was rewarded with fifteen guineas for his contrivance. This is given in fig. 4, plate II., and has its compensation of a tube of zinc acting on the ball from the lower end of the steel verge thus: A B is the steel verge, made a little thicker where it enters the ball C, and also of a lozenge shape, to prevent the ball's turning, but above and below it is cylindrical; near the centre of the ball is a shoulder in the verge, against which the upper end of the zinc tube D presses the cross piece of the ball when the nut E is turned up close to its lower extremity, but when the nut is turned back, in adjusting for rate, the tube descends a little, and the ball with it, while it rests on the upper extremity of the tube. When the compensation is too much the tube may be shortened till it is found of the exact length, by a trial of the rate in extremes of temperature. In the figure the length of the zinc tube does not appear sufficiently long to compensate an entire verge of steel. The inventor observes that platinum might be substituted for steel, and steel for zinc, for the formation of this kind of pendulum, but that the expense would be enhanced by the dearness of platinum.

Ritchie's and Nicholson's compensation pendulum.—In March 1812 Mr. David Ritchie, of Clerkenwell, laid before the society a model of a compensation pendulum, for which he received twenty guineas. The compensation was effected by the flexure of two compound horizontal bars interposed between the verge and the ball, which act on the same principle as the compound bars in the ordinary compensation balances of a chronometer. Fig. 5 represents the pendulum, in which A is the spring of suspension, B the ball, and C the steel verge as usual, with the nut of adjustment for rate at E, below the ball. The compensating bars are F and G, the upper part of F and the lower part of G being steel, and the other parts brass; so that any additional heat may bring the bars nearer together by the convexity of the brass faces of the compound bars being contiguous. These compound bars have each a sliding piece above and below, and *f* respectively, by the sliding of which the bars may have their effective lengths altered, in the adjustment for temperature; and are connected by the slender springs *e* and *f*, which bear a portion of the ball's weight; the remainder being borne by the springs *l* and *m* attached by screws at *h*, one to the verge piece *d* and the other to the ball piece *b*, while they themselves are united by screws at *l* and *m*. The compensation frame, so constructed, is adjusted by sliding the compound bars, before they are fixed, till the centre of the ball falls in the vertical line of the verge, where the screws at *h* fix it for trial. It has been feared that when the crutch of the clock urges the verge the ball will not move with it till the springs *e* and *f* are bent a little; for when the

ball is heavy, as is now customary in seconds' pendulums, its weight will place a great stress on the slender springs that connect it with the verge, and produce, probably, a vacillation, as in Doughty's, that must be very unfavorable to isochronism, allowing even that the compensation is perfect. To avoid this evil Mr. Nicholson placed a similar compensation bar on the cock of suspension above the verge of his pendulum, and also above the cock of limitation, as seen in fig. 6, but without any spring, and in this situation the varying curvature of the horizontal compound bar, E E, altering the length of the suspension spring, produced the alternate rising and falling of the ball, as the verge carried it in an opposite direction, so that the centre of oscillation was comparatively stationary. See Phil. Journal, vol. i. 4to. ed., plate V. fig. 3. The same author also contrived a compensation pendulum composed of four rods of steel and one of a compound, or alloy, of zinc and silver, which is described in vol. ii. of his 4to. Phil. Journal, p. 205, plate IX.

PENELOPE, in fabulous history, the daughter of Icarus, who married Ulysses, by whom she had Telemachus. During the absence of Ulysses, who was gone to the siege of Troy, and who staid twenty years from his dominions, several princes, charmed with Penelope's beauty, told her that Ulysses was dead, offered to marry her, and pressed her to declare in their favor. She promised compliance on condition they would give her time to finish a piece of tapestry she was weaving; but at the same time she undid in the night what she had done in the day, and thus eluded their importunity until Ulysses's return.

PENELOPE, in ornithology, a genus of birds of the order of gallinæ, the characters of which are these: The beak is bare at the base; the head is covered with feathers; the neck is quite bare; the tail consists of twelve principal feathers; and the feet are for the most part bare. Linné, in his *Systema Nature*, enumerates six species.

1. *P. crax cumanensis*, called by Latham, &c., yacou. It is bigger than a common fowl. The bill is black; the head feathers are long, pointed, and form a crest, which can be erected at pleasure. The irides are of a pale rufous color; the space round the eye is naked, similar to that of a turkey. It has also a naked membrane or kind of wattle, of a dull black color. The blue skin comes forward on the bill, but is not liable to change color like that of the turkey. The plumage has not much variation; it is chiefly brown, with some white markings on the neck, breast, wing coverts, and belly; the tail is composed of twelve feathers, pretty long, and even at the end; the legs are red. This species inhabits Cayenne, but is a very rare bird, being met with only in the inner parts, or about the Amazon's country, though in much greater plenty up the river Oyapoc, especially towards Camoupi; and indeed those which are seen at Cayenne are mostly tame ones; for it is a familiar bird, and will breed in that state, and mix with other poultry. It makes the nest on the ground, and hatches the young there, but is at other times mostly seen on trees. It frequently erects the

crest, when pleased or taken notice of, and likewise spreads the tail upright like a fan, in the manner of the turkey. It has two kinds of cry; one like that of a young turkey, the other lower and more plaintive; the first of these is thought by the Indians to express the word *couyovoit*, the other *yacou*.

2. *P. maralia*, the marail, about the size of a fowl, and shaped somewhat like it. The bill and irides are blackish; the space round the eye is bare, and of a pale red; the chin, throat, and fore part of the neck are scarcely covered with feathers; but the throat itself is bare, and the membrane elongated to half an inch or more; both this and the skin round the eyes change color, and become deeper and thicker when the bird is irritated. The head feathers are longish, so as to appear like a crest when raised up, which the bird often does when agitated; at which time it also erects those of the whole body; and so disfigures itself as to be scarcely known. The general color of the plumage is a greenish black; the fore part of the neck is tipped with white; the wings are short; the tail is long, consisting of twelve feathers, which are even at the end, and commonly pendent, but can be lifted up, and spread out like that of the turkey; the legs and toes are of a bright red; the claws are crooked, and somewhat sharp. In a collection, says Latham, from Cayenne was a bird, I believe, of this very species. It was twenty-eight inches long; the bill is like that of a fowl, brown, and rather hooked; round the eyes bare; the head is crested; the feathers of the fore part of the neck are tipped with white; the breast and belly are rufous brown; the rest of the plumage is greenish brown; the tail is eleven inches long, and rounded at the end; the quills just reach beyond the rump; the legs are brown, and the claws hooked. This species is common in the woods of Guiana, at a distance from the sea, though it is less known than could be imagined; and generally found in small flocks, except in breeding time, when it is only seen by pairs, and then frequently on the ground, or on low shrubs; at other times on high trees, where it roosts at night. The female makes her nest on some low bushy trees as near the trunk as possible, and lays three or four eggs. When the young are hatched, they descend with their mother, after ten or twelve days. The mother acts as other fowls, scratching on the ground like a hen, and brooding the young, which quit their nurse the moment they can shift for themselves. They have two broods in a year; one in December or January, the other in May or June. The best time of finding these birds is morning or evening, being then met with on such high trees whose fruit they feed on, and are discovered by some of it falling to the ground. The young birds are easily tamed, and seldom forsake the places where they have been brought up: they need not be housed, as they prefer the roosting on tall trees to any other place. Their cry is inharmonious, except when irritated or wounded, when it is harsh and loud. Their flesh is much esteemed. Buffon supposes this bird to be the female of the *yacou*, or at least a variety; but that this cannot be, the anatomical inspection will at once determine. The windpipe of this

bird has a singular construction, passing along the neck to the entrance of the breast, where it arises on the outside of the flesh, and after going a little way downwards, returns, and, then passes into the cavity of the lungs. It is kept in its place on the outside by a muscular ligament, which is perceivable quite to the breast bone. This is found to be the case in both male and female, and plainly proves that it differs from the *yacou*, whose wind-pipe has no such circumvolution in either sex. If this be the bird mentioned by Fermin, in his History of Guiana, p. 176, he says that the crest is cuneiform, and of a black and white color; and observes that they are scarce at Surinam; but it does not seem quite certain whether he means this species or the *yacou*. Bancroft mentions a bird of Guiana by the name of *marrodée*, which he says is wholly of a brownish-black: the bill the same; and the legs gray. These he says are common, and make a noise not unlike the name given it, perching on trees. The Indians imitate their cry so exactly as to lead to the discovery of the place the birds are in, by their answering it. The flesh of them is like that of a fowl: it is therefore most likely the marail.

3. *P. meleagris cristata*, called by Ray *pene-lope jacupeme*, and by Edwards the *guan*, or *quan*, is about the size of a fowl, being about two feet six inches long. The bill is two inches long, and of a black color; the irides are of a dirty orange color; the sides of the head are covered with a naked purplish blue skin, in which the eyes are placed: beneath the throat, for an inch and a half, the skin is loose, of a fine red color, and covered only with a few hairs. The top of the head is furnished with long feathers, which the bird can erect as a crest at pleasure; the general color of the plumage is brownish black, glossed over with copper in some lights; but the wing coverts have a greenish and violet gloss. The quills mostly incline to a purple color; the fore part of the neck, breast, and belly, are marked with white spots; the thighs, under tail coverts, and the tail itself, are brownish black; the legs are red; the claws black. Some of these birds have little or no crest, and are thence supposed to be females. They inhabit Brasil and Guiana, where they are often made tame. They frequently make a noise not unlike the word *jacu*. Their flesh is much esteemed.

4. *P. meleagris satyra*, the horned pheasant. Latham calls it the horned turkey. This species is larger than a fowl, and smaller than a turkey. The color of the bill is brown; the nostrils, forehead, and space round the eyes are covered with slender black hairy feathers; the top of the head is red. Behind each eye there is a fleshy callous blue substance like a horn, which tends backward. On the fore part of the neck and throat there is a loose flap of a fine blue color, marked with orange spots, the lower part of which is beset with a few hairs; down the middle it is somewhat looser than on the sides, being wrinkled. The breast and upper part of the back are of a full red color. The neck and breast are inclined to yellow. The other parts of the plumage and tail are of a rufous brown, marked all over with white spots, encompassed with black. The legs

are somewhat white, and furnished with a spur behind each. A head of this bird, Mr. Latham tells us, was sent to Dr. Mead from Bengal, together with a drawing of the bird, which was called anpaul pheasant. It is a native of Bengal.

5. *P. pipile*, or *craz pipile*, black in the belly, and the back brown, stained with black. The flesh on the neck is of a green color. It is about the bigness of the yacou, and has a hissing noise. The head is partly black and partly white, and is adorned with a short crest. The space about the eyes, which are black, is white; the feet are red. It inhabits Guiana.

6. *P. vociferans*, the vociferating penelope. The bill of this bird is of a greenish color; the back is brown, the breast green, and the belly is of a whitish brown. Latham calls it the crying curassaw. It is about the bigness of a crow.

PENESTICA, a town of the Helvetii, between Lacus Lausonius and Salodurum; called *Petenisca* by Peutinger; thought now to be Biel, the capital of a small territory in Switzerland.—Antonine. Cluverius.

PENETRALE, a sacred room or chapel in private houses, which was set apart for the worship of the household gods among the ancient Romans. In temples also there were *penetralia*, or apartments of distinguished sanctity, where the images of the gods were kept, and certain solemn ceremonies performed.

PENETRATE, *v. a. & v. n.*

PENETRABLE, *adj.*

PENETRABILITY, *n. s.*

PENETRAILS,

PENETRANCY,

PENETRANT, *adj.*

PENETRATION, *n. s.*

PENETRATIVE, *adj.*

to affect the mind or feelings; to make way mentally or otherwise: penetrable is, susceptible of being pierced, or of mental impression; sympathetic: penetrability, the corresponding noun-substantive: penetrails, an obsolete word for the interior parts of the body: penetrant, having power to pierce or enter; sharp, subtle, prevailing: penetrative is synonymous with penetrant: penetration, the act of entering a body; mental entrance, acuteness, or subtlety.

Peace!

And let me wring your heart, for so I shall,

If it be made of penetrable stuff. *Shakespeare.*

Wouldst thou see

Thy master thus with pleacht arms, bending down
His corrugible neck, his face subdued

To penetrative shame? *Id.*

Let not air be too gross, nor too penetrative, nor
subject to any foggy noisomeness from fens. *Wotton.*

It warms

The universe, and to each inward part,
With gentle penetration, though unseen,
Shoots invisible virtue even to the deep. *Milton.*

If the operation of these salts be in convenient
glasses promoted by warmth, the ascending steams
may easily be caught and reduced into a penetrant
spirit. *Boyle.*

Let him try thy dart,

And pierce his only penetrable part. *Dryden.*

If we reach no farther than metaphor, we
rather fancy than know, and are not yet penetrated
into the inside and reality of the thing. *Locke.*

The subtlety, activity, and penetrancy of its effluvia
no obstacle can stop or repel, but they will make
their way through all bodies. *Ray.*

The food, mingled with some dissolvent juices, is
evacuated into the intestines, where it is further sub-
tilized and rendered so fluid and penetrant that the
finer part finds its way in at the straight orifices of
the lacteous veins. *Id.*

There shall we clearly see the uses of these
things which here were too subtle for us to pen-
etrate. *Id.*

Marrow is of all other oily substances, the most pe-
netrate. *Arbuthnot on Aliments.*

There being no mean between penetrability and
impenetrability, passivity and activity, they being
contrary; therefore the infinite rarefaction of the
one quality is the position of its contrary. *Cheyne.*

Court virtues bear, like gems, the highest rate,
Born where heaven's influence scarce can penetrate:
Though the same sun with all diffusive rays
Smile in the rose, and in the diamond blaze,
We praise the stronger effort of his power,
And always set the gem above the flower. *Pope.*

O thou, whose penetrative wisdom found
The south sea rocks and shelves, where thousands
drowned. *Swift's Miscellanies.*

The heart resists purulent fumes, into whose pe-
netrails to insinuate some time must be allowed. *Harvey.*

A penetration into the abstruse difficulties and
depths of modern algebra and fluxions is not worth
the labor of those who design either of the three
learned professions. *Watts.*

PEN'GUIN, *n. s.* See **PINGUIN**. A bird.
This bird was found with this name, as is sup-
posed, by the first discoverers of America; and
penguin signifying in Welsh a white head, and
the head of this fowl being white, it has been
imagined that America was peopled from Wales;
whence Hudibras:—

British Indians named from penguins.

Also a fruit.

The penguin is so called from his extraordinary
fatness: for, though he be no higher than a large
goose, yet he weighs sometimes sixteen pounds; his
wings are extremely short and little, altogether un-
useful for flight, but by the help whereof he swims
very swiftly. *Grew's Museum.*

The penguin is very common in the West Indies,
where the juice of its fruit is often put into punch,
being of a sharp acid flavour: there is also a wine
made of the juice of this fruit, but it will not keep
good long. *Miller.*

PENGUIN, in botany (sect. I. Def. 2), or wild
ananas, is a species of bromelia. See **BROMELIA**.

PENICHE, a fortified town of Portugal, on a
peninsula in the Atlantic, surrounded by rocks.
It has a harbour defended by a fort. In 1589
this town was taken by the English under Sir
Francis Drake. Inhabitants 2800. Forty-eight
miles N. N. W. of Lisbon. Long. 9° 23' 56" W.,
lat. 39° 21' 48" N.

PENICILLUS, among surgeons, is used for a
tent to be put into wounds or ulcers.

PENIEL, or **PENUEL**, a city beyond Jordan,
near the ford or brook Jabbok, where Jacob
wrestled with an angel. See Gen. xxxii. 24, &c.
The city built afterwards in this place was given
to the tribe of Gad. Gideon, returning from the

pursuit of the Medianites, overthrew the tower of Peniel (Judges viii. 17), and put all the men of the city to death, for having refused bread to him and his people, and having answered him in a very insulting manner. Jeroboam I. rebuilt Peniel (1 Kings xii. 25); and Josephus says that he built a palace in it.

PENJINSKAJA, a gulf of Eastern Siberia, forming the northern part of the bay of Okhotsk. It extends a considerable distance inland, and receives the Penjine River.

PENINGTON (Isaac), a celebrated English Quaker, born in 1617. He was an early convert of George Fox; and both preached and wrote in defence of his system. Under the persecuting spirit of that age, he was several times imprisoned, although he was of a meek, quiet, and philanthropic spirit, and very much beloved. He died at Goodnestone in Sussex in 1679.

PENINNAH, the second wife of Elkanah, the father of Samuel. Her fertility, and Hannah's barrenness, are recorded in 1 Sam. i., with several interesting circumstances, which show the folly and inconvenience of polygamy.

PENINSULA, *n. s.* } *Fr. peninsula*; *Lat. penin'sulatus, adj.* } *peninsula*. A piece of land almost surrounded by the sea.

Aside of Milbrook lieth the *peninsula* of Inswork, on whose neckland standeth an ancient house.

Carow.

PENITENCE, *n. s.* } *Fr. penitence, peni-*
PEN'ITENT, *adj. & n. s.* } *tent, penitentiel, of*
PENITEN'TIAL, *adj. & n. s.* } *Lat. penitentia.*
PENITEN'TIARY, *n. s.* } Repentance; con-
PEN'ITENTLY, *adj.* } trition; sorrow for sin; repentant course of action: penitent is, sorrowful for sin; reforming or reformed; a person thus sorrowful and reformed; also one under a course of church penance or censure: penitential is expressing penitence, or enjoined as a course of discipline for sin; also a book directing such a course: penitentiary is, one who prescribes penitential rules; one who observes them; or a place where they are observed.

Much it joys me

To see you become so *penitent*. *Shakspeare.*

I have done penance for contemning love,
Whose high imperious thoughts have punished me
With bitter fasts and *penitential* groans. *Id.*

Concealed treasures shall be brought into use by the industry of converted *penitents*, whose carcasses the impartial laws shall dedicate to the worms of the earth. *Bacon.*

Upon the loss of Urbin, the duke's undoubted right, no *penitentiary*, though he had enjoined him never so straight penance to expiate his first offence, would have counselled him to have given over pursuit of his right, which he prosperously re-obtained. *Id.*

A prison restrained John Northampton's liberty, who, for abusing the same in his unruly mayoralty of London, was condemned hither as a perpetual *penitentiary*. *Carow.*

To maintain a painful fight against the law of sin is the work of the *penitentiary*. *Hammond.*

Nor in the land of their captivity

Humbled themselves, or *penitent* besought

The God of their forefathers. *Milton.*

Provoking God to raise them enemies;

From whom as oft he saves them *penitent*. *Id.*

The counterfeit Dionysius describes the practice of the church, that the catechumens and *penitents* were

admitted to the lessons and psalms, and then excluded. *Stillington.*

Death is deferred, and *penitence* has room
To mitigate, if not reverse the doom. *Dryden.*

The proud he tamed, the *penitent* he cheered,
Nor to rebuke the rich offender feared;
His preaching much, but more his practice wrought,
A living sermon of the truths he taught. *Id.*

Is it not strange, that a rational man should adore
leeks and garlick, and shed *penitential* tears at the
smell of a deified onion? *South.*

The *penitentials*, or book of penance, contained such matters as related to the imposing of penance, and the reconciliation of the person that suffered penance. *Ayliffe.*

The great *penitentiary* with his counsellors pre-
scribes the measure of penance.

Ayliffe's Perargon.

The repentance, which is formed by a grateful sense of the divine goodness towards him, is resolved on while all the appetites are in their strength: the *penitent* conquers the temptations of sin in their full force. *Rogers.*

His frown was full of terror, and his voice

Shook the delinquent with such fits of awe

As left him not, till *penitence* had won

Lost favour back again, and closed the breach.

Cowper.

PENITENCE is sometimes used for a state of repentance, and sometimes for the act of repenting. See **REPENTANCE**. It is also used for a discipline or punishment attending repentance, more usually called penance. It also gives title to several religious orders, consisting either of converted debauchees and reformed prostitutes, or of persons who devote themselves to the office of reclaiming them. Of this latter kind are these:

PENITENCE OF ST. MAGDALEN, at PARIS, CONGREGATION OF, owed its rise to the preaching of F. Tisseran, a Franciscan, who converted a number of courtizans about the year 1492. Louis, duke of Orleans, gave them his house for a monastery, or rather, as appears by their constitutions, Charles VIII. gave them the hotel called the Bochaigne, whence they were removed to St. George's chapel in 1572. By virtue of a brief of pope Alexander, Simon, bishop of Paris, in 1497, drew them up a body of statutes, and gave them the rule of St. Augustine. None were admitted who were above thirty-five years of age, and, till the beginning of the last century, none but penitents; but after its reformation by Mary Alvequin in 1616, none were admitted but maids, who, however, still retain the ancient name penitents.

PENITENCE OF ST. MAGDALEN, ORDER OF, established about the year 1272 by one Bernard, a citizen of Marseilles, who devoted himself to the work of converting the courtizans of that city. Bernard was seconded by several others, who, forming a kind of society, were at length erected into a religious order by pope Nicholas III., under the rule of St. Augustine. F. Gesnay says, that they also made a religious order of the penitents, or women they converted, giving them the same rules and observances which they themselves kept.

PENITENTS, an appellation given to certain fraternities of penitents, distinguished by the different shape and color of their habits. These are secular societies, who have their rules, statutes,

and churches, and make public processions under their particular crosses or banners. Of these there are more than 100; the chief of which are, 1. The white penitents, of which there are several different sorts at Rome, the most ancient of which was constituted in 1264: the brethren of this fraternity every year give portions to a certain number of young girls, in order to their being married: their habit is a kind of white sackcloth, and on the shoulder is a circle, in the middle of which is a red and white cross. 2. Black penitents, the chief of which are the brethren of mercy, instituted in 1488 by some Florentines, to assist criminals during their imprisonment, and at their death: on the day of execution they walk in procession before them, singing the seven penitential psalms and the litanies; and after they are dead they take them down from the gibbet and bury them: their habit is black sackcloth. There are others whose business it is to bury such persons as are found dead in the streets: these wear a death's head on one side of their habit. There are also blue, gray, red, green, and violet penitents, remarkable for little else but the different colors of their habits. Mabillon tells us that at Turin there are a set of penitents kept in pay to walk through the streets in procession, and cut their shoulders with whips, &c.

PENITENTS, or CONVERTS OF THE NAME OF JESUS, a congregation of religious at Seville in Spain, consisting of women who had led a licentious life, founded in 1550. This monastery is divided into three quarters: one for professed religious; another for novices; a third for those who are under correction. When these last give signs of a real repentance, they are removed into the quarter of the novices, where, if they do not behave themselves well, they are remanded to their correction. They observe the rules of St. Augustine.

PENITENTS OF ORVIETO are an order of nuns, instituted by Antony Simoncelli, a gentleman of Orvieto in Italy. The monastery he built was at first designed for the reception of poor girls, abandoned by their parents, and in danger of losing their virtue. In 1662 it was erected into a monastery, for the reception of such as, having abandoned themselves to impurity, were willing to consecrate themselves to God by solemn vows. Their rule is that of the Carmelites. These religious undergo no novitiate. All required is, that they continue a few months in the monastery in a secular habit, after which they are admitted to the vows.

PENITENTIARY, in the ancient Christian church, a name given to certain presbyters or priests, appointed in every church to receive the private confessions of the people, in order to facilitate public discipline, by acquainting them what sins were to be expiated by public penance, and to appoint private penance for such private crimes as were not proper to be publicly censured.

PENITENTIARY, at the court of Rome, is an office in which are examined and delivered out the secret bulls, graces, or dispensations, relating to cases of conscience, confessions, &c.

PENITENTIARY is also an officer in some cathedrals, vested with power from the bishop to absolve, in cases reserved to him. The pope has

his grand penitentiary, who is a cardinal, and the chief of the other penitentiary priests established in the church of Rome, who consult him in all difficult cases. He presides in the penitentiary, despatches dispensations, absolutions, &c., and has under him a regent and four proctors, or advocates of the sacred penitentiary.

PENK, a river of Staffordshire, which runs into the Sow, a mile below Stafford.

PENKEMAS, a cape on the west coast of Wales, and north point of Pembrokeshire, at the mouth of the Tivy, four miles below Cardigan.

PENKRIDGE, a market-town and parish of Staffordshire, situate on the river Penk, over which it has a stone bridge; four miles north-east from Brewood, and 129 north-west from London. The town is ancient, and supposed to have been the Pennocrucium of the Romans. The church has a square tower, containing five bells. Here is a charity-school for twelve boys and eight girls. Market on Tuesday. Fairs April 30th, and a great horse fair October 10th.

PENMAEN MAWR, a noted mountain of Caernarvonshire, Wales, rises abruptly from the sea to the height of 1540 feet, and its passage, on the road from Chester to Bangor and Holyhead, was extremely dangerous, until 1772, when those improvements were undertaken which have now rendered it safe, and at the same time one of the most striking and romantic roads in the kingdom. It is secured from the sea by a wall breast-high. On the summit is Braich-y-Ddinas, or the arm of the city, an ancient fortification encompassed with a strong treble wall.

PENN (Sir William), was born at Bristol in 1621, and inclined from his youth to maritime affairs. He was made captain at twenty-one years of age, rear-admiral of Ireland at twenty-three, vice-admiral of Ireland at twenty-five, admiral to the Straits at twenty-nine, vice-admiral of England at thirty-one, and general in the first Dutch war at thirty-two. Returning in 1655, he was chosen representative for the town of Weymouth; and in 1660 was made commissioner of the admiralty and navy, governor of the town and fort of Kinsale, vice-admiral of Munster, and a member of that provincial council. In 1664 he was chosen great captain commander under the duke of York, and distinguished himself in an engagement against the Dutch fleet; after which he took leave of the sea, but continued in his other employments till 1669. He died in 1670.

PENN (William), an eminent writer among the Quakers, and the founder and legislator of Pennsylvania, was the son of Sir William Penn, and was born at London in 1644. In 1660 he was entered a commoner at Christ Church in Oxford; but, having previously received an impression from the preaching of one Thomas Loe, a Quaker, withdrew with some other students from the national worship, and held private meetings, where they preached and prayed among themselves. This giving great offence to the heads of the college, Mr. Penn, though but sixteen years of age, was fined for non-conformity; and, continuing his religious exercises, was at length expelled his college. Upon his return home, he was treated with great severity by his

father, who at last turned him out of doors; but, his resentment abating, he sent him to France in company with some persons of quality; where he continued a considerable time, and returned not only well skilled in the French language, but a polite and accomplished gentleman. About 1666 his father committed to his care a considerable estate in Ireland. But being found in one of the Quakers' meetings in Cork, he, with many others, was thrown into prison: on his writing to the earl of Orrery, however, he was discharged. But his father, being informed that he still adhered to his opinions, sent for him to England, and finding him inflexible to all his arguments, turned him out of doors a second time. About 1668 he became a preacher among the Quakers; and that year was committed close prisoner to the Tower, where he wrote several treatises. Being discharged, after seven months' imprisonment, he went to Ireland, where he also preached amongst the Quakers. Returning to England, he was in 1670 committed to Newgate, for preaching in Gracechurch-street meeting-house; but, being tried at the sessions-house in the Old Bailey, he was acquitted. In September 1670 his father died; and, being perfectly reconciled to him, left him his paternal blessing and a plentiful estate. But his persecutions were not yet at an end; for, in 1671, he was committed to Newgate for preaching at a meeting-house in Wheeler-street; and during his imprisonment, which continued six months, he wrote several treatises. After his discharge, he went into Holland and Germany, and in the beginning of 1672 married, and settled with his family at Rickmansworth in Hertfordshire. The same year he published several pieces; particularly one against Reeves and Muggleton. In 1677 he again travelled into Holland and Germany to propagate his opinions; and had frequent conversations with the princess Elizabeth, daughter to the queen of Bohemia, and sister to the princess Sophia, mother to king George I. In 1681 king Charles II., in consideration of the admiral's services, and several debts due to him from the crown at his decease, granted William Penn and his heirs the province lying on the west side of the Delaware, which thence obtained the name of Pennsylvania. Upon this Penn published a brief account of that province, with the king's patent; and proposing an easy purchase of lands, and good terms of settlement for such as were inclined to remove thither, many went over. But Penn, justly considering that no European sovereign had a right to dispose of the property of other nations, however savage, without some compensation, appointed commissioners to purchase the land he had received from the king of the native Indians, and concluded a treaty with them. The city of Philadelphia was planned and built; and he himself drew up the fundamental constitutions of Pennsylvania in twenty-four articles. In 1681 he was elected F. R. S., and in 1682 he embarked for Pennsylvania, where he continued about two years, and returned in England in August 1684. Upon the accession of king James II. he was taken into a great degree of favor, which exposed him to the imputation of being a Papist; but from which he fully vindicated him-

self. However, upon the Revolution, he was examined before the council in 1688, and obliged to give security for his appearance on the first day of the next term, which was afterwards continued. He was several times discharged and examined; and at length, warrants being issued out against him, he was obliged to conceal himself for two or three years. Being at last permitted to appear before the king and council, he represented his innocence so effectually that he was acquitted. In August 1699 he, with his wife and family, embarked for Pennsylvania; whence he returned in 1701, to vindicate his proprietary right. Upon queen Anne's accession, he was in great favor, and was often at court. But, in 1707, he was involved in a law-suit with the executors of a person who had been formerly his steward; and, though many thought him aggrieved, the court of chancery did not relieve him; upon which account he was obliged to live within the rules of the Fleet for several months, till the matter was accommodated. He died in 1718. Penn's friendly and pacific manner of treating the Indians produced in them an extraordinary love for him and his people; so that they have maintained a perfect amity with the Anglo-Americans in Pennsylvania ever since. He was the greatest bulwark of the Quakers; in whose defence he wrote numberless pieces. Besides the above works, he wrote a great number of others, the most esteemed of which are:—

1. Primitive Christianity revived.
2. Defence of a paper, entitled Gospel Truths, against the Exceptions of the Bishop of Cork.
3. Persuasive to Moderation.
4. Good Advice to the Church of England, Roman Catholic, and Protestant Dissenters.
5. The Sandy Foundation shaken.
6. No Cross, no Crown.
7. The great Case of Liberty of Conscience debated.
8. The Christian Quaker, and his Testimony stated and vindicated.
9. A Discourse of the general Rule of Faith and Practice, and Judge of controversy.
10. England's present Interest considered.
11. An Address to Protestants.
12. Reflections and Maxims.
13. Advice to his Children.
14. Rise and Progress of the People called Quakers.
15. A Treatise on Oaths.

Most of these have passed through several editions, some of them many. The letters between William Penn and Dr. Tillotson, and William Penn and William Popple, Esq., together with Penn's letters to the princess Elizabeth of the Rhine, and the countess of Hornes, as also one to his wife on his going to Pennsylvania, are inserted in his works, which were first collected and published in 2 vols. folio; and the parts since selected and abridged into 1 vol. fol. are very much and deservedly admired.

PENN'S NECK, LOWER, a town of Salem county, New Jersey. Population 1163.

PENNA, in zoology. See PINNA.

PENNACHED, *adj.* Fr. *pennache*. Applied to flowers when the ground of the natural color of their leaves is radiated and diversified neatly without any confusion.

Carefully protect from violent rain your *pennached* tulips, covering them with mattresses. *Evelyn.*

PENNANT, *n. s.* Fr. *pennon*. A small flag

or ensign: also tackle for hoisting things on board ships.

PENNANT (Thomas), Esq., LL. D., F. R. S., &c., a late eminent English naturalist, born in Flintshire, in 1726, and descended of a race of ancient Britons, who had settled in that country for many centuries. He was educated successively at Wrexham, Fulham, and Oxford, where he graduated; and, having made considerable proficiency in the classics, for some time studied law. About this time a present of Willoughby's Ornithology gave him an attachment to natural history, which continued through life. After making a tour through Wales, Cornwall, and other parts of England, he travelled to the continent, and established a correspondence with several of the greatest men of the age, particularly count Buffon, Dr. Pallas, Dr. Haller, Linnæus, and Voltaire. On his return he married, and had two children; but did not succeed to the family fortune till his thirty-seventh year, when he settled at Downing. His wife dying, he made another tour to the continent; where his reputation as a man of science was now established by his British Zoology; which was published in 4 vols. 4to. so early as 1750. About 1770 he set out on his travels through Scotland; and in 1771 published a most entertaining account of that tour, in 3 vols. 4to., which passed through several editions. After this tour he penetrated to the Hebrides, and visited Man. In 1776 he married his second wife, Miss Mostyn, sister of Sir Roger Mostyn. In 1778 he commenced the publication of his Welsh Tour, in 2 vols. 4to. In 1782 he published his Journey from Chester to London, in 1 vol. 4to.; and in 1784 his Arctic Zoology, an admirable work. In 1790 he published another 4to. vol. entitled Of London; and with it a Farewell Address to the public; notwithstanding which soon after appeared his Natural History of the Parishes of Holywell and Downing; in 1 vol. 4to. And even so late as 1797, his seventy-first year, he published The View of Hindostan, a splendid work in 2 vols. 4to., with twenty-three plates, admirably engraved. From his apology in the preface, these 2 vols. appear to be only part of a work of which the remaining vols. were promised to be published. He also published the following papers in the Philosophical Transactions: 1. A Letter on an Earthquake felt at Downing in 1753. 2. Another on Coralloid Bodies (*coralloides*), collected by him: and 3. Synopsis of Quadrapeds, 1771. 4. A Pamphlet on the Militia. 5. A paper on the Turkey: and 6. A volume of Miscellanies. Besides being F. R. S. of London, he was a Member of the Society of Antiquaries: F. R. S. of Upsal, in Sweden: a member of the American Philosophical Society, and of the Anglo-Linnæan Society, &c. His ample fortune enabled him to keep a hospitable table; and to dedicate the profits of several of his works to charitable institutions; particularly the Welsh charity school. He died at Downing in 1798, aged seventy-two. He left several works in MS. entitled Outlines of the Globe, of which the View of Hindostan composed the fourteenth and fifteenth volumes. He was en-

ded with a healthy frame of body, an open and intelligent aspect, an active and cheerful disposition, and great vivacity. His heart was kind, benevolent, and charitable. He was also extremely candid and free from prejudices.

PENNATED, *adj.* Lat. *pennatus*. Winged; among botanists pennated are those leaves of plants which grow directly one against another on the same rib or stalk; as those of the ash and walnut-tree.

PENNATULA, the sea-pen, in natural history, a genus of zoophyte, which, though it swims about freely in the sea, approaches near to the gorgonia. This genus has a bone along the middle of the inside, which is its chief support; and this bone receives the supply of its osseous matter by the same polype mouths that furnish it with nourishment. Linnæus reckons seven species. See ZOOPHYTES. It partakes both of the animal and vegetable nature; but some suppose it to be nothing but a fucus or sea-plant. It is certainly an animal, however, and as such is locomotive. Its body generally expands into processes on the upper parts, and these processes or branches are furnished with rows of tubular denticles; they have a polype head proceeding from each tube. The sea-pen is distinguished from the corallines by this specific difference; corals, corallines, alcyonia, and all that order of beings, adhere firmly by their bases to submarine substances; but the sea-pen either swims about in the water, or floats upon the surface. But there are other kinds of sea-pens, or species of this animal, which have no resemblance to a pen: as

1. *P. digitalis*, or *digitiformis*, the finger-shaped sea-pen.

2. *P. filota* of Linnæus.

3. *P. mirabilis*.

4. *P. pavonis piscis*, the feather of the peacock fish.

5. *P. phosphorea*. Dr. Coote Molesworth sent one of these animals to the ingenious Mr. Ellis, the author of many curious papers on the nature of corallines, which was taken in a trawl in seventy-two fathoms water, near the harbour of Brest, in France; the same species are frequently found in the ocean, from the coast of Norway to the Mediterranean Sea, sometimes at considerable depths, and sometimes floating on the surface. Mr. Ellis describes that sent him as follows:—Its general appearance greatly resembles that of a quill feather of a bird's wing; it is about four inches long, and of a reddish color; along the back there is a groove from the quill part to the extremity of the feathered part, as there is in a pen; the feathered part consists of fins proceeding from the stem. The fins move the animal backward and forward in the water, and are furnished with suckers or mouths armed with filaments. There is no perforation at the bottom, and therefore Mr. Ellis is of opinion that the exuvie of the animals upon which it feeds are discharged by the same apertures at which the food is taken in; and in this it is not singular, the same economy being observed in the Greenland polype, described by Mr. Ellis in his Essay on Corallines. Each sucker has eight filaments, which are protruded when prey

is to be caught; but at other times they are drawn back into their cases, which are furnished at the end with spiculae that close together round the entrance, and defend this tender part from external injuries. Dr. Bohadsch of Prague had an opportunity of observing one of those animals alive in the water, and he gives the following account of what he saw:—"A portion of the stern contracted, and became of a strong purple color, so as to have the appearance of a ligature round it; this apparent ligature, or zone, moved upwards and downwards successively through the whole length of the stem, as well the feathered as the naked part; it began at the bottom, and moving upwards to the other extremity, it there disappeared, and at the same instant appeared again at the bottom, and ascended as before; but as it ascended through the feathered or pinnated part it became paler. When this zone is much constricted, the trunk above it swells, and acquires the form of an onion; the constriction of the trunk gives the color to the zone, for the intermediate parts are paler in proportion as the zone becomes deeper. The end of the naked trunk is sometimes curved like a hook; and at its extremity there is a sinus or chink, which grows deeper while the purple ring is ascending, and shallower as it is coming down. The fins have four motions, upward and downward, backward and forward, from right to left, and from left to right. The fleshy filaments or claws move in all directions; and, with the cylindrical part from which they proceed, are sometimes protruded from the fins, and sometimes hidden with them. Upon dissecting this animal, the following phenomena were discovered:—"When the trunk was opened lengthwise, a saltish liquor flowed out of it, so viscid as to hang down an inch. The whole trunk of the stem was hollow, the outward membrane being very strong, and about a tenth part of an inch thick; within this membrane appeared another much thinner; and between these two membranes, in the pinnated part of the trunk, innumerable little yellowish eggs, about the size of a white poppy seed, were seen floating in a whitish liquor; about three parts of the cavity within the inner membrane is filled by a kind of yellowish bone; this bone is about two inches and a half long, and one-twentieth of an inch thick; in the middle it is four square, but towards the ends it grows round and very taper, that end being finest which is next the pinnated part of the trunk. This bone is covered in its whole length with a clear yellowish skin, which at each end runs out into a ligament; one is inserted in the top of the pinnated trunk, and the other in the top of the naked trunk: by the help of the upper ligament, the end of the bone is either bent into an arch, or disposed into a straight line. The fins are composed of two skins; the outward one is strong and leathery, and covered over with a vast number of crimson streaks; the inner skin is thin and transparent: the suckers are also in the same manner composed of two skins, but the outer skin is something softer. Both the fins and suckers are hollow, so that the cavity of the suckers may communicate with those of the fins, as the cavity of the fins does with that of the trunk. Dr.

VOL. XVI.

Shaw, in his History of Algiers, says, these animals are so luminous in the water that in the night fishermen discover fishes swimming about in various depths of the sea by the light they give. From this extraordinary quality Linnæus calls this species of the sea pen *pennatula phosphorea*, and remarks, after giving the synonymes of other authors, *Habitat in oceano fundum illuminans*. Of all the *pennatulae* yet known, this feather-shaped one, or, as it is called by others, the silver sea pen, is the largest, as well as the most specious in its appearance. It is of a beautiful silvery white, elegantly striated on each of the feather-like processes with lines or streaks of the deepest black. It is very rare, and is a native of the Indian seas. There is a very fine specimen of this species in the British Museum.

6. *P. reniformis*, the kidney-shaped sea pen. The kidney-shaped sea pen was discovered some time ago on the coast of South Carolina, and sent to Mr. Ellis by John Gregg, esq., of Charlestown. It is of a fine purple color; the kidney part is about an inch from end to end, and about half an inch wide in the narrowest part; a tail proceeds from the middle of the body, which is roundish, and about an inch long; is also full of rings like an earth worm, and along the middle both of the upper and under part of it there is a small groove which runs from one end to the other, but there is no perforation at either extremity. The upper part of the body is convex, and about an inch thick; the whole surface is covered with small yellow starry openings, through which little suckers are protruded, each furnished with six tentacula, or filaments, like what are observed on some corals; the under part of the body is quite flat, and is full of ramifications of fleshy fibres, which proceeding from the insertion of the tail, as a common centre, branch out so as to communicate with the starry openings on the exterior edge and upper surface of the animal.

7. *P. sagitta*, the arrow *pennatula*.

PENNELHEUGH, a hill of Roxburghshire, in Crailing parish; on the top of which are relics of a strong camp.

PENNI (John Francis), born at Florence in 1488, was the disciple of Raphael, who, observing his genius and integrity, intrusted his domestic concerns entirely to his management; by which means he got the appellation of *il fattore*, or the steward. His genius was universal; but his greatest pleasure was in painting landscapes and buildings; he was an excellent designer, and colored well in oil, distemper, and fresco. He painted portraits exquisitely, and had such happy talents that Raphael left him heir to his fortune, in partnership with Romano his fellow disciple. Penni died at Naples in 1528.

PENNI (Luke), brother of the above, worked at Genoa and other parts of Italy, with Del Vaga, who married his sister; he went thence to England, where he worked for Henry VIII., and was employed by Francis I. at Fontainebleau; but at last devoted himself to engraving.

PENNINÆ ALPES, a division of the Alps.—Liv. xxi. 38. See ALPS.

PEN'NON, *n.s.* Fr. *pennon*. A small flag or color.

Her yellow locks craped like golden wire,
about her shoulders wren loosely shed,
And, when the wind amongst them did inspire,
They waved like a pennon wide dispred. *Spenser.*
Harry sweeps through our land
With pennons painted in the blood of Harfleur.
Shakspeare.

High on his pointed lance his pennon bore,
His Cretan fight, the conquered Minotaur. *Dryden.*

PENNSYLVANIA, one of the United States of North America, bounded north by New York; east by the river Delaware, which separates it from New Jersey; south by Delaware, Maryland, and Virginia; and west by Virginia and Ohio. It is 307 miles long, and 160 broad; containing about 44,000 square miles. Population, in 1790, 434,373; in 1800 602,545; and in 1810 810,091, of whom 795 were slaves, and 22,492 free blacks. The number of militia in 1817 amounted to 118,016. The counties, number of townships, and chief towns, are exhibited in the following table:—

| Counties. | Townships. | Chief Towns. |
|----------------|------------|---------------|
| Adams | 13 | Gettysburg. |
| Alleghany | 15 | Pittsburg. |
| Armstrong | 7 | Kitaxning. |
| Beaver | 12 | Beavertown. |
| Bedford | 15 | Bedford. |
| Berks | 33 | Reading. |
| *Bradford | | Meansville. |
| Bucks | 29 | Doylestown. |
| Butler | 13 | Butler. |
| Cambria | 3 | Ebensburg. |
| Centre | 11 | Bellefont. |
| Chester | 40 | West Chester. |
| Clearfield | 1 | Clearfield. |
| *Columbia | | Danville. |
| Crawford | 14 | Meadville. |
| Cumberland | 18 | Carlisle. |
| Dauphin | 15 | Harrisburg. |
| Delaware | 21 | Chester. |
| Erie | 14 | Erie. |
| Fayette | 19 | Union. |
| Franklin | 14 | Chambersburg. |
| Greene | 10 | Greene. |
| Huntingdon | 18 | Huntingdon. |
| Indiana | 7 | Indiana. |
| Jefferson | 1 | Jefferson. |
| Lancaster | 25 | Lancaster. |
| *Lebanon | | Lebanon. |
| *Lehigh | | Northampton. |
| Luzerne | 29 | Wilkesbarre. |
| Lycoming | 18 | Williamsport. |
| M'Kean | 1 | Smethport. |
| Mercer | 16 | Mercer. |
| Mifflin | 9 | Lewistown. |
| Montgomery | 30 | Norriston. |
| Northampton | 32 | Easton. |
| Northumberland | 26 | Sunbury. |
| Philadelphia | 18 | Philadelphia. |
| Potter | 1 | Cowdersport. |
| *Pike | 1 | Milford. |
| *Schuylkill | | Orwigsburg. |
| Somerset | 15 | Somerset. |
| *Susquehanna | | Montrose. |
| Tioga | 2 | Wellsborough. |
| *Union | | New Berlin. |

* Formed since last census.

| York | 22 | York. |

651

There are three incorporated cities in this state, Philadelphia, Pittsburg, and Lancaster. Harrisburg is the seat of government. The other most considerable towns are Reading, Easton, Bethlehem, Carlisle, York, Germantown, Chambersburg, Columbia, Sunbury, Brownsville, Washington, &c. There are about fifty banks in this state, of which ten are at Philadelphia. Here is also a university, and colleges have been established at Carlisle, Lancaster, Canonsburg, Washington, and Meadville. There are respectable and flourishing Moravian schools at Bethlehem, Nazareth, and Litiz; and academies have been established at Allentown, Beavertown, Bellefont, Bustletown, Chambersburg, Easton, Erie, Germantown, Greensburg, Griensburg, Meadville, Newtown, Norriston, Northumberland, Pittsburg, Union, Waterford, Wilkesbarre, York, and some other places. Provision has been made by the legislature for establishing an academy in every county.

The congregations of the different denominations of Christians in Pennsylvania were stated, in 1816, to be in the following proportions:—Presbyterians 186; German Calvinists ninety-four, German Lutherans seventy-four; Friends fifty-five, Episcopalians twenty-six, Baptists fifteen, Roman Catholics fourteen, Scotch Presbyterians eight, Universalists one, Covenanters two, Methodists many, and two Jews' synagogues; amounting in all to about 500 religious societies. Some of these numbers are doubtless stated too low. From a statement made by the society of Friends, it appears that they have ninety-seven meetings in this state; and, according to the Baptist report, the number of Baptist churches is sixty.

The inhabitants are principally descendants of the Welsh, English, Irish, Germans, and some Scotch, French, Swedes, and a few Dutch. The Germans are numerous; they consist of Lutherans, Calvinists, Moravians, Catholics, Menonists, &c.; and are distinguished for temperance, industry, and economy. The Swedish language is almost extinct, but the German prevails to a very considerable extent. There are now published in Pennsylvania eighty-four newspapers, of which fifteen are in German.

Sir Walter Raleigh was the first adventurer that attempted to plant colonies on these shores, in the reign of queen Elizabeth. Mr. Hudson, an Englishman, sailing to that part of the coast which lies between Virginia and New England, in the reign of James I., and being about to make a settlement at the mouth of Hudson's River, the Dutch gave him a sum of money to dispose of his interest in this country to them. In 1606 they began to plant it; and, by virtue of this purchase, laid claim to all those countries which are now denominated New York, New Jersey,

and Pennsylvania; but, there remaining some part of this coast which was not planted by the Hollanders, the Swedes sent a fleet of ships thither, and took possession of it for that crown; but the Dutch, having a superior force in the neighbourhood, compelled the Swedes to submit to their dominion, allowing them, however, to enjoy the plantations they had settled. The English, not admitting that either the Dutch or Swedes had any right to countries first discovered and planted by a subject of England, and part of them at that time possessed by English subjects, under charter from queen Elizabeth and king James I.: king Charles II. during the first Dutch war in 1664, granted New York, Jersey, and Pennsylvania, of which the Dutch had usurped the possession, to his brother James duke of York: and Sir Robert Carr being sent over with a squadron of men of war and land forces, and summoning the Dutch governor of the city of New Amsterdam, now New York, to surrender, he yielded that capital to the English: and the rest of the places in the possession of the Dutch and Swedes followed his example; and these countries were confirmed to the English by the Dutch, at the next treaty of peace between the two nations. The duke of York afterwards parcelled them out to under proprietors; selling in particular, to William Penn the elder, in 1683, the town of Newcastle, alias Delaware, and a district of twelve miles round the same; to whom his heirs, and assigns, by another deed of the same date, he made over all that tract of land from twelve miles south of Newcastle to the Whorehills, otherwise called Cape Henlopen, now known by the name of the Three Lower Counties upon Delaware River. All the rest of the under-proprietors, some time after, surrendered their charters to the crown; whereby New York and the Jerseys became royal governments; but Penn retained that part of the country which had been sold to him by the duke of York, together with what had been granted to him before, in 1680, 1681, which now constitutes the State of Pennsylvania. As soon as Penn had got his patent, he began to plant the country. Those who went over from England were generally Dissenters and Quakers, whose religion is established by law here, but with full liberty to all other Protestant sects. The Dutch and Swedes, who were settled before Mr. Penn became proprietor, choosing still to reside in this country, as they did in New York and the Jerseys, obtained the same privileges as the rest of the king's subjects; and their descendants are now the same people, speaking their language and being governed by the same laws. Mr. Penn, however, not satisfied with the title granted him by king Charles II. and his brother, bought the lands also of the Indians for a valuable consideration, or what they esteemed such, paying them in cloth, tools, and utensils, to their entire satisfaction; for they had not hands to cultivate the 100th part of their lands, and, if they could have raised a product, there was nobody to buy: the purchase, therefore, was all clear gain to them; and, by the coming of the English, their paltry trade became so profitable, that they soon found their condition much altered for the better. The

Indian council at Onondago, however, disapproved of their deputies parting with so much land; and, in 1755, obliged the proprietaries to reconvey great part of the same to the Indians. A dispute subsisted a long time between the proprietaries of the province and lord Baltimore, proprietary of Maryland, about the right to certain lands; which was at last amicably adjusted, greatly in favor of the Penns. About 1704 there happened some alteration in the constitution of the province. The establishment that took place, and subsisted till the American war broke out, consisted of a governor, council, and assembly, each with much the same power and privileges as in the neighbouring colony of New York. The lieutenant-governor and council were appointed by the proprietors Thomas and Richard Penn, with his majesty's approbation; but, if the laws enacted here were not repealed within six months after they had been presented to the king for his approbation or disallowance, they were not repealable by the crown after that time. A state of peace and happiness affords few materials for the historian. On the breaking out of the American war, the citizens of Philadelphia took an early and active part. In September 1776 they established a new constitution; which was considerably altered and improved in June 1792. In 1793 this state, but particularly the capital, was visited by the yellow fever, which, in the short space of three months, carried off about 5000 people. In 1794 an alarming insurrection took place in the western counties, the ostensible cause of which was an excise upon whisky, but an incendiary letter, afterwards discovered, showed that a deep scheme had been laid to excite a rebellion in the state. But by the wise and decisive measures adopted by the executive government, supported by the great body of the citizens, the insurrection was quelled and tranquillity restored almost without bloodshed.

The legislature at this period consists of a senate and a house of representatives. The representatives, whose number cannot be less than sixty nor more than 100, are chosen annually. The senators are chosen for four years, one quarter of them being elected every year. Their number cannot be less than one-fourth, nor more than one-third of the representatives. The governor is elected for three years by the people, but cannot hold the office more than nine years in twelve. The elections are made on the second Tuesday in October and the legislature meets in December. This state sends twenty-three representatives to congress.

The principal rivers are the Delaware, Schuylkill, Lehigh, Susquehanna, Juniata, Alleghany, Monongahela, Ohio, and Youghiogeny.

Pennsylvania is intersected by various mountains. The principal ridges, of the Alleghany Mountains, comprehended in Pennsylvania, are the Kittatinny, or the Blue Mountains. Behind these, and nearly parallel to them, are Peters, Tuscarora, and Nescopeck mountains, on the east side of the Susquehanna; on the west Shareman's Hill, Sideling Hill, Ragged, Great, Warrior's Evil's and Will's mountains; then the great Alleghany ridge, which, being the largest,

gives name to the whole; and west of this are the Chestnut Ridges. Between the Juniatta and the west branch of the Susquehanna, are Jacks, Tussys, Nittiny, and Bald Eagle mountains. The valleys between these mountains are often of a rich, black soil, suited to the various kinds of grass and grain. Some of the mountains admit of cultivation almost to their summits. The other parts of the state are generally level, or agreeably diversified with hills and valleys.

The soil of Pennsylvania is various; a small part of it is barren, but a great proportion of it fertile, and a considerable part very excellent. It is generally better adapted to tillage than grazing; and much of it, particularly the south-east part, is under excellent cultivation. The two best tracts of land are, one in the south-east part, along the Susquehanna, the other in the north-west part, between Lake Erie and Alleghany River. Wheat is the most important article of produce. The next in value is Indian corn. Buck wheat, rye, barley, oats, flax, hemp, beans, peas, and potatoes, are extensively cultivated. Cherries, peaches, apples, and cider, are abundant. There are large dairies in many parts. Pennsylvania has an excellent breed of horses. The number of domestic animals in the state, according to the returns of 1810, was as follows: horses 255,645, neat cattle 612,998, sheep 619,223. Of the sheep 4128 were Merinos, and breeds mixed with Merinos.

Iron ore is distributed in large quantities in many parts of the state; and in some places copper, lead, and alum are found. Here are also numerous lime-stone quarries, and various kinds of marble; and in the middle and western parts there is an abundance of coal.

The general style of architecture in this state is neat and solid. Stone buildings are most common in old settlements; brick houses are frequent; log and frame houses abound in the new country. In the towns there is a considerable proportion of brick houses. Many turnpike roads of the most durable materials, and best construction, are made in various parts of the state. That from Philadelphia to Lancaster is sixty-two miles in length, twenty-four feet wide, and covered eighteen inches deep with powdered stone. Numerous bridges, of great strength and beauty, are constructed over the rivers.

Pennsylvania exceeds all the other states in the variety and extent of her manufactures, some of which are of superior excellence. In 1810 there were sixty-four cotton-manufactories, forty-four blast furnaces, six air furnaces, four bloomeries, seventy-eight forges, fifty trip-hammers, eighteen rolling and slitting mills, 175 naileries, sixty-four paper-mills, eight glass works, thirty-five rope-walks, and 108 printing-offices. The total amount of the manufactures, embracing 220 articles, was 44,194,740 dollars. The exports in 1816 amounted to 7,196,246 dollars. They consist of flour, grain, iron, and various manufactured articles.

PEN'NY, *n. s.*

PEN'NYLESS, *adj.*

PEN'NYWEIGHT,

PEN'NYWISE,

PEN'NYWORTH,

Plural pence. Sax.

penig. A small coin, of which twelve make a shilling; the radical denomination from which English

coin is numbered. See below. Pennyless is without pence or money; poor: pennyweight, a weight of twenty-four grains troy: pennywise, wise only in pence; saving in small sums, and careless of greater: pennyworth, as much as a penny, or any given portion of money, will buy; hence a bargain; a purchase; a good bargain.

And whanne the covenaut was maad with workmen of a *peny* for the day he sente hem into his vyneyard. *Wiclif. Matt. xx.*

And they say unto him, Shall we go and buy two hundred *pennyworth* of bread? *Mark vi. 37.*

The same servant found one of his fellow-servants, which owed him an hundred *pence*, and took him by the throat. *Matthew.*

As for corn it is nothing natural, save only for barley and oats, and some places for rye; and therefore the larger *pennyworths* may be allowed to them. *Spenser on Ireland.*

You shall hear

The legions, now in Gallia, sooner landed
In our not fearing Britain, than have tidings
Of any *peny* tribute paid.

Shakspeare. Cymbeline.

We will not lend thee a *peny*.
Pirates may make cheap *pennyworths* of their pillage,

Id. Henry VI.

Be not *penywise*; riches have wings and fly away of themselves. *Bacon.*

Lucian affirms that the souls of usurers after their death are translated into the bodies of asses, and there remain certain days for poor men to take their *pennyworths* out of their bones and sides by cadgel and spur. *Peacock.*

Because there is a latitude of gain in buying and selling, take not the utmost *peny* that is lawful, for although it be lawful, yet it is not safe. *Taylor.*

She sighs and shakes her empty shoes in vain.
No silver *peny* to reward her pain. *Dryden.*

Pepper and Sabeen incense take;
And with post-haste thy running markets make;
Be sure to turn the *peny*. *Id.*

For fame he prayed, but let the event declare
He had no mighty *penyworth* of his prayr. *Id.*

Though in purchases of church lands men have usually the cheapest *pennyworths*, yet they have not always the best bargains. *South.*

It may be a contrivance of some printer, who hath a mind to make a *peny*. *Swift's Miscellany.*

My friendship I distribute in *pennyworths* to those about me who displease me least. *Swift.*

The Seville piece of eight is $1\frac{1}{2}$ *penyweight* in the pound worse than the English standard; weighs fourteen *penyweight*; contains thirteen *penyweight*, twenty-one grains, and fifteen mites, of which there are twenty in the grain of sterling silver; and is in value forty-three English *pence*, and eleven hundredths of a *peny*. *Arbuthnot.*

PENNY, or PENY, in commerce, an ancient English coin, which had formerly considerable course; but, till of late, was dwindled into an imaginary money, or money of account, containing the twelfth part of a shilling, or 240th of a pound. Camden derives the word from the Latin pecunia, money. The ancient English penny, penig, or pening, was the first silver coin struck in England; and the only one current among the Anglo-Saxons: according to Camden, Spelman, Dr. Hicks, &c. The penny was equal in weight to our three-pence: five of them made one shilling, or scilling Saxon; thirty a mark or

manouse, equal to our seven shillings and sixpence. Till the time of king Edward I. the penny was struck with a cross, so deeply indented in it that it might be easily broke, and parted, on occasion, into two parts, thence called half-pennies; or into four, thence called fourthings, or farthings. But that prince coined it without indenture; in lieu of which he first struck round halfpence and farthings. He also reduced the weight of the penny to a standard; ordering that it should weigh thirty-two grains of wheat, taken out of the middle of the ear. This penny was called the penny sterling. Twenty of these pence were to weigh an ounce; when the penny became a weight as well as a coin. See COINS. The silver penny is now disused.

PENNY, in ancient statutes, is used for all silver money: and hence the ward-penny, averpenny, hundred-penny, tithing-penny, and brothal-penny.

PENNYCUICK (Alexander), M. D., a Scottish poet and physician, who published a small volume of humorous poems in the Scottish dialect, in the seventeenth century. He was proprietor of New Hall and Romanno.

PENNY-ROYAL, in botany. See MENTHA.

PENNY-ROYAL, VIRGINIAN. See SATUREJA.

THE PENNY-WEIGHT is a Troy weight, containing twenty-four grains; each grain weighing a grain of wheat gathered out of the middle of the ear, well dried. The name took its rise hence, that this was formerly the weight of one of our ancient silver pennies. See PENNY. Twenty of these penny-weights make an ounce Troy.

PENNY-WORT, MARSH. See HYDROCO-STYLE.

PENNY-WORT, WALL. See COTTLEDON.

PENNY-WORT, WATER. See HYDROCOYLE.

PENOBSCOT, a county of Maine, North America, bounded on the east by Washington and Hancock counties, on the south by Hancock county, and on the west by Kennebeck and Somerset counties. It is watered by the Penobscot, formed from the north part of Hancock county. Chief town Bangor.

PENOBSCOT, a sea-port and post town of Hancock county, Maine, on the east side of Penobscot Bay; four miles north of Castine; and 240 north-east of Boston. Population 1302. It is a place of considerable trade. The shipping belonging to this port, in 1816, amounted to 18,611 tons.

PENOBSCOT, the largest river in Maine. The western and principal branch rises in the western part of the state, some of its sources being near the head waters of the Chaudiere, and others near those of St. John's. It flows east by south through Chesuncook and Pemmidumpkok lakes, and unites with the eastern branch, fifty-four miles in a right line, north by east of Bangor. The eastern branch rises near the sources of the Aroostic. After the junction it holds a general course south by west, till it flows into the head of Penobscot Bay, between the towns of Penobscot and Prospect. It is navigable for ships to Bangor, where the navigation and tide terminate, fifty-two miles north of Owl's Head, at the en-

trance of the bay. The towns on the west side of the river and bay, beginning at the head of navigation, are Bangor, Hampden, Frankfort, Prospect, Belfast, Northport, Lincolnville, Camden, and Thomastown; on the east side, Brewer, Orington, Bucksport, Orland, Penobscot, Castine, Sedgewick, and Deer Isle.

PENOBSCOT BAY, a large bay of the Atlantic, on the south coast of Maine. It embosoms Long Island, on which is the town of Islesborough, the Fox Islands, containing the town of Vinalhaven, and several smaller islands. It is a very fine bay, affords great advantages of navigation, and presents a variety of beautiful landscapes. Its entrance between the Isle of Holt and Owl's Head, is eighteen miles wide, and its length from north to south is about thirty. Long. 68° 40' to 68° 56' W., lat. 44° to 44° 30' N.

PENOBSCOT HILLS, mountains of Maine, on the west coast of Penobscot Bay.

PENRITH, a market town and parish of Cumberland, seventeen miles south from Carlisle, and 283½ N. N. W. from London. Checks, hats, and fancy waist-coat-pieces, are the manufactures of this place. The town was originally claimed, and continued a long time in the possession of the Scots; but it being disputed by the English, it was twice burnt in the reigns of Edward III. and Richard II., when it had a castle. It consists of several irregular streets, but some of the houses are handsome and commodious, and extensive improvements have been made of late. The church is a large and handsome modern structure. It has a good free-school, a charity-school, and two Sunday-schools, with several meeting-houses for Presbyterians and Quakers, a museum for natural curiosities, and an assembly-room. On the north bank of the Emont are two caves or grottos, dug out of the solid rock, and very extensive. This town suffered greatly by the plague in 1380 and 1598. Markets on Tuesday and Saturday. Fairs, June 8th, and August 5th.

PENROSE (Thomas), was the son of the Rev. Mr. Penrose, rector of Newbury, Berks, a man of great abilities, descended from an ancient Cornish family. Mr. Penrose, jun., being intended for the church, pursued his studies with success, at Christ Church, Oxford, until summer 1762; when, his eager inclination to the naval and military service overpowering his attachment to his real interest, he left college, and embarked in the unfortunate expedition against Nova Colonia, in South America, under captain Macnamara. The issue was fatal. The Clive (the largest vessel) was burnt; and though the Ambuscade escaped (on board of which Mr. Penrose, acting as lieutenant of marines, was wounded), yet the hardships which he afterwards sustained in a prize sloop, in which he was stationed, utterly ruined his constitution. Returning to England with ample testimonials of his gallantry and good behaviour, he finished, at Hertford College, Oxford, his course of studies; and, having taken orders, accepted the curacy of Newbury, the income of which, by the voluntary subscription of the inhabitants, was considerably augmented. After he had continued in that station about nine years, he was

presented by a friend to a living worth nearly £500 per annum. It came, however, too late; for Mr. Penrose's health was now in a deep decline, and he died at Bristol in 1779, aged thirty-six. In 1768 he married Miss Mary Slocock, of Newbury, by whom he had one child, Thomas, who was educated at Winton College. Mr. Penrose was respected for his extensive erudition, admired for his eloquence, and esteemed for his social qualities. By the poor, to whom he was liberal, he was venerated. To his poetical abilities, the public, by their reception of his *Flights of Fancy*, &c., have given a favorable testimony.

PENRYN, a borough and market-town of Cornwall, situate on an eminence at the mouth of the King's Road River, that runs into Falmouth harbour, three miles north-west from Falmouth, and 266½ W.S.W. from London. Its principal business is in the pilchard and Newfoundland fisheries. It is a large town, consisting of one main street, and several smaller ones. Formerly it had a collegiate church. Here is a market-house, town-hall, assembly-room, and a good custom-house. The town is extremely well watered, having streams running through the streets; on which are four grist-mills, and one paper-mill. Here are several good breweries, which supply the Falmouth shipping; and it is reckoned the granary of the south-western part of the county. It was anciently surrounded by a wall, and defended by a castle. It is governed by a corporate body, consisting of twelve aldermen, twelve common-councillmen, a recorder, steward, and other officers, and sends two members to parliament, who are elected by the mayor, portreeve, aldermen, and inhabitants at large, paying scot and lot. The number of voters is about 140. The manor of Penryn-Forryn has a court of record, and the steward holds pleas to any amount, and proceeds by bailable capias in all cases above £10. Market on Wednesday, Friday, and Saturday. Fairs, 1st of May, 7th of July, and 21st of December.

PENSA, a government in the east part of European Russia, lying between Niznei-Novgorod and Saratov. Its area is 16,500 square miles; the number of its circles or districts ten. Lying between 53° and 54° N. lat., its climate is mild, and the soil fertile; but it is as backward in cultivation as the rest of this vast empire. The corn raised, however, is more than is wanted for consumption; part of the overplus is distilled, and the rest exported. Here are Tartars of various tribes, such as Mordvans, Baschkirs, Calmucs, and some Circassians. These retain their pastoral habits; and the Mordvans, in particular, attach themselves to the rearing of bees. With the exception of distilled spirits and soap, the manufactures are insignificant; and the exports are limited to spirits and raw produce, i. e. corn, wax, honey, and wool. Population 800,000.

PENSA, the capital of the above government, is situated on an eminence at the confluence of the Penza and Sura, on a height. It contains twelve churches, and two monasteries. The high church is a fine building. The manufactures are leather and soap, and the inhabitants carry on a brisk traffic in corn and foreign wines. Inhabitants 10,000. 460 miles south-east of Moscow.

PENSACOLA, a town of West Florida, on the gulf of Mexico, at the head of a bay or basin, formed by several rivers. This harbour is safe from every wind, and has from seven to eight fathoms water; so that vessels drawing twenty-one feet may enter. Pensacola is in 30° 28' N. lat., and 87° 12' W. long. The city is of an oblong form, about a mile in length, and a quarter of a mile in breadth, delightfully situated. The entrance into the bay is fortified by a fort on Rosa Island, and a battery on the opposite shore. When it was in the hands of the English it exported, in skins, furs, logwood, and dyeing stuffs, to England to the amount of £63,000 annually; and its imports from this country were valued at £97,000. After the Spaniards took it in 1781 it gradually declined. In 1794 the total population did not exceed 400. When the town was attacked by the Spaniards, in 1781, the defence was spirited, and the progress of the siege slow; but, unfortunately, a shell, bursting at the door of a magazine in one of the advanced works, set fire to the powder, which in an instant blew up the whole redoubt: seventy-six of the garrison were killed, and twenty-four badly wounded. In 1818 Pensacola was occupied by an American force, in virtue, as was supposed, of a treaty between Spain and the United States for the cession of the Floridas. The forces were, however, recalled. Long. 87° 12' W., lat. 30° 28' N.

PENSILE, *adj.* } Lat. *pensilis*. Hanging;
PENSILENESS, *n. s.* } suspended.

Two trepidations; the one manifest and local, as of the bell when it is *pensile*; the other, secret of the minute parts. *Bacon.*

This ethereal space,
Yielding to earth and sea the middle space,
Anxious I ask you, how the *pensile* ball
Should never strive to rise, nor never fear to fall.
Prior.

PENSION, *n. s. & v. a.* } Fr. Span. Belg.
PENSIONARY, *adj. & n. s.* } and Teut. *pension*;
PENSIONER, *n. s.* } of Lat. *pensio*. A stipend paid without equivalent: to pension is to support by a gratuitous stipend: pensionary means supported by or connected with a pension: pensioner, a person thus supported.

Prices of things necessary for sustentation, grew excessive to the hurt of *pensioners*, soldiers, and all hired servants. *Camden.*

Scorn his household politics,
His silly plots and *pensionary* spies. *Donne.*
They were devoted by *pensionary* obligations to the olive. *Houel.*

Hovering dreams,
The fickle *pensioners* of Morpheus' train. *Milton.*
Those persons whom he trusted with his greatest secret and greatest business, his charity, seldom had recourse to him, but he would make enquiry for new *pensioners*. *Pell.*

A charity bestowed on the education of her young subjects has more merit than a thousand *pensions* to those of a higher fortune. *Addison.*

One might expect to see medals of France in the highest perfection, when there is a society *pensioned* and set apart for the designing of them.

Id. on Medals.
The rector is maintained by the perquisites of the curate's office, and therefore is a kind of *pensioner* to him. *Collier.*

The hero William, and the martyr Charles,
One knighted Blackmore, and one pensioned Quarles.

Pope.

He has lived with the great without flattery, and
been a friend to men in power without pensions. *Id.*

In Britain's senate he a seat obtains,
And one more pensioner St. Stephen gains. *Id.*

Chremes, for airy pensions of renown,
Devotes his service to the state and crown.

Young.

A pension given as a reward for service to the state
is surely as good a ground of property as any security
for money advanced to the state.

Burke.

Arrived, the pensionary band,
Hopping and chirping, close at hand,
Solicit what they soon receive,
The sprinkled plenteous donative.

Couper.

A PENSION is, or ought to be, a sum of money
paid annually for actual services, or considera-
tions already past. The yearly payment of each
member to the houses of the inns of courts are
likewise named pensions; and the yearly assem-
bly of the society of Gray's Inn, to consult on
the affairs of the house, is also called a pension.

PENSIONARY, or PENSIONER, a person who
has an appointment or yearly sum, payable
during life, by way of acknowledgment, charged
on the estate of a prince, company, or particular
person.

PENSIONARY, in the former government of
the United Provinces, was the first minister of
the regency of each city in Holland. His office
was to give his advice in affairs relating to the
government, either of the state in general, or of
the city in particular; and, in assemblies of the
states of the province, he was speaker in behalf
of his city. The function, however, of these
pensionaries was not every where alike: in some
cities they only gave their advice, and were never
found in assemblies of the magistrates, except
when expressly called thither; in others they at-
tended constantly; and, in others, they made
the propositions on the part of the burgomasters,
drew up their conclusions, &c. They were
called pensionaries, because they received an ap-
pointment or pension.

PENSIONARY, GRAND, an appellation given to
the first minister of the states of Holland. The
grand pensionary was chairman in the assemblies
of the states of that province: he proposed the
matters to be consulted on; collected the votes;
formed and pronounced the resolutions of the
states; opened letters; conferred with foreign
ministers, &c. His business was also to inspect
the finances, to maintain the authority of the
states, and to see that the laws were observed;
and he was perpetual deputy of the states-general
of the United Provinces. His commission was,
however, given him only for five years; after
which it was deliberated whether or not it should
be renewed; but there is no instance of its being
revoked; therefore death only put an end to the
functions of this important minister.

PENSIONER, in the university of Cambridge,
and in that of Dublin, has a very peculiar mean-
ing; for those students, either under-graduates or
bachelors of arts, are called pensioners who live
wholly at their own expense, and who receive no
emolument whatever from the college of which
they are members. They are divided into two

kinds, the greater and the less; the former of
whom are generally called fellow-commoners,
because they eat with the fellows of their college;
the latter are always called pensioners, and eat
with the scholars, who are those students of the
college, either under-graduates or bachelors, who
are upon the foundation, who receive emolu-
ments from the society, and who are capable of
being elected fellows. See SERVITOR and SIZAR.

PENSIONER, in general, denotes a person who
receives a pension, yearly salary, or allowance
from government. Hence

PENSIONERS, THE BAND OF GENTLEMEN, a
sort of guard to the king's person, consisting of
forty gentlemen, who receive a yearly pension of
£100, and are supposed to wait in his bed-
chamber. This band was first instituted by
king Henry VII., and their office is to attend
the king's person, with their battle-axes, to and
from his chapel-royal, and to receive him in the
presence-chamber, or coming out of his privy
lodgings: they are also to attend at all great
solemnities, as coronations, St. George's feast,
public audiences of ambassadors, at the sove-
reign's going to parliament, &c. They likewise
carry up the sovereign's dinner on the coronation-
day and St. George's feast; at which times the
king or queen often confers the honor of knight-
hood on two such gentlemen of the band as their
captain presents. Their arms are gilt battle-
axes; and their weapons on horse-back, in time
of war, are cuirassiers' arms, with sword and
pistols. Their standard, in time of war, is ar-
gent, a cross gules. Their captain is a noble-
man, who has under him a lieutenant, a standard-
bearer, a clerk of the check, secretary, paymaster,
and harbinger.

PENSIVE, *adj.* Pr. *pensif*; Ital. *pensivo*;
from Latin, *pensio*. Sorrowfully serious or
thoughtful; melancholy.

So fair a lady did I spy,
On herbs and flowers she walked pensively
Mild, but yet love she proudly did forsake.

Spenser.

Think it still a good work, which they in their
pensive care for the well bestowing of time account
waste.

Hooker.

Concerning the blessings of God, whether they
tend unto this life or the life to come, there is great
cause why we should delight more in giving thanks
than in making requests for them, inasmuch as the
one hath *pensiveness* and fear, the other always joy
annexed. *Id.*

Are you at leisure, holy father?

—My leisure serves me, *pensive* daughter, now.

Shakespeare.

Would'st thou unlock the door

To cold despairs and gnawing *pensiveness*?

Herbert.

We at the sad approach of death shall know
The truth, which from these *pensive* numbers flow
That we pursue false joy, and suffer real woe.

Prior.

Anxious cares the *pensive* nymph oppress,
And secret passions laboured in her breast.

Pope.

PENSTOCK, a sluice or flood-gate, serving
to retain or let go the water of a mill-pond, or
the like.

PENT, *part. pass.* } Shut up. A small shed
 PENTHOUSE, *n. s.* } hanging out from a main
 wall: written corruptly pentice.

The Turks lurking under their *penthouse*, laboured with mattocks to dig up the foundation of the wall.

Knolles.

The son of Clarence have I *pent* up close.

Shakespeare.

Close *pent* up guilts,

Rive your concealing countenances.

Id.

This is the *penthouse* under which Lorenzo desired us to make a stand. *Id. Merchant of Venice.*

Sleep *pent* neither night nor day

Hang upon his *penthouse* lid.

Shakespeare.

Climes that fear the falling and lying of much snow, ought to provide more inclining *pentices*.

Wotton.

Those defensive engines, made by the Romans into the form of *penthouses*, to cover the assailants from the weapons of the besieged, would be presently battered in pieces with stones and blocks.

Wilkins.

My *penthouse* eye-brows and my shaggy beard
 Offend your sight; but these are manly signs.

Dryden.

The soul pure fire, like ours, of equal force;

But *pent* in flesh, must issue by discourse. *Id.*

Pent up in Utica he vainly forms

A poor epitome of Roman greatness.

Addison.

Yet man, fool man! here buries all his thoughts,
 Inters celestial hopes without one sigh,
 Prisoner of earth, and *pent* beneath the moon,
 Here pinions all his wishes.

Young.

PENTA, a town of the French empire, in the island and department of Corsica, seven miles north-east of Porta.

PENTACEROS, in natural history, a name given by Linkius and some other authors to a kind of stella marina, or sea-star fish, composed of five principal rays, with several transverse hairy or downy processes.

The PENTACHORD, of Gr. *πεντε* five, *χορδή* string, was an ancient musical instrument. The invention of the pentachord is referred to the Scythians; the strings were of bullock's leather; and they were struck with a plectrum made of goat's horn.

PENTACROSTIC, in poetry, a set of verses so disposed as that there are always five acrostics of the same name, in five divisions of each verse. See ACROSTIC.

PENTACTINODOS, in natural history, a name given by some authors to those species of star-fish which are composed of a body divided into five rays.

PENTADACTYLON, five fingers, in botany, a name given by some authors to the ricinus or palma Christi, from the figure of its leaf.

PENTADACTYLOS PISCIS, the five-fingered fish, in ichthyology, the name of a fish common in all the seas about the East Indies, and called by the Dutch there *viif vinger visch*. It has this name from five black streaks which it has on each side, resembling the prints of five fingers. Its head is flat, convex at the bottom, plain in the sides, and inclined in the fore part. The snout is thick, obtuse, and round; the lower jaw at its extremity bent and rounded; the nostrils are double; the balls of the eye oval; the iris of a silver color; the first fin of the back is small,

the second is more elevated; those of the breast are inserted obliquely, that of the anus is greatly extended, and that of the tail much sloped. The whole body is covered with scales of a moderate size, thin, flexible, and slightly indented on their hinder edge; the back is reddish, the sides of a silver color, and the fins white. The fish is described by some as about nine inches long; by others as a foot and a half. It is a dry but not ill-tasted fish.

PENTAEDROSTYLA, in the old system of mineralogy, a genus of spars. The bodies of this genus are spars in form of pentagonal columns, terminated by pentagonal pyramids at one end, and regularly affixed at the other to some solid body.

PENTAE'DROUS, *adj.* Gr. *πεντε*, five, and *εδρα*, scat, or sides. Having five sides.

The *pentaedrous* columnar coralloid bodies are composed of plates set lengthways, and passing from the surface to the axis.

Woodward.

PENTAGON, *n. s.* } Fr. *pentagon*; Gr.
 PENTAGONAL, *adj.* } *πεντε*, five, and *γωνια*, an angle. A figure with five angles: pentagonal, quinquangular; having five angles.

I know of that famous piece at Capraïora, cast by Barocchio into the form of a *pentagon* with a circle inscribed.

Wotton.

The body being cut transversely, its surface appears like a net made up of *pentagonal* meshes, with a *pentagonal* star in each mean.

Woodward.

PENTAGON, in geometry, is a figure of five sides and five angles. See GEOMETRY.

PENTAGON, in fortification, denotes a fort with five bastions.

PENTAGONOTHECA, in botany, the name given by Vaillant to the plant called by Linnæus, Plumier, Houston, and others, pisonia.

PENTAGRAPH, an instrument designed for copying figures in any given proportion without any general skill in the art of drawing. See MINIATURE. The instrument is otherwise called a parallelogram. The common pentagraph of the diagram

consists of four brass or wooden rulers, two of them from fifteen to eighteen inches long, the other two half that length. At the ends, and in the middle, of the longer rulers, as also at the ends of the shorter, are holes, upon the exact fixing of which the perfection of the instrument chiefly depends. Those in the middle of the long rulers are to be at the same distance from those at the end of the long ones, and those of the short ones; so that when put together they may always make a parallelogram. The instrument is fitted together for use by several little pieces, particularly a little pillar, No. 1, having at one end a screw and nut, whereby the two long rulers are joined; and at the other a little knot for the instrument to slide on. The piece, No. 2, is a rivet with a screw and nut, wherewith each short ruler is fastened to the middle of each long one. The piece, No. 3, is a pillar, one end whereof, being hollowed into a screw, has a nut fitted to it. At the other end is a worm to screw into the table; when the instrument is to be used, it joins the end of the two short rulers. The piece, No. 4, is a pen, portcrayon, or pencil, screwed into a little pillar. The piece, No. 5, is a brass point, moderately blunt, screwed likewise into a little pillar.

I. To copy a design in the same scale or bigness as the original: screw the worm No. 3 into the table; lay a paper under the pencil No. 4, and the design under the point No. 5. This done, conducting the point over the several lines and parts of the design, the pencil will draw or repeat the same on the paper. II. If the design be to be reduced, e. g. into half the space, the worm must be placed at the end of the long ruler, No. 4, and the paper and pencil in the middle. In this situation, conduct the brass point over the several lines of the design, as before; and the pencil at the same time will draw its copy in the proportion required; the pencil here only moving half the lengths that the point moves. Hence, on the contrary, if the design be to be enlarged by one-half, the brass point, with the design, must be placed in the middle, at No. 3, the pencil and paper at the end of the long ruler, and the worm at the other. III. To enlarge or reduce in other proportions, there are holes drilled at equal distances on each ruler, viz. all along the short ones, and half way of the long ones, in order for placing the brass point, pencil, and worm, in a right line therein; i. e. if the piece carrying the point be put in the third hole, the two other pieces must be put in its third hole. If, then, the point and design be placed at any hole of the great rulers, and the pencil with the paper at any hole of the short ruler, which forms the angle therewith, the copy will be less than half the original. On the contrary, if it be placed at one of the holes of that short ruler, which is parallel to the long ruler, the copy will be greater than half the original.

The construction of this instrument requires a degree of accuracy which most of our instrument-makers are strangers to; for which reason there are very few of the instruments that succeed. Few will do any thing tolerably but straight lines; and many of them not even these. To prove that the figure described by a pentagraph

is similar to the given figure; let C, of the following diagram, be the fixed centre of motion;

P the pencil for tracing the given figure PP , and p the pencil which traces the other figure pp ; p , &c., must be so adjusted, that p , C , and P , may lie in one straight line; then, since $Bp : A p :: B P : A C$, whatever be the situation of the pentagraph, the angles $P C P$ and $p C p$, are vertical: and therefore, $P C p$ will in every position of the instrument be a right line; but $P C : p C :: B A : A p$, in each of the two positions in the figure, and consequently the triangles $P C P$, $p C p$, are similar; and $P P : p p :: P C : C p :: B A : A p$, or in a given ratio. Hence it appears, that, by moving the pencil p , $A p$ may be equal to $B A$, or less in any proportion; and consequently $p p$ may be equal to $P P$, or less in the same proportion.

PENTAGYNIA, from Gr. *πεντε* five, and *γυνή*, a woman, or wife, in the Linnæan system of botany, an order in the classes pentandria, decandria, dodecandria, icosandria, and polyandria; consisting of plants which have hermaphrodite flowers, with five female organs. See BOTANY.

PENTAMETER, *n. s.* Fr. *pentametre*; Lat. *pentametrum*. A Latin verse of five feet.

Mr. Distich may probably play some *pentameters* upon us, but he shall be answered in Alexandrines. Addison.

PENTANDRIA, from Gr. *πεντε* five, and *ανηρ*, a man, or husband, the fifth class in Linnæus's sexual method, consisting of plants which have hermaphrodite flowers, with five stamens or male organs. See BOTANY.

PENTANDRIA is also the name of an order in the classes monadelphia, diadelphia, polyadelphia, gynandria, monœcia, and diœcia. See BOTANY.

PENTANGULAR, *adj.* Gr. *πεντε* and *ανγυλον*. Five cornered.

His thick and bony scales stand in rows, so as to make the flesh almost *pentangular*. Grew.

PENTAPETES, in botany, a genus of the dodecandria order, belonging to the monadelphia class of plants; and in the natural method ranking under the thirty-seventh order, columniferae. The calyx is quinquepartite; the stamens are twenty in number, of which five are castrated and long; the capsule quinquelocular and polyspermous. There is but one species known, viz. *P.*

Phœnicia, with halbert-pointed, spear-shaped, sawed leaves. It is an annual plant, a native of India, and rises to two or three feet, adorned with fine scarlet flowers, consisting of one petal cut into five segments. In the centre of the flower arises a short thick column, to which adhere fifteen short stamina. It is a tender plant, and must be brought up in the hot-house.

PENTAPOLIS, a district of Cyrenaica, situated on the Mediterranean; denominated from its five cities; namely, Berenice, Arsinoe, Ptolemais, Cyrene, and Apollonia.—Ptol.

PENTAPOLIS OF THE PHILISTINES, the five cities of the Philistines, Gaza, Gath, Ascalon, Azotus, and Ekron.

PENTATEUCH, *n. s.* Fr. *pentateuque*; Gr. *πεντε* and *τευχος*. The five books of Moses.

The author in the ensuing part of the *pentateuch* makes not unfrequent mention of the angels.

Bentley.

Hesiod in his commerce with the daughters of memory had recourse to foreign correspondents, and often drew bills at sight on the *pentateuch*.

Whyte's Poems, Preliminary Essay.

PENTATEUCH is derived from the Greek *πεντατευχος*, from *πεντε*, five, and *τευχος*, an instrument or volume; and signifies the collection of the five instruments or books of Moses, viz. GENESIS, EXODUS, LEVITICUS, NUMBERS, and DEUTERONOMY. See these articles.

PENTATHLON, or PENTATHLUM, in antiquity, a general name for the five exercises performed at the Grecian games, viz. wrestling, boxing, leaping, running, and playing at the discus.

PENTECOST, *n. s.* } Gr. *πεντηκοστη*; Fr. *Pentecoste*, *adj.* } *pentecoste*, i. e. the fiftieth, because kept fifty days after the passover. A feast among the Jews: pertaining to pentecost or Whitsuntide.

And whanne the daies of *pentecoste* weren filled all his disciples weren togedre in the same place.

Wiclif. Dedis 2.

But I will tarry at Ephesus until *pentecost*.

1 Cor. xvi. 8.

'Tis since the nuptial of Lucenio,

Come *pentecost* as quickly as it will,

Some five-and-twenty years.

Shakespeare.

This was a feast, the feast of *pentecost*, but for the estate of these Jews it was a day of contrition, a day of deep hunger and thirst after righteousness.

Bp. Hall.

I have composed sundry collects, made up out of the church collects, with some little variation; as the collects adventual, quadregesimal, paschal, or *pentecostal*.

Sanderson.

At the time of *Pentecost*, when the Jews were obliged to rejoice before the Lord, rendering thanks unto him for the harvest newly gathered in—did God bountifully impart the first fruits of his Holy Spirit.

Barrow.

Pentecost signifies the fiftieth, because this feast was celebrated the fiftieth day after the sixteenth of Nisan, which was the second day of the feast of the passover; the Hebrews call it the feast of weeks, because it was kept seven weeks after the passover: they then offered the first fruits of the wheat harvest, which then was completed: it was instituted to oblige the Israelites to repair to the temple, there to acknowledge the Lord's dominion, and also to render thanks to God for the law he had given them from Mount Sinai, on the fiftieth day after their coming out of Egypt.

Calmet.

PENTECOST. At this feast the Jews presented at the temple seven lambs of that year, one calf, and two rams, for a burnt offering; two lambs for a peace offering; and a goat for a sin offering: Levit. xxiii. 15, 16; Exod. xxiv. 22, and Deut. xvi. 9, 10. The modern Jews celebrate the *pentecost* for two days. They deck the synagogue and their own houses with garlands of flowers. They hear a sermon in praise of the law, which they suppose to have been delivered on this day. The Jews of Germany make a very thick cake, consisting of seven layers of paste, which they call Sinai. The seven layers represent the seven heavens, which they think God reascended from the top of this mountain. See Leo de Modena and Buxtorffii synag. Jud. It was on the feast of *pentecost* that the Holy Ghost miraculously descended on the apostles. Acts ii.

PENTECOST, an island in the Archipelago of the Great Cyclades. It was discovered by Bougainville on *Pentecost* day, 22d May, 1768. It is six miles from Aurora Island.

PENTELICUS, a mountain of Attica, famous for beautiful marble.

PENTHESILLA, a queen of the Amazons, succeeded Orythia, and gave proofs of her courage at the siege of Troy, where she was killed by Achilles. Pliny says that she invented the battle-axe.

PENTHEUS, in fabulous history, the son of Ethion and Agave, king of Thebes in Bœotia. He was murdered by the Bacchanalian women, for opposing the worship of Bacchus, then newly introduced; though others say it was for prying into the mysteries of the new deity. His mother and his aunts, Ino and Autonoe, were the first to tear him to pieces. Ovid. Met. iii. fab. 7, 8, 9. Virg. Æn. iv. 469. See MYSTERIES.

PENTHILUS, a son of Orestes and Erigone, the daughter of Ægysthus; who reigned conjunctly with his brother Tisamenēs at Argos, till they were expelled by the Heraclidae. He then went to Achaia, and thence to Lesbos, where he planted a colony.—Paus. 4. Patern. 1. c. 1.

PENTHORUM, in botany, a genus of the pentagynia order and pentandria class of plants: CAL. quinquefid; there are either five petals or none: CAPS. five-pointed and quinquelocular.

PENTHYLUS, a king of Paphos, who assisted Xerxes with twelve ships. Being seized by the Greeks he gave them much useful information as to the situation of the Persians.—Herod. vii. 195.

PENTILE, *n. s.* Pent and tile. A tile formed to cover the sloping part of the roof: often called pantiles.

Pentiles are thirteen inches long, with a button to hang on the laths; they are hollow and circular.

Mason.

PENTLAND FRITH, or PICTLAND FRITH, a narrow strait of twelve miles between the main land of Scotland and the Orkney Isles. This strait is the great thoroughfare for shipping between the east and west seas, the terror of the boldest mariners, and the grave of thousands. By the meeting of many different tides, the sea runs with such impetuosity that no vessel can

withstand it. The spray is often driven several miles on land. These storms however, afford many natives on the opposite shores a better livelihood than they could obtain by fishing or husbandry. They search from place to place, and from one cavern to another, in the hopes of finding timber, casks, and other floating articles of the wrecked vessels. The navigation of this pass is rendered more dangerous by the island of Stroma, and two rocks called the Skerries, lying near the middle of it. It may be crossed and sailed through, however, without danger, at particular times, known to the pilots on that coast.

PENTLAND HILLS, a ridge of hills which begin about four miles south by west of Edinburgh, and extend ten miles west towards the west borders of Mid Lothian. They are mostly green to the top, and afford excellent pasture to numerous flocks of sheep. The valleys between them are watered by several romantic streams; particularly the North Esk, Glencross, and Logan Water. Some of the hills are very high. Carketan Craig, the most northern, is 1450 feet above the sea level; Capelaw, west of it, is 1550; and Logan House hill is 1700. In this last is found the stone called Petunse Pentlandica, from its resemblance to the materials used in China for making china wares. The hills of Braid and Blackford are a continuation of this ridge.

PENTLAND SKERRIES, three islands in the east end of Pentland Frith; on the largest of which two light-houses were erected in 1794; four miles north-east of Duncan's-bay Head.

PENUCONDA, or Bilconda, an old town and fortress of the Mysore, south of India. On the defeat of the Hindoo sovereign of Bijanagur, in 1564, he fixed his residence here for some time, but finding it inconvenient removed back to Chandgherry. In 1575 Penuconda was besieged by the Mahometans, but nobly defended by Jug Deo, a relation of the Maha rajah, in recompense for which he received the government of an extensive district, which remained in his family, till dispossessed by the rajah of Mysore; since this period it has fallen to decay. It is now included in the British territories. Long. 77° 40' E., lat. 14° 1' N.

PENULA, among the ancient Romans, was a coarse garment or cloak worn in cold or rainy weather. It was shorter than the lacerna, and therefore more proper for travellers. It was generally brown, and succeeded the toga after the state became monarchical. Augustus abolished the custom of wearing the penula over the toga, considering it as too effeminate for Romans; and the ædiles had orders to suffer none to appear in the circus or forum with the lacerna or penula. Writers are not agreed as to the precise difference between these two articles of dress; but we are told that they were chiefly worn by the lower orders of people.

PENULTIMA, or PENULTIMATE SYLLABLE, in grammar, the last syllable but one of a word.

PENUMBRA, *a. s.* Lat. *pene* and *umbra*. An imperfect shadow; that part of the shadow which is half enlightened.

The breadth of this image answered to the sun's diameter, and was about two inches and the eighth part of an inch, including the *penumbra*. *Newton*.

PENUMBRA, in astronomy, is a partial shade observed between the perfect shadow and the full light in an eclipse. It arises from the magnitude of the sun's body: for were he only a luminous point, the shadow would be all perfect; but, by reason of the diameter of the sun, it happens, that a place which is not illuminated by the whole body of the sun does yet receive rays from a part thereof.

PENURY, *n. s.* Lat. *penuria*. Poverty; indigence; PENURIOUSLY, *adv.* want: penurious is, PENURIOSNESS, *n. s.* in the manner of one indigent, hence parsimonious; mean; niggardly; the adverb and noun substantive corresponding: penurious, niggardly; sparing; sordid.

Who can perfectly declare
The wondrous cradle of thy infancy?
When thy great mother Venus first thee bare,
Begot of plenty and of penury. *Spenser*.

The penury of the ecclesiastical state. *Hooker*.

Sometimes am I a king
Then treason makes me wish myself a beggar;
And so I am: then crushing penury
Persuades me I was better when a king;
Then I am kinged again.

Shakspeare. Richard III.
Let them not still be obstinately blind,
Still to divert the good designed,
Or with malignant penury
To starve the royal virtues of his mind. *Dryden*.
All innocent they were exposed to hardship and
penury, which, without you, they could never have
escaped. *Sprat*.

Some *penurious* spring by chance appeared
Scanty of water. *Addison*.
If we consider the infinite industry and *penuriousness* of that people, it is no wonder that, notwithstanding they furnish as great taxes as their neighbours, they make a better figure. *Id*.

What more can our *penurious* reason grant
To the large whale or castled elephant? *Prior*.
May they not justly to our climes upbraid
Shortness of night, and penury of shade? *Id*.
O blessed effect of penury and want,
The seed sown there, how vigorous is the plant!
No soil like poverty for growth divine,
As least land supplies the richest wine. *Cowper*.

PENZANCE, a sea-port and market-town of Penwith hundred, Cornwall, on the north-west side of Mount's Bay, three miles from Marazion, and 280 W. S. W. from London. The town is well built, and is formed principally of four streets. Several ships belong to the port, although the harbour will not admit large vessels. The pier, which was first erected nearly fifty years since, was considerably extended in 1813, and was improved in 1816 by the erection of a light-house. It has several meeting houses for dissenters, a Jews' synagogue: a grammar school, dispensary, geological society, an agricultural institution, &c. The surrounding country abounds with metallic ore, and it is said that at low water veins of lead, copper, and tin, are to be discovered in the sea. The tin mines furnish considerable traffic and employment here, and hot and cold baths have been established for the accommodation of invalids. The town is governed by a mayor, recorder, twelve aldermen, and twenty-four common-councillmen. In 1596

it was burnt by the Spaniards, but it was soon after rebuilt, and made a coinage town. High water, spring tides, at 5 o'clock. Market on Thursday. Fairs, Trinity Thursday and Holy Thursday.

PEON, in the language of Hindostan, a foot soldier, armed with sword and target. In common use, it is a footman, so armed, employed to run before a palanquin. Piada is the proper word, of which peon is a corruption.

PE'ONY, *n. s.* Lat. *peronia*. A flower.

A physician had often tried the *peony* root unseasonably gathered without success; but having gathered it when the decreasing moon passes under Aries, and tied the slit root about the neck of his patients, he had freed more than one from epileptical fits.

Boyle.

PEOPLE, *n. s.* Fr. *peuple*; Lat. *populus*. A nation; in this sense it admits the plural, frequent in Scripture, 'people'; the multitude; the commonalty or vulgar; men in general: to people is to stock with people.

For myn *gyhen* han seyn thin helth: which thou hast maad redy before the face of alle *peoplia*.

Wiclif. Luk. i.

Ants are a *people* not strong, yet they prepare their meat in summer.

Proverbs xxx. 26.

Prophecy again before many *peoples* and nations and tongues.

Revelations x. 11.

What is the city, but the *people*?

—True, the *people* are the city.

Shakespeare. Coriolanus.

Suppose that Brute, or whosoever else that first *peopled* this island, had arrived upon Thames, and called the island after his name Britannia. *Raleigh.*

If a man temper his actions to content every combination of *people*, the musick will be the fuller.

Bacon.

A small red flower in the stubble field country *people* call the wincope.

Id.

I must like beasts or common *people* dye,

Unless you write my elegy.

Cowley.

The knowing artist may

Judge better than the *people*, but a play

Made for delight,

If you approve it not, has no excuse. *Waller.*

He would not be alone, who all things can:

But *peopled* heaven with angels, earth with man.

Dryden.

The frogs petitioning for a king, bids *people* have a care of struggling with heaven.

L'Estrange.

Myself shall mount the rostrum in his favour, And strive to gain his pardon from the *people*.

Addison.

Imperious death directs his ebon lance; *Peoples* great Henry's tombs, and leads up Holben's dance.

Prior.

Watery liquors will keep an animal from starving by diluting the fluids; for *people* have lived twenty-four days upon nothing but water.

Arbutnot.

People were tempted to lend by great premiums and large interest.

Swift's Miscellanies.

People in adversity should preserve laudable customs.

Clarissa.

By solemn, awful ceremony, he

Was set apart to speak the truth entire,

By action and by word; and round him stood

The *people*, from his lips expecting knowledge.

Pollok.

PEOR, a famous mountain beyond Jordan, which Eusebius places between Heshbon and Livia. The mountains Nebo, Pisgah, and Peor, were near one another, and probably made the

same chain. It is very likely that Peor took its name from some deity, for Peor, Phagor, or Baal-Peor, was worshipped in this country. See Numb. xxv. 3; Deut. iv. 3; Psal. cv. 28; and BAAL-PEOR.

PEOR, a city of Judah, which is not mentioned in the Hebrew, nor in the Vulgate, but only in the Greek of the Septuagint. Josh. xv. 60. Eusebius says it was near Bethlehem, and Jerome adds, that in his time it was called Paora.

PEPARETHOS, an island in the Aegean Sea, on the coast of Macedonia, twenty miles in circumference; famous for excellent wine and olives. Plin. iv. 12; Ovid. Met. vii. 470; Liv. xxviii. 5.

PEPIN DE HERISTAL, or Le Gros, mayor of the palace under Clovis III., Childbert, and Dagobert III. The power of these mayors in France was so great that they left the sovereign only the empty title, and in the end seized on the throne itself.

PEPIN LE PETIT, or le Brief (i. e. the short), grandson to Pepin le Gros, and first king of the second race of French monarchs, was mayor of the palace to Childeric III., a weak prince: he contrived to confine him and his son Theodoric in different monasteries; and then with the assistance of pope Stephen III. he usurped the sovereign power. He died in 768, aged fifty-four. See FRANCE.

PEPLIS, in botany, a genus of the monogynia order, and hexandria class of plants: natural order seventeenth, calycanthemæ. The perianthium is campanulate; the mouth cleft in twelve parts; there are six petals inserted into the calyx: CAPS. bilocular.

PEPLUS, a long robe worn by the women in ancient times, reaching down to the feet, without sleeves, and so very fine that the shape of the body might be seen through it. The Athenians used much ceremony in making the peplus, and dressing the statue of Minerva in it. Homer makes frequent mention of the peplus of that goddess.

PEPOZIAN, a sect of Christian heretics, who sprung up in the second century; a branch of the Montanists.

PEP'PER, *n. s.* Fr. *poivre*: Lat. *pip. r.*; Ital. *pepen*; Gr. *πεπρι*. A pungent spice.

We have three kinds of *pepper*; the black, the white, and the long, which are three different fruits produced by three distinct plants: black *pepper* is a dried fruit of the size of a vetch and roundish, but rather of a deep brown than a black colour: with this we are supplied from Java, Malabar, and Sumatra, and the plant has the same heat and fiery taste that we find in the *pepper*: white *pepper* is commonly facetious, and prepared from the black, by taking off the outer bark; but there is a rarer sort, which is a genuine fruit, naturally white. long *pepper* is a fruit gathered while unripe and dried, of an inch or an inch and half in length, and of the thickness of a large goose quill.

Hill.

I have *peppered* two of them; two I have paid, two rogues in buckram suits.

Shakespeare. Henry IV.

I will now take the leacher; he cannot creep into a halfpenny purse nor into a *pepper*-box.

Shakespeare.

Our performances, though *dues*, are like these

peppercorns which freeholders pay their landlord to acknowledge that they hold all from him. *Boyle.*

Folks from mud-walled tenement
Bring landlords *peppercorn* for rent. *Prior.*

Scatter o'er the blooms the pungent dust
Of *pepper*, fatal to the frosty tribe. *Thomson.*

PEPPER, piper, in natural history, an aromatic berry of a hot dry quality, chiefly used in seasoning. Pepper is principally used by us in food, to assist digestion: but the people in the East Indies esteem it as a stomachic, and drink a strong infusion of it in water by way of giving them an appetite; they have also a way of making a fiery spirit of fermented fresh pepper with water, which they use for the same purposes. They have also a way of preserving the common and long pepper in vinegar, and eating them afterwards at meals. There are three kinds of pepper at present used in the shops, the black, the white, and the long pepper.

I. PEPPER, BLACK, is the fruit of the piper, and is brought from the Dutch settlements in the East Indies.

II. PEPPER, LONG, is a dried fruit, of an inch or an inch and a half in length, and about the thickness of a large goose quill: it is of a brownish gray color, cylindrical in figure, and produced on a plant of the same genus.

III. PEPPER, WHITE, is factitious, being prepared from the black in the following manner:—they steep this in sea-water, exposed to the heat of the sun for several days, till the rind or outer bark loosens; they then take it out, and, when it is half dry, rub it till the rind falls off; then they dry the white fruit, and the remains of the rind blow away like chaff. A great deal of the heat of the pepper is taken off by this process, so that the white kind is more fit for many purposes than the black. However, there is a sort of native white pepper produced on a species of the same plant; which is much better than the factitious, and indeed little inferior to the black.

PEPPER, BARBARY. See CAPSICUM.

PEPPER, GUINEA. See CAPSICUM.

PEPPER, JAMAICA. See MYRTUS and PIMENTO.

PEPPER, POOR MAN'S. See LEPIDIUM.

PEPPER, WATER, a liquor prepared by putting common black pepper, grossly powdered, into an open vessel of water. In a few days it acquires a pellicle or thin surface, which is composed entirely of animalcules excellently adapted for microscopical observation.

PEPPER GRASS. See PILULARIA.

PEPPER-MINT. See MENTHA.

PEPPER-MINT TREE, in botany, the eucalyptus piperita. In a journal of a voyage to New South Wales, by John White, esq., we have a plate of this tree, with the following account of it:—'This tree grows to the height of more than 100 feet, and is above thirty feet in circumference. The bark is very smooth, like that of the poplar. The younger branches are long and slender, angulated near the top; but as they grow older the angles disappear. Their bark is smooth, and of a reddish brown. The leaves are alternate, lanceolate, pointed, very entire, smooth on both sides, and remarkably unequal or oblique at their base; the veins alternate, and not very con-

spicuous. The whole surface of both sides of the leaves is marked with numerous minute resinous spots, in which the essential oil resides. The foot-stalks are about half an inch in length, round on the under side, angular above, quite smooth. The flowers we have not seen. What Mr. White has sent as the ripe capsules of this tree (although not attached to the specimens of the leaves) grow in clusters, from six to eight in each, sessile and conglomerated. These clusters are supported on angular alternate footstalks, which form a kind of panicle. Each capsule is about the size of a hawthorn berry, globular, but as it were cut off at the top, rugged on the outside, hard and woody, and of a dark brown color. At the top is a large orifice, which shows the internal part of the capsule divided into four cells, and having a square column in the centre, from which the partitions of the cell arise. These partitions extend to the rim of the capsule, and terminate in four small projections, which look like the teeth of a calyx. The seeds are numerous, small, and angular. The name of pepper-mint tree has been given to this plant by Mr. White, on account of the very great resemblance between the essential oil drawn from its leaves and that obtained from the pepper-mint (*mentha piperita*) which grows in England. This oil was found by Mr. White to be much more efficacious in removing all cholicky complaints than that of the English peppermint, which he attributes to its being less pungent and more aromatic. A quart of the oil had been sent by him to Mr. Wilson. The tree appears to be undoubtedly of the same genus with that cultivated in some greenhouses in England, which M. L'Héritier has described in his *Sertum Anglicum* by the name of *eucalyptus obliqua*, though it is commonly called in the gardens *metrosideros obliqua*; but we dare not assert it to be the same species, nor can this point be determined till the flowers and every part of both be seen and compared: we have compared the best specimens we could procure of each, and find no specific difference. The *eucalyptus obliqua* has, when dried, an aromatic flavor, somewhat similar to our plant. We have remarked, indeed, innumerable minute white spots, besides the resinous ones, on both surfaces of the leaves in some specimens of the garden plant, which are not to be seen in ours; and the branches of the former are rough, with small scaly tubercles. But how far these are constant we cannot tell. The obliquity in the leaves, one side being shorter at the base than the other, as well as somewhat narrower all the way up, as in the *Begonia nitida* of the *Hortus Kewensis*, is remarkable in both plants. Mr. White's figure represents a branch of the pepper-mint tree in leaf: on one side of it part of a leaf separate, bearing the gall of some insect; on the other the fruit above described.'

PEPPER-POT. See CAPSICUM.

PEPPER-WORT. See LEPIDIUM.

PEPUSCH (John Christopher), Mus. D., and F. R. S., one of the greatest theoretic or scientific musicians of modern times, was born at Berlin in 1667. In 1680, when not fifteen, he had made such proficiency on the harpsichord that he was appointed to teach music to the prince royal of

Prussia. About 1700 he came over to England, and was engaged at Drury Lane. The popularity of Handel kept him in the secondary rank; but Pepusch chose a new track for himself, and taught music in the full sense of the word; i. e. the principles of harmony and the science of composition,—not to children or novices, but to professors of music themselves, who attended him; so much were his talents and judgment respected. In 1713 the University of Oxford admitted him Doctor of Music. In 1724 he accepted an offer from Dr. Berkeley to go with him to Bermudas, as professor of music in his intended college; but the ship being wrecked he returned to London, and married Frances Margaret De L'Epine, who had made a fortune of 10,000 guineas by her voice. His fortune and reputation were now at their height. At the desire of Messrs. Gay and Rich he composed the music for the Beggar's Opera. In 1737 he was chosen organist for the Charter House. In 1740 his wife died, and a short time after their only son. He wrote An Account of the Ancient Genera of Music, which was read before the Royal Society, and published in the Phil. Trans. for October, November, and December, 1736; and was soon after chosen F. R. S. He died July 20th, 1752, aged eighty-five.

PEPYS (Samuel), F. R. S., secretary to the admiralty in the reigns of Charles II. and James II., was born at Brampton in Huntingdonshire, of an ancient family of the same name, of Cottenham in Cambridgeshire, and educated at St. Paul's school, London, whence he was removed to Magdalen College, Cambridge. He early acquired the patronage of the earl of Sandwich, who employed him as secretary in the expedition for bringing Charles II. from Holland. On his return he was appointed one of the principal officers of the navy, which post he maintained during the plague, the fire of London, and the Dutch war. In 1673, when the king took the admiralty into his own hands, he appointed Mr. Pepys secretary. In 1684 he was accused of being a papist, without a shadow of proof; and soon after, the admiralty being put into commission, he lost his place. He was still, however, employed under lord Dartmouth, in the expedition against Tangier, and often accompanied the duke of York to Scotland, and in his cruises. When Charles II. resumed the office of lord high admiral he was once more appointed secretary, and held the office until the Revolution. On the accession of William and Mary he resigned, and published his 'Memoirs,' relating to the navy. He led a very retired life from this time; and, having survived his lady, retired for two years before his death to the seat of a naval friend at Clapham, where he died May 26th, 1703. Such indeed was his literary and scientific reputation that in 1684 he was elected president of the Royal Society, which office he held for ten years. He left a large collection of MSS. to Magdalen College, Oxford, and five large folio volumes of ancient English poetry, begun by Seldep, and carried down to 1700, from which the Reliques of Ancient English Poetry, by Dr. Percy, are chiefly selected. Mr. Pepys has lately become more known by the publica-

tion of his very interesting Diary, by lord Braybrooke.

PEPYS' ISLANDS, a name given to Falkland Islands.

PERA, one of the suburbs of Constantinople, where ambassadors and Christians usually reside. See **CONSTANTINOPLE.**

PERACUTE', *adj.* Lat. *peracutus*. Very sharp or violent.

Malign, continual *peracute* fevers, after most dangerous attacks, suddenly remit of the ardent heat.

Harvey.

PERADVENTURE, *adv.* & *n. s.* Fr. *par aventure*. Perhaps; may be; by chance; as a noun-substantive, doubt or question.

For a good man *peradventure* summan dar die.

Wiclif. Rom. 5.

Peradventure there be fifty righteous within the city; wilt thou also destroy and not spare the place for the fifty righteous that are therein?

Genesis xviii. 24.

That wherein they might not be like unto either, was such *peradventure* as had been no whit less unlawful.

Hooker.

As you return, visit my house; let our old acquaintance be renewed; *peradventure* I will with you to court.

Shakespeare.

What *peradventure* may appear very full to me, may appear very crude and maimed to a stranger.

Digby.

Though men's persons ought not to be hated, yet without all *peradventure* their practices justly may.

South.

PERAGRATION *n. s.* Lat. *peragro*. The act of passing through any state or space. Obsolete.

A month of *peragation* is the time of the moon's revolution from any part of the zodiac into the same again, and this containeth but twenty-seven days and eight hours.

Broune.

The moon has two accounts which are her months or years of revolution; one her periodick month, or month of *peragation*, which chiefly respects her own proper motion or place in the zodiac, by which she like the sun performs her revolution round the zodiac from any one point to the same again.

Holder on Time.

PERAMBAUCAM, a town of the south of India, Carnatic. This, though a small place, is memorable for the defeat and destruction of a fine British army, commanded by the gallant colonel Baillie, in the month of September 1780, by Hyder Aly. Of eighty-six British officers present, thirty-six were killed, thirty-four wounded, and the remaining sixteen taken prisoners; the greater part of them dying in captivity. In August 1781 a second battle was fought here between Hyder and the army commanded by Sir Eyre Coote. On this occasion the British were victorious. It is situated on the south side of the Courtellier, fourteen miles north-east of Co-nieveram.

PERAM'BULATE, v. a. } Lat. *perambulo*.

PERAMBULA'TION, n. s. } To walk, or pass through; survey by passing through: perambulation is, the act of passing through; survey made, or districts perambulated.

The duke looked still for the coming back of the Armada, even when they were wandering and making their *perambulation* of the northern seas.

Beacon.

Persons the lord deputy should nominate to view and *perambulate* Irish territories, and thereupon to divide and limit the same.

Davies on Ireland.

It might in point of conscience be demanded, by what authority a private person can extend a personal correction beyond the persons and bounds of his own *perambulation*? *Holyday.*

France is a square of five hundred and fifty miles traverse, thronging with such multitudes that the general calcul, made in the last *perambulation*, exceeded eighteen millions. *Hovel.*

PERAMBULATOR, in surveying, an instrument for measuring distances, called also pedometer, way-wiser, and surveying-wheel. It consists of a wheel AA two feet seven inches and a

half in diameter; consequently half a pole, or eight feet three inches, in circumference. On one end of the axis is a nut, three quarters of an inch in diameter, and divided into eight teeth; which, upon moving the wheel round, fall into the eight teeth of another nut c, fixed on one end of an iron rod Q, and thus turn the rod once round in the time the wheel makes one revolution. This rod, laying along a groove in the side of the carriage of the instrument, has at its other end a square hole, into which is fitted the end b of a small cylinder P. This cylinder is disposed under the dial-plate of a movement, at the end of the carriage B, in such a manner as to be moveable about its axis; its end a is cut into a perpetual screw, which falling into the thirty-two teeth of a wheel perpendicular to it, upon driving the instrument forward, that wheel makes a revolution each sixteenth pole. On the axis of this wheel is a pinion with six teeth, which, falling into the teeth of another wheel of sixty teeth, carries it round every 160th pole, or half a mile. This last wheel, carrying a hand or index round with it over the divisions of a dial-plate, whose outer limb is divided into 160 parts, corresponding to the 160 poles, points out the number of poles passed over. Again, on the axis of this last wheel is a pinion, containing twenty teeth, which, falling into the teeth of a third wheel which has forty teeth, drives it once round in 320 poles, or a mile. On the axis of this wheel is a pinion of twelve teeth, which, falling into the teeth of a fourth wheel having seventy-two teeth, drives it once round in twelve miles. This fourth wheel, carrying another index over the inner limb of the dial-plate, divided into twelve for miles, and each mile subdivided into halves, quarters, and furlongs, serves to register the revolutions of the other hand, and so keep account of the miles and half miles

passed over, as far as twelve miles. The use of this instrument is obvious from its construction. Its proper office is the surveying of roads and large distances, where a great deal of expedition, and not much accuracy, is required. It is evident that driving it along and observing the hands has the same effect as dragging the chain and taking account of the chains and links. Its advantages are its hardness and expedition: its contrivance is such that it may be fitted to the wheel of a coach, in which state it performs its office, and measures the road without any trouble.

PERAMES, in geography, a town of America, in Bergen county, New Jersey, lying on the point of land formed by the branches of Saddle River, a north branch of the Passaic; about eighteen miles north of Bergen.

PERCA, the perch, a genus of fishes belonging to the order of thoracici. The head is furnished with scaly and serrated opercula; there are seven rays in the membrane of the gills; and the fins on the back are prickly. There are thirty-eight species, principally distinguished by peculiarities in the back fin. The most remarkable are—

1. *P. cernua*, the pope, or ruffe, is found in several English streams: it is gregarious, assembling in large shoals, and keeping in the deepest part of the water. It is of a much more slender form than the perch, and seldom exceeds six inches in length. The teeth are very small, and disposed in rows. It has only one dorsal fin, extending along the greatest part of the back; the first rays, like those of the perch, are strong, sharp, and spiny; the others soft. The body is covered with rough compact scales. The back and sides are of a dirty green, the last inclining to yellow but both spotted with black. The dorsal fin is spotted with black; the tail marked with transverse bars.

2. *P. fluviatilis*, or common perch, has a deep body, very rough scales, and the back much arched. The colors are beautiful; the back and part of the sides being of a deep green, marked with five broad black bars pointing downwards; the belly is white, tinged with red; the ventral fins of a fine scarlet; the anal fins and tail of the same color, but rather paler. In a lake called Llyn Raithlyn, in Merionethshire in Wales, is a very singular variety of this fish: the back part is quite hunched, and the lower part of the back-bone next the tail strangely distorted; in color and other respects it resembles the common perch, which are as numerous in this lake as the deformed fish. They are not peculiar to this water; for Linneus takes notice of them in a lake at Fahlun in his country. It is said that they are also met with in the Thames near Marlow. The perch was much esteemed as food by the Romans; nor is it less admired at present as a firm and delicate fish; and the Dutch are particularly fond of it when made into a dish called water-soupy. It is a gregarious fish, and loves deep holes and gentle streams; is exceedingly voracious, and an eager biter: if the angler meets with a shoal of them he is sure of taking every one. The perch is very tenacious of life, and has been known to survive a journey of sixty

miles in dry straw. It seldom grows to a large size, though Mr. Pennant mentions one that weighed nine pounds; but this is very uncommon.

3. *P. labrax*, the *basse*, is a very voracious, strong, and active fish. Ovid calls them *rabidi lupi*, a name continued to them by after writers; and they are said to grow to the weight of 15 lbs. The *irides* are silvery; the mouth large; the teeth are situated in the jaws, and are very small; in the roof of the mouth is a triangular rough space, and just at the gullet are two others of a roundish form. The scales are of a middling size, are very thick set, and adhere closely. The body is formed somewhat like that of a salmon. The color of the back is dusky, tinged with blue. The belly is white. In young fish the space above the side line is marked with small black spots. It is esteemed a very delicate fish.

4. *P. marina*, the sea-perch, is about a foot long: the head large and deformed; eyes great; teeth small and numerous. On the head and covers of the gills are strong spines. The color red, with a black spot on the covers of the gills, and some transverse dusky lines on the sides. It is a fish held in some esteem at the table.

5. *P. Nilotica*, the perch of the Nile, is taken about Cairo. The flesh has a sweet and exquisite flavor, and is not hard, but very white. It is one of the best fishes in the Nile; and, as it is of the largest size in Egypt, it adorns a table if brought upon it entire and well fried. See *PILOT-FISH*.

PERCASE, *adv.* Par and case. Perchance; perhaps. Not used.

A virtuous man will be virtuous in solitude, and not only in theatro, though *percase* it will be more strong by glory and fame, as an heat which is doubled by reflection. *Bacon*.

PERCEANT, *adj.* Fr. *perçant*. Piercing; penetrating. Obsolete.

Wond'rous quick and *perceant* was his spright
As eagles' eyes that can behold the sun. *Spenser*.

PERCEIVE, *v. a.* } Latin *percipio*.
PERCEIVABLE, *adj.* } To discover by
PERCEIVABLY, *adv.* } some effect; to
PERCEPTIBLY, *adj.* } know; be affected
PERCEPTIBLY, *adv.* } by; observe: per-
PERCEPTIBILITY, *n. s.* } ceivable and per-
PERCEPTION, *n. s.* } ceptible mean, dis-
PERCEPTIVE, *adj.* } coverable; such as
PERCIPIENT, *adj.* & *n. s.* } may be observed;
the adverbs corresponding: perceptibility, state
of being an object of perception; power of per-
ceiving; for which, however, perception is the
better word: perceptive, having the power of
perceiving: perception is perceiving: percipient
is perceiving, one who has the power of
perception.

His sons come to honour, and he knoweth it not;
and they are brought low, but he *perceiveth* it not. *Job* xiv. 21.

Jesus *perceived* in his spirit, that they so reasoned
within themselves. *Mark* ii. 8.

Consider,
When you above *perceive* me like a crow,
That it is place which lessens and sets off.

The upper regions of the air *perceive* the collection
of the matter of tempests before the air here below. *Shakespeare*.

No sound is produced but with a *perceptible* blast
of the air, and with some resistance of the air
stricken. *Bacon*.

Great mountains have a *perception* of the disposition
of the air to tempests sooner than the valleys below;
and therefore they say in Wales, when certain
hills have their night caps on, they mean mischief. *Id.*

Answer to this dimness of their *perception*, was
the whole system and body of their religion. *Id.*

Decay of Piety.
It *perceives* them immediately, as being immedi-
ately objected to and *perceptible* to the sense; as I
perceive the sun by my sight. *Hale*.

By the inventors and their followers that would
seem not to come too short of the *perceptions* of the
leaders, they are magnified. *Id.*

Id. Origin of Mankind.
There is a difficulty that pincheth; the soul is
awake and solicited by external motions, for some of
them reach the *perceptive* region in the most silent
repose and obscurity of night: what is it then that
prevents our sensations? *Glanville*.

The soul is the sole *percipient*, which hath ani-
madversion and sense properly so called, and the
body is only the receiver of corporeal impressions. *Id.*

The illumination is not so bright and fulgent, as
to obscure or extinguish all *perceptibility* of the rea-
son. *More*.

Whatever the least real point of the essence of the
perceptive part of the soul does *perceive*, every real
point of the *perceptive* must *perceive* at once. *Id.*

Id. Divine Dialogues.
The body, though it really moves, yet not chang-
ing *perceivable* distance with some other bodies, as
fast as the ideas of our own mind will follow one
another, seems to stand still; as the hands of clocks. *Locke*.

Sensation and *perception* are not inherent in mat-
ter as such; for, if it were so, every stock or stone
would be a *percipient* and rational creature. *Bentley*.

In the anatomy of the mind, as of the body, more
good will accrue to mankind by attending to the large,
open, and *perceptible* parts, than by studying too
much finer nerves. *Pope*.

The woman decays *perceptibly* every week. *Id.*
Matter hath no life nor *perception*, and is not con-
scious of its own existence. *Bentley's Sermons*.

Perception is that act of the mind, or rather a
passion or impression, whereby the mind becomes
conscious of any thing; as when I feel hunger,
thirst, cold, or heat. *Watts*.
